2846. STEPHENS, T. C. The taxonomic unit. Proc. Iowa Acad. Sci. 27: 41-50. 1920.—The citations are chiefly zoological, to be "interpreted as a protest against the substitution of the subspecies for the species as a taxonomic unit."—H. S. Conard.

PTERIDOPHYTES

2847. BENEDICT, R. C. Have you ever seen *Polypodium vulgare* as an "air plant?" [Rev. of: JOHNSON, DUNCAN S. *Polypodium vulgare* as an epiphyte. Bot. Gaz. 72: 237-244. 1921.] Amer. Fern Jour. 12: 63-64. 1922.—Other instances of common ferns growing as air plants are mentioned.—F. C. Anderson.

2848. BENEDICT, R. C. Variation in ferns. Amer. Fern Jour. 12: 93-96. 1922.—Types of variation in ferns are summarized under 10 heads, and ferns illustrating these types are listed under their respective heads.—F. C. Anderson.

2849. BRECKENRIDGE, L. P. *Asplenium ebenoides*—a station in North Carolina. Amer. Fern Jour. 12: 64-65. 1922.

2850. GRAVES, E. W. A fern collecting trip in Cuba. Amer. Fern Jour. 12: 46-53. 1922.—The author describes his trip, pointing out features of interest connected with the ferns seen. A list of the 51 species collected, distributed among 18 genera, is given. The abundance and locality of each species is noted.—F. C. Anderson.

2851. HERTER, W. *Itinera Herteriana III. Heteropteridophyta austroamericana. (Equisetales Lycopodiales Selaginellales Isoëtales austroamericanae.)* Beih. Bot. Centralbl. II Abt. 39: 248-256. 1922.—The distribution of 20 South American species is given. *Isoëtes Weberi* Hert. is described as a new species from Brazil.—L. Pace.

2852. KITTREDGE, E. M. *Osmunda Claytoniana* forma *Mackiana*. Amer. Fern Jour. 12: 53-57. Pl. 3-4. 1922.—Near Bridgewater Corners, Vermont, Mrs. Mack found a new form which was later named *Osmunda Claytoniana* L. forma *Mackiana* n.f. A description and photographic reproductions of the form are given.—F. C. Anderson.

2853. LONG, BAYARD. Occurrence of *Botrychium matricariaefolium* in New Jersey. Amer. Fern Jour. 12: 1-9. 1922.—The author points out that the species has a fair distribution and a variety of habitats—ranging from low, wet woods or rocky woods containing limestone to sandy thickets. However, the fern shows a preference for acid soil.—F. C. Anderson.

2854. MARSHALL, M. A. *Lycopodium complanatum* var. *flabelliforme* with twenty-five spikes. Amer. Fern Jour. 12: 24. 1922.

2855. MARSHALL, M. A. Reminiscences of a fern lover. Amer. Fern Jour. 12: 16-19. 1922.

2856. [McCALLAN, E. A.] The wild ferns of Bermuda. Agric. Bull. Bermuda Dept. Agric. 1922: 4 p. August, 1922.—A list of native ferns of Bermuda is given with names of stations where each occurs.—H. H. Whetzel.

2857. MCCOLL, W. R. *Cystopteris bulbifera* Bernh. Amer. Fern Jour. 12: 22-23. 1922. 1922.—The author describes a locality in which variant forms of *Cystopteris bulbifera* grow. When these forms are transplanted to other places, they return to their original type form.—F. C. Anderson.

2858. MUNZ, PHILIP A., and IVAN M. JOHNSTON. The distribution of Southern California pteridophytes. Amer. Fern Jour. 12: 69-77. 1922. The authors define what they mean by "Southern California" and divide it into coastal, mountain, and desert areas. Four varieties and 51 species distributed among 7 families are given. Keys to families, genera, and species are also given. Under each species are synonyms, illustration references, location and habitat, and authorities and references for locality records. The article is to be continued.—F. C. Anderson.

2859. UPHAM, ALAN W. A list of ferns found in Woodstock, Conn. Amer. Fern Jour. 12: 96-97. 1922.—The list consists of 26 species and 1 variety distributed among 14 genera. *Botrychium simplex* is new for northeastern Connecticut. *Woodsia ilvensis*, not included in the above list, is found a short distance outside Woodstock's border.—F. C. Anderson.

2860. WEATHERBY, C. A. Is *Botrychium dissectum* a sterile mutant? Amer. Fern Jour. 12: 9-12. Pl. 1. 1922.—The specimen photographed was collected in Cass County, Indiana, and shows 3 well-developed fruiting panicles.—F. C. Anderson.

2861. WEATHERBY, C. A. On a supposed hybrid in *Equisetum*. Amer. Fern Jour. 12: 12-16. 1922.—*Equisetum variegatum* var. *Jesupi* A. A. Eaton has been described as a hybrid of *E. variegatum* and *E. hyemale*. When the New England ranges of *E. variegatum* and its variety *Jesupi* were mapped, it was found that the best station for the hybrid contained neither of the supposed parents and that the closest points of approach of these 2 species is 20 miles. Suggestions regarding hybrids are made, but no attempt is made to solve the problem.—*F. C. Anderson*.

SPERMATOPHYTES

2862. BENNETT, ARTHUR. *Calamagrostis stricta* and *C. strigosa*. Trans. and Proc. Bot. Soc. Edinburgh 27: 305-308. 1919.—The occurrence of these species and their varieties and forms in the British Isles is discussed and further comparison of these with European forms is advised in order to make their adequate definition possible.—*Roxana Stinchfield Ferris*.

2863. BENNETT, ARTHUR. *Potamogeton longifolius* Gay in England. Trans. and Proc. Bot. Soc. Edinburgh 27: 312-314. 1919.—This and related species with which it has been confused are discussed from a systematic standpoint.—*Roxana Stinchfield Ferris*.

2864. CAMUS, HICKEL, et A. [CAMUS.] Les chênes d'Indo-Chine. [The oaks of Indo-China.] Ann. Sci. Nat. Bot. 3: 377-409. Fig. 1-5. 1921.—Sixty-nine species are arranged under the 2 genera, *Quercus* L. and *Pasania* Miquel. These are divided into several subgenera. The following new species are described: *Quercus platycalyx*, *Q. Chevalieri*, *Q. tranninhensis*, *Q. lang-bianensis*, *Q. macrocalyx*, *Q. Poilanei*, *Q. Dussaudii*, *Q. chrysocalyx*, *Q. austrocochinchinensis*, *Pasania sabulicola*, *P. Harmandii*, *P. cerifera*, *P. mucronata*, *P. vestita*, *P. annamensis*, *P. pseudosundaica*, *P. Finetii*, *P. bacgiangensis*, *P. tenuinervis*, *P. auriculata*, *P. gigantophylla*, *P. Pierrei*, *P. kemmaratensis*, *P. Krempfii*, *P. elata*, *P. triquetra*, *P. megastachya*, *P. laotica*, *P. Bonnetii*, *P. Bonnetii* var. *tienyenensis*, *P. Capusii*, *P. Areca*, *P. Magneinii*, *P. tubulosa*, *P. nhatrangensis*, *P. cerebrina*, and *P. dinhensis*. The following new combinations are included: *Pisania Chittagonga* (*Quercus spicata* var. *Chittagonga* King), *P. Thomsonii* (*Q. Thomsonii* Miq.), *P. farinulenta* (*Q. farinulenta* Hance), *P. elephantum* (*Q. elephantum* Hance), *P. Lindleyana* (*Q. Lindleyana* Wall.), *P. sootepensis* (*Q. sootepensis* Craib), *P. tephrocarpa* (*Q. tephrocarpa* Drake del Castillo), *P. truncata* (*Q. truncata* King), *P. baviensis* (*Q. baviensis* Drake del Castillo), *P. Garretiana* (*Q. Garretiana* Craib), *P. Balansae* (*Q. Balansae* Drake del Castillo), *P. hemisphaerica* (*Q. hemisphaerica* Drake del Castillo), *P. cyrtocarpa* (*Q. cyrtocarpa* Drake del Castillo), and *P. calathiformis* (*Q. calathiformis* Skar).—*Paul Weatherwax*.

2865. DENIS, MARCEL. Les Euphorbiées des îles australes d'Afrique. [The Euphorbias of the islands of southern Africa.] Rev. Gén. Bot. 34: 5-64, 96-123, 171-177, 214-236, 287-299, 346-366. Fig. 1-32. 1922.—The Euphorbias are represented in the islands of southern Africa by the genera *Anthostema* (1 species) and *Euphorbia* (63 species). The genus *Synadenium* has been introduced into Reunion. Because of an error of determination which the author corrected, it was thought that the genus *Pedilanthus* was present in Madagascar. This genus remains strictly American. The first object of the research was the revision of all the Euphorbias of the islands of southern Africa with a discussion of their specific characters. Some of the characters which were used have not been considered previously as of taxonomic value (presence or absence and form of the cyathophyll, sexuality of the cyathium, form of the fruit, persistence of the calyx in the female flowers). By rendering the idea of species homogeneous and exact, the author was able to suppress or unite with others a dozen species which had been previously established. He was led to consider the genus *Calycopseplus* as an ancient type of *Euphorbia*. Eleven species are described as new: *E. Humbertii*, *E. Antso*, *E. obcordata*, *E. Caput aureum*, *E. biaculeata*, *E. pedilanthoides*, *E. Viguieri*, *E. mahafalensis*, *E. mangokyensis*, *E. xanthadenia*, *E. brachyphylla*, and *E. hexadenia* (*E. daphnoides* Baill., not Balf. f.). Two new varieties, *E. Perrieri* β *elongata* and *E. enarmensis* β *imbricata*, are described. The author secondly attempted to arrange the species in their natural groups. This is the first trial for

the Madagascar Euphorbias. The chapter on classification was completed with a dichotomous key using characters which were considered most secure and easy of determination. The author considered it impossible to distinguish the Euphorbias of Madagascar by anatomical characters alone. Although anatomy did not furnish the assistance usually expected from it in regard to distinguishing species, it at least confirmed the generic unity, which is otherwise so well defined by the floral constancy. In spite of the multiple aspects and varied adaptations which the Euphorbias of Madagascar present, there is a deep structural constancy. While under the influence of analogous ecological conditions comparable adaptations and morphological convergences between very different systematic elements occur, it is very easy to separate at one stroke species of *Euphorbia*, *Didierea*, or *Asclepias*, because the most profound adaptations do not affect the anatomical characters on which the genus always very definitely rests. In each of the climatic regions of Madagascar is found a certain number of species which seem localized. The central region for example offers a series of forms which are very peculiar from the botanist's point of view and very circumscribed geographically (*E. emirnensis*, *E. orthoclada*, *E. tetraptera*, and *E. ensifolia*). In the 3 regions of the flora of the windward (climate tropically humid) the leafy Euphorbias have persistent leaves; in 2 regions of the flora of the leeward (climate rather dry) the leafy Euphorbias have deciduous leaves. In the south central, the west-south, and throughout the southwest, the xerophytic Euphorbias become fleshy or spiny according to the locality in which they occur. The Euphorbias are remarkable for their adaptations to drought (reserves of water in the pith of the twig or in root tubercles, epidermis protected by reduced transpiration surfaces, embedding of the lenticels, or cutinization of the membrane). As a whole the Madagascar Euphorbias are much more sensitive to the physical influence of the soil than the chemical influence. The sections of *Euphorbia* are separated on the basis of their origin and affinities. They contain some series having a separate evolution. The Madagascar Euphorbias are either strictly endemic, related to the African species (in the great majority of cases), or, exceptionally, related to the Indian species. Concerning the evolution of the Euphorbias in Madagascar, it is possible to make an hypothesis that is in harmony with geologic facts and the epoch of the appearance of the genus *Euphorbia*. During the Nummulitic period, after the reunion of Madagascar with the African continent, the genus *Euphorbia*, which certainly existed at that time, spread to Madagascar by means of the African type *Anthostema*. There it divided into 3 foundation stocks or 3 groups of such stocks which evolved separately: 1 primitive stock of *Anisophyllum*, 1 or more stocks of *Tithymalus*, 1 or more ancestral stocks of *Euphorbia*. The "pro-Euphorbias" have evolved in parallel lines in Madagascar and Africa under the influence of a dry climate. There are produced on each side of the channel of Mozambique a series of comparable xerophytic types, which fact explains the affinities that occur between *Diacanthium* and *Tirucalli* of Madagascar and between the same genera of Africa. The *Goniostemas*, i.e., the leafy Euphorbias, represent the direct inheritance of a group of "pro-Euphorbia" that evolved under a tropical climate. Man has introduced to Madagascar and the southern islands of Africa some species of wide tropical range. His industry has modified, by utilitarian destruction or by fire, the localization or frequency of some indigenous species.—*J. C. Gilman.*

2866. FARWELL, OLIVER A. *Panicum lineare*, Linn. Amer. Midland Nat. 6: 49-51. 1919.—The author discusses the description and distribution of *Panicum lineare* as given by Linnaeus, who defined it as a new species in 1762. He also gives a number of the more important synonyms for the species.—*Sister M. Ellen.*

2867. HALLIER, HANS. Beiträge zur Kenntnis der Linaceae (DC. 1819) Dumort. [Contributions to the knowledge of the Linaceae.] Beih. Bot. Centralbl. II Abt. 39: 1-178. 1921.—The Cistaceae and related families are discussed. From the genus *Reinwardtia* Dumort. a new genus, *Tirpitzia*, is separated; it is represented by 1 species, namely, *T. sinensis* (*Reinwardtia sinensis* Hemsl.). *Ixonanthes Beccarii* from Sarawak and *I. crassifolia* from Borneo are described as new species. *Ochthocosmus* Benth. and *Phyllocosmus* Klotzsch are united in 1 genus, giving *Ochthocosmus sessiliflorus* Baill. (*Phyllocosmus sessiliflorus* Oliv.), *O. africanus*

Hook. f. (*P. africanus* Klotzsch), *O. Dewewrei* (*P. Dewewrei* Engl.), *O. senensis* (*P. senensis* Engl.), *O. Lemaireanus* de Wild. & Dur. (*P. Lemaireanus* Th. & H. Dur.), *O. candidus* (*P. candidus* Engl. & Gilg), *O. congolensis* de Wild. & Dur. (*P. congolensis* Th. & H. Dur.). The following new species are added: *O. parvifolius* from British Guiana, *O. Barrae* from northern Brazil, and *O. Zenkeri* from Kamerun. *Rhodoclada* Baker is placed in the genus *Asteropeia* Thours, giving *A. rhopaloides* Baill. (*Rhodoclada rhopaloides* Baker). A new species, *Asteropeia micraster*, from Madagascar is added. *Rouchera columbiana* is characterized as a new species from Colombia. *Indorouchera* is proposed and described as a new genus and under it the following new combinations, species, and variety occur: *I. Contestiana* (*Rouchera Contestiana* Pierre), *I. Griffithiana* (*R. Griffithiana* Planch.), *I. rhamnifolia* from Sarawak, and *I. Griffithiana* Hallier var. *coriacea* from Borneo. Certain species hitherto referred to *Rouchera* are removed from that genus and their equivalent indicated, as follows. *Rouchera humiriifolia* Planch. = *Hebepetalum humiriifolium* Benth., *R. latifolia* Spruce = *H. latifolium* Benth., *R. macrophylla* Miq. = *Sarcotheca macrophylla* Bl. The following families and some related groups are discussed: Flacourtiaceae, Cappariaceae, Erythroxylaceae, Humiriaceae, Irvingiaceae, Symplocaceae, Salicaceae, Lecythidaceae, Roussaceae, Strasburgeriaceae, Pentaphyllaceae, Diapensiaceae, Oxalidaceae, and Geraniaceae.—L. Pace.

2868. HOFMEYER, JOAN, and E. P. PHILLIPS. The genus *Cyclopia*, Vent. *Bothalia* 1: 105-109. 1922.—Several species of *Cyclopia* have become of some value locally as the source of "bush tea." The genus has been subdivided into 12 very distinct species mostly confined to the Western Province and the southeastern regions. The following new species, varieties, and combinations are recorded: *Cyclopia Burtonii*, *C. brachypoda* (*C. Vogelii* var. *brachypoda* Harv.), *C. brachypoda* var. *intermedia* (*C. Vogelii* var. *intermedia* Harv., *C. intermedia* E. Mey.), *C. Ashtonii*, *C. Bolusii*, *C. montana*, and *C. montana* var. *glabra*.—E. P. Phillips.

2869. HOFMEYER, JOAN, and E. P. PHILLIPS. The genus *Olinia*. *Bothalia* 1: 97-104. *Pl.* 1-3. 1922.—Sim recognized only 1 species, viz., *O. cymosa* Thunb., but divided this into 3 varieties. The examination of all the South African herbarium material shows that 2 of these varieties belong to *O. cymosa* while the 3rd is a distinct species which Klotzsch described as *O. acuminata*. Another species from Zululand and East Pondoland is described for the first time in the present paper as *O. radiata*.—E. P. Phillips.

2870. JUMELLE, HENRI. Un grand palmier du centre de Madagascar. [A large palm in the central region of Madagascar.] *Compt. Rend. Acad. Sci. Paris* 174: 957-960. 1922.—A description is given of a palm, previously described by the author as *Neodypsis basilongus*. It is now identified as the same plant which Beccari earlier described as *Chrysaliidocarpus decipiens*.—C. H. Farr.

2871. KRÄNZLIN, FR. Beiträge sur Kenntnis der Gattung *Telipogon* HBK. [Contributions to the knowledge of the genus *Telipogon* HBK.] *Ann. Naturhist. Mus. Wien* 33: 9-38. 1920.—In addition to the new species listed in Bot. Absts. 8, Entry 2251, the following are also published here for the first time: *Telipogon Phalaena* Reichb. f. in sched., Colombia (Hübsch); *T. Schmidchenii* Reichb. f. in sched., Colombia (Schmidtchen); *T. semipictus* Reichb. f. in sched., Colombia (Karsten), Ecuador (Karsten); *T. Hercules* Reichb. f. Ms., north Peru and Ecuador (Roezl, Lehmann); *T. suffusus* Reichb. f. in sched., Colombia (Lehmann); *T. polynurus* Reichb. f. in sched. (sphalmate *T. polymerus* Reichb. f. in Linnæa 41: 4. 1877), Colombia (Roezl, Kalbreyer No. 1923). Notes are added on 2 imperfectly known species, *T. nitens* Reichb. f. and *T. pamplonensis* Reichb. f.—A. S. Hitchcock.

2872. LESTER-GARLAND, L. V. A revision of the genus *Baphia*, DC. (Leguminosae). *Jour. Linn. Soc. Bot. London* 45: 221-244. 1921.—A revision is presented of the mainly tropical African genus *Baphia*. Fifty-eight species are enumerated, including 3 described as new: *B. myrtifolia*, *B. elegans*, and *B. Nannani* Baker f. *B. elegans* var. *vestita* is also new. Three species are reduced: *B. Mildbraedii* Harms = *B. Wollastoni* Baker f.; *B. ovata* T. R. Sim = *B. Kirkii* Baker; *B. Pynaertii* DeWild. = *B. polygalacea* Baker. Three names are excluded:

B. africana Afz., *B. congolensis* Welw., and *B. lancifolia* Baill. The first of these is a *nomen nudum*, the other 2 are obviously clerical errors for *B. angolensis* and *B. laurifolia* respectively.—A. J. Eames.

2873. MANGANARO, ANA. *Leguminosae Bonaerenses*. [Legumes of the province of Buenos Aires.] An. Soc. Cien. Argentina 87: 77-264. Fig. 1-15. 1919.—The author presents a study of the endemic Leguminosae of the province of Buenos Aires (Argentina). Five chapters are devoted to a general survey of the family under the following captions: (1) Generalities and affinities; (2) development and morphology, comprising a study of the seedling, root, stem, foliar apparatus, agamic propagation, flowering apparatus, fruit, seeds, secretory apparatus; (3) histology; (4) physiology and ecology, including movements and sensitive organs, symbiosis, pollination, dissemination, edaphic and climatic relations, species diffusion and geographic distribution, origin and constitution of the leguminous flora of Buenos Aires, and statistical studies; (5) paleontological records; (6) taxonomy. Keys are given to the *Mimosoideae*, *Papilionoideae*, and *Caesalpinoideae*, and to the genera included under each subfamily. Pages 123 to 262 are given to the descriptive matter of the genera and species recorded for the province. Two new species are described, namely, *Acacia platensis* and *Astragalus argentinus*. One new combination is made, as follows: *Cercidium praecox* (*Caesalpinia praecox* Ruiz & Pav.). A bibliography is appended.—A. Bonazzi.

2874. PHILLIPS, E. P. The genus *Ochna*. *Bothalia* 1: 87-96. 1922.—In the Flora Capensis 3 species of *Ochna* are described but investigations show that there are 9 species in South Africa. These are all described and a key to the species precedes the descriptions. The following new species, new combination, and variety are included: *O. Chilversii*, *O. O'Connorii*, *O. natalitia* Engl. & Gilg (*O. atropurpurea* var. *natalitia* Harv., *Diporidium natalitium* Meisn.), and *O. atropurpurea* DC. var. *angustifolia*.—E. P. Phillips.

2875. PHILLIPS, E. P. The thorn pears (*Scolopia* spp.). *Bothalia* 1: 83-86. 1922.—An examination of herbarium material has led to the recognition of *Scolopia Zeyheri* Szyszy and *S. Ecklonii* Szyszy as specifically distinct, and that *S. Gerrardii* Harv. and *S. Engleri* Gilg are varieties of *S. Ecklonii*. A very distinct species of the genus, collected at Barberton, is described as *S. Thorncroftii*.—E. P. Phillips.

2876. PODPĚRA, JOS. Studien über den Formenkreis der *Cortusa Matthioli* L. [Studies concerning the form variations of *Cortusa Matthioli*.] Beih. Bot. Centralbl. II Abt. 39: 276-287. 1922.—The Brün and Prague museums and the collections of Vienna University and the Kerner herbarium furnished the material for this study. Differences in leaf form, calyx teeth, and hairiness were the basis for separation of this species into races. Seven forms with several subforms are described. *Cortusa Matthioli* belongs to the high mountains of Eurasia. It possesses great plasticity in adjusting itself to local conditions. Such differences are of great importance to the plant geographer and ecologist.—L. Pace.

2877. POLE EVANS, I. B. The flowering plants of South Africa 2^o: Pl. 41-50 [colored]. 1922.—*Aloe Wickensii* Pole Evans, *Commelina benghalensis* L., *Hessea Zeyheri* Baker, *Watsonia Galpinii* L. Bolus, *Massonia latifolia* L., *Kniphofia alooides* Moench., *Heliophila scandens* Harv., *Holmskioldia speciosa* Hutchinson & Corbishley, and *Rhamphicarpa tubulosa* Benth. are described and illustrated. *Ceropegia tristis* Hutchinson is recorded as a new species from Cape Province, Natal.—E. P. Phillips.

2878. POLE EVANS, I. B. The flowering plants of South Africa 2^o: Pl. 51-60 [colored]. 1922.—*Gazania subulata* R. Br., *Pelargonium crassicaule* L'Her., *Androcymbium melanthioides* Willd., *Mesembryanthemum aloides* Haw., *Aloe striata* Haw., *Polyzena haemanthoides* Baker, *Dimorphotheca spectabilis* Schltr., *Mimetes capitulata* R. Br., *Erythrina caffra* Thunb., and *Sparaxis grandiflora* Ker are described and illustrated.—E. P. Phillips.

2879. POLE EVANS, I. B. **The flowering plants of South Africa.** 2¹: Pl. 61-70 [colored]. 1922.—*Corycium crispum* Sw., *Aloe excelsa* Berger, *Gladiolus alatus* var. *namaquensis* Baker, *Gazania pygmaea* Sond., *Ornithogalum Thunbergianum* Baker, *Ferraria antherosa* Ker, *Harveya squamosa* Steud., *Gladiolus Pritzeltii* Diels, *Gazania Pavonia* R. Br., are described and illustrated. *Ochna pretoriensis* Phillips is proposed as a new species from Pretoria.—E. P. Phillips.

2880. PONZO, A. **Considerazioni sulle Cistacee.** [On the Cistaceae.] *Nuovo Gior. Bot. Ital.* 28: 157-173. Fig. 1-9. 1921.—A careful study of the group indicates that there have been several lines of development within the family. *Cistus* represents the oldest branch of the phylogenetic tree, while *Heteromeris*, *Lechea*, and *Hudsonia* are of more recent origin.—Ernst Artschwager.

2881. SCHÖNLAND, S. **South African Cyperaceae.** *Bot. Surv. South Africa Mem.* 3: 1-72. Pl. 1-80. 1922.—The greater part of the text consists of critical notes on the genera of Cyperaceae represented in the South African flora. Selected species have been chosen as illustrative of the genera concerned. These species are portrayed by full-page illustrations; their geographical distribution is indicated, and numerous exsiccatae are sighted. A table is introduced to show the relationship of the South African genera of Cyperaceae. No new species are included.—E. P. Phillips.

2882. SMITH, W. W. **Whytockia, a new genus of Gesneraceae.** *Trans. and Proc. Bot. Soc. Edinburgh*, 27: 338-339. Pl. 7. 1919.—*Stauranthera chiritaeflora* Oliver and var. *minor* W. W. Smith, both from Province of Yunnan, western China, are referred to the new genus *Whytockia*.—Roxana Stinchfield Ferris.

2883. SURGIS, E. **Recherches sur les Frankéniacées.** [Researches on the Frankeniaceae.] *Rev. Gén. Bot.* 34: 409-416, 450-462, 499-507. Pl. 1-4, fig. 1-13. 1922.—The Frankeniaceae, a small family of dicotyledonous plants which has been incorporated in the Caryophyllales, are halophytic plants, being found at the edge of the sea or in dry places, salt deserts in subtropical and temperate regions of 5 parts of the world. All authors who have studied the group have retained it as a family. The difficulties encountered with the genera *Hypericopsis* and *Beatsonia* resulted from the use of such variable characters as pilosity, leaves, calyx, and corolla instead of stamens and carpels, which furnish more constant characters. Five genera are recognized, *Niederleinia*, *Hypericopsis*, *Beatsonia*, *Anthobryum*, and *Frankenia*. *Hypericopsis persica* Boiss. var. *angustifolia* is described as a new variety from southern Persia; *Beatsonia compacta* as a new species from the Island of St. Helena. *Anthobryum* Philippi is transferred from the Primulaceae to the Frankeniaceae and 3 species are included under it, namely, *A. triandrum* (*Frankenia triandra* Remy), *A. tetragonum* Philippi, and *A. aretioides* Philippi. A study of the anatomy of this family completes the paper.—J. C. Gilman.

2884. WOLF, W. **Notes on Alabama plants.** *Amer. Midland Nat.* 6: 151-158. 1919.—Critical notes on several plants are recorded, and a new species, *Talinum Mengesii*, is described from Cullman County, Alabama.—J. M. Greenman.

H. DIXON on Transport of Organic Substances in Plants.—O. A. Stevens.

2886. ANONYMOUS. **The British Association addresses of 1922.** [Rev. of: ANONYMOUS. **The advancement of science 1922.** Addresses delivered at the 90th annual meeting of the British Association for the Advancement of Science, Hull, September, 1922. 252 p. John Murray: London, 1922.] *Nature* 110: 507-508. 1922.—This publication is in anticipation of the annual volume giving a complete record of the British Association's proceedings at the meeting. The practice of such publication is to be commended and is found to meet a public demand. The addresses, slightly abridged in some cases, have been, or are being, reproduced in *Nature*.—*O. A. Stevens.*

2887. BENEDICT, R. C. **Game laws for ferns and wild flowers.** *Amer. Fern Jour.* 12: 33-45. *Pl.* 2. 1922.—The author quotes the law passed by the state of Vermont in 1921 for the protection of native wild plants. The list of the plants protected is included in the law. Many of the plants are becoming rare on account of ravages made by commercial collectors, forest fires, and utilization of the land for agriculture and quarrying. Some remedies, such as the growing of decorative species artificially and the establishing of reservations for the rare species that are in danger of becoming extinct, are suggested. Other states are urged to follow the example of Vermont.—*F. C. Anderson.*

2888. CARINI, A. **Abscès de la région ombilicale dû à la pénétration à travers l'ombilic des semences de Capim (*Melinis minutiflora*).** [Abscess of the umbilical region due to penetration by seeds of Capim.] *Bull. Soc. Path. Exotique* 15: 215-219. *Fig.* 1-3. 1922.—Seeds of *Melinis minutiflora* P. Beaur. and of *Capim jaragua* (*Andropogon rufus* Jacq.) are reported to have produced abscesses by penetrating the skin of the workmen handling large quantities of the seed. Reports of the trouble were rather frequent. The seeds are covered with a series of spines directed in such a way as to permit of easy entrance and difficult removal. Hygroscopic movements, as well, aid in penetration.—*G. H. Godfrey.*

2889. CONN, H. J. **Collaborators in the standardization of biological stains.** *Science* 56: 594-596. 1922.

2890. DAWSON, W. J. **A new method of paraffin infiltration.** *Ann. Botany* 36: 377-378. 1922.—The material is transferred from absolute alcohol to a mixture of 1 part melted paraffin, 2 parts xylol, and 3 parts absolute alcohol; after 24 hours the cork is removed and evaporation allowed to proceed until only the paraffin remains. Transition from absolute alcohol to paraffin is effected in 1 step, at a uniform and sufficiently slow rate.—*W. P. Thompson.*

2891. GEORGESON, C. C. **Summary of work at the stations.** *Rept. Alaska Agric. Exp. Sta.* 1920: 1-12. 1922.—A general summary and review of the work done at the 5 experiment stations in Alaska is presented. This work is given in more detail in the reports of the station superintendents which follow in the same report.—*J. P. Anderson.*

2892. McWHARF, J. M. **The banana as a food product.** *Trans. Kansas Acad. Sci.* 30: 124-125. 1919/21 [1922].—An account is given of the utility of bananas as food, together with a comparison of the calory values of 33 foods in common use, showing bananas as 7th in rank.—*F. C. Gates.*

2893. NYEBØE, M. **Torvs Anvendelighed til Fremstilling af Elektricitet.** [Peat for operating an electric plant.] *Tidsskr. Landokonomi* 11. 497-506. 1922.—A discussion is given of the value of peat or peat moss as fuel to replace coal in the operation of an electric plant.—*Albert A. Hansen.*

2894. O'KANE, W. C. **Crop Protection Institute fellowship.** *Phytopathology* 12: 156. 1922.—The Crop Protection Institute, National Research Council, Washington, D. C., announces 2 fellowships with an income of \$2500 each, to promote research relative to the fungicidal and insecticidal value of sulphur.—*B. B. Higgins.*

2895. PATCH, EDITH M. **Marooned in a potato field.** *Sci. Monthly* 15: 166-180. 1922.—An account is presented of the thoughts and dreams of a scientist while getting together the material for one of the matter-of-fact publications sent out by agricultural experiment stations.—*L. Pace.*

2896. PEARL, RAYMOND. **Trends of modern biology.** *Science* 56: 581-592. 1922.

2897. SAYRE, L. E. **Nature's use of disinfectants and antiseptics.** *Trans. Kansas Acad. Sci.* 30: 388-392. 1919/21 [1922].—This is a general paper of popular interest emphasizing that legal and commercial discouragement of popular study of antiseptics in the preservation of food is inimical to progress. The author also states, however, that he has no intention of advocating unnecessary and indiscriminate use of antiseptics for the purpose mentioned.—*F. C. Gates.*

2898. TUCKER, ELBERT S. **Studies of insects associated with the American mistletoe.** *Trans. Kansas Acad. Sci.* 30: 143-170. *Pl. 1-3.* 1919/21 [1922].—Reference is made to the occurrence of more than 60 insects found associated with the mistletoe (*Phorodendron flavescens* Nutt.). An annotated bibliography of 32 titles is appended.—*F. C. Gates.*

2899. WATSON, J. R. **Correlation between sun spots and Florida freezes.** *Proc. Florida State Hort. Soc.* 35: 166-169. 1922.—The earliest freeze recorded (1766) occurred during a period of high sun spot activity. Of the 6 most severe freezes recorded in Florida (a temperature of 18°F. or lower) all occurred during the periods of high sun spot activity.—*J. C. Th. Uphof.*

BOTANICAL ABSTRACTS

A monthly serial furnishing abstracts and citations of publications in the international field of botany in its broadest sense.

UNDER THE DIRECTION OF
THE BOARD OF CONTROL OF BOTANICAL ABSTRACTS, INC.

J. R. SCHRAMM, Editor-in-Chief
National Research Council, Washington, D. C.

(See also in this issue Entries 2968, 2971, 2974, 3006, 3038, 3101, 3139, 3158, 3177, 3188, 3207, 3249, 3253, 3254, 3281, 3288, 3450, 3462, 3526, 3561, 3567, 3574, 3576, 3606)

2900. ANONYMOUS. Combating droughts. Jour. Dept. Agric. Victoria 18: 716. 1920.—The appointment of a commission by the Parliament of the Government of South Africa to inquire into the best methods of combating drought is announced.—*Wm. E. Lawrence.*

2901. ANONYMOUS. Die Bedeutung des Kalkes für Pflanze und Boden. [The significance of lime for the plant and the soil.] Mitteil. Deutsch. Landw. Ges. 38: Flugblatt 66. 1 p. 1923.

2902. ANONYMOUS. Eradication of St. John's wort by means of introduced insects. Jour. Dept. Agric. Victoria 19: 187-188. 1921.—The results of investigations in England were practically negative. The phytophagous beetle (*Chrysomela varians*) appeared to be the only insect that did any serious harm to *Hypericum perforatum*. The introduction of such an insect into Australia is regarded as a very dangerous experiment.—*W. E. Lawrence.*

2903. ANONYMOUS. Meteorology and agriculture. Jour. Ministry Agric. Great Britain 29: 432-436. 1922.—This summary of the report of a committee appointed by the Agricultural Research Council discusses the relation of meteorological research and weather forecasting to agriculture, giving the plan of issuing forecasts in England, together with suggestions for further investigations.—*Roland McKee.*

2904. ANONYMOUS. Pasture top-dressing. Jour. Dept. Agric. Victoria 19: 238-239. 1921.—The application of superphosphate and lime gave better results than superphosphate alone or basic slag. The fertilizers markedly improve the bulk, quality, and palatability of the herbage, and increase the percentage of native clovers.—*Wm. E. Lawrence.*

2905. ANONYMOUS. Rotation for hay growing. Jour. Dept. Agric. Victoria 19: 237. 1921.—“During the past seven years the yields of hay grown after bare-fallow, and after barley and bare-fallow, have been more than double the yield of the plot on which hay was grown continuously.”—*Wm. E. Lawrence.*

2906. ANONYMOUS. **The oat crop. Results of departmental experiments.** Jour. Dept. Agric. Victoria 19: 235-236. 1921.—Superphosphate fertilizer produced better yields than the basic types.—*Wm. E. Lawrence.*

2907. ANONYMOUS. **Weather cycles in relation to agriculture and industrial fluctuations.** Nature 110: 889-890. 1922.—This article contains reviews of several papers presented at the Hull meeting of the British Association.—*O. A. Stevens.*

2908. ANONYMOUS. **Wheat experiment plots.** Jour. Dept. Agric. Victoria 19: 231-234. 1921.—The highest yields in the Wimmera and Mallee districts were obtained from Gallicoli, a new hybrid wheat.—*Wm. E. Lawrence.*

2909. AUDAS, J. W. **The true clovers naturalized in Victoria.** Jour. Dept. Agric. Victoria 19: 650-660. 2 fig. 1921.—Botanical and agricultural information is given for 6 species of introduced clovers.—*Wm. E. Lawrence.*

2910. BARTELS, L. C. **Lucerne experiments. State Research Farm, Werribee.** Jour. Dept. Agric. Victoria 19: 608-611. 1921.—The results are given of variety, rate and frequency of watering, and time of cutting tests.—*Wm. E. Lawrence.*

2911. BEVAN, W. **Cyprus tobacco.** Cyprus Agric. Jour. 17: 34. 1922.—Samples of Cyprus-grown tobacco were sent to the Imperial Institute to ascertain their commercial value either for smoking or for nicotine extract. Thus far it has not been possible to find buyers for the tobacco now on hand; further production except for home use is therefore not recommended.—*Wm. Stuart.*

2912. BEVAN, W. **Latakia tobacco industry in Cyprus.** Cyprus Agric. Jour. 17: 82-83. 1922.—According to the author the Latakia tobacco industry was established in Cyprus during the late war by a small group of Syrians. The writer claims that the preparation of Latakia tobacco is a simpler process than that required for cigarette tobacco. Information is given on handling and curing the crop.—*Wm. Stuart.*

2913. BEVAN, W. **Seed potatoes.** Cyprus Agric. Jour. 17: 36. 1922.—Growers in the plains area of Cyprus usually send their seed stock to the higher lands to be grown the following year and returned. The 1-year subjection of the seed to a colder and later climate seems to renew, or at least prolong, its vigor.—*Wm. Stuart.*

2914. BRÜNE, F. **Der Kartoffelbau in den Mooregebieten Nordwestdeutschlands.** [Potato culture in the moor area of northwest Germany.] Mitteil. Deutsch. Landw. Ges. 38: 7-12. 1923.—The best cultural and fertilizing methods for potatoes on moor soils are outlined. The following points are mentioned as especially important: planting of varieties of strong growth; avoiding too early planting; maintaining a high water table in spring; rolling the field immediately after planting and after each harrowing; and avoiding hilling. To these should be added the selection of adapted varieties.—*A. J. Pieters.*

2915. CUNNINGHAM, C. C., and B. S. WILSON. **Varieties of corn in Kansas.** Kansas Agric. Exp. Sta. Bull. 227. 40 p., 9 fig. 1921.—A study was made of a large number of varieties of corn throughout the state in cooperative tests with farmers. Because of seasonal variations, no one variety proves consistently superior to all other varieties in any one locality. Home-grown seed of adapted varieties outyields introduced seed. Varieties of corn developed under adverse climatic conditions in western Kansas are usually more vigorous and hardy than varieties similar in size and developed in the corn belt. Early varieties from western Kansas when grown in eastern Kansas outyield early varieties from the northern states.—*L. E. Melchers.*

2916. DAVEY, H. W. **Weeds and their eradication.** Jour. Dept. Agric. Victoria 19: 661-664, 705-714. Fig. 1-8. 1921; 20: 10-18. Fig. 9-15. 1922.—This series of articles is prefaced by a general statement about weed control. In part they deal with the control of St. John's wort (*Hypericum perforatum* L.). Experiments were conducted in the Bright district of Victoria, Australia, to determine the ability of strong growing grasses and other plants to force back and ultimately suppress this weed. The heavy crop of dried St. John's wort was burned off, the land plowed shallow and harrowed, and grass seeds sown. After 2 years the following grasses gave most promise: *Poa pratensis*, *Festuca duruiscula*, *Dactylis glomerata*, *Festuca rubra*, *Cynosurus cristatus*, in the order named. The Subterranean clover (*Trifolium subterraneum*) grew luxuriantly, covering the St. John's wort during the spring and autumn; but it dies down during the summer, thus permitting the revival of the weed. Grasses gave better results. *Hypericum androsaemum*, *H. calycinum*, and *H. aponicum* are described briefly.—Wm. E. Lawrence.

2917. DAVIDSON, W. D. **The Irish seed potato trade, with some notes on the distinguishing features of the principal varieties of potatoes.** Jour. Dept. Agric. Ireland 22: 3-13. 1922.—Irish and Scotch seed are equally good in Ireland and England, and better than English. Inspection and varietal certification are restricted to varieties immune to black scab, of which a few are described.—Donald Folsom.

2918. DAVIS, ROBT. L. **Pedigreed fiber flax.** U. S. Dept. Agric. Bull. 1092. 22 p., 9 fig. 1922.—Improved strains of flax have been developed by selection methods. A semi-commercial test showed the pedigreed strains to be superior to commercial fiber flax. A special score card and special instruments for cross-pollinating and for measuring flax have been devised and efforts are now being made to combine desirable characters by crossing the different strains.—J. T. Buchholz.

2919. DOWNING, R. G., and C. McCAULEY. **Field experiments with wheat. Summary of variety trials, 1911 to 1921.** Cowra experiment farm. Agric. Gaz. New South Wales 33: 837-843. 1922.—Cowra is situated some 200 miles from Sydney and is in a good wheat-producing section. About 20 varieties were under trial for 3 years or more, planted early, medium, and late and for both grain and hay. Canberra and Yandilla King were outstanding in yield. Notes are given on all varieties, including those not recommended.—L. R. Waldron.

2920. FARRELL, J. **New Zealand flax (*Phormium tenax*). Propagation, cultivation, and milling treatment.** Jour. Dept. Agric. Victoria 18: 658-671, 705-716. Fig. 1-17. 1920; 19: 77-88, 143-156, 209-223. Fig. 18-40. 1921.—The plant is native of New Zealand and Norfolk Island, and is also found in the Chatham Islands. It was used by the natives before white colonists arrived, and considerable trade was developed by 1828. Of the many varieties, 60 were distinguished by the Maoris before 1870. It is said to thrive better under irrigation than in its native habitat. Less confusion regarding the fiber has existed since it became known as New Zealand hemp. The true flax (*Linum usitatissimum*) fibers are bast cells of the stem, whereas the Phormium fibers are derived from the prosenchymatous wood-cells of the vascular bundles in the leaf. Both the soil and climate of Australia are well suited to the production of Phormium fiber. It is used in the manufacture of binder twine, rope, and other cordage; the ropes are very durable, resisting weathering action better than Manila hemp or hemp.—Wm. E. Lawrence.

2921. FOY, R. NELSON. **Seed testing notes.** New Zealand Jour. Agric. 24: 92-93. 1922.—Meadow foxtail (*Alopecurus pratensis*) and *Poa trivialis* are important grasses, but it is difficult to secure seed with high percentage of germination. Impurities are mentioned.—N. J. Giddings.

2922. GALLAGHER, P. Selection of seed maize. New Zealand Jour. Agric. 24: 79-82. 3 fig. 1922.—Types of ears are discussed and methods of improving corn by seed selection are suggested.—N. J. Giddings.

2923. GANZ. Künstliche Beregnung von Ackerfeld. [Artificial watering of fields.] Mitteil. Deutsch. Landw. Ges. 38: 40. 1923.—Oats, summer and winter barley, luzerne, potatoes, and rutabagas were watered and large increases in yields secured during 3 years. The method of watering is not described.—A. J. Pieters.

2924. GERLACH. Die inländische Eiweisserzeugung. [Domestic protein production.] Mitteil. Deutsch. Landw. Ges. 37: 438-442. 1922.—Attention is called to the fact that before the war $\frac{1}{3}$ of the protein consumed in Germany was imported. The following methods are suggested for increasing the protein supply: (1) increased production, especially the per acre yields, by the use of nitrates; (2) increasing the acreage planted to high protein crops, such as peas, beans, vetches, clover, and lucerne for the better soils and lupines and serradella for sand; (3) production of greater quantities of grass with higher protein content on meadows and pastures (top dressing with nitrate is recommended); (4) feeding urea to cattle to save protein (this process is not yet beyond the experimental stage but has great significance); (5) preventing the loss of fresh fodder in making hay and in the earth pits. To this end the use of fermentation chambers, silos, and the use of the electric current is advised. In the discussion emphasis was placed on the effect of nitrates in encouraging the production of grass at the expense of the legumes. The increased production of lupines on light lands and the breeding of improved varieties was urged. Regarding the ensiling of legumes it was brought out that the use of electric current quickly to raise the temperature had been successful, the disadvantages of this method being the difficulty of always commanding sufficient current. The importance to German agriculture of investigations on ensiling methods was stressed.—A. J. Pieters.

2925. GERLACH. Die Verfütterung von Kartoffeln an Pferde. [Feeding potatoes to horses.] Mitteil. Deutsch. Landw. Ges. 37: 739-740. 1922.—A general statement is made concerning feeding of potatoes to horses, together with advice as to the best methods.—A. J. Pieters.

2926. GORDON, GEORGE S. Farm notes for December, 1920 and January, 1921. Jour. Dept. Agric. Victoria 19: 117-124. Fig. 1-3. 1921.—The results of plot tests on the selection and rotation of wheat are given.—Wm. E. Lawrence.

2927. GORDON, GEORGE S. Farm notes for February. Experimental work at State Research Farm, Werribee. Jour. Dept. Agric. Victoria 19: 181-185. 2 fig. 1921.—In a wheat-growing region of 20 inches annual rainfall a suitable green crop, fed off with sheep, is recommended instead of bare fallowing or plowing in "green manure." Algerian oats gave best results for feeding value, with barley, rape, and peas next in order of value. Wheat following barley was almost ruined by "take all" (*Ophiobolus graminis* Sacc.). A clean crop of wheat followed crops of Algerian oats, rape, and peas.—Wm. E. Lawrence.

2928. GORDON, GEORGE S. Summer forage crops. Jour. Dept. Agric. Victoria 19: 441-444. Illus. 1921.—Results of field tests are given.—Wm. E. Lawrence.

2929. GOULDEN, C. H. Oat production in Saskatchewan. Sci. Agric. 3: 125-134. 1922.—Canada produces about 10 per cent of the world's oat crop, of which Saskatchewan produces about $\frac{1}{3}$. In Saskatchewan oats are used as a straight grain crop, in cultivated rows, as partial substitute for summer fallow, as an annual hay crop, in annual pasture mixtures, and as a nurse crop for grasses and clovers. The leading varieties are Banner, Gerlach, Gold Rain, Abundance, Sixty Day, Cole, Leader, and Liberty. A brief discussion of the ordinary methods of cultivation is given.—T. G. Major.

2930. HANSEN, K. Planteavlten 1921. [The crops of 1921.] Tidsskr. Landokonomi 1922: 436-468. 1922.—A detailed report is presented of the 1921 crop yields in Denmark, including the province of Slesvig.—*Albert A. Hansen.*

2931. HENSEL, R. L., and E. P. HARLING. Russian knapweed: A new weed in Kansas. Kansas Agric. Exp. Sta. Circ. 94. 4 p., 2 fig. 1922.—This weed, *Centaurea calcitrapa* L., was reported in Washington County, Kansas, in July 1921.—*L. E. Melchers.*

2932. KEANE, J. Rotation system for hay growing. Jour. Dept. Agric. Victoria 19: 367-374. 2 fig. 1921.—A rotation with summer fallow gave better results than "hay after barley and bare-fallow" or "hay after barley and peas" where rainfall during the growing period is the limiting factor.—*Wm. E. Lawrence.*

2933. KING, C. J. Water-stress behavior of Pima cotton in Arizona. U. S. Dept. Agric. Bull. 1018. 24 p., 4 pl. 1922.—A report is given of the results of an investigation of the behavior of Pima cotton when grown under different conditions of soil moisture and available plant food in Salt River Valley, where the growing season, though ample for substantial yields, is none too long for the complete development of the plant. Mean period of maturation for 3000 bolls was 68 days, early bolls maturing within a much shorter period than later sets, with a mean difference of 27 days between July and September blooming. "Water-stress" affects most seriously the plants with greatest vegetative growth. Effect of root systems on water-stress behavior was studied and is discussed. There is little difference in size of roots between large and small plants. Severe water-stress in luxuriant plants was not always induced by lack of available moisture throughout the soil mass, but was probably caused by the reduction of the moisture in the soil immediately surrounding the roots faster than it could be restored by capillarity. An important relation is shown between increase in shedding rate during the first 2 months of the flowering season and the gradual reduction of moisture content in the lower soil layers. Heavy rain materially shortened the interval between flowering and shedding. Irrigation water supplied after flower buds begin to form and frequently thereafter produced greater stem growth and a greater number of flowers during the first 45 days of flowering than plants irrigated 16 days later. Sparingly watered plants produced a maximum number of bolls late in the season. An effort should be made to stimulate setting of fruit to the fullest extent during July and August, since the bolls set during this period largely determine the crop.—*J. T. Buchholz.*

2934. KNAPP, GEORGE S. Relation of crop yields to quantity of irrigation water in southwestern Kansas. Kansas Agric. Exp. Sta. Bull. 228. 29 p., 11 fig. 1922.—A study was made of the amount of irrigation water used by sorghums, barley, oats, and wheat under field conditions, and its effect on yields of grain and clover.—*L. E. Melchers.*

2935. MCGOWAN, H. E. Commercial potato growing. New Zealand Jour. Agric. 24: 85-87. 1922.—Where machinery is used for planting and harvesting, the average cost of production and marketing is about \$180 per acre. Oversupplies may be used in making alcohol or potato flour.—*N. J. Giddings.*

2936. MALTE, M. O. The 1000-kernel weight of seed in relation to experimental error. Sci. Agric. 3: 69-71, 119-122. 1922.—Because of great variation in the 1000-kernel weight, it is necessary, in order to obtain as equal stands as possible, to take the 1000-kernel weight into consideration and sow varying amounts of seed, calculated on the basis that equal numbers of germinable seed should be applied to equal areas.—*T. G. Major.*

2937. MAUME, L. Le chlorhydrate d'ammoniaque et les engrais azotés. [Ammonium chloride and the nitrogenous fertilizers.] Ann. Ecole Nation. Agric. Montpellier 17: 244-250. 1918/1919.—It was found that with wheat, ammonium chloride gave results comparing favorably with those obtained when sulphate of ammonia or calcium nitrate were used.—*F. F. Halma.*

2938. MOE, G. G. **Improvement of farm crops in British Columbia.** Sci. Agric. 3: 82-86. 1922.—An outline is given of the methods of breeding small grains, grasses and clovers, potatoes, corn and rye, and root crops.—*T. G. Major.*

2939. MULLETT, H. A. **Crop and fallow competition, Horsham, 1920.** Jour. Dept. Agric. Victoria 19: 356-363. 4 fig. 1921.—The crop and fallow competitions aim to discover and disseminate information concerning the methods by which the best wheat crops are raised in the respective districts. The results are given for the above district.—*Wm. E. Lawrence.*

2940. MULLETT, H. A. **Crop and fallow competition. Report on the Warracknabeal crop and fallow competition.** Jour. Dept. Agric. Victoria 19: 65-72. 5 fig. 1921.—The results emphasize the importance of fallowing, and the use of sheep to increase yields and keep down the weeds and the take-all disease caused by *Ophiobolus graminis* Sacc.—*Wm. E. Lawrence.*

2941. MULLETT, H. A. **Dimboola crop and fallow competition, 1920.** Jour. Dept. Agric. Victoria 19: 257-266. 6 fig. 1921.—This article emphasizes greater care in smut control and gives directions.—*Wm. E. Lawrence.*

2942. MULLETT, H. A. **Grassing golf links and recreation fields. What has been done by the Royal Melbourne Golf Club at Sandringham.** Jour. Dept. Agric. Victoria 19: 749-751. 1921.—Methods are described by which a high class turf was established on poor soil; also the subsequent management. The turf is composed of couch grass (*Cynodon dactylon*) Kentucky Blue grass (*Poa pratense*), and annual meadow grass (*Poa annua*). The greens are laid down with Chewing's fescue (*Festuca duriuscula*) [*Festuca rubra* var. *follax*].—*Wm. E. Lawrence.*

2943. MULLETT, H. A. **Inter-district farm competition. Royal Agricultural Society's second competition, 1920-21.—prizes £ 100.** Jour. Dept. Agric. Victoria 19: 385-426. *Illus.* 1921.—The author relates the benefits derived. "Some 23,000 acres of wheat and 10,000 acres of summer fallow were subjected to a careful investigation and classification" distributed in farms ranging from 513 to 3,000 acres. Judgment was based upon a consideration of the cropping systems, crops, fallows, live stock, storage of water, fodder reserves, and other factors. The results obtained are described.—*Wm. E. Lawrence.*

2944. MULLETT, H. A. **Mallee settlement successful. Second Ouyen farm competition.** Jour. Dept. Agric. Victoria 19: 193-206. 12 fig. 1921.—These competitions are educational in character, stimulating the adoption of up-to-date farming methods. Despite the dense mallee scrub the land may be rapidly and cheaply brought under cultivation, and substantial returns secured the 1st year of settlement. Wheat-growing and sheep raising are recommended.—*Wm. E. Lawrence.*

2945. MULLETT, H. A. **Nhill crop and fallow competition.** Jour. Dept. Agric. Victoria 19: 129-142. *Illus.* 1921.—The results of the annual competitions have shown the value of later seeding, deeper plowing, increased seeding, and manuring. Later seeding permitted the first crop of weeds to be destroyed before planting and a greater yield resulted.—*Wm. E. Lawrence.*

2946. NEWMAN, L. H. **Origin of false wild oats.** Sci. Agric. 3: 169-170. 1923.—This review of an article by Å. ÅKERMAN [Sveriges Utsädesförenings Tidskrift, 1921] contains an application to Canadian conditions. Since it appears that the false wild oat is a mutation and not connected with true wild oats, it should not be considered a dangerous weed.—*T. G. Major.*

2947. PRIDHAM, J. T. **Natural crossing—a danger in growing seed wheat.** Agric. Gaz. New South Wales 33: 849-850. 1922.—Natural crossing in wheat fields intended for seed production should be considered and impurities resulting therefrom rogued out.—*L. R. Waldron.*

2948. REMB. **Der Kartoffelbau im Lichte eigener Erfahrungen und Beobachtungen.** [Potato culture in the light of personal experiences and observations.] Mitteil. Deutsch. Landw. Ges. 38: 21-26. 1923.—The author considers the various factors controlling successful potato culture. Great stress is laid on high grade, disease-free seed. It is stated that slightly immature potatoes when used for seed yielded better than mature ones. Planting machinery, fertilizing, and spacing are among the other topics treated.—*A. J. Pieters.*

2949. RICHARDSON, A. E. V. **Improvement of farm crops by selection.** Jour. Dept. Agric. Victoria 19: 427-439. 6 fig. 1921.—Wheat yields per acre have shown greater increase than any other farm crop in Victoria. This is due to systematic and scientific study during the past 20 years. New varieties have been developed and better farming methods adopted. "There is an unlimited field in Australia for the application of the same systematic methods for the improvement of oat, barley, maize, and potato varieties." The different methods of improvement by seed selection are discussed with a brief consideration of each crop.—*Wm. E. Lawrence.*

2950. RICHARDSON, A. E. V. **Some results in top-dressing of pastures.** Jour. Dept. Agric. Victoria 19: 347-355. 2 maps. 1921.—The results of test plots show that an application of superphosphate, and of superphosphate and lime greatly increases the weight of the herbage, the percentages of clovers and trefoils, and the palatability and stock-carrying capacity of the herbage. These results are most marked in the regions having 20 or more inches of rainfall.—*Wm. E. Lawrence.*

2951. SEIFERT, ALFRED. **Quality of New Zealand hemp.** New Zealand Jour. Agric. 24: 89-91. 1922.—Export of Phormium fiber of the U. S. A. has fallen off due to faults in the milling of the leaves. Practical methods for improving the quality of the fiber are discussed.—*N. J. Giddings.*

2952. SHEPHERD, A. N., and J. M. PITT. **Farmers' experiment plots. Maize experiments, 1921-22.** Agric. Gaz. New South Wales 33: 844-848. 1922.—Notes are given on yields of maize for grain based upon variety trials and upon fertilizer trials for the Murrumbidgee irrigation areas and the lower north coast.—*L. R. Waldron.*

2953. SIMMERMACHER. **Zur Stickstoffdüngung der Schmetterlingsblütler.** [Nitrogenous fertilizers for legumes.] Mitteil. Deutsch. Landw. Ges. 38: 12-13. 1923.—In 1918 and again in 1922 certain lucerne fields were fertilized with various carriers of nitrogen, but in only 1 case out of 7 was there any increase from the use of the fertilizer, and this was small. Similar experiments were made with red clover, *Vicia faba* and peas, but in no case did nitrogenous fertilizers increase yields.—*A. J. Pieters.*

2954. SOUTHWORTH, W. **Improvement of fodder corn for Manitoba and other prairie provinces.** Sci. Agric. 3: 143-151. 1922.—Manitoba-grown seed corn is better for local conditions than that obtained from warmer climates. Strains maturing more rapidly have been isolated by selection. First-generation hybrid seed corn obtained from a cross between a small early variety and a large late variety gave a total crop yield of 4,795 pounds per acre, greater than the crop produced by seed from the larger parent.—*T. G. Major.*

2955. TAYLOR, E. McK., and A. C. BURNS. **The basis of Egyptian agriculture and its relation to the decline in the average yield per feddan of cotton.** Ministry Agric. Egypt Tech. and Sci. Serv. Bull. 25. vi+70p., 4pl. 1922.—The history of the change from the basin system of irrigation to perennial irrigation and the modifications it has made in Egyptian

agriculture are given. Experimental data showing the effects of different fertilizer treatments on the growing of cotton, the chief crop introduced since the change in the methods of irrigating, are reported. A comprehensive bibliography is added.—*Lyman Carrier*.

2956. TENNENT, R. B. **Otago lucerne-growing competitions.** New Zealand Jour. Agric. 24: 170-171. 1922.—The competition was divided into 2 classes, one for irrigated and the other for non-irrigated lucerne. A 23-year old and a 16-year old irrigated field were entered, the former being one of the oldest in New Zealand, and having a truly remarkable stand. The latter secured 3rd place in the competition.—*Mary R. Burr*.

2957. TITUS, CHARLES P. **Cigarettes under the microscope.** 48 p. Publ. by author: East Orange, New Jersey. 1922.—The history of the cigarette is interwoven with that of tobacco. Chapter headings are: Historical, Botanical, Agricultural, Curing, Statistics, Microscopical, Chemical, Purity of product, Aromatics principles, Psychology of smoking, Bibliography. Tobacco seed average about 5000 per pod and nearly 500,000 per ounce, and retain germinating power for about 10 years.—*C. S. Gager*.

2958. TULLOH, I. M. **Goroke crop and fallow competition, season, 1920.** Jour. Dept. Agric. Victoria 19: 266-272. 2 fig. 1921.—This article gives recommendations for the treatment of heavy and light soils.—*Wm. E. Lawrence*.

2959. WAGNER, PAUL. **Stickstoffdüngung der Luzerne.** [Fertilizing lucerne with nitrogen.] Mitteil. Deutsch. Landw. Ges. 38: 49-51. 1923.—The author reports on pot and field experiments with sulphate of ammonia at various rates; in one case red clover was used. The results showed no, or unprofitable, increases in yield.—*A. J. Pieters*.

2960. WARD, F. E. **Some recent lucerne experiences in Canterbury.** New Zealand Jour. Agric. 24: 226-229. 2 fig. 1922.—This article discusses fertilizer experiments at Ashburton, and railway demonstrational areas.—*N. J. Giddings*.

BIBLIOGRAPHY, BIOGRAPHY, AND HISTORY

2961. ANONYMOUS. **Bernhard Eduard Fernow.** Science 57: 255-256. 1923.—This obituary notice of the prominent forester, author, and educator includes a brief biographical sketch, emphasizing his work in forestry.—*C. J. Lyon*.

2962. ANONYMOUS. **Index Kewensis, supplement V.** Kew Bull. 1921: 408. 1921.—The work, which covers the years 1911-1915, was published in 1921.—*T. J. Fitzpatrick*.

2963. ANONYMOUS. **International conference on phytopathology and economic entomology.** Science 57: 142. 1923.—Announcement is made of the conference to be held near Wageningen, Holland, June 25-30, 1923.—*C. J. Lyon*.

2964. ANONYMOUS. **Lists of staffs of the Royal Botanic Garden, Kew, and of the botanical departments, establishments and officers at home, and in India and the colonies, in correspondence with Kew.** Kew Bull. 1921: Appendix II: 27-42. 1921.—Names, titles, and lines of work are given.—*T. J. Fitzpatrick*.

2965. ANONYMOUS. **New Japanese botanical serials.** Nature 110: 891-892. 1922.—This is a brief statement regarding the first issues of the Japanese Journal of Botany and Acta Phytochimica.—*O. A. Stevens*.

2966. ANONYMOUS. **Obituary. Sir Isaac Bayley Balfour.** *Nature* 110: 816-817. 1922.—I. B. Balfour, son of J. H. Balfour who was professor of botany at the University of Edinburgh from 1845 to 1879, was born at Edinburgh on March 31, 1853, and died at Court Hill, Haslemere, on November 30, 1922. He was educated at the Edinburgh Academy and at the University, receiving a degree in science and later in medicine. He continued botanical studies in the universities of Strasbourg and Würzburg, and was appointed professor of botany in the University of Glasgow in 1879. In 1884 he became Sherardian Professor of botany at Oxford, and in 1888 professor of botany at the University of Edinburgh, King's Botanist for Scotland, and Regius Keeper of the Royal Botanic Garden. These positions he held until March, 1922. Prominent among his early work was a botanical survey of Socotra and studies of *Halophila* and *Pandanus*. Later he devoted much time to the genera *Primula* and *Rhododendron*. He contributed to the English edition of DeBary's Fungi, Mycetozoa and Bacteria and to the *Annals of Botany*.—O. A. Stevens.

2967. ANONYMOUS. **The centenary of Pasteur's birth.** *Science* 57: 17. 1923.—This is a list of several meetings held during December, 1922, throughout the world, with mention of the speakers on these occasions.—C. J. Lyon.

2968. ANONYMOUS. [The Lingnaam Agricultural Review.] *Lingnaam Agric. Rev.* [Canton, China] 1⁴: 2nd unnumbered page. 1922.—This new semi-annual serial is announced of which the first number was published in December, 1922. It is intended primarily for the results of research carried on at Canton Christian College, but manuscripts on agricultural and related work by others in the Orient are invited. The serial is published by the College of Agriculture of Canton Christian College and is edited by C. O. Levine of the same institution. The subscription price is \$2.00 a year, but the publication will be sent on an exchange basis to "agricultural colleges and publishers of scientific and technical agricultural bulletins and periodicals."—J. R. Schramm.

2969. ANONYMOUS. **The Royal College of Science for Ireland.** *Nature* 110: 814-816. 1 fig. 1922.—This is a brief account of this college, founded in 1865.—O. A. Stevens.

2970. ANONYMOUS. **William Purdom.** *Kew Bull.* 1921: 408. 1921.—This is a note concerning the life and botanical work of Purdom who died at Peking, China, November 7, 1921.—T. J. Fitzpatrick.

2971. CHERRY, THOMAS. **The discovery of agriculture.** *Jour. Dept. Agric. Victoria* 19: 577-586, 641-649. 1921.—Evidence is given to show that barley, millet (probably a species of *Sorghum*) and the root tubers of the nut rush, (*Cyperus esculentus*), formed a part of human food at the beginning of Egyptian civilization. The author argues that these plants were found growing wild and that the art of cultivation was learned by imitating the natural conditions along the Nile, which occur in no other region. The Nile overflows at the end of the hot season and sufficient moisture remains in the soil to mature crops in the following spring, conditions which suit the requirements of barley and millet. The annual overflow would lead primitive man to scrape away shallow channels and throw up low ridges that the flood waters might pass to other ground. The periodic deepening of these channels would finally result in basin irrigation. Tillage by means of a stick may have started from the observation that areas trampled by wild animals produced a better growth of plants. The author denies that agriculture began in many independent localities, by a series of gradual steps. From a study of the biology and ecology of barley and wheat it appears that the wild ancestors of these cereals no longer exist and that the later stages of their evolution took place under special conditions. The author believes that barley originated in the Nile Valley and that wheat came from an island in the Aegean Sea, for on an island it would be protected from herbivorous animals, as it is defenseless in the struggle for existence. "They were evolved in regions of dry and nearly rainless summers, and therefore, not in any forest region (which implies heavy rainfall) or in a snow-clad winter climate." The rapid development of Egyptian civilization can be regarded as a natural consequence of the discovery of these 2 valuable plants.—Wm. E. Lawrence.

2972. FARMER, J. B. *The West Indian College of Tropical Agriculture*. *Nature* 110: 775-776. 1922.—This institution was opened on October 16. It has a site of 85 acres located about 7 miles east of Port of Spain, Trinidad. The site is considered exceptionally good. The provisional arrangement includes a 3-year diploma course, a 1-year elementary course, courses for agricultural officers, and facilities for graduate research.—*O. A. Stevens*.

2973. GOLDSCHMIDT, RICHARD. *Richard Hertwig und die experimentelle Zoologie*. [Richard Hertwig and experimental zoology.] *Naturwissenschaften* 8: 771-774. 1920.—This paper, one of a series of biographical sketches published in honor of Richard Hertwig's 70th birthday, deals with his work as an experimental zoologist.—*J. L. Collins*.

2974. LIPMAN, J. G. *Tendencies in agricultural research*. *Science* 57: 71-76. 1923.—In his address the author shows by an historical analysis how agricultural research gave effective aid to the pioneer stage of American agriculture. Recent progress has been along lines of soil building and exact information concerning soil biology. The present problems are those of proper handling and use of food resources, and conservation in every phase of farm activity.—*C. J. Lyon*.

2975. LUSK, GRAHAM. *Pasteur, the man*. *Science* 57: 139-141. 1923.—The author recounts many incidents in the life of Pasteur that reveal his personal characteristics. His development as a scientific worker is traced from his earliest preparation in the École Normale at Paris.—*C. J. Lyon*.

2976. RHODE, ELEANOUR SINCLAIR. *The old English herbals*. *xii + 243 p., 18 pl.* Longmans, Green & Co.: London, 1922.—The author discusses and quotes freely from the Leech Book of Bald, the Lacnunga, Bartholomaeus Anglicus De Proprietatibus Rerum, Banckes's Herbal, the Grete Herball, and those by Turner, Gerard, Parkinson, Culpepper and Cole. A number of herbals dealing with New World plants are also discussed. The author then turns her attention to 16th and 17th century still room books. The work is concluded by a very complete bibliography of manuscript, and of early printed herbals which are the work of Englishmen, of or foreigners resident in England.—*C. W. Dodge*.

2977. WATERHOUSE, G. A. *Presidential address (including an account of some breeding experiments with the Satyrine genus Tisiphone)*. *Proc. Linnean Soc. New South Wales* 47: i-xx. 1 map, 2 colored pl. 1922.—Mention is made of the two 1921 meetings of the Australian Association for the Advancement of Science at Sydney (May) and at Melbourne (August), where it was decided to publish a quarterly abstract of papers by scientific workers in Australia. Attention was called to the fact that the card catalogue of scientific and technical periodicals in the chief libraries of the Commonwealth has been completed by the Commonwealth Institute of Science and Industry. Its publication is planned.—*Eloise Gerry*.

BOTANICAL EDUCATION

C. STUART GAGER, *Editor*

ARTHUR H. GRAVES, *Assistant Editor*

(See also in this issue Entries 2959, 2972, 2974)

2978. ANONYMOUS. [Rev. of: (1) MARSHALL, C. E. *Editor. Microbiology*. 3rd ed., *xxviii + 1043 p., 1 pl.* J. and A. Churchill: London, 1921. (2) ANONYMOUS. *Laboratory manual in general microbiology*. Prepared by the Laboratory of Bacteriology and Hygiene Michigan Agricultural College. 2nd ed., *xxii + 472 p., 1 chart.* J. Wiley and Sons: New York; Chapman and Hall: London, 1921.] *Nature* 110: 694. 1922.

2979. ANONYMOUS. [Rev. of: SHANN, E. W. *First lessons in practical biology*. *xv + 256 p.* G. Bell and Sons: London, 1922 (see Bot. Absts. 12, Entry 2987).] *Nature* 110: C01-C02. 1922.—The reviewer cites a number of errors.—*O. A. Stevens*.

2980. COSTANTIN, J., et F. FAIDEAU. *Histoire naturelle illustrée. I. Les plantes* [Illustrated natural history. I. Plants.] 316 p., 26 pl., 796 fig. Larousse: Paris, 1922.

2981. EBERHARDT, PH. *Précis de botanique agricole, industrielle, et médicale.* [Manual of agricultural, industrial, and medical botany.] 219 p. Challamel: Paris, 1920.

2982. KENOYER, L. A. *Plant studies for Indian high schools.* viii + 159 p., 67 fig. The Christian Literature Soc., United Provinces Branch: Allahabad, India, 1922.—“As the best way to know plants is to grow them, emphasis is placed on those avenues of approach to plant life that are open to the pupil in the school garden.”—C. S. Gager.

2983. LOWSON, J. M. *A text-book of botany.* 6th ed., 8 vo, viii + 638 p. University Tutorial Press, Ltd.: London, 1922.

2984. MARTIN, GEORGE W. *What is a plant?* Science 57: 175-176. 1923.—Dictionary definitions of the term plant are considered unsatisfactory for use in college classes in botany. The writer suggests the following: “A plant is an organism possessing chlorophyll or descended from chlorophyll-possessing ancestors.” It is recognized that this definition excludes the bacteria and in view of the possibility that they antedate distinction between plants and animals, this seems desirable.—C. J. Lyon.

2985. MOON, TRUMAN J. *Biology for beginners.* x + 558 p., 168 fig. Henry Holt & Co.: New York, 1921.—The book comprises 54 chapters, of which 14 have to do with botany, one with biology and agriculture, and one with bacteria; the remaining chapters deal with general biology and animals. Each chapter is preceded by a vocabulary of both technical and non-technical words, and is followed by a bibliography for collateral reading, and in many cases by a summary. “The course emphasizes the fact that biology is a unit science, based on the fundamental idea of evolution rather than a forced combination of portions of botany, zoology, and hygiene.”—C. S. Gager.

2986. PARKER, JOHN H. *Laboratory instruction in field crops at Kansas State Agricultural College.* Jour. Amer. Soc. Agron. 15: 43-54. 1923.

2987. SHANN, E. W. *First lessons in practical biology.* xv + 256 p., 71 fig. G. Bell and Sons: London, 1922.—This text is intended primarily for use in lower fifth forms in English schools and includes the study of both plants and animals. The illustrations have been selected to demonstrate the method of drawing in a notebook, a new feature being the introduction of drawings by the boys themselves. [See also Bot. Absts. 12, Entry 2979.]—C. S. Gager.

GENERAL, FACTORS, MEASUREMENTS

2988. ANONYMOUS. [Rev. of: FLATTELY, F. W., and C. L. WALTON. *The biology of the seashore.* xvi + 336 p., 16 pl. Sidgwick and Jackson: London, 1922.] Nature 110: 540. 1922.—This book is an exhaustive summary of the known facts and “bristles with suggestions for research.”—O. A. Stevens.

2989. ANONYMOUS. [Rev. of: KENDREW, W. G. *The climates of the continents.* xv + 337 p. Clarendon Press: Oxford, 1922.] *Nature* 110: 630. 1922.—This is a well arranged, lucidly written account of the climates of the regions of the world.—O. A. Stevens.

2990. BURTT DAVY, JOSEPH. *The suffrutescent habit as an adaptation to environment.* *Jour. Ecology* 10: 211-219. 2 fig. 1922.—Accepting the hypothesis that woody plants are the more ancient and that herbaceous forms have been derived from them, it is noted that in arid portions of South Africa arborescent plants are scarce and seem largely replaced by suffrutices. It is pointed out that the climate is hostile to tree development in its dry winters, extremes of temperature, and desiccating winds, resulting in the development of grasses and other herbs and frutices. A number of the latter are from genera that normally are arborescent only. These are interpreted as possibly an intermediate stage in the evolution of an herbaceous type. A number of suffruticose species are cited and their growth-habit described, including *Parinarium capense* (Rosaceae), *Eugenia pusilla*, *Erythrinia Zeyheri*, *Myrica brevifolia*, *Acacia stolonifera*, *M. elliptica*, and *Zizyphus helvola*.—Geo. D. Fuller.

2991. [C., W. E.] *Hull and the East Riding.* [Rev. of: SHEPPARD, T. Editor. *Handbook to Hull and the East Riding of Yorkshire.* viii + 532 p. A. Brown and Sons: London and Hull, 1922.] *Nature* 110: 539-540. 1922.—It was prepared for the members of the British Association for the Advancement of Science on the occasion of their visit to Hull, in September, 1922. Nearly 300 pages are devoted to the fauna and flora.—O. A. Stevens.

2992. CHOUX, P. *Revue des travaux de botanique tropicale et subtropicale (1910-1919).* (Suite.) [Review of the work in tropical and subtropical botany (1910-1919). (Continued.)] *Rev. Gen. Bot.* 34: 547-555, 596-603, 669-675. 1922.

2993. CHUN, P. [The insectivorous plants.] Ko-Hsueh [Science—Publ. Chinese Sci. Soc.] 7: 711-716. 1922. [Text in Chinese.]—An historical review is presented of the discovery of the plants and the accounts of their physiology, anatomy, sensitivity, and ways of capturing their prey. One species each of the following families is described: Sarracenaceae, Nepenthaceae, Droseraceae, and Lentibulariaceae.—Chunjen C. Chen.

2994. HARRIS, THISTLE. *Pseudo fulgurites.* *Australian Nat.* 5: 72. 1923.—The roots of plants form carbonic acid which partially dissolves the carbonate of lime of shell fragments in the soil thus forming rough, tube-like structures which remain after the roots decay. They are thus unlike true fulgurites formed by lightning striking in the sand.—T. C. Frye.

2995. KASSNER, C. *Die Trieblänge der Fichten und das Wetter.* [The twig length of spruce and the weather.] *Mitteil. Deutsch. Landw. Ges.* 38: 51-52. 1923.—The author gives records of growth, temperature, and precipitation at Hechingen for 1907-1920 inclusive, to show the relation between twig growth, temperature, and moisture.—A. J. Pieters.

2996. LARSEN, J. A. *Effect of removal of the virgin white pine stand upon the physical factors of site.* *Ecology* 3: 302-305. Fig. 2. 1922.—Experiments were performed in northern Idaho throughout July and August, the hottest and most critical months of the growing season, on the effect of the removal of dense virgin timbers upon air and soil temperature, humidity, soil moisture, and evaporation. One station was in uncut, 300-year-old western white pine forest; a 2nd in a recently logged white pine, hemlock, western red cedar forest with $\frac{1}{2}$ forest cover; a 3rd on land cleared in 1910 with practically no forest reproduction and no trees. The stations were only a few hundred feet apart. Temperature and humidity were taken at a height of 4.5 feet; evaporation, 6 inches above the soil surface. The air in the uncut forest was about 10°F. higher at a height of 4½ feet than in the open at night, and about 10°F. cooler during the day. Daily soil fluctuations of 4 or 5°F. at 6 inches depth occurred in the open, but only 1° in the forest, the soil being warmest in the open from 12 to 2 o'clock at night and at 4 a.m. in the forest. Evaporation was more than twice as great in the open as under timber,

being intermediate in the partly cut area. Relative humidity was similar in this respect to evaporation. Soil moisture was lowest in the virgin timber. This is probably accounted for by rainfall interception and high transpiration. Water-content at all of the stations was thought to be high enough for white pine seedlings. Their survival in cut-over areas would depend upon humidity, temperature, and rate of transpiration. Many of the evergreen species common on the floor of white pine forests had disappeared in the cleared area.—*J. E. Weaver.*

2997. NEWTON, R. **Plant distribution as related to climate.** *Sci. Agric.* 3: 137-142. 1922.—This is an account of the work of LIVINGTON and SHREVE [see *Bot. Absts.* 12, Entry 210].—*T. G. Major.*

2998. SHREVE, FORREST. **Conditions indirectly affecting vertical distribution on desert mountains.** *Ecology* 3: 269-274. 2 fig. 1922.—Influence of altitude *per se* has yielded no conclusive results of importance from experiments by plant physiologists. The "altitude factor" includes differences of insolation, temperature, rainfall, humidity, evaporation, and a score of related conditions. Desert areas of southwestern U. S. A. furnish an excellent field for such studies because of undisturbed conditions on the mountains. Cases are described in which the variety of the earth's surface so modifies the vertical gradients of physical conditions that dissimilar communities are found at the same altitude in adjacent localities. An increase in basal elevation of 2,000 feet has pushed the pine forests upward about 1,800 feet in the Pinaleno Mountains as compared with the Santa Catalinas, orientation, character of rock and soil being almost identical. Experimental evidence points to this as caused by the ratio of evaporation to soil moisture. Different types of vegetation, e.g., desert species as compared with evergreen oak forest, are found at the same altitude, on comparing small and large mountains with the same base level. On small mountains desert species may range 900 feet higher than on larger ones with similar soil, etc. Character of rock and soil profoundly affect altitudinal range. Differences in mineralogical character of mountains similar in basal elevation and height appear to influence the vertical distribution of plants in certain cases by about 600 feet, desert plants reaching higher elevations on the volcanic soils. Some evidence is offered to show that the separate modifying influences of the mineralogical nature and total elevation are additive.—*J. E. Weaver.*

2999. T[ANSLEY], A. G. **Methodology: the new Zurich-Montpellier school.** [Rev. of: (1) BRAUN-BLANQUET, J. *Prinzipien einer Systematik der Pflanzengesellschaften auf floristischer Grundlage.* (Principles of a systematic plant association on a floristic basis.) *Jahrb. St. Gallisch. Naturwiss. Ges.* 57: 305-351. 1921. (2) RÜBEL, EDUARD. *Geobotanische Untersuchungsmethoden.* (Methods of geobotanical investigation.) xii + 290 p., 1 pl., 69 fig. Gebrüder Borntraeger: Berlin, 1922. (3) PAVILLARD, J. *Cinq ans de phytosociologie.* (Five years of phytosociology.) 30 p. Montpellier, 1922. (4) BRAUN-BLANQUET, J., et J. PAVILLARD. *Vocabulaire de sociologie végétale.* (The terminology of plant sociology.) 16 p. Montpellier, 1922.] *Jour. Ecology* 10: 241-248. 1922.—The leaders of the new school, some of whose names appear in the titles just cited, are the pupils of Schröter of Zurich and of Flahault of Montpellier. They lay special stress upon more accurate methods of analysis of plant associations regarded as social units and upon the concepts connected with these. The reviewer is in sympathy with the principles involved but warns against overdoing formal treatment in too early a stage of the development of plant sociology. He sees greater need of more detailed successional studies combined with investigations of environmental factors. He does not find their grouping of associations desirable. On the other hand he commends the increasing recognition of the genetic principles of the American and English ecologists.—The reviewer characterizes Rübel's work on quantitative methods in ecology as most useful and "written on broad, temperate, judicious lines with very little to criticise adversely." The final paper giving large additions to our ecological nomenclature in French and German is carefully and critically abstracted and English equivalents given for the French-German terminology.—*Geo. D. Fuller.*

3000. [TANSLEY, A. G.] [Rev. of: CLEMENTS, F. E. *Aeration and air content*. Carnegie Inst. Washington Publ. 315. 183 p., 1921 (see Bot. Absts. 11, Entry 1950).] *Jour. Ecology* 10: 122-123. 1922.—The most valuable feature of the book is the emphasis placed on the biological aspects of soil fertility. The conclusion that oil acidity in bogs is a result of deficient aeration is regarded as too simple a statement of the case, and it is thought that too little emphasis is placed on the fact that saturated soils may bear vegetation of 2 distinct types,—hydrophytic and xerophytic.—*Geo. D. Fuller*.

3001. T[ANSLEY], A. G. *Vegetation and climate in the United States*. [Rev. of: LIVINGSTON, BURTON E., and FORREST SHREVE. *The distribution of vegetation in the United States as related to climatic conditions*. Carnegie Inst. Washington Publ. 284. xvi + 590 p., 73 pl. 1921 (see Bot. Absts. 12, Entry 210).] *Jour. Ecology* 10: 252-253. 1922. [See also Bot. Absts. 12, Entry 2997.]

[Ecology of the inundations of the Yser and the flora of the ruins of Nieuport.] 22 p., Bruxelles, 1922.] *Jour. Ecology* 10: 237-239. 1922.

3003. TANSLEY, A. G. *The structure, physiology and soil of peat plants*. [Rev. of: (1) PRIESTLEY, J. H., and MILDRED HINCHLIFF. *The physiological anatomy of the vascular plants characteristic of peat*. *Naturalist* 1922: 263-268. 1922. (2) PEARSALL, W. H. *Plant distribution and basic ratios*. *Naturalist* 1922: 269-271. 1922.] *Jour. Ecology* 10: 250-251. 1922.—These are said to be 2 preliminary papers that seem to promise a secure foundation for the development of our knowledge of the ecology of the vegetation of sour peat, a subject hitherto involved in obscurity.—*Geo. D. Fuller*.

3004. T[ANSLEY], A. G. *Maritime soils*. [Rev. of: SALISBURY, E. J. *The soils of Blakeney Point: a study of soil reaction and succession in relation to the plant covering*. *Ann. Botany* 36: 391-431. Fig. 5. 1922.] *Jour. Ecology* 10: 249-250. 1922.—The work is characterized as an important investigation presenting for the first time a full study, with determinations of carbonates, H-ion concentration, and organic matter of sand dune, shingly beach, and salt marsh soils in which habitat and vegetation are correlated with a high degree of accuracy.—*Geo. D. Fuller*.

3005. TROLL, WILHELM. *Über Staubblatt- und Griffelbewegungen und ihre teleologische Deutung*. [Stamen and pistil movements and their teleological significance.] *Flora* 115: 191-250. Pl. 4-6, 1 fig. 1922.—Within the same family (Rutaceae), the same genus (*Lopezia*), or even the same species (*Amaryllis formosissima*) the movements of stamens and pistil may be either autonomous, or induced by light or gravity. There is no evidence that these movements are to be explained on the basis³ of their value in the "struggle for existence."—*A. G. Stokey*.

3006. WERNECK-WILLINGRAIN, H. L. *Der Sortenbau auf Pflanzegeographischer Grundlage*. [Culture of varieties according to the principles of plant geography.] *Mitteil. Deutsch. Landw. Ges.* 37: 723-727. 1922.—In this preliminary report on an extensive study of varieties and species of cultivated plants, begun 23 years ago, the author reviews the fundamentals of plant ecology and shows how the factors controlling the distribution of wild species also operate on cultivated varieties. Several examples are given of varieties of rye to illustrate how the hygrophyl or tropophyl character of the variety determines the region in which it will succeed.—*A. J. Pieters*.

3007. YAPP, R. H. *The concept of habitat*. *Jour. Ecology* 10: 1-17. 1922.—The historical development of the concept of habitat is first discussed and then the factors, both physical and biotic, are examined. Those of the former class are divided into (1) climatic, (2) edaphic, and (3) topographic, and attention is directed to the fact that different growth-forms in the

same community are often growing in very different habitat conditions especially in a stratified community. A habitat is defined as "the place of abode of a plant, a plant community or in some cases even a group or a succession of related plant communities, together with all the factors operative within the abode, but external to the plants themselves."—In classifying habitats the author distinguishes: (1) The successional habitat,—“the changing habitat occupied by an allied group of plant associations which, as a rule, comprise the stages of a normal succession or sere.” (2) The communal habitat,—“the general habitat of any recognizable plant community, such as an association or a society.” (3) The individual habitat,—“the habitat of an individual plant, whether solitary or forming part of a plant community.” (4) The partial habitat,—“the habitat of an individual plant during any given period or stage of existence.” He also expresses the opinion that in ecological research the extensive should as a rule precede the intensive and advocates cooperation in the building up of ecological reference herbaria.—*Geo. D. Fuller.*

STRUCTURE AND BEHAVIOR

3008. ANONYMOUS. **The carrot's crimson eye.** *Gard. Chron.* 72: 54. 1922.—The object of the color of this and other flowers is discussed in its relation to insect visitors.—*P. L. Ricker.*

3009. AGRELIUS, FRANK U. G. **Botanical notes for 1918-1919.** *Trans. Kansas Acad. Sci.* 30: 121-123. 1919/21 [1922].—Unusual seasonal activities, especially flowering after the usual time, are noted for 42 plants in an annotated list. Nine out of 43 twigs listed, when placed in water in the laboratory, had by April 7, 1919, started roots more or less abundantly. Further notes on polycotyledony in the castor bean and tomato are given.—*F. C. Gates.*

3010. AGRELIUS, FRANK U. G. **Botanical notes, 1919-1920.** *Trans. Kansas Acad. Sci.* 30: 234-235. 1919/21 [1922].—An annotated list is given of unusual seasonal activities of 15 plants in the vicinity of Emporia, Kansas, together with further notes on polycotyledony in castor bean and tomato.—*F. C. Gates.*

3011. AGRELIUS, FRANK U. G. **Botanical notes for 1920.** *Trans. Kansas Acad. Sci.* 30: 392-394. 1919/21 [1922].—An annotated list is presented of unusual seasonal activities in 38 plants, together with further notes on polycotyledony in tomato and castor bean seedlings. In the latter it is noted that out of 62 seed of the 1919 crop (2nd generation tricotots) a ratio of about 20 : 1 obtains in comparison with the 264 : 1 ratio the previous year.—The occurrence of a cone of Austrian pine in which the upper third is pistillate and the rest staminate is noted. The specimen was preserved.—*F. C. Gates.*

3012. BAILEY, I. W. **Notes on neotropical ant-plants. I. *Cecropia angulata*, sp. nov.** *Bot. Gaz.* 74: 369-391. *Pl. 1, 8 fig.* 1922.—The author describes the anatomy of a new species of *Cecropia* found in British Guiana. It possesses simple juvenile and large palmately compound adult leaves and commonly has colonies of ants within its hollow stems. Glandular food-bodies were produced on the base of the petioles and these served as food for the colonies of Azteca ants residing within the stem. The ants also maintained within their domatia coccids, which were tended and provided much of the ants' food. Bailey decides that there is no evidence of any advantage to the plant in harboring the ant colonies and that the insect relationship is purely that of parasitism. Little or no protection seems to be afforded from the attacks of leaf-cutting ants, particularly as *Cecropia* is not colonized by the ants until it attains considerable size. The ants seem to prepare feeding places for their coccids and to be solicitous for the welfare of their eggs, larvae, and pupae. He finds no evidence whatever that the glandular food-bodies and the thin prostomata are allurements, acquired by natural selection, for the attraction of colonizing ants. The association of the ants and plants seems merely a most interesting case of parasitism by the former and shows the remarkable adaptiveness of the ants in availing themselves of the peculiarities of special environments.—*Geo. D. Fuller.*

3013. BURKILL, I. H. *Annual report of the Director of Gardens for the year 1921.* Straits Settlements Government Gaz. 1922, Supplement No. 79. 1922.—This is an administration report. The beetle *Protocerus Colossus* having been troublesome, a list of the palms attacked by it is given. In the course of alterations the half of the Lake was run dry, and the mud used as filling elsewhere; the weeds which sprang up on the exposed surfaces are recorded. Some reached flowering in 65 days, others in 80 days. The 65-day plants were, *Jussiaea fissendrocarpa*, *Vandellia crustacea*, *Euphorbia aspera*, and *Panicum indicum*; and the 80-day plants, *Eleusine indica*, *Paspalum conjugatum*, *P. platycaule*, *Ischaemum Ridleyi*, *Cyperus Haspan*, *C. Irya*, *C. umbellatus*, *Kyllingia monocephala*, and *Fimbristylis aestivalis*. Seedlings of *Albizia moluccana*, germinating on the exposed lake-bed, developed bacterial tubercles upon their roots as if the bacteria existed submerged and ready to take advantage of leguminous plants should any appear; but the lake-bed is normally free from any members of the order though Leguminosae occur on its shore.—I. H. Burkill.

3014. SKIPPER, E. G. *The ecology of the gorse (Ulex) with special reference to the growth-forms on Hindhead Common.* Jour. Ecology 10: 24-52. Pl. 1, 9 fig. 1922.—The growth-forms of *Ulex europeus* and *U. nanus* are here considered in detail both as to external and internal anatomy and the results expressed by means of drawings, graphs, and tables of measurements. The former species shows (1) the ordinary type with sun and shade variations and (2) the ericoid with short accessory branches. Both show open and cushion varieties. In *U. nanus* there are recognized 5 types: prostrate, intermediate, erect, aerial-cushion, corymbose.—The author concludes, and presents data proving, that the various parts of the different growth-forms show differences of anatomy dependent upon the degree of exposure. Thus the shade branches show more slender growth, more hairy surface, fewer but larger leaves with fewer but more efficient stomata, a thinner cuticle, and a reduced assimilatory system. The stem of the shade plant possesses a smaller proportion of xylem with a greater range in size of the conducting elements. Similar differences are found between leaves from the interior and exterior portions of the cushion forms, between those of the prostrate and upright branches and in general between the sheltered and the exposed foliage. In general the sheltered form transpires more vigorously than the exposed form, as shown by potometer experiments, although some decided exceptions are encountered. The cushion form appears to be the efficient one for reducing transpiration rate. The ericoid seems to have resulted from a less efficient conducting system, the cause of which remains for the present obscure.—Geo. D. Fuller.

VEGETATION

3015. ALLORGE, PIERRE. *Les associations végétales du Vexin Français.* [Plant associations of the French Vexin.] Rev. Gén. Bot. 33: 481-489, 589-652, 708-751, 792-807. 1921. 34: 71-79, 134-144, 178-191, 251-256, 311-319, 376-383, 425-431, 471-480, 519-528, 564-576, 612-639, 676-701. 1922.—The principal associations dealt with are: (1) plankton; (2) algae and mosses of running water; (3) associations submerged and floating; (4) aquatic herbs with submerged bases; (5) slimes and alluvial gravels; (6) peat bogs; (7) artificial prairie; (8) meadow and xerophilous grasses; (9) meso-hygrophilous woods; (10) mesophilous woods; (11) meso-xerophilous woods; (12) turf woods; (13) heaths and moors; (14) saxicolous; (15) corticolous; (16) murals; (17) ruderals; (18) cultivated plants; (19) mesicolous.—Because of its great edaphic diversity and its geographic position at the edge of the domain of the plains of north-west Europe and at the base of the mountains of central Europe, the French Vexin includes on a relatively small area the majority of associations recognized in western Europe, maritime associations and associations of the high mountains excepted. The phytogeographic characteristics of the French Vexin are exemplified in the Basin of Paris. In spite of the profound transformations imposed on the primitive vegetation by the influence of man, it was possible to find primitive associations. The agricultural activities of man have established highly individualized groups having all the attributes of natural associations. The introduction of foreign species compensates for the floristic impoverishment of the Basin of Paris in autochthonous species. The classic localities do not possess many of the species indicated by the ancient authors, but these species frequently occur in abundance in other localities.

When the influence of man ceases to be exercised at a given point the vegetative groups rarely reconstitute themselves in their primitive form. Cryptogamic plants show remarkable independence of human influence.—The climax mesophytic forest associations in the Atlantic climate have been destroyed or artificially restored.—A. Hayden.

3016. ARRHENIUS, O. A new method for the analysis of plant communities. Jour. Ecology 10: 185-199. Fig. 1. 1922.—Seeking an adequate method for analyzing the composition of plant communities the author examines those already in use and decides that Raunkiaer's is the best, although somewhat lacking in accuracy. He then describes one devised by himself in which the plant population is taken from a belt of suitable width alongside a rope marked in decimeters and meters. The vegetation is divided into an upper and a lower layer, and these are analyzed and charted separately. From the charts of the belt the frequency percentage and the number of individuals per unit area, "absolute frequency degree," are easily calculated. This latter expression permits direct comparisons between various areas even when they have been studied by different individuals, and is one of the major advantages claimed for the method. Other advantages claimed are: convenience, time saving, exact results from even a short belt, a simple expression of the closeness of the community, and a convenient means of analyzing zonation. The mass of vegetation is measured photometrically through the degree of shading.—Geo. D. Fuller.

3017. BARKER, E. EUGENE. A note from the Okefinokee Swamp. Torreyia 22: 104-106. 1922.—A party from the University of Georgia visited Okefinokee Swamp in April, 1922, and made a study of the vegetation between Billey's and Floyd's Islands. Characteristic plants, either wholly or partly submersed, belonging to 14 genera are listed.—J. C. Nelson.

3018. BARKER, M. M., and C. M. GIBSON. Studies of the Somerset turf moors. Jour. Ecology 10: 178-184. 4 maps. 1922.—These turf moors are let out in acre or half-acre holdings for peat cutting. This cutting varies much in depth, ranging from $1\frac{1}{2}$ -6 feet. Within it 2 areas were mapped and studies initiated to answer the question of the condition of the vegetation before and after cutting and drainage were undertaken. Colonization after cutting was found to be most commonly an invasion of the weeds of cultivated lands followed by *Juncus* spp. Later *Juncus communis* and *Eriophorum angustifolium* become more abundant, to be followed by *Myrica gale*, *Molina coerulea*, and *Erica tetralix*. Different variations were found due to the depth of the peat cutting, the vegetation of the surrounding area, and the treatment (grazing, etc.) after cutting. The mapping will permit comparisons at a later date.—Geo. D. Fuller.

3019. CANNON, WILLIAM AUSTIN. Plant habits and habitats in the arid portions of South Australia. Carnegie Inst. Washington Publ. 308. viii + 139 p., 32 pl., 31 fig. 1921.—After an introduction in which is given a list of plants collected (49 genera and 113 species, of which *Kochia Cannoni* J. M. Black is new), the volume opens with a treatise on the physical environment of the vegetation of Australia. This presents physiographic and climatic information and is illustrated by numerous charts. A discussion of the environment, vegetation, and flora of South Australia follows, with detailed consideration of typical regions, such as those of Copley, Ooldea, Tarcoola, Port Augusta, Quorn, the mallee region, etc. Morphological aspects of the xerophytic flora of South Australia are considered, as well as certain structural features of the main perennials and some other forms. The text closes with an account of reactions and adjustments to light, temperature, low water supply, and subterranean environment. A bibliography of about 40 authors is appended.—Burton E. Livingston.

3020. COLLINS, MARJORIE I. On mangrove and saltmarsh vegetation near Sydney, New South Wales, with special reference to Cabbage Tree Creek, Port Hacking. Proc. Linnean Soc. New South Wales 46: 376-392. Pl. 26-32, 11 fig. 1921.—The observations cover Sept., 1916, to June, 1921. This coastal area is characterized by much-branched inlets with deep water close to the shore, drowned river valleys of comparatively recent subsidence. The

region ranges from 33° 50' to 34° 5' S. Lat. Extensive areas of tidal flats are lacking since accumulation of silt is not rapid enough to keep pace with gradual subsidence. The 2 plant formations of the occurring tidal flats are discussed and an account of their developmental phases given. The 1st and outermost is mangrove formation characterized by 2 species: (1) *Avicennia officinalis*, the Australian grey mangrove, growing 15-30 feet in height. This germinates in the fetid deposits of algae, shellfish, and drift, and aids in building up the mud flat. (2) *Aegiceras majus*, a shrub which is not so constant. The leaves in early morning often bear glistening salt crystals. The roots rarely project above the surface.—The 2nd inner formation is salt marsh in which 2 associations of plants are recognized, *Salicornietum* and *Juncetum*. Development groups or associates of *Salicornietum* are often found in zoned arrangement according to slight differences in level. With accretion and attainment of uniform surface level, these associates mingle. Special conditions at Cabbage Tree Creek are described. Here drifting sand has been raising the level of the marsh for some years and has brought about the imposing of one formation upon another. At present the *Juncetum* is invading the *Salicornietum*, which consequently shows signs of arrested development. The occurrence of a dwarf form of *Avicennia officinalis* is recorded. In discussions and a table these tidal flats are compared with those of Great Britain and America. The Australian groupings are in general as follows: A. Mangrove formation. *Avicennia officinalis*, *Aegiceras majus*. B. Saltmarsh formation. (1) *Salicornietum*: (a) *Salicornia-Suaeda* Associates: *Salicornia australis*, *Suaeda australis*; (b) *Salicornia-Spergularia* Associates: *Salicornia australis*, *Spergularia rubra*, *Samolus repens*, *Suaeda australis*, *Mesembryanthemum tegens*, *Tetragonia expansa*, *Atriplex hastata* (*patula*), *Wilsonia Backhousii*; (c) *Sporobolus-Cynodon* Associates: *Sporobolus virginicus*, *Cynodon dactylon*, *Zoysia pungens*, other perennial halophytes. (2) *Juncetum*: *Juncus maritimus*, *Casuarina glauca*.—Eloise Gerry.

3021. COOPER, W. S. The broad sclerophyll vegetation of California: an ecological study of the chaparral and its related communities. Carnegie Inst. Washington Publ. 319. 124 p., 21 pl., 43 fig. 1922.—By using 6 of Adams' criteria for determining centers of distribution and by superposing the ranges of species the ecological range of chaparral is cartographically exhibited and the center of its distribution shown to lie in southern coastal California. Chaparral is dominant in the region with 10-30 inches of rainfall, and in which the precipitation of the growing season is less than 20 per cent of the annual total. The temperature extremes are moderate. In the classification of the broad-sclerophyll communities 2 formations are recognized: broad sclerophyll forest and the chaparral. Under the former are described the following associations and consociations: *Pasania-Quercus-Arbutus*, *Quercus agrifolia-Arbutus*, *Quercus agrifolia*, *Umbellularia*, *Quercus agrifolia-lobata*, *Quercus chrysolepis-kelloggii*, and *Quercus chrysolepis*. Under the latter are recognized the climax chaparral association and the conifer forest chaparral association. These communities are described with respect to their ecological characteristics and floristic content. An intensive study of structure and environmental conditions was made through portions of 2 years in the vicinity of Palo Alto and on adjacent mountains. Figures and tables depict the covering on 6 representative quadrats. Readings of precipitation were made and of soil moisture at 3 depths to 100 cm., with stations in forest and 2 types of chaparral. The roots of *Adenostoma* and *Arctostaphylos* penetrate below 100 cm., at which depth the soil moisture in mid-summer is less than 5 per cent. Soil temperature and evaporation were also measured throughout the year at 3 stations. Chaparral is conclusively shown to be the true climax vegetation for extensive areas of hill and mountain in southern California, and the contention is made that it formerly occupied much of the hill and valley land now covered by grassland or under cultivation. The root distribution, leaf anatomy, and transpiration behavior of the leading chaparral species have also been described.—Forrest Shreve.

3022. FRITSCH, F. E. The terrestrial alga. Jour. Ecology 10: 220-236. 1922.—A review is here given of the recent literature dealing with terrestrial algae. Two communities are distinguished, subterranean and surface. The former includes Diatomaceae, Cyanophyceae, and the more abundant Chlorophyceae with associated moss protonema, while in the latter the

diatoms are largely absent. The importance of the surface communities as pioneer organisms in rock and soil colonization is emphasized as well as the desirability of pursuing a branch of botanical study now in its infancy.—*Geo. D. Fuller.*

3023. GILLMAN, C. An ascent of Kilimanjaro. *Geog. Jour.* 61: 1-27. 4 pl., 2 maps. 1923.—This paper describes the physical features of the south face and states the vertical limits of the belts of vegetation: surrounding plains up to 1,100 m., xerophilous grassland; 1,100-1,800 m., agricultural land formerly tropical rain-forest; 1,800-3,000 m., tropical and temperate rain-forest; 3,000-4,400 m., alpine grass and shrubs; above 4,400 m., alpine desert and glaciers. Vegetational belts occupy lower elevations on Kilimanjaro than on Kenya on account of lower basal elevation of the former. On both mountains the vegetation is much heavier on the south face than on the north, due to greater precipitation. The belt of bamboo found above the forest on Kenya is absent on Kilimanjaro. The paper contains only brief allusions to vegetation.—*Forrest Shreve.*

3024. HOLTUM, R. E. The vegetation of west Greenland. *Jour. Ecology* 10: 87-108. Pl. 3-5. 1922.—After a review of the existing literature on the vegetation of Greenland, the topography and climate are characterized and 2 regions distinguished, separated by the parallel of 62° N. Lat. The northern division has as its climax the heath with the willow scrub as a post-climax on particularly favorable situations, and "fjaeldmark" or fell-field and moss bog as stabilized pre-climaxes. The heath is dominated by *Empetrum nigrum* and *Cassiope tetragona* with *Vaccinium uliginosum* var. *microphyllum*, *Salix glauca*, *Betula nana*, *Phyllodoce caerulea*, *Ledum palustre*, *Rhododendron lapponicum*, and *Loiseleuria procumbens* common and locally abundant. The xerarch succession abounds in mats of lichens invaded by such plants as *Lycopodium selago*, *Pyrola grandiflora*, *Carex* spp., *Saxifraga* spp., and mosses. In the hydrarch succession *Hippuris* and *Menyanthes trifoliata* are the most abundant hydrophytes with sedges dominating the later stages. The other herbaceous associations are also described. The "fjaeldmark" is an open vegetation of isolated flowering plants accompanied by mosses and lichens. It is characteristic of the extreme north and is also the type of vegetation on the nunataks. The moss bogs have cushions composed of many species among which those of *Sphagnum* never seem to predominate.—South of 62° N. Lat., within the July isotherm of 10°C., a scrub forest with trees reaching a maximum height of 4-7 m. is the climax with many of the associations already mentioned as stages in the succession. The tree species are *Betula odorata*, *Sorbus americana*, and *Alnus ovata* together with shrubby *Salix glauca* and *Juniperus communis* var. *nana*. The oceanic climate with its cool and damp summer causes the vegetation of long stretches of the coast to be very uniform in character. Mycorrhizal fungi are abundant both as endotrophic and ectotrophic forms.—*Geo. D. Fuller.*

3025. KOZŁOWSKA, ANIELA. Etude phytogéographique de la région de Miechów. [Phytogeographical study of the district of Miechów.] *Bull. Acad. Polonaise Sci. et Lettres Cl. Sci. Path. et Nat. Ser. B. Sci. Nat.* 1921: 273-286. 1921.—This article gives systematic, ecological, and historical relations of vegetation in the region of Miechów, near Krakow, Poland. In it, are characterized the typical plant associations which are due to the occurrence of various soils in this district and also due to the very interesting topography of this country. The accompanying geobotanic map illustrates the conditions. Special attention is given to the association of steppe plants which is closely connected with light conditions. In the historical section is demonstrated the development of vegetation from the glacial period to the present. All climatic changes known in the Quaternary period left traces in the district of Miechów in the form of plant relics found on the isolated calcareous rocks and in the peat bogs.—*Aniela Kozłowska.*

3026. NORDHAGEN, ROLF. Vegetationsstudien auf der Insel Utsire im westlichen Norwegen. [Studies on the vegetation of the Utsire Island in western Norway.] *Bergens Mus. Aarb. Naturv. Raekke* 1920/1921¹: 1-149. Fig. 1-37. 1922.

3027. OSMASTON, A. E. Notes on the forest communities of the Garhwal Himalaya. Jour. Ecology 10: 129-167. Pl. 8-16. 1922.—In one of the first attempts to classify on purely ecological grounds the forests of a part of northern India there is a linking made between the steppe forest of Tibet and the subtropical forests of the plains. The region under consideration ranges from 2,500 to 15,000 feet in altitude and includes over 2,500 square miles of forested lands, distributed over 4 zones, distinguished as (1) Tibetan with less than 10 inches of annual precipitation, (2) arid, with 10-15 inches, (3) dry, with 15-40 inches, and (4) moist, with 50-80 inches. Five forest formation types are distinguished, described, and divided into associations: (1) Caragana-Lonicera-Artemisia formation, within the Tibetan zone, 9,000-15,000 feet, characterized by shrubs with flexible procumbent branches and deciduous foliage, and by the absence of trees and grasses; (2) Betula-Rhododendron formation, mostly in the dry and arid zones, 9,000-13,500 feet, with more humid atmosphere than the preceding and characterized by rather dense stands of small trees and shrubs with deciduous foliage having various adaptations to retard transpiration. The most mesophytic association is the Betula-Abies, where an open upper story of *Abies Webbiana*, with a height of 60-100 feet, has below it a lower story of *Betula utilis*, 30-50 feet high, and an undergrowth of shrubby *Rhododendron campanulatum* and *Pyrus foliosa*; (3) Pinus-Cedrus formation, in the dry and arid zones, 6,500-12,000 feet, rather xerophytic in appearance, being forests of rather open stands of such conifers as *Cedrus deodara*, *Pinus excelsa*, *Cupressus torulosa*, and *Picea Morinda* together with dicotyledonous deciduous trees that sometimes form a lower story, the undergrowth varying from grasses in the more arid areas to shrubs in the moister situations; (4) Quercus-Abies formation, in the moist zone, 5,000-11,500 feet, a mesophytic forest of good height, *Abies Pindrow*, one of the chief species, ranging from 140 to 200 feet, the dominants being conifers and evergreen oaks but with secondary species largely deciduous, and epiphytic ferns and mosses abundant; (5) Shorea-Anogeissus-Pinus formation, in the moist zone, in valleys up to 6,500 feet, with a subtropical climate and a rather xerophytic aspect, a rather open forest of conifers or trees more or less leafless during the hot weather preceding the monsoon rains, the undergrowth being largely grasses. High temperature and the frequent occurrence of forest fires are factors of importance in this formation and tend to increase its xerophytism. *Pinus longifolia* is the chief tree, often in pure stands, attaining a height of 70-140 feet, and possessing thick bark, excellent coppicing powers and rapid growth while young,—characters that enable it to withstand fires. In addition to the descriptions of the formations much detailed information is contained in the characterization of the associations and in an annotated list of the principal species.—Geo. D. Fuller.

3028. RIGG, GEORGE B. The sphagnum bogs of Mazama Dome. Ecology 3: 321-324. Fig. 1. 1922.—Mazama Dome is situated in Whatcom County, Washington, at an elevation of 6,000 feet. The author visited the region in August, 1921. Bogs occur on benches near the summit, watered by rivulets from the melting snow. One of the bogs studied, typical of the vicinity, formed the south side of a pond. Here in the day time were much light and moisture as well as rather high temperature. The bog association was simple and consisted almost entirely of *Sphagnum* sp. and *Kalmia polifolia*. All the Kalmias seen were less than a foot in height and occurred only in the Sphagnum area. *Vaccinium deliciosum* was frequent in the bog and common in the vicinity. *Phyllodoce empetriformis* and *Lutkea pectinata* were abundant in the vicinity but very little of either entered the bog association. Vegetation was advancing on the pond, sedge and mosses other than *Sphagnum* being the pioneers. The bog association advances only by way of the sedge-moss association. *Sphagnum* was common in the vicinity, occurring in little patches in small, undrained places. In such places *Sphagnum* exercised no selective influence. The flora was the same as in other undrained places, some of which had mosses other than *Sphagnum*; *Equisetum*, *Carex*, and *Veratrum viride* were common in these. The possession of a distinctive flora distinguishes the Sphagnum bogs on Mazama Dome from the Sphagnum areas in the vicinity which lack a distinctive flora.—T. J. Fitzpatrick.

3029. TANSLEY, A. G. Studies of the vegetation of the English chalk. II. Early stages in the redevelopment of woody vegetation on chalk grassland. Jour. Ecology 10: 168-177. Pl.

1, 4 fig. 1922.—In 1909, 2 inclosures were made, with rabbit-proof wire, of grassland at the edge of a wood on the South Downs having areas of 820 and 390 square meters respectively. A portion of the belt of shrubs was included in each case. The woody population of these areas was studied and charted in 1909, 1914, and 1920 and the invasion of the grassland noted. The closed woody vegetation on the edge of the wood had advanced considerably, due mostly to the vegetative growth of *Rubus leucostachys*; the woody colonizers that were numerically most important were found to be *Crataegus monogyna*, *Fraxinus excelsior*, *Rosa* spp., and *Quercus robur*.—Geo. D. Fuller.

3030. [TANSLEY, A. G.] **Forest and prairie.** [Rev. of: (1) VESTAL, A. G. (1) **Local inclusions of prairie within forest.** Trans. Illinois Acad. Sci. 11: 122-126. 1918. (2) **Invasion of forest land by prairie along railroads.** Ibid. 126-128. 1918.] Jour. Ecology 10: 125. 1922.

3031. THOMPSON, H. STUART. **Changes in the coast vegetation near Berrow, Somerset.** Jour. Ecology 10: 53-61. Pl. 1, map. 1922.—The area under consideration is situated along the Bristol Channel, England, where, on account of the high tides, mud flats 4 miles in width are submerged at each tide. These flats were reported by Moss, in 1906, as without vegetation. Now from the development of a new stream tributary to River Parret an area of approximately 100 acres has become covered with vegetation most of which seems to have come in during the past 4 years. Much of this new vegetation is of the salt-marsh type showing its recent origin in the small number of species present, among which *Glyceria maritima* and *Aster tripolium* are conspicuous.—Geo. D. Fuller.

3032. UPHOF, J. C. TH. **Vegetationsbilder aus Kalifornien.** [Vegetation pictures from California.] Vegetationsbilder 14: 22 p., 6 pl. 1922.

3033. WALTON, JOHN. **A Spitzbergen salt marsh: with observations on the ecological phenomena attendant on the emergence of land from the sea.** Jour. Ecology 10: 109-121. Pl. 1, 6 fig. 1922.—A portion of a raised beach in Klaas Billen Bay is described, where the land is rising relatively fast, and a plane-table survey of the area is given in order that changes in later years may be recorded. The zonation from the tidal mud flat to the raised flat showed, (1) *Enteromorpha* with *Glyceria vilfoidea*, (2) *Bryum* sp., (3) mosses and lichens, (4) *Saxifraga oppositifolia*, *Dryas octopetala*, and *Stereocaulon paschale*, and (5) the plants of the former zone together with *Pedicularis lanata*, *Draba alpina*, *Papaver radicum*, and lichens. This last was on the main shingle beach. A somewhat similar zonation on silt and boulder clay was found, culminating in a more swampy type, due to an excess of soil water, in which *Salix polaris*, *Luzula hyperborea*, *Juncus biglumis*, *Polygonum viviparum*, and *Equisetum* were conspicuous. The possible climax of the shingle beach is seen in a Cassiope-heath association. The algal flora of the bay and the brackish pools also has been given some attention.—Geo. D. Fuller.

3034. YAPP, R. H. **The Dovey salt marshes in 1921.** Jour. Ecology 10: 18-23. 1922.—Data are reported of the rate of erosion of pans in a salt marsh studied in 1914. It was found to be slow and the tidal scour to be more effective than wave action. In 1914 a number of pans were artificially drained and it was found that *Glyceria* soon commenced to invade them. The amount of invasion in 1921 is recorded. In one compound pan of 594 square feet area, 387 square feet had been covered with vegetation in 7 years. The appearance of *Spartina Townsendii* is recorded as the first appearance of the plant in that part of Britain.—Geo. D. Fuller.

FLORISTICS

3035. CHRISTY, MILLER. **Primula elatior Jacquin: its distribution in Britain.** Jour. Ecology 10: 200-210. Map. 1922.—The "Bardfield oxlip" is confined in Britain to 2 districts in Cambridgeshire separated by an interval of 20 miles occupied by the River Cam. In addition there are 10 small outlying stands, both the main districts and the outlyers being on chalky boulder clay, the plant being strongly calciphilous. The conclusion is reached that the species is undergoing slow but steady contraction of its area, that this contraction is principally from

the north, that the outlying stands are remnants, and that the contraction is due in some measure to extermination through hybridization with the more potent *Primula vulgaris*.—*Geo. D. Fuller*.

3036. RITCHIE, JAMES. **Naturalization of animals and plants.** [Rev. of: THOMSON, GEO. M. **The naturalization of animals and plants in New Zealand.** $x + 607$ p. University Press: Cambridge, 1922.] *Nature* 110: 868-870. 1922.—New Zealand has presented unusual opportunity for such study since the introduced species have been widely different from the indigenous, and the time is comparatively recent, thus allowing better observation. The author "has been chary of broad generalization, and he has been at endless pains to collect and verify information, much of which in a few years would otherwise have slipped from ken." The book treats each animal and plant in systematic order, more than 600 species of plants being recorded as having become more or less truly wild. Fifty years of close observation lead the author to state that he is "aware of no definite permanent change in any introduced species." Some variations in size and habits are noted, however. The author sees no evidence of the native vegetation being exterminated by the introduced and holds that the former can always hold its own, though its range may be restricted. The reviewer thinks that this limitation often is only a step to ultimate extinction. On the whole, introductions in New Zealand have done more harm than good, and the reviewer suggests that nowhere should naturalization of exotic animals be permitted without the consent of a properly constituted committee containing a strong representation of biological science.—*O. A. Stevens*.

APPLIED ECOLOGY

3037. PEARSON, G. A. **Preservation of natural areas in the national forests.** *Ecology* 3: 284-287. 1922.—A movement has been launched by the Ecological Society of America to secure the preservation of natural areas where conditions may remain undisturbed by human activities. The author discusses the possibilities of the national forests of Arizona and New Mexico as affording areas to be set aside for perpetuation in their natural state. It is suggested that the formal withdrawal of certain sections of the forests under specific provisions as to future care might be accomplished.—*John W. Crist*.

3038. QUAYLE, E. T. **Possibilities of modifying climate by human agency, with special application to south-eastern Australia.** *Proc. Roy. Soc. Victoria* 33: 115-132. 1 map. 1921.—Evidence presented leads to the conclusion that the southeastern states are all under such weather conditions that they will benefit climatically by any considerable increase in surface moisture. The clearing of the land, and the institution of cultivation or pastures for the scrub forests on the inland plains cause some improvement of the rainfall, especially in spring when green growth results in vigorous evaporation. A more general improvement results from irrigation which ensures growth of vegetation throughout the year.—*Eloise Gerry*.

3039. QUAYLE, E. T. **Local rain producing influences under human control in South Australia.** *Proc. Roy. Soc. Victoria*, 34: 89-104. 1 map. 1922.—The author has previously shown for Victoria that (1) the substitution in the Mallee of crops and grass for drought-resistant forest and (2) the instituting of irrigation have a marked effect in increasing rainfall.—The conclusions made are based on the differences in mean rainfall in 1910-1919 and in 1885-1914. The areas with precipitation increased up to 15 per cent are in the lee or south-east of the cultivation or irrigation. The work on Victoria did not fully explain conditions in the neighboring area in South Australia where southeast of Lake Torrens as much as 20 per cent increase in rainfall is shown. Irrigation is negligible as a cause in South Australia, but the settlement of the country has brought about the substitution of crops and grass for the Mallee scrub and this is found to be a contributory reason. Effects are in proportion to the extent of cultivation. The increase in the water supply of the larger inland lakes and salt pans, especially Lake Torrens, is found to be of chief significance. This is attributed to the increased runoff of water at the higher levels where channels are being deepened and former pools have now vanished. Ring-barking is thought to increase the flow of water in

springs and general clearing of the land is found to make permanent flow in previously intermittent streams.—The desirability of purposely further increasing the volume of water in the lakes is pointed out. By clearing hilly land or portions of the inland foothills and mountains suitable for pasture, water which would otherwise evaporate into the air, move east or south without condensation, and so escape, may be obtained for storage in the lakes. It is believed that in the struggle for existence the perennial vegetation, with its adaptations for reduced transpiration, has exceeded its usefulness and that as a consequence gradual contraction of the belt of perennial vegetation toward the inland slopes has occurred.—*Eloise Gerry.*

3040. T[ANSLEY], A. G. **Root systems of crop plants.** [Rev. of: WEAVER, J. E., FRANK C. JEAN, AND JOHN W. CRIST. **Development and activities of roots of crop plants.** Carnegie Inst. Washington Publ. 316. vi + 117 p., 14 pl., 42 fig. 1922 (see Bot. Absts. 11, Entry 4694).] *Jour. Ecology* 10: 239-241. 1922.

FOREST BOTANY AND FORESTRY

3042. ANONYMOUS. **Conseil superieur des forêts.** [Superior Council of Forests.] *Bull. Soc. Centrale Forest. Belgique* 28: 470-488, 531-540. 1921.—This is a verbatim report of the meetings held on Jan. 19 and March 17, 1921, by the Superior Council of Forests to consider the proposed law for regulating certain classes of private forests.—*H. T. Gisborne.*

3043. ANONYMOUS. **Les forêts sous sequestre.** [Sequestered forests.] *Bull. Soc. Centrale Forest. Belgique* 28: 427-429. 1921.—A demand is made on the Senate that the government acquire all forests sequestered from alien enemies during the war.—*H. T. Gisborne.*

3044. ANONYMOUS. **Loi autorisant provisoirement le gouvernement à s'opposer à l'exploitation excessive de certains bois et de certaines forêts.** (Fin.) [A law provisionally authorizing the government to prevent excessive cutting in certain woods and forests. (Conclusion).] *Bull. Soc. Centrale Forest. Belgique* 28: 348-361. 1921.—This is the concluding report of the Senate discussions concerning the proposed law which was adopted, and proclaimed Jan. 11, 1921. Arguments for and against are discussed.—*H. T. Gisborne.*

3045. ANONYMOUS. **Report of proceedings of the Australian forestry conference, Brisbane, April, 1922.** 142 p. 1922. [See also Bot. Absts. 12, Entries 3065, 3069, 3093.]

3046. ANONYMOUS. **Service des aménagements.** [Forest management service.] *Bull. Soc. Centrale Forest. Belgique* 28: 541-543. 1921.—This is a tabular report showing by area and districts, from 1885 to 1914, and 1914 to 1920: (1) revised management plans; (2) extent of reserved areas; (3) conversion of ruined woods into coniferous and mixed high forest; (4) conversion of coppice and standards into full high forest; (5) conversion of simple coppice into coppice and standards and into full high forest; (6) lengthening the rotation of coppice and standards; (7) lengthening the rotation of simple coppice; and (8) reducing the period of return in broad leaved high forest.—*H. T. Gisborne.*

3047. ANONYMOUS. Tableau résumant les instructions pour la récolte des graines. [Résumé of instructions for harvesting forest tree seeds.] Bull. Soc. Centrale Forest. Belgique 28: 463-467. 1921.—General rules for all species and separate instructions for each of 23 genera of trees are given.—*H. T. Gisborne.*

3048. ANONYMOUS. The age of gum trees. Jour. Dept. Agric. Victoria 19: 478. 1921.—The article deals with *Eucalyptus globulus*.—*Wm. E. Lawrence.*

3049. A., G. Estimation d'une pineraie incendiée. [Estimating the value of burned pine reproduction.] Bull. Soc. Centrale Forest. Belgique 28: 492-495. 1921.—This article deals with the evaluation of a stand of pine reproduction 9 years old destroyed by fire, for which the owner claims damages.—*H. T. Gisborne.*

3050. ALVIELLA, FELIX GOBLET D'. L'impôt sur les revenus forestiers. Rapport sur l'application des lois coordonnées des 29 octobre 1919 et 3 août 1920 à la propriété boisée. (Impôts sur le revenu.) [The tax on forest revenues. Report on the application of the coordinated laws of October 29, 1919, and August 3, 1920, to wooded (or forest) property. (Taxes on the revenue.)] Bull. Soc. Centrale Forest. Belgique 28: 399-427. 1921.—This description of the new law includes a detailed discussion by foresters of the methods of taxing the soil, the capital invested, and the revenues resulting from both regulated and unregulated forests.—*H. T. Gisborne.*

3051. ANTOINE, V. Restauration des bois exploités pendant l'occupation. [The restoration of woods exploited during the occupation.] Bull. Soc. Centrale Forest. Belgique 28: 451-463. 1921.—The minister of agriculture has called upon the superior council of forests to indicate the cultural, legislative, or other measures helpful in reforesting the areas denuded during the war. The article outlines the problem and the measures, obligatory and otherwise, recommended by the council.—*H. T. Gisborne.*

3052. BENCKE, ALBERT. Die Wiederaufforstung Frankreichs. [The reforestation of France.] Zeitschr. Forst.- u. Jagdw. 53: 692-694. 1921.—Prior to the war France imported about $\frac{1}{2}$ of its timber, today it must import at least $\frac{3}{4}$ of its supply. According to a recent estimate 26 per cent of the land area, 18 per cent of which is now forested, can grow forests. The area of state forests is only 12 per cent. The great regeneration project of 1910, never executed, is now being reconsidered along with the planting of 4 million hectares of denuded land. Several examples are cited of denuded areas successfully regenerated and made very productive.—*J. Roesser.*

3053. BENJAMIN, L. R. Suitability of certain New South Wales eucalypts for paper pulp. Australian Forest. Jour. 4: 369-376. 1921.—*Eucalyptus pilularis*, *E. dalrympleana*, *E. maculata*, and *E. sieberiana* were tested for suitability for paper pulp. Autoclave pulping tests indicated that all 4 species give good pulp, but that *E. pilularis* and *E. sieberiana* are apparently the most suitable.—*C. F. Korstian.*

3054. BRUSH, WARREN D. Utilization of basswood. U. S. Dept. Agric. Bull. 1007. 64 p., 8 pl., 7 fig. 1922.—Basswood has never been a plentiful timber. Its many uses in manufacture and its profitable disposal are fully discussed. Basswood grows rapidly, reproduces easily, and should be encouraged in the basswood region. An appendix contains a classified list of nearly 500 uses of basswood.—*J. T. Buchholz.*

3055. BUTLER, O. M. What forestry means to southern commerce. Amer. Forest. 28: 433-435. 1922.—Of the original stand of saw timber in the U. S. A., only about $\frac{1}{3}$ remain. Of this, 61 per cent lies west of the great plains, 23 per cent in the southern states. Proximity to the great lumber markets and the distance from a strong competing region give the south a commercial advantage unequalled in the history of American lumbering. The south's opportunity is equally great in hard and soft woods. The 9 principal factors favoring wood production in the south are discussed.—*Chas. H. Otis.*

3056. C. A propos d'un mélange d'essences. [Concerning a mixture of species.] Bull. Soc. Centrale Forest. Belgique 28: 468-470. 1921.—This article refers principally to oak stands and recommends mixing beech rather than spruce with oak.—*H. T. Gisborne*.

3057. DENZIN. Die Ergänzungen zur Betriebsregelungs-Anweisung für die preussischen Staatsforsten. [Supplementary instructions of the management-plan instructions for the Prussian state forests.] Zeitschr. Forest.- u. Jagdw. 53: 517-542. 1921.—This critical discussion of the instructions points out the many ways in which they make the work of the official unnecessarily difficult.—*J. Roeser*.

3058. DRUMAU, L. Le mélèze du Japon en Hollande et en Belgique. [Japanese larch in Holland and Belgium.] Bull. Soc. Centrale Forest. Belgique 28: 507-519. 1921.—This recounts the growth of *Larix leptolepis* in Holland, where it has been grown since 1906, and in Belgium, where stock was set out in 1907. Complete measurements of average trees at ages of 15 and 18 years are given.—*H. T. Gisborne*.

3059. DUTT, SHAMBHOO. Annual report on the forest administration in Ajmer Merwara for the year 1918-19. 30 p., Ajmer, 1920.—This report covers in detail the work of the Forest Department in one of the smaller Indian Forest districts. It gives the forest area, lists forest offenses, discusses fire protection and shows the kind of produce taken from the forests. Due to severe drought most of forest area was opened to grazing. The drought did damage to timber, and natural reproduction was poor. A summary for period 1914-15 to 1918-19 is included.—*S. B. Show*.

3060. DUTT, SHAMBHOO. Annual report on the forest administration in Ajmer Merwara for the year 1919-20. 29 p., Ajmer, 1921.—This report discusses forest offenses, forest income, fire protection, and grazing. A severe frost did great damage to trees and especially to reproduction. Experiments in planting, in growing spineless cactus, in development of lac, and in tapping of salar for gum are considered.—*S. B. Show*.

3061. EBERBACH. Die beste Bestandsform und das beste Einrichtungs verfahren? [The best silvicultural form and the best plan of management?] Zeitschr. Forst.- u. Jagdw. 53: 466-474. 1921.—Eberbach replies to Eichhorn's critique of his Ordnung der Holznutzungen, which appeared in 1913. The author defends his advocacy of regular measurement and of inventory as necessary business, of the abolition of rotation and of distinction between final and secondary yields, and his method of calculating the increment.—*J. Roeser*.

3062. ESCHERICH, K. Die Streu fauna. [The fauna inhabiting forest litter.] Forstwiss. Centralbl. 44: 23-29. 1922.—It is of great importance to foresters to understand the nature of the animal life in the forest litter, and its detrimental and beneficial effects on the stand. Pillai's automatic method of separating the animals from the litter is described, and a long list is given of genera found in the litter from conifer forests, some kinds being abundant, others occasional. Seasonal differences are striking; in June there are fewer than in May; the number rises again in July, falls in September, rises in October, and falls in December. The fluctuation is greater, as is also the number of insects, in older stands. Preliminary results show that removal of the litter upsets the natural balance by removing many useful insects, and thereby favors the activities of noxious species.—*W. N. Sparhawk*.

3063. GEIST. Welchen Einfluss hat ein zu tiefer stand der Kiefer auf deren Lebensdauer und Ertrag? [What influence has too deep setting of pine upon its longevity and yield?] Zeitschr. Forst.- u. Jagdw. 53: 690-692. 1921.—This is a study of a sample plot of 0.2 hectare having a stand of pure 54-57 year old pine, started by sowing seed in plow furrows. The side roots were laid bare and their number and depth determined for all diameter classes. The results show the danger of deep furrows and the value of securing shallow rooting, and of manuring with raw humus. They indicate that deep underplowing of the raw humus and

deep setting of trees in plant slits are very dangerous in dry sandy soils; also that thinnings in the lower story only should be made with plow furrows or spot cultures (Platzekulturen), advance growth to be cut out only when diseased or badly formed.—*J. Roesser.*

3064. GILL, A. J. **Bushfire brigades.** Jour. Dept. Agric. Victoria 19: 690-691. 1921.—The author discusses methods of fire fighting and recommends growing maize and potato crops in the more dangerous situations.—*Wm. E. Lawrence.*

3065. GILL, WALTER. **History of the development of the South Australian Pinus insignis forests.** Proc. Australian Forest. Conference, Brisbane 1922: 26-28. 1922.—The introduction of and ultimate returns from these plantations are discussed.—*C. F. Korstian.*

3066. GLORIE, H. **La forêt de Houthulst (fin).** [The forest of Houthulst (conclusion).] Bull. Soc. Centrale Forest. Belgique 28: 335-339. Pl. 1-4. 1921.—This is the concluding article on the documentary history of this forest.—*H. T. Gisborne.*

3067. GOUDIE, H. A. **Eucalypts in New Zealand.** New Zealand Jour. Agric. 24: 229-235, 1922.—Various species of *Eucalyptus*, well suited for afforestation purposes in New Zealand, are described. Care should be taken to select desirable species.—*N. J. Giddings.*

3068. HARTMANN, FRANZ. **Über das Kohlensäureproblem im Walde.** [On the carbon dioxide problem in forests.] Wien. Allg. Forst.- u. Jagdzeitg. 40: 43-45. 1922.—This article supports the view that carbon dioxide concentration is of great importance in forest growth, based upon the facts that the average carbon dioxide concentration of 0.03 per cent is far below the optimum, that an increase of only 0.01 per cent results in stimulated growth, and that the favorable effect is not limited to vegetative growth but extends to seed production. Proof that vigor of growth is dependent upon carbon dioxide content of the air is difficult, for the same factors of moisture, warmth, and litter accumulation which are most favorable to carbon dioxide production are likewise undoubtedly favorable to tree growth. The well known unfavorable effects of undergrowth in forests are claimed to be due to the absorption of the carbon dioxide rising from the ground before it reaches the crowns of the forest trees.—*F. S. Baker.*

3069. HAY, R. DALRYMPLE. **Silvicultural and conversion work in New South Wales.** Proc. Australian Forest. Conference Brisbane 1922: 82-85. 1922.—This is a brief account of progress made in the forestry commission's work in the management and reestablishment of indigenous forests in New South Wales.—*C. F. Korstian.*

3070. HELMS, A. **Plantations in New South Wales: Factors influencing spacing.** Australian Forest. Jour. 5: 11-13. 1922.—The author discusses the effects on shape and growth of individuals in the community, caused mainly by the quantity of light available, and development caused by internal individual characteristics, some species showing a greater form variation than others.—*C. F. Korstian.*

3071. HISS. **Die beste Bestandsform und das beste Einrichtungsverfahren.** [The best forest-form and the best working plan experience.] Zeitschr. Forst.- u. Jagdw. 53: 636-641. 1921.—This is a reply to Eichhorn's critique of Eberbach's booklet "Aus dem Walde," [see Bot. Absts. 11, Entry 2363]. The present management methods are based on the cameralistic conception, founded on a theory of the ultimate performance of the forest. Eberbach's book is the 1st German attempt to prepare a plan based on biological conceptions, or on facts. The forest condition at the beginning and end of every working plan period is the foundation for these methods; the scale which measures the result is the running increment (secured by a stem-to-stem inventory of the growing stock). The biological method is applicable to all forest forms.—*J. Roesser.*

3072. HOWARD, S. H. Volume tables and form factors for sal (*Shorea robusta*) 8 p. Calcutta, 1922.—These are preliminary tables based on the measurement of 817 trees. A discussion of the tables and the various derived figures is included.—*S. B. Show.*

3073. JANACZEK. Beobachtungen anlässlich der Barkenkäferbekämpfung 1921. [Observations on the bark beetle attack of 1921.] Wien. Allg. Forst.- u. Jagdzeitg. 40: 79–81. 1922.—This article discusses fully a destructive outbreak of the bark beetle, *Ips typographus*. The best remedy is to cut and peel trees containing the larvae. The trap tree system is effective. The bark must be burned. Burying 40 cm. deep as an alternative proved ineffective. Careful disposal of slash and tops especially in areas of snowbroken and windfallen timber, is the best preventive measure. "Natural" management, a selection system, and avoidance of clean cutting and planting systems is advocated as a means of maintaining a healthy forest.—*F. S. Baker.*

3074. KARITZKY. [Rev. of: MARTIN, H. Die Fortbildung des sächsischen Forsteinrichtungsverfahrens. (The development of the Saxon forest organization.) 154 p. Paul Parey: Berlin, 1920.] Zeitschr. Forst.- u. Jagdw. 53: 434–439. 1921.

3075. KECK. Dauerwald und Grossbetrieb. [The continuous forest and extensive operations.] Zeitschr. Forst.- u. Jagdw. 53: 632–636. 1921.—In 1908–1910 the forest range of Gertlauken, one of the Lithuanian loam ranges, was seriously damaged by the nun-moth (*Liparis monacha*). The stand consists of spruce in mixture with broad leaf species. The author practiced a form of continuous management under a new plan based on regulation by volume instead of area distribution of age classes. Regeneration secured naturally was supplemented by some planting. Birch and aspen were encouraged in mixture, because of their relative importance at the time. The forest administration, the wood buyers, and the trade accustomed themselves to the distribution of the harvest over the whole area, which was the most difficult factor in the continuous system.—*J. Roesser.*

3076. KIENITZ, M. Wuchsleistung eines 40-jährigen Bestandes von Douglastannen. [Growth performance of a 40-year old stand of Douglas fir.] Zeitschr. Forst.- u. Jagdw. 53: 573–575. 1921.—In 1883, 828 sq. m. in the Chorin forest nursery were planted with alternate rows of 2-year old Oregon Douglas fir and 4-year old nursery grown Norway spruce, with occasional rows of linden. The spruce, soon outgrown, was gradually removed for Christmas trees. No thinning was necessary in the Douglas fir until 1920, when the average breast height diameter was 27.94 cm., and 119.69 cm. were removed in thinning. The fear that Douglas fir and other western American trees will finally fail in Germany even after a good start is not altogether justified. Regardless of the future of Douglas fir stands, their rapid growth and large early yields on fresh loamy soils warrant abundant planting and cultivation, preferably in mixture with spruce.—*J. Roesser.*

3077. KÖNIG. Hacken und Behäufeln. [Hoeing and hilling.] Zeitschr. Forst.- u. Jagdw. 53: 429–430. 1921.—Although the hoeing of pine cultures has been done with success, it has not yet found general usage as it has in oak cultures. In order to obtain the maximum effect, hoeing must be done at the beginning of the regular pre-summer drought as soon as the soil has lost its superficial porosity. The hilling of pine cultures, unlike that of field crops and oak is not beneficial and may even be detrimental. More research work is desirable in the forestry phase of hoeing.—*J. Roesser.*

3078. LEGAT, C. E. Annual report of the forest department for the year ended 31st March 1920, including report on railway sleeper plantations for the same period. Ann.Rept.Forest Dept. Union South Africa 31 p. 1920.—This report discusses the operations of the Department under the following headings: Extension and Constitution of State Forests, Management of State Forests, Financial Results, Administration, Staff, etc. Progress is reported in preparing working plans and in collecting growth and yield data. Silviculture is treated under the

headings: Natural Reproduction, Artificial Reproduction, Drift Sand Operations, Artificial Reproduction in the Indigenous Forests, Cultural Operations, Nurseries and Sales of Seeds, Operations for Improvement of Growing Stocks and Silvicultural Notes. The revenue for the year amounted to slightly more than £131,976, which is 54.6 per cent of the total expenditure. Investigations were initiated as to seasoning and preserving timber.—*C. F. Korstian*.

3079. MADDOX, R. S. **Directions for planting black locust [seed], seedlings and sprouts.** Tennessee Forest. Bur. Circ. 3. 8 p. 1922.

3080. MADDOX, R. S. **Forest fires and your home.** Tennessee Forest. Bur. Circ. 1. 4 p. 1922.

3081. MADDOX, R. S. **Forests, gullies and reconstruction.** Resources of Tennessee 9: 23-31. 1919.—This article gives a brief description of present forest conditions in Tennessee, the causes of and injuries from gullies, and methods of reclamation. The construction of cheap dams of brush is recommended. It is usually desirable to plow off the banks, so the dams may catch the soil more rapidly. The establishment of a vegetative cover is considered. Black locust, Bermuda grass, and honeysuckle vines have so far proved the most successful soil binders.—*C. F. Korstian*.

3082. MARCHET, JULIUS. **Das Forstwesen im Österr. Landeskulturförderungsgesetz.** [Forestry in the Austrian agricultural appropriation law.] Wien. Allg. Forst.-u. Jagdzeitg. 40: 49-50. 1922.—The new law makes an annual appropriation for the next 10 years for forestry purposes, which include education and farmers' conferences; promotion of societies and associations; forest workmen's affairs; animal production, pasture and grazing development; horticulture; forestry proper; watershed protection and torrent control; flood patrol and control. The appropriations are well planned, but gives pure forestry a rather small share of the total.—*F. S. Baker*.

3083. MARCKWORTH, GORDON D. **How forest fires damage the cattlemen.** Tennessee Forest. Bur. Circ. 2. 8 p. 1922.—This is a popular leaflet refuting the fallacious argument that forest fires improve the range.—*C. F. Korstian*.

3084. NECHLEBE, A. **Das forstliche Versuchswesen in der Tschecho-slowakei.** [Forest research in Czecho-slovakia.] Wien. Allg. Forst.- u. Jagdzeitg. 40: 169, 175. 1922.—The necessity for a forest experiment station was emphasized during the nun-moth outbreak of 1917-18. It has now been decided to establish a research force in Czecho-slovakia under 3 heads; one division will specialize on moth control work, the other 2 on silviculture and economics respectively. It is hoped that these may be independent establishments, connected neither with schools nor agricultural experiment stations.—*F. S. Baker*.

3085. PETRIE, W. R. **Tarrietia argyrodendron** (Crow's foot elm or brown oak). Australian Forest. Jour. 5: 9-10. 1922.—The author gives brief silvicultural notes on seed production, germination, and seedling growth.—*C. F. Korstian*.

3086. POSKIN, A. **Observations sur les semences forestières.** [Observations on forest tree seeds.] Bull. Soc. Centrale Forest. Belgique 28: 387-398. 1921.—Results of experiments in storing forest tree seeds by various methods for from 3 months to 6 years are given. The conclusion is reached that "the preservation of forest tree seeds in air-tight containers at low temperatures should be tried by practitioners."—*H. T. Gisborne*.

3087. Q., C. J. **Estimation d'une pineraie incendiée.** [Estimating the value of burned pine reproduction.] Bull. Soc. Centrale Forest. Belgique 28: 552-553. 1921.—The author comments on the methods in a previous article (Sept. 1921), [see Bot. Absts. 12, Entry 3049] concerning the evaluation of a 9-year-old stand of pine reproduction destroyed by fire.—*H. T. Gisborne*.

3088. R., E. *Pineraies de Campine. Eclaircies.* [Thinnings in the pine woods of Campine.] Bull. Soc. Centrale Forest. Belgique 28: 345-347. 1921.—Thinning *Pinus sylvestris* at Campine is described.—*H. T. Gisborne.*

3089. REGINSTER, G. *Excursion forestière en 1920.* [The 1920 excursion of the Society of Belgian Foresters.] Bull. Soc. Centrale Forest. Belgique 28: 519-531. Pl. 1-2. 1921.—This is a detailed description of the forest of Hertogenwald, comprising 11,250 hectares.—*H. T. Gisborne.*

3090. RUZETTE. *Project de loi relatif à la protection de certains bois et de certaines forêt appartenant à des particuliers.* [Proposed law relating to the protection of certain woods and forests in private ownership.] Bull. Soc. Centrale Forest. Belgique 28: 339-344. 1921.—This article shows the necessity for and the justification of a law preventing the devastation of certain classes of privately owned woodlots and forests. The text of the law as passed Jan. 11, 1921 is given.—*H. T. Gisborne.*

3091. SCHRÖDER. *Eindrücke aus dänischem Walde.* [Impressions from Danish forests.] Zeitschr. Forst.- u. Jagdw. 53: 430-434. 1921.—Beech (*Fagus silvatica*) comprises $\frac{3}{4}$ of the forest area of Denmark. Regeneration is secured by sowing in mast years, or by planting 2-year-old seedlings during non-mast years under a very light shelter of old trees, after very intense soil preparation. This system can not be practiced in Germany, because of poorer soil and the danger of frosts, which demands a heavier shelterwood. The Danish method of heavy thinnings in early age would be unfavorable on most German sites and would lead to the formation of poorly shaped boles whose volume increase would not offset the decrease in value.—*J. Roeser.*

3092. SEEHOLZER. *Saumfemelschlag und Blendersaumschlag.* Forstwiss. Centralbl. 44: 125-137. 1922.—Seeholzer explains the distinction between the Bavarian "Saumfemelschlag" and Wagner's "Blendersaumschlag." Characteristic of both are mixed stands, natural reproduction, progressive cuttings in successive strips on the border of the stand, segregation of age-classes, restriction of cutting to small areas, and maintenance of overhead cover. Wagner's method, however, is more or less schematic, requiring cutting in regular parallel strips, whereas the Bavarian method, which leaves the shape and amount of the cut entirely to the forester, is generally characterized by great irregularity in the border strip which is cut over each time. The "Femel" cutting in general is entirely distinct from the "Plenter" (selection) form and the "Schirm" (shelterwood) form. Under a true selection method the stand is never removed, while under the clear cutting (Kahlschlag), shelterwood (Schirmschlag), and Femelschlag methods the stand is removed in one or several operations and replaced by a new one. In these the stand is the unit of management, while with selection cutting the individual tree is the unit. Wagner's method is incorrectly named, because it does not result in a selection forest (Plenterwald).—*W. N. Sparhawk.*

3093. SIMON, M. H. *The financial bases of silviculture and agriculture.* Proc. Australian Forest. Conference, Brisbane 1922: 129-130. 1922.—A comparison is made between agriculture and forestry on "scrub" land in Queensland. The original crop should be realized on to the fullest extent prior to the launching of silvicultural operations having in view the reforestation of an area. Objection is raised to deducting revenue from the disposal of the old crop for the cost of planting the new crop.—*C. F. Korstian.*

3094. STÅLFELT, M. G. *Till Kännedomen om Förhållandet mellan Solbladens och Skuggbladens Kolhydratsproduktion.* [Relation between carbohydrate production of sun leaves and shade leaves.] Meddel Statens Skogsförsöksanst. 18: 221-280. Fig. 1-16. 1921.—Tests were made with leaves of *Acer platanoides*, *Pinus sylvestris* and *Picea excelsa*. In the 1st, sun leaves exhibit much higher photosynthetic activity than shade leaves. Thickness of the leaf as well as area must be considered, as thick leaves produce more carbohydrate than

thin. Considering the mass of tissue involved, leaves of medium thickness are most efficient. When exposed to the same light intensity both sun and shade leaves of pine show higher photosynthetic activity than those of spruce. In nature, the spruce makes up for this deficiency by a greater mass of needles. Spruce is able to persist in much less intense light. In both pine and spruce assimilation increases with light intensity, attaining maximum activity in full sunlight. Broadleaf trees generally attain maximum output of carbohydrates in medium light intensities. This difference is attributed to the fact, shown by Lubimenko, that pine and spruce needles contain a relatively low proportion of chlorophyll. The same limitation apparently renders pine and spruce unable to respond to increases over the normal proportion carbon dioxide in the atmosphere. Shade leaves of both pine and spruce are relatively more efficient than sun leaves in a given light intensity, which is explained by the higher chlorophyll content of the shade leaves. Assimilation is strongly dependent on soil moisture. During a protracted drought in June and July, when transpiration was reduced to within 12 per cent of normal in spruce and to a somewhat higher figure in pine, assimilation practically ceased in the former and fell to a very low figure in the latter. After heavy rains both transpiration and assimilation rose abruptly. The cessation of assimilation is attributed to the closing of the stomata in order to check water loss. (Summary in German).—*G. A. Pearson.*

3095. STOATE, T. N. **Silvicultural notes: *Pinus insignis* VIII.** Australian Forest. Jour. 5: 8-9, 75-76. 1922.—The author discusses protection against atmospheric agencies and grazing animals, rabbits, hares, wallabies and wombats, deer, bandicoots, mice, and birds.—*C. F. Korstian.*

3096. STUBENRAUCH. **Forstliche Plauderei. [Forest gossip.]** Zeitschr. Forst.- u. Jagdw. 53: 406-423. 1921.—Problems causing most contention in forestry concern the care of forest stands through thinnings and the natural and artificial establishment of such stands. Volume calculation based on light thinnings and increment as influenced by fertility are considered. Light thinnings in uneven-aged stands under continuous management and in even-aged stands are discussed. The even-aged forest is a better producer of quantity and quality than other forest forms. The determination of the financial rotation under the present Prussian management is also discussed.—*J. Roeser.*

3097. TRESCKOW, VON. **Forstwirtschaftlicher Rückblick auf die Jahre 1919/1920. Review of forest economics for the years 1919-20.** Zeitschr. Forst.- u. Jagdw. 53: 581-616. 1921.—The author considers the economic situation, its effect on the wood market and on building operations, state forest management and exploitation, the depressing import possibilities from neighboring states, questions of organization, legal provisions, and silvicultural questions, such as the argument over the relative merits of systems occasioned by Möller's "continuous management" in pine, and the bettering of the structure of forest organization. Heavy inroad into the growing stock will be necessary, but this should be counterbalanced by replacement, cultivation, and increasing production.—*J. Roeser.*

3098. WILBRAND. **Der wilde Kirschbaum. [The wild cherry tree.]** Zeitschr. Forst.- u. Jagdw. 53: 641-644. 1921.—The great demand for fuel has led to the reduction of many tree species, notably the wild cherry, which, after walnut, is the most important and desirable furniture wood. The wild cherry regenerates easily, is very tenacious, and individual trees of 185 and 172 cm. breast height diameter have been measured, the former in close association, with, but not suppressed by, a 264 cm. oak. The wild cherry should be brought back by natural and artificial means because of its timber value and aesthetic value, and its fruit.—*J. Roeser.*

3099. WILBRAND. **Staatliche Forstgesetze und der Grosswaldbesitz. [State forest laws and ownership of large forests.]** Zeitschr. Forst.- u. Jagdw. 53: 542-553. 1921.—To prevent destruction of private forest lands and to secure unified organization, state laws and super-

vision are desirable. A plan is outlined for state control of the personnel and management of large private forests, especial emphasis being given to the regulation of the yearly cut and adherence to the limitation. Using statistics from Hessian forest management, Chr. Müller, opposed to state control, shows that the income from private forests is greater than from state forests. This is due, primarily, to a greater production cost and a larger unit outlay for roads in the state forests. The author contends that the state is looking ahead by making salvage cuttings, getting rid of unproductive material, and spending liberally and wisely for artificial restocking.—*J. Roeser.*

3107. ANONYMOUS. [German rev. of: WECK, R. *Über Bewertung bei Selektionsarbeiten*. [The value of selection.] *Fühling's Landw. Zeitg.* 71: 134-139. 1922.] *Zeitschr. Pflanzenzücht.* 8: 444. 1922.

3108. ANONYMOUS. [Rev. of: WERTH, E. *Der fossile Mensch; Grundzüge einer Palä-anthropologie*. *Erster Teil*. (Fossil man: Basis of paleo-anthropology. Part 1.) iv + 336 p. Gebrüder Borntraeger: Berlin, 1921.] *Nature* 110: 508-509. 1922.—The author depends

largely upon the methods and conclusions of Schwalbe and Klaatsch. No mention is made of remains found at Piltown, Boskop, Talgai, or Wadjak, but full accounts are given of 2 discoveries in Germany during war-time,—one at Ehringsdorf, near Weimar, the other at Obercassel near Bonn. The former is rightly attributed to Neanderthal man and the latter is regarded as Cromagnon.—*O. A. Stevens.*

3109. ANDERSON, E. G. **Heritable characters of maize XI—Fine streaked leaves.** Jour. Heredity 13: 91-92. 2 fig. 1922.—A number of maize plants grown in 1917 showed fine white streaks in the leaves, somewhat resembling the lineate leaves described by Collins and Kempton. These cultures were closely related. Out-crosses with unrelated green plants gave normal green plants in the F_1 , and less than 25 per cent streaked plants in the F_2 . The factor for fine-streaked leaves is apparently linked with that for white endosperm, as no yellow seeds ever produced fine-streaked plants.—*R. C. Cook.*

3110. ANDERSON, W. S. **Sterility in relation to animal breeding.** Kentucky Agric. Exp. Sta. Bull. 244. 201-234. 1922.—Many farms within a radius of 25 miles of the Kentucky Experiment Station are devoted to raising 1 of the 3 breeds of light horses or some other breeds of registered stock. A study of sterility of male and female breeding animals has been conducted during the past 9 years.—I. Sterile males. Microscopic examination of semen and results of matings were used in determining fertility of males. A complete lack, a decreased number, or reduced vigor of motion of spermatozoa, or admixture of pus cells with spermatozoa are all indications of sterility. In some instances a male may at first discharge semen entirely free from spermatozoa but on a second mating a few minutes later discharge perfectly normal semen. Nineteen examples of sterile males are given which represent the types of male sterility worked with: (1) fibroid degeneration of the testes; (2) repeated attacks of orchitis; (3) production of a large percentage of inactive sperms; (4) presence of pus in the semen due to an inflammation of some portion of the genital tract. Proper feeding and exercise has resulted in some sterile males again becoming fertile.—II. Sterile females. Less than half the mares bred in Kentucky in any year raise foals to maturity the next year. Some of the causes of barrenness in mares and jennets are: (1) breeding at the wrong period of heat; (2) abnormal discharges in the female tract resulting in rapid inactivation of the sperms; (3) irregular heat periods due to inflammation and final destruction of the ovaries; (4) indifferent mares or mares which fail to catch at the first mating may pass 2 or 3 periods without showing signs of heat, possibly due to physiological conditions resulting from the care of foal. It is good practice to breed a mare that has just foaled, on the 7th and 9th or on the 8th and 10th days after foaling.—III. Artificial insemination. Methods are described of collecting semen. It is not safe to extract semen from a served mare for use with another mare because of the possibility of transferring disease. Usually it is not satisfactory to divide the discharge of a male between 2 or more females as in doing so the chances of a successful mating are reduced. The chief value of the syringe is to catch all available semen and inject it into the female. This method has proved the most efficient yet devised to insure the impregnation of a valuable brood mare.—*W. D. Valleau.*

3111. ANDERSON, W. S. **The effect on the germ plasm of isolation in a mountain section.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics, and the family. 297-302. Williams & Wilkins Co.: Baltimore, 1923.—Two families about 100 years ago took possession of a broken and unproductive strip of land in the foot-hills of the Kentucky mountains. One family was afflicted with chorea, the other family was feeble-minded. The 2 families have intermarried; now in the 5th generation there are about 150 families. In $\frac{3}{4}$ of these families there is chorea in some form or other. The disease has become intensified with each new generation owing to isolation which has encouraged cousin marriages. The feeble-minded tendency of the original stock seems also to have been intensified by the same intermarriages and the present generation has less energy, ambition, and ability than any of the previous generations. The most unfortunate feature of the affliction is the early and severe onset of the chorea as it has been manifest in the last 2-3 generations, in some instances appearing in childhood or in early

manhood, and in some of these cases assuming the form of complete mental irresponsibility along with the customary lack of muscular control. As a whole the women are very productive although the primitive conditions under which they live and the lack of care exercised by the mentally deficient mothers causes a very large infantile death-rate.—*W. S. Anderson.*

3112. BAGG, HALSEY J. **Disturbances in mammalian development produced by radium emanation.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 150-167. Williams & Wilkins Co.: Baltimore, 1923.—Two groups of female white rats were treated. In 1, the animals were injected intravenously or subcutaneously at varying periods before and after mating, with solutions of the active deposit of radium emanation. The usual dose was 5 millicuries. In the 2nd group pregnant females at nearly full term were treated with gamma-ray radiation from an amount of radium emanation equivalent to about $1\frac{1}{2}$ gm. of radium metal. The source of radiation was placed 1 cm. from the ventral body wall of the animal, and 2 mm. of lead and 1 mm. of silver were used as a filter. Doses of about 1,300 millicurie hours were used in this group. The results for the intravenous or subcutaneous treatments were similar, as shown by the arrested development of the foetus. Following treatment after mating, many embryos were killed and absorbed, or aborted. Many other effects are detailed. It would seem that by treatment of the mother before mating the faculty of the later developing embryo to form proper blood vascular endothelium is interfered with. When pregnant females at nearly full term were irradiated with gamma rays approximately $\frac{1}{2}$ of the young of each litter died 10 days after the treatment. The condition and symptoms of the young are described. Interesting developmental arrests were noted in the other half of the litters that survived the treatment. Although the animals grew to normal size, they soon showed abnormal eyes, with opaque pupils and the entire organ generally deformed. The abnormal animals were sterile in both sexes. They showed no neurological disturbances, and yet at autopsy marked developmental arrests were noted in the differentiation of the brain. The neopallium was greatly reduced in some cases and the cortex largely missing in others. The gonads of these animals were greatly atrophied and degenerated, although the other viscera showed no pathological changes.—*Halsey J. Bagg.*

3113. BANKER, HOWARD J. **The ideal family history.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 306-311. Williams & Wilkins Co.: Baltimore, 1923.—The author argues for a centrifugal type of family-history study as the only form based on correct biological principles and supplying the greatest interest to the greatest number of the family.—*Howard J. Banker.*

3114. BANKER, HOWARD J. **The learned blacksmith—an aristogenic type.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 340-347. Williams & Wilkins Co.: Baltimore, 1923.—A pedigree study is reported of Elihu Burritt showing the incidence of intellectual ability in his family network.—*Howard J. Banker.*

3115. BANNER, J. P. [Dutch rev. of: TÄCKHOLM, GUNNAR. *Zytologische Studien über die Gattung Rosa.* (Cytological studies on the genus *Rosa*.) *Acta Horti Bergiani* 7: 103-381. 1922.] *Genetica* 4: 544-550. 1922.

3116. BANTA, ARTHUR M., and L. A. BROWN. **Some data on control of sex in Cladocera.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 142-149. Williams and Wilkins Co.: Baltimore, 1923.—The writers found evidence that under favorable laboratory conditions parthenogenetic reproduction may continue indefinitely without resort to sexual reproduction. Thus the long-accepted internal sexual cycle seems non-existent for this material; environmental influences are held responsible for such irregular and sporadic sexual forms as occur. Indirect evidence that sexual forms, males and sexual (ephippial) eggs,—are called forth by certain environmental factors was seen in the occurrence of sexual forms in *Cladocera* in an outdoor pond and simultaneously among other types of *Cladocera*, reared in the laboratory in culture water from the same pond. Direct evidence has been

obtained that environmental factors influence the production of males. The simple expedient of crowding the mothers causes the production of males among a population usually wholly female. In most of these experiments there are few crowded bottles in which males fail to appear and it is exceptional to find males from mothers in any of the control bottles. A satisfactory measure of sex control was obtained for every strain adequately tested. This involved 3 species of *Moina*, 3 of *Simocephalus*, and 1 of *Daphnia*.—A. M. Banta.

3117. BARKER, L. F. The relation of the endocrine glands to heredity and development. *Science* 55: 685-690. 1922.—Secretions of the endocrine or so-called ductless glands have a profound effect upon the development of the individual. Such pathological conditions as gigantism, goitre, diabetes, and others, are known to be due to abnormal functioning of these glands. Tadpole metamorphosis may be accelerated by feeding thyroid and retarded by feeding thymus. Whether these secretions may not also affect the germplasm merits investigation. On the other hand, that conditional influences may so affect the secretions of the glands that they in turn modify the germplasm in such a way that the conditional influence is inherited, appears to be merely a conjecture without supporting evidence.—P. C. Mangelsdorf.

3118. BAUR. Einige Aufgaben der Rebenzüchtung im Lichte der Vererbungswissenschaft. [Some grape-breeding problems in the light of genetic knowledge.] *Beitr. Pflanzenzucht* 5: 104-110. 1922.—The author recommends the production of wine grapes resistant to *Peronospora viticola* and *Uncinula (Oidium) Tuckeri* by crossing the better kinds of *Vitis vinifera* varieties with the disease resistant American grape species. Methods of procedure which should be followed to secure the desired results are given. The paper is followed by numerous comments [p. 110-118].—Richard Wellington.

3119. BECHER, ERICH. [German rev. of: HERTWIG, OSKAR. Zur Abwehr des ethischen, des sozialen, des politischen Darwinismus. (A defense of Darwinism, ethically, sociologically and politically.) 121 p. Gustav Fischer: Jena, 1921.] *Zeitschr. Indukt. Abstamm.- u. Vererb.* 29: 200-202. 1922.

3120. BEDWELL, C. E. A. Eugenics in international affairs. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 427-429. Williams & Wilkins Co.: Baltimore, 1923.—The author believes that the establishment of permanent national and international organizations, to carry on the work of the 1st International Eugenics Congress, London, 1912, would foster such a spirit of cooperation among the nations as would tend "to offset dangers of unrestrained ambition" and might prove to be more effective than disarmament, arbitration, and the League of Nations. As the primary object of eugenics is the improvement of race, there is a very wide field of investigation, involving problems not only of international health, but also of racial differences in connection with race migration and influence of race on human history, the possibility, by wise crossing, of perpetuating dying races and of levelling up backward races without the advanced being debased, etc.—The policy of cooperation with the League of Nations, Pan American Union, and with existant research associations is strongly advocated.—C. B. S. Hodson.

3121. BELLING, JOHN. The attraction between homologous chromosomes. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 84-95. Williams & Wilkins Co.: Baltimore, 1923.—A brief account is given of some microscopical work with the *Daturas* bred by A. F. Blakeslee, and with *Cannas*. Homologous chromosomes in the late prophase or metaphase of the reduction division in pollen mother cells were, with rare exceptions, in connected sets of 2, 3, 4, and 5, according to the number concerned. This was found in diploids, triploids, tetraploids, diploids with 1 or 2 extra chromosomes, and tetraploids with 1 extra chromosome.—John Belling.

3122. BERNSTEIN, CHARLES. Microcephalic people sometimes called "pin head." Jour. Heredity 13: 30-39. 3 fig. 1922.—The article describes a family of 10 children, 4 boys and 1 girl being microcephalic and 5 apparently normal. The oldest girl graduated from normal school and is a successful public school teacher.—Pictures of 2 microcephalic girls not related to each other or to the Pin family are shown.—The family chart shows a history of 5 generations and the connection of these microcephalic children to the general family tree, which shows little degeneracy or dependency. The only marked causative factor of degeneracy is chronic alcoholism, which is very prevalent in a considerable number of the family fraternity.—Charles Bernstein.

3123. BLAKESLEE, A. F. Variation in the Jimson weed (*Datura Stramonium*) caused by differences in the number of chromosomes. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics, and the family. 82-83. Williams and Wilkins Co.: Baltimore, 1923.—The author discusses the balanced and unbalanced chromosomal types in *Datura* and gives a table of those already observed.—M. E. Farnham.

3124. BLARINGHEM, LOUIS. Mosaïque héréditaire chez le pois (*Pisum sativum* L.). [Heredity mosaic in the pea.] Compt. Rend. Acad. Sci. Paris 175: 1432-1434. 1922.—Seed of intermediate color have been obtained from a green pea which originally came from the yellow Pariser Gold. These intermediate seed segregate into a majority of intermediates with graduated variations from yellowish white to dark green. The extent of segregation of the intermediate forms seems to depend upon certain conditions of growth. Mosaic heredity in the pea is influenced by the age of the plant and the climate in which it is grown.—H. C. McPhee.

3125. BLARINGHEM, L. Sur la paedogénèse du chanvre (*Cannabis sativa*). [On paedogenesis in *Cannabis sativa*.] Bull. Soc. Path. Veg. France 9: 290-294. 1922.—Flowers may occur in the axils of the 3rd or 4th leaf of juvenile plants of *Cannabis sativa* grown in the hot-house. Seed obtained from these flowers are smaller than those obtained later from the adult plants, but may contain normal embryos.—J. Dufrenoy.

3126. BLARINGHEM, L. Sur la résistance aux parasites cryptogamiques d'un hybride d'épeautre et de seigle. [Disease resistance of a hybrid *Triticum spelta* [var. T.] × *Secale cereale*.] Bull. Soc. Path. Veg. France 9: 266-276. 3 fig. 1922.—The hybrid is (1) a giant, the vegetative tissues of which retain juvenile characters and weigh 8 times more (air dry) than those formed by either parent; (2) sterile; (3) much more resistant than the parents to *Puccinia graminis*. Infestation by *Claviceps* is favored on ovaries of the hybrid, which are exposed for a very long time. However, ergots were not numerous on hybrids.—J. Dufrenoy.

3127. BLARINGHEM, LOUIS. Sur un hybride stérile d'épeautre et de seigle. [On a sterile hybrid of spelt and rye.] Compt. Rend. Acad. Sci. Paris 175: 635-637. 1922.—Five kernels were obtained from emasculated flowers of spelt (*Triticum spelta* L.) pollinated with rye (*Secale cereale* L.) pollen. The author claims that the effect of the foreign pollen, xenia, was apparent in these kernels. Five sterile F₁ plants were produced. These were taller than the parents and produced about 8 times as much dry matter per plant as the larger parent. The characters of the hybrid were in part paternal, but especially maternal,—the characters of organization being maternal, the superficial and ornamental being paternal. The flowers remain open for a considerable time, being incapable of fertilization with spelt or rye pollen, while their own stamens are empty.—C. E. Leighty.

3136. BOLLES, C. B. Creating new dahlias—a garden sport for every man. *Gard. Mag.* 36: 32. 1922.—As all new forms have been obtained from seedlings, the possibilities of obtaining new forms of merit from seedling selections seems very great. The necessity of using seed of desirable varieties and the value of controlled crosses is emphasized.—H. K. Hayes.

3137. BOND, C. J. Sex of Irish yew trees. *Nature* 110: 810. 1922.—All *Taxus fastigiata* trees observed are female; no male plants are known. It is believed all Irish yews are grown by cuttings from the original mutational form found a century ago in Fermanagh, Ireland. The author is interested in possible linkage of erect habit of growth with femaleness; also the effect of pollinating female Irish yew with *T. baccata* yew pollen. He has made the cross, *Taxus fastigiata* × *T. baccata*. The F₁ shows graded series from spreading (baccata) type to erect (fastigiata) type. They are too young to determine sex.—J. Ben Hill.

3138. BOWDITCH, HAROLD. Red-green colorblindness in three allied families. *Jour. Heredity* 13: 136-142. 1 chart. 1922.—The inheritance of the defect is traced in the families for 6 generations, and while nothing new is brought out, the truth of the accepted law of inheritance is illustrated.—R. S. Cook.

3139. BRAUN, K. Bemerkungen zur Verbesserung der Sisalagave durch Züchtung. [Suggestions for the improvement of the sisal agave by breeding.] *Zeitschr. Pflanzenzücht.* 8: 278-290. 1922.—The author refers to preparations made before the World War for improvement experiments with sisal agave in the former German colony in East Africa. The ideal

plant he had aimed to work for was a long-lived one (to have been selected from those that delayed blooming longest), with at least 160 leaves averaging 170 cm. or more in length. He had planned also to make use of the established fact of individual diversity in percentage of fiber. Attention was to have been paid to selection for resistance to adverse conditions.—*J. P. Kelly.*

3140. BREEZE, M. S. G. Degeneration in anthers of potato. [Abstract.] Rept. British Assoc. Adv. Sci. 1921: 462-464. 1921 [see Bot. Absts. 11, Entry 1304.]

3141. BREITENBECHER, J. K. A red-spotted sex-limited mutation in *Bruchus*. Amer. Nat. 57: 59-65. 1923.—The female of *Bruchus quadrimaculatus* has 4 black spots on the elytra; the male is not spotted. A dominant mutation alters the color of the spots in the female to red, and leaves the male unaffected. This is the 4th dominant sex-limited mutation found in the species.—*Conway Zirkle.*

3142. BREMER, G. Opmerkingen over het cytologisch onderzoek van suikerriet. [Remarks on the cytological investigation of sugar cane.] Arch. Suikerindust. Nederland.-Indië 30: 229-238. 3 fig. 1922.—A popular exposition is presented of the more important results of the research published in full elsewhere [see Bot. Absts. 12, Entry 406].—*R. D. Rands.*

3143. CÄMMERLOHER, HERMANN. Zur Frage der Heimat der Banane. [The original home of the banana.] Oesterreich. Bot. Zeitschr. 71: 262-266. 1922.—The author reviews the literature pertaining to the native habitat of the banana and points out that it has been given both an Asiatic and a South American origin. Since he found excellent relief figures of the banana, *Musa sapientum*, upon the Tempel Borobudur (Java), which is over 1100 years old, and since its name is of Sanskrit derivation, he concludes that the banana came originally from the tropics of the Old World.—*Richard Wellington.*

3144. CHAPMAN, H. H. A new hybrid pine (*Pinus palustris* x *Pinus taeda*). Jour. Forest. 20: 729-734. 1 pl. 1922.—An unusual type of pine, supposedly a hybrid, was found in 1915 by V. H. Sonderegger in Winn Parish, Louisiana, ranging southwest to Calasieu Parish. It occurred scattered at widely separated points. *P. palustris* is probably the female parent. Seed germination is in the autumn as in *P. palustris*. The juvenile foliage is similar to that of *P. palustris*, while the rapid growth and habit of the seedling resemble the *P. taeda* parent. The cones are intermediate between the parent species. Fully developed seed are formed by the hybrid but their fertility was not determined. The wood structure is like that of *P. taeda*. It yields high in naval stores. The name *Pinus Sondereggeri* is suggested for the hybrid. It has commercial possibilities in reforestation.—*J. Ben Hill.*

3145. CHRISTY, MILLER. The origin of the hybrid *Primula elatior* × *vulgaris* demonstrated in the field, with notes on other British *Primula* hybrids. New Phytol. 21: 293-300. 1922.—Intermediates were found between: (1) *P. elatior* and *P. vulgaris*, (2) *P. elatior* and *P. veris*, and (3) *P. veris* and *P. vulgaris*. The author concluded that they represented hybrids between these species. He planted *P. vulgaris* in a bed of *P. elatior*, the nearest *P. vulgaris* being 2 miles distant. Hybrids of the same type as those noted above were found in the same region 17 years later. The other hybrids were not produced in this manner. Of these the supposed hybrid between *P. elatior* and *P. veris* is rare. The range of intermediates between *P. veris* and *P. vulgaris* and the fact that they are very vigorous and semi-sterile indicate strongly that hybridization in the wild also accounts for this case.—*Margaret C. Mann.*

3146. CHRISTY, MILLER. The pollination of the British *Primulas*. Jour. Linn. Soc. Bot. 46: 105-139. 1922.—After surveying the evidence of insect visitation to 3 yellow species of *Primula* belonging to the section *Vernales*, i.e., the British primrose, oxlip, and cowslip, the author reverts to Darwin's conclusion that pollination must be due to night-flying moths. All but 5 species of Noctuidae and Geometridae known to be present when these early flowering

primroses are in bloom were eliminated because they alone had tongues long enough to reach nectar in any of the species involved. The author's conclusion is based on the following: (1) the heterostylism must be for the purpose of cross-fertilization and such insects as visit these species by day frequently enough to effect pollination would be indiscriminate in their effects; (2) one of the 5 possible species has been seen to visit a cowslip; (3) pale yellow flowers are most visible at night; (4) nectar guides of type found in flowers so pollinated are present in all 3 species; (5) scent of primroses is most noticeable at dusk. It is suggested that the question be definitely settled by experiment.—*Margaret C. Mann.*

3147. CLAUSEN, J. **Studies on the collective species *Viola tricolor* L. II.** Bot. Tidsskr. 37: 363–416. *Illus.* 1922.—Variations in the following characters in *V. tricolor* and *V. arvensis* are described, named, and illustrated: size of petals, labellum of stigma, spot on style, pollen-magazine, honey-streak, color of petals, length of spur, form of spur, form of spur-bearing petal, lateral sepals, epidermal cells of petals, pollen grains, size of leaves, form of leaves, stipules, end lobe of stipules, habit of plant, color of stem, duration of life.—That these variations are induced by genotypical differences is affirmed by observation in nature, cultivation of types under the same conditions, and by breeding experiments.—That all combinations of these variations are possible is indicated by tabulation of sets of 4, 5, or 6 characters at a time for many plants from various habitats.—That the many different isoreagents (microspecies) within the collective species *V. tricolor* L. have arisen from crosses between *V. tricolor* and *V. arvensis* and between segregants, is shown by: (1) analysis of progeny of natural populations and of segregants; (2) synthesis of mixed populations similar to wild populations by crossing *V. tricolor* and *V. arvensis*; (3) cytological evidence. All relevant and stabilized types of *V. tricolor* and *V. arvensis* have respectively 13 and 17 chromosomes (haploid). Nuclear divisions in artificial hybrids and in suspected spontaneous hybrids are very similar. When 13 *V. tricolor* chromosomes and 17 *V. arvensis* chromosomes are brought together they behave in different ways in the heterotypic metaphase. They can form either 15 bivalents, 14 bivalents and 2 univalents, or 13 bivalents and 4 univalents, the 2nd arrangement being most frequent. As no *V. tricolor* with less than 13 (haploid) are found it seems that gametes with less than that number and zygotes with less than 26 degenerate. This new type of chromosome distribution after crosses resembles that found in the F_2 of Winkler's cross *Solanum nigrum*, diploid \times tetraploid. As usually only 2 numbers, 13 and 17, occur in nature, the chromosome sets of hybrids must be unstable or plants with these combinations do not survive in nature.—That naturally occurring combinations of variations (isoreagents) should not be considered as "species" is argued from the fact that the number of these combinations is very large even when limited to homozygotic combinations. Also, some already named varieties and sub-varieties can be identified as segregants from *V. tricolor* \times *V. arvensis*. Search for expected combinations in nature was successful. All this is believed to show how little reason there is in the modern splitting up of Linnaean species, as illustrated by *Hieracium* with 1400 "species." While this course leads to chaos, the old division of species is not regarded as sufficient. Hence the following propositions are made: (1) that species be maintained in the Linnaean sense but as superior to varieties, microspecies, and isoreagents; (2) that species, so used, be critically revised with new diagnoses not including varying characters, the latter listed below with known combinations; (3) that minor units be named microspecies (Ostenfeld, 1921) and isoreagents (Raunkiaer, 1918), forma to be applied to variations caused by external conditions solely; (4) that ternar nomenclature be used for microspecies and isoreagents.—*V. tricolor* and *V. arvensis* must be regarded as distinct species, although they intercross, because: (a) chromosome numbers are distinct; (b) 2 well defined types are far more frequent than transition types; (c) hybridization does not result in simple Mendelian segregation because of the chromosome situation.—The only guide as to original *V. tricolor* and *V. arvensis* types is the frequency of character combinations in nature; Geographically they are co-extensive.—Distribution of isoreagents follow definite limitations of environment, e.g., degree of soil acidity.—Adaptation of certain microspecies to peculiar environmental complexes is explained not as a direct effect of the conditions but as the result of mutations, crosses, and subsequent selection.—*E. B. Babcock.*

3148. COCKERELL, T. D. A., and DOROTHY YOUNG. A mutation of the columbine. *Nature* 110: 701. 1 fig. 1922.—A single plant of *Aquilegia coerulea* James was found near Ward, Colorado, which had the sepals deeply trifold.—O. A. Stevens.

3149. COOK, O. F. Are any species uniform? Or should the assumption of "pure" species be discarded and diversity recognized as the normal evolutionary condition? *Jour. Heredity* 13: 285-287. 1922.—There appears to be no doubt as to the existence of "impure" or heterozygous species. There is considerable doubt however regarding the existence of species that may accurately be called "pure" or uniform. Taxonomists' ideals of uniformity differ from those of geneticists and evolutionists. Species which the taxonomists consider pure are often very heterozygous. The author believes that species cannot originate by sudden mutations but only by gradual modifications in the network of descent.—P. C. Mangelsdorf.

3150. COOPER, H. P. The inheritance of the spring and winter growing habit in crosses between typical spring and typical winter wheats, and the response of wheat plants to artificial light. *Jour. Amer. Soc. Agron.* 15: 15-25. 1923.—In both direct and reciprocal crosses between true spring and true winter wheats, the short vegetative period is dominant. Crossing of a spring type (Marquis) and 3 winter types shows that there is a dominant factor for winter and an inhibitor against winter involved, for there resulted a ratio of approximately 13 spring to 3 winter forms. By artificially lengthening the daily duration of light, it is possible to grow 2 generations of spring grains in 1 year.—F. M. Schertz.

3151. CROWTHER, C. R. Evolutionary faith and modern doubts. *Nature* 109: 777. 1922.—The author criticises Bateson's statement [see Bot. Absts. 12, Entry 1767] that "The conclusion in which we were brought up, that species are a product of a summation of variations, ignored the chief attribute of species, that the product of their crosses is frequently sterile in greater or less degree." The author thinks it easier to imagine sterility arising from a gradual modification spread over a length of time, and involving many chromosomes, than from the half monstrous variations chiefly studied by Bateson, variations which appear to affect only a few chromomeres, and those by loss alone.—Walter Scott Malloch.

3152. DANFORTH, C. H. The frequency of mutation and the incidence of hereditary traits in man. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 120-128. Williams & Wilkins Co.: Baltimore, 1923.—Several well-known hereditary traits are clearly detrimental to their possessors. Others, while not obviously detrimental, are almost certainly not beneficial. The incidence of these traits must depend on the frequency of their determining genes in the racial germ-plasm, and since there is good evidence that some of them have appeared from earliest times, the incidence, at least of the adverse traits, must be maintained by occasional mutations. Among hereditary traits that are presumably indifferent the incidence varies in different racial groups. This racial difference implies a different rate of mutation in different human strains, and this rate can be estimated roughly by taking into account the length of time since 2 or more racial stocks diverged from a common source. Estimated in this way it seems probable that in some directions mutations have occurred in not more than 1 gene in 30,000 while in other directions the mutations have apparently been more frequently. The indications are that parallel mutations appear in different races, but that a more or less pronounced tendency toward a certain type of mutation may itself be a racial characteristic.—C. H. Danforth.

3153. DARWIN, LEONARD. Aims and methods of eugenical societies. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 5-19. Williams & Wilkins Co.: Baltimore, 1923.—The aims of eugenical societies are discussed in general terms. All proposals made should be based on heredity. Rules of conduct in regard to parenthood, and methods of stimulating conduct productive of racial progress are to be considered. Eugenics is the advocacy of social reforms based on genetics. Only general principles can now be laid

down in regard to many problems. Moral principles are to be kept in the foreground. Eugenic reform is unlikely to be rapid. Ways in which the aims can be promoted are cited.—*Leonard Darwin.*

3154. DARWIN, LEONARD. **The field of eugenic reform.** 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 189–202. Williams & Wilkins Co.: Baltimore, 1923.—Some eugenists would cover a wider field than others. When dealing with single factor qualities, to prevent parenthood might eliminate the evil but could not raise the general standards. In such cases individuals must be selected; as also with criminals, wastrels, etc. Segregation and sterilization are discussed. With multiple factor qualities, individual selection is less effective. Reforms should deal with large numbers. Correlation between infertility and superiority leads to deterioration. The questions of a moral campaign in favor of fertility, financial burdens, motherhood endowment, and state aid to the inefficient are considered.—*Leonard Darwin.*

3155. DAVENPORT, CHARLES B. **Research in eugenics.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics, and the family. 20–28. Williams & Wilkins Co.: Baltimore, 1923.—This gives the history and the needs of, and some of the results already obtained, in research on human heredity. In addition are discussed (with some practical application) mate selection, fecundity, and influence of immigration on national traits.—*C. B. Davenport.*

3156. DAVIDSON, DORIS. **The inheritance of ability.** [Rev. of: TERMAN, L. **The intelligence of school children.** 317 p. Houghton Mifflin: Cambridge, Massachusetts, 1919.] Jour. Heredity 13: 124–126. 1922.—Terman's book is a study of 41 children rating exceptionally high in intelligence tests. Family histories were given in all instances. In 72 cases the occupation of the father is given, who in 18 is a professional man and in 17 a college graduate. In only 2 cases is it stated that there were no relatives of superior intelligence on either side of the family.—*R. C. Cook.*

3157. DONCASTER, L. **Further observations on chromosomes and sex-determination in *Abraxas grossulariata*.** Quart. Jour. Microsc. Sci. 66: 397–408. 1922.—This paper was completed after Doncaster's death by his assistant, RUTH C. BAMBER (MRS. BISBEE). In a previous paper (Jour. Genetics 4: 1. 1914) the inheritance of a tendency to produce families consisting chiefly or entirely of females was described. Females of the strain had 55 chromosomes as the somatic number; all males and most other females had 56. In maturation of the 55-chromosome strain, 28 pass to one pole and 27 to the other. Since all spermatozoa had 28 it seemed evident that the egg with 27 must be female-determining. The above observations were supported by Morgan on *Phylloxera*. The extra chromosome seemed to go into the polar body—though in *Phylloxera* these eggs always became males. In later work published in a letter to Nature (June 10, 1915) Doncaster did not seem to bear this out. Two questions are at issue: (1) whether the all-female families are so because all the fertilized eggs are truly female, or whether they arise through non-viability of male zygotes; (2) if all zygotes in such families are female, whether egg-nuclei before fertilization contain always 27 chromosomes, sometimes 28. There is no evidence regarding the first. Evidence from the use of various stains indicates that a certain amount of chromatin is left behind on the equator of the spindle in anaphase. If so, perhaps the sex-chromosome loses so much chromatin that it becomes useless; hence the all-female families from eggs, some of which contain 27 and others 28 chromosomes.—*C. S. Hoar.*

3158. DOWN, E. E., and O. B. WINTER. **Selecting mother sugar beets.** Quart. Bull. Michigan Agric. Exp. Sta. 5: 36–38. 1 pl. 1922.—The mother sugar beets with higher sugar content may be recognized by the specific gravity method, as there is a fairly close correlation between high specific gravity and high sugar content. The method outlined is one that has long been known in Germany. The writers point out the necessity of storing and handling the mother beets in a uniform, careful manner if the method outlined is to be of much value.—*H. K. Hayes.*

3159. DUBLIN, LOUIS I. **Mortality of foreign race stocks.** 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 78-89. Williams & Wilkins Co.: Baltimore, 1923.—Studies made of the mortality rates in the various race stocks in Pennsylvania and New York show important differences in the several groups. The native born of native parentage have the lowest mortality rate and the foreign born, the highest. The foreign born and the native born of foreign or mixed parentage agree much more closely with each other than with native stock.—Of the foreign born groups, the Russians, who are mostly Jews, the Italian, and the Austro-Hungarians present the most favorable conditions. The British, the Germans, and the Irish have death rates very much in excess. Pulmonary tuberculosis, pneumonia, and the degenerative diseases are largely responsible for this unfavorable mortality of the 3 stocks last named.—The figures appear to indicate that the immigrants of New York State and Pennsylvania are not representative of the most vigorous in their own races, the death rates being often higher here than in their own countries.—*Louis I. Dublin.*

3160. DUCK, R. W. **Mendelism in fur sheep crosses—II.** Jour. Heredity 13: 63-68. 4 fig. 1922.—In a previous paper [see Bot. Absts. 11, Entry 3830] it appeared that the black fur of the homozygous Karakul sheep was dominant to the white of the Longwool. A discussion of the appearance of occasional red lambs in Karakul \times Longwool crosses was reserved for a later paper. It appears that the natives of Transcaspia, the home of the Karakul, conduct their sheep breeding operations carelessly and that mixing with the red-wooled breeds, also found in that region, is almost certain to occur. Data from breeding experiments at the Dawley Farm, Fayetteville, New York, are presented to substantiate the theory that the supposed homozygous Karakul rams are really heterozygous for red. An account is also given of a peculiar 6-horned Karakiev ram. Breeding experiments indicated that the character was entirely lacking in dominance,—not appearing in the F_1 progeny.—*R. C. Cook.*

3161. DUNN, L. C. **Some results of race mixture in Hawaii.** 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 109-124. Williams & Wilkins Co.: Baltimore, 1923.—This paper presents the preliminary results of a study of the physical anthropometry of Hawaiians of pure and mixed bloods. Hybridization between native Hawaiians and other races exists in incipient stages, most of the hybrids observed being of the 1st generation and very few further removed than 2 generations from the original cross (F_2 or backcross). Of the race mixture involving Hawaiians as 1 element, about 57 per cent in the sample of 344 cases was attributable to crosses with 1 of the white races, chiefly North European and Portuguese; about 31 per cent involved crosses of Hawaiian and Chinese; only 2 per cent involved Hawaiian and Japanese; and the remaining 10 per cent consist of crosses with other stocks: Negro, American Indian, Philipino, Malay, Hindoo, etc. The commonest triracial mixture was Hawaiian-Chinese—"White."—The south Chinese (coolies from Quantung) proved the purest of any of the racial groups involved in the crosses and the most conservative in all characters; they differ from the native Hawaiians in head form, stature and its segments, nose shape, hair form, and other characteristics. In a small number of hybrids most of these characteristics were intermediate between the parent types (e.g., stature); in some they resembled the Chinese (e.g., hair form), and in others presented an appearance different from either parent race (e.g., head form). The production of new types from this and similar racial crosses by recombination and segregation of heritable factors is briefly discussed.—*L. C. Dunn.*

3162. DUNN, L. C. **The relationship between the weight and the hatching quality of eggs.** Connecticut [Storrs] Agric. Exp. Sta. Bull. 109. 89-114. 1922.—A total of 545 eggs laid by 47 White Leghorn pullets and 170 eggs laid by 18 White Leghorn hens were weighed and incubated. Average-weight eggs hatched better than either large or small eggs. No correlation was found between the weight of an individual bird's eggs and the percentage of fertile eggs that hatched. A slightly greater hatchability was found in the eggs weighing less than the mean than in those weighing more than the mean.—*F. A. Hays.*

3163. EHRENBERG, PAUL. **Die Wirkung der Ernährung auf die Entstehung von bleibenden Veränderungen der Pflanzen.** [The effect of nourishment on the origin of permanent changes

in plants.] Beitr. Pflanzenzücht. 5: 45-67. 1922.—The author cites the influence of environmental factors, acting through the nutrition, upon the morphology and physiology of plants and offers evidence which he believes indicates that the induced changes are inherited. Thus, by appropriate external stimuli, the normal biennial habit in beets may be changed to the annual habit, and *vice versa*. Since both annual and biennial races of beets are known, the 2 methods of flowering must be inherited. Hence, the author believes, it is reasonable to suppose that when a change in the time of flowering is brought about by artificial stimuli, hereditary changes at the same time have been induced through alterations in the nutrition. From similar lines of argument, but without detailed evidence from pedigreed cultures, it is believed that increased relative weight of straw to grain in wheat under irrigation, and increased number of ears in maize under favorable weather conditions, as well as certain other modifications brought about by the environment, are to be classed as induced changes which are hereditary. In the discussion following the address [p. 67-71] W. OETKEN, PH. STOLL, and SPERLING speak of the effect of cold upon time of flowering, and KOSTLAN, ROEMER, and SEELHORST of the length of time necessary to induce hereditary changes.—A. F. Blakeslee.

3164. EMOTO, YOSHIKADZU. Über die relative Wirksamkeit von Kreuz- und Selbstbefruchtung bei einigen Pflanzen. [The relative effectiveness of cross- and self-fertilization on several plants.] Jour. Coll. Sci. Tokyo Imp. Univ. 43⁴: 1-31. 2 pl., 6 fig. 1920.—This paper discusses the relative effectiveness of cross pollination as compared with selfing by pollen from the same flower or other flowers on same plant. The plants studied were *Primula sinensis*, *P. obconica*, *Brassica campestris*, *Tricyrtis hirta*, *Hyacinthus orientalis*, *Freesia leichtlini*, and *Tritonia aurea*. Cross pollination yielded most seeds in all species. It was also most effective in a majority of species in respect to number of capsules set, size of capsule, weight of seeds, and percentage of germination.—L. L. Burlingame.

3165. ESTABROOK, ARTHUR H. The tribe of Ishmael. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 398-404. Williams & Wilkins Co.: Baltimore, 1923.—The Tribe of Ishmael is a large group of degenerates descended from several hundred family heads, with the Ishmael family itself the central and most degenerate. These people have lived mostly in Indiana and the neighboring states. The different families of the Tribe came to Indiana, separately in most cases, on the general tide of immigration west from the original colonies. There is reason to assume that some of these families came from the convicts deported by England to America in early times. The pauper and criminal families which comprise the Tribe number about 10,000 people. Many have been inmates of institutions, receive poor relief, and live by begging. Many are feeble-minded. There are 3 outstanding characteristics of the Tribe: pauperism, licentiousness, and gypsying. Some families or individuals in new communities have mated into new stocks and some improvement is found where the mating has been into a stock carrying better traits and abilities. The matings in general however have been like to like with a resulting poor offspring which in turn has shown a low social reaction. The story is much like that of the Jukes and other defective families.—A. H. Estabrook.

3166. EWART, J. COSSAR. Sheep breeding experiments in Scotland. British Res. Assoc. Woolen and Worsted Indust. Publ. 14. March, 1922.—The author summarizes briefly the probable origin of the European breeds of sheep. He holds that the short-tailed primitive breeds, such as the Soay and Shetland, were derived from crosses between the Mouflon and Urial and that the long-tailed breeds are derived largely from varieties of the Ammon and the fat-tailed and fat-rumped sheep of central Asia. He describes the results of first crosses between the Highland Blackface and Southdown sheep, between Blackface and Soay, Blackface and Siberian-Shetland.—Sewall Wright.

3167. EYSTER, WILLIAM H. Inheritance of zigzag culms in maize. Genetics 7: 559-567. 1922.—Zigzag culms is an abnormality of maize in which some of the internodes are shortened, thickened, and twisted. This abnormal condition is recessive to the normal form and results

from the interaction of 2 factors designated *Zg zg* and *Zz*. One of these factor pairs *Zg zg*, is very closely linked with a chlorophyll disorder known as green-striped leaves and designated *Gr gr*.—*J. H. Kempton*.

3168. EYSTER, W. H. The intensity of linkage between the factors for sugary endosperm and for tunicate ears and the relative frequency of their crossing over in microspore and megaspore development. *Genetics* 7: 597-601. 1922.—The average per cent of crossing over between the 2 linked characters of maize, Tunicate, *Tu tu*, and sugary endosperm, *Su su*, has been determined to be 28.63 ± 0.45 . While the degree of linkage between these characters is variable, there is no appreciable difference between the rate of crossing over in microsporogenesis and megasporogenesis, a condition found with other linked characters in maize.—*J. H. Kempton*.

3169. FELDMAN, H. W. A fourth allelomorph in the albino series in mice. *Amer. Nat.* 56: 573-574. 1922.—A new mouse mutant has been obtained from a fancier who had been breeding it for some time. It resembles the ruby-eyed guinea pig, ruby-eyed rat, and ruby-eyed or chinchilla rabbit in the degree of pigment reduction in the hair; but the eyes are apparently darker than those of the rat and guinea pig. This mutation forms one of a series of quadruple color allelomorphs in the mouse, and the author designates it as *c*. In a scale of dominance, the 4 forms probably fall in the following order: intense or wild color *C*, dilute *c'* (herein described), extreme dilute *c^d*, and complete albinism *c*. Wild color, *C*, is completely dominant to other allelomorphs, but *c'* and *c^d* are incompletely dominant to albinism. The cross between *c'* and *c^d* has not yet been made, but the heterozygote (*c' c^d*) will probably be intermediate in color.—*B. W. Johnson*.

3170. FERGUS, E. N. Self-fertility in red clover. *Kentucky Agric. Exp. Sta. Circ.* 29. 17-36. 1922.—A review of literature on self-sterility of red clover is given which indicates that red clover is generally considered self-sterile although occasional seed may set under bags. Preliminary tests of a method of artificial self-pollination, which consists in rolling the heads between thumb and fingers, indicated that this method was efficient in causing self-pollination. Approximately 650 heads, each representing a separate plant, were artificially self-pollinated by this method. From 32 of these plants 153 seed were secured, several producing many seed. All of the seed were sown and the following year 79 normal plants were obtained. Artificial self-pollination was performed on 463 heads, of which 115 set seed yielded an average of 9.0 seed per head. A single plant produced 134 seed in 5 self-pollinated heads. The self-pollinated seed obtained were from the progeny of 13 of the original 32 plants which set seed. Strains which produced many seed in the 1st self-pollination tests were generally highly self-fertile in the next generation. Four strains produced some chlorophyll-deficient seedlings, which is considered evidence of self-fertilization. Greater uniformity was noted between the selfed progeny of individual plants than between the progeny of individual open pollinated plants. The 5 progeny obtained by self-pollination from 1 parent plant were all highly resistant to mildew.—*W. D. Valleau*.

3171. FETSCHER. [German rev. of: BAUER, J. *Vorlesungen über allgemeine Konstitutions- und Vererbungslehre*. (Lectures on the "human constitution" and heredity.) iv + 186 p., 47 fig. Julius Springer: Berlin, 1921.] *Arch. Rass.- u. Ges.- Biol.* 14: 195. 1922.

3172. FISCHER, G. Originalsaatgut und Vermehrungsanbau. [Original seed stock and culture for increase of the stock.] *Zeitschr. Pflanzenzücht.* 8: 295-308. 1922.—Marked differences in powers of increase of various plants prevent an arbitrary designation of some particular generation from the originally selected parent as the original seed stock ("Originalsaatgut"). Inquiry revealed that in 21 cases out of 37, the 5th generation of seed from the initial selection was sold as original seed stock. The author also discusses selling diverse generations from the originally selected parents as original seed stock, restoring original seed stock in increase establishments, and the advisability of inserting "elite increase plots" between the breeding farms and the increase establishments.—*J. P. Kelly*.

3173. FISHER, R. A. **Darwinian evolution by mutations.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 115-119. Williams & Wilkins Co.: Baltimore, 1923.—Many misapprehensions have arisen as to the bearing of modern research on the Darwinian theory of natural selection. It is here contended that, apart from changes in the use of words, the only serious point in which Darwin's views require modification is that Darwin appears to have considered that the ordinary differences between parent and child are due to new mutations occurring afresh in each generation, whereas modern work shows that mutations are of infrequent occurrence, and that the differences commonly observed are due for the most part to the rearrangement, on the Mendelian scheme, of old heritable differences long incorporated in the species. It is shown that this fact does not at all diminish the efficacy of natural selection. The conditions under which new genes become incorporated in the genetic stock of the species are discussed; and the conclusion is drawn that the utility of sexual reproduction with Mendelian inheritance lies in the fact that it allows a wide genetic variation with a minimum of mutation.—*R. A. Fisher.*

3174. FISHER, R. A. **New data on the genesis of twins.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 195-197. Williams & Wilkins Co.: Baltimore, 1923.—Attention is called to (1) the importance of the evidence supplied by twins of inheritance of human traits, (2) inconsistency of current biological theories of the genesis of twins with twin measurements published by Thorndike, which constitutes the only available numerical data. Thorndike's measurements suggest a uniform type of origin for the majority of twins, intermediate between the supposed "fraternal" and "identical" types. The supposition that twins are alike in maternal inheritance but not necessarily in paternal inheritance has definite Mendelian consequences by which it may be tested. Such cases as are available in albinism, eye color, and other, probably Mendelian, traits appear to support this supposition. The number of cases at present available are admittedly inconclusive but afford grounds for further inquiry.—*R. A. Fisher.*

3175. FISHER, R. A. **The evolution of the conscience in civilized communities (in special relation to sexual vices).** 2nd. Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 313-317. Williams & Wilkins Co.: Baltimore, 1923.—The evidence for the inheritance of mental and moral qualities which has been adduced by modern work in psychology, statistics, and genetics is confirmed by the historical facts of the evolution of moral opinion in civilized communities. In the case of the mental attitude towards practices limiting population, the selective agency may be indicated, and the change of moral opinion traced in successive ages. As examples, are taken female infanticide of the pre-Moslem Arabs, and the abortion in the Greek and Roman civilization. Effects of these selective agencies are still apparent in modern vital statistics, and they should be borne in mind in discussing modern contraceptive practices.—*R. A. Fisher.*

3176. FISHER, R. A. **The systematic location of genes by means of crossover observations.** Amer. Nat. 56: 406-411. 1922.—The author develops a method of calculating the most probable values for linkages ("distances") of any set of closely adjacent genes (genes between which double crossing-over is negligible) from results of any series of experiments involving various combinations of these genes. The chance of getting the entire result actually obtained (1) is the product of the chances for each individual in the counts having been what it was, the chance of an individual being a cross-over in the first distance being represented as p_1 , the chance for a cross-over in second distance as p_2 , etc. The problem then is to find values of p_1 , p_2 , etc., at which the chance of getting the entire result obtained is a maximum. The latter is maximum when its derivatives with respect to p_1 , p_2 , etc., are 0; also when these derivatives of its log = 0, which is a more practicable expression. Logarithmic derivatives of (1), equated to 0, are therefore to be solved for p_1 , p_2 , etc. This gives nonlinear equations (equations involving powers higher than the first of the variables p_1 , p_2 , etc.) but linear approximations may be obtained from these by expanding them according to Taylor's theorem, and using only those terms in the expansion which involve first or zero powers of p_1 , p_2 , etc; (higher powers become

negligible here on the assumption that real values of p are not very different from the experimental). The simultaneous linear equations thus obtained are:

$$\begin{aligned} a_{11} p_1 + a_{12} p_2 + a_{13} p_3 & \dots\dots\dots = b_1 \\ a_{21} p_1 + a_{22} p_2 + a_{23} p_3 & \dots\dots\dots = b_2 \\ a_{31} p_1 + a_{32} p_2 + a_{33} p_3 & \dots\dots\dots = b_3 \end{aligned}$$

where a_{11} is the sum of the values $\frac{(\text{total individuals})^2}{\text{crossovers} \times \text{non-crossovers}}$ to be obtained from all experiments in which the first distance, p_1 , or any distance that includes p_1 is studied, a_{12} (or a_{21}) is the sum of such values from those experiments in which the distance $p_1 + p_2$ or any distance including both p_1 and p_2 is studied, etc.; and b_1 is the sum of the values $\frac{(\text{total individuals})^2}{\text{non-crossovers}}$

from all experiments dealing with p_1 , or a distance that includes it, etc. The author applies this method to obtain the most probable chromosome map from certain results of Lancefield and Metz, and then calculates the accuracy of fit of the observed series of results to this map. The fit is fair, though not close,—doubtless owing to genetic or environic influences causing slight variations in frequency of crossing over.—*H. J. Muller.*

3177. FRECKMANN, W. *Pflanzenzüchtung und Moorkultur*. [Plant breeding and moor-culture.] Jour. Landw. 70: 109–116. 1922.—Cultivation of moors is regarded as necessary for German agricultural self-sufficiency. Several satisfactory varieties of potatoes and beets are cultivated on moors, but their development has not been due to plant breeders. Breeders should look to their further development and find suitable strains of rye, barley, legumes, and hemp.—*Helen D. Hill.*

3178. FRIMMEL, FRANZ. *Über die Vererbung der Fruchtgrösse der Tomaten*. [Inheritance of fruit size in tomatoes.] Zeitschr. Pflanzenzücht. 8: 457–462. 1922.—Size of fruit in tomatoes is a complex character depending upon number of carpels per fruit and size of individual carpels. Varieties (29) of tomatoes having an average fruit weight of 5–200 gm. were crossed with Burbank's Preserving, a small non-fasciated variety with an average fruit weight of less than 5 gm. Average weight of the hybrids varied from 16 to 25 gm. Fasciation, which is necessary for large fruits, appears to be recessive in these crosses. Heterosis in the hybrids was marked. Average yield per acre of the hybrids was greater than for standard varieties by more than 3000 pounds per acre. The author believes that this increase justifies crossing as a commercial practice.—*P. C. Mangelsdorf.*

3179. FRUWIRTH, C. *Handbuch der landwirtschaftlichen Pflanzenzüchtung*. Bd. I. Allgemeine Züchtungslehre der landwirtschaftlichen Kulturpflanzen. [Handbook of agricultural plant breeding. Vol. I. General principles for the breeding of agricultural plants.] 6th rev. ed., xviii + 443 p., 8 pl., 91 fig. Paul Parey: Berlin, 1922.—A comprehensive, general treatment of the theoretical principles of genetics and their application to plant breeding is given. The edition differs from the 5th only in scattered changes throughout the book.—*R. E. Clausen.*

3180. GAINES, E. F., and F. J. STEVENSON. *Rye-wheat and wheat-rye hybrids*. Jour. Heredity 13: 81–90. 4 fig. 1922.—This is the 1st record of a cross between *Secale* and *Triticum* in which rye was used as the female. Rosen rye was used as the female parent in crosses with Hybrid 128, Winter Fife, and Jenkin wheats; and as the pollen parent in a cross with Turkey wheat. In all crosses the hybrid offspring resembled the species of the female parent. The F_1 plants showed a high degree of sterility but some of the F_2 plants were fully fertile. *Tilletia Tritici* was found in the F_2 of both Hybrid 128 \times Rosen and Rosen \times Turkey. The results indicate an unusual recombination of chromatin as rye has 7 chromosomes while the wheats have 21.—*E. F. Gaines.*

3181. GARMAN, H., and H. H. JEWETT. *The white flies of hot houses*. *Asterochiton abutilonea* by H. Garman and *Asterochiton vaporariorum* by H. H. Jewett. Kentucky Agric. Exp.

Sta. Res. Bull. 241. 75-111. 10 fig. 1922.—A few observations are recorded on the life history and physical characters of *A. abutilonea* followed by a comprehensive life history study of *A. vaporariorum*. Tests of various insecticides for control are recorded. Fertilized and unfertilized females of *A. vaporariorum* show no appreciable difference in the number of eggs laid. Unfertilized eggs produce all males. Fertilized eggs do not produce all females, the proportions being nearly 40 per cent males and 60 per cent females. In one case of 818 adults collected in the greenhouse in May, 549 were females and 270 males. In March of the same year, of 362 adults collected 212 were males and 150 were females.—W. D. Valleau.

3182. GATENBY, J. BRONTÉ. Sex change in Mollusca. Nature 110: 544. 1922.—The author objects to Spärek's conclusion [see Bot. Absts. 12, Entry 3267] that the male stage in the oyster is due to low temperature. He cites observations on certain hermaphrodite Mollusca which seem to show that nutriment is a determining factor, and other observations which point to factors other than temperature and nutriment.—R. E. Clausen.

3183. GATES, R. RUGGLES. A new type of variability in plants. 2nd. Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 100-101. Williams & Wilkins Co.: Baltimore, 1923.—The current interpretation of size inheritance depends upon the assumption of several cumulative Mendelian factors for size, without dominance and with free distribution of the factors in the germ cells of hybrid generations. This conception has been applied to many cases of quantitative inheritance. It is at least possible, however, that the inheritance of repeated parts such as flowers and leaves may follow a different law from that of the inheritance of size or weight of the organism as a whole. In crosses between *Oenothera* species (*O. rubricalyx* and *O. biennis*) with large and small flowers the F_1 is intermediate in petal-length, while in later generations a wider range of variation occurs than in both parent species together, different lengths of petal occurring on the same plant and even sometimes in the same flower. Curves of variability show that these differences are partly inherited but without fixed units being involved. In later inbred generations the range of variation is progressively less, until the curve of variation resembles an ordinary fluctuation curve. This type of behavior is then intermediate between (1) fluctuation and (2) Mendelian inheritance. It may depend in part on mass segregations occurring in the cytoplasm, as contrasted with the segregation of chromosomes in the germ cells.—R. Ruggles Gates.

3184. GATES, R. R. Mutations and evolution. New Phytol. 19: 26-34, 64-88, 132-151, 172-188, 213-253. 1920.—The subject is discussed mainly from the point of view of *Oenothera* mutations.—I. Introduction. The modern Mendelian-mutationist's view of evolution is at best only a slight refinement of Darwinism. "When Darwin refers to individual differences it is usually clear that he is citing what we should now call small or parvigrade (Poulton) mutations. * * * It appears probable that the era of the vain search for a single evolutionary principle is now at an end. * * * Future advance in the understanding of evolution must then consist in the determination of the limitations of each factor."—II. Foundations of the mutation concept. Most conspicuous and most clearly understood types of *Oenothera* mutants are forms having 1 extra chromosome (e.g., *O. lata*). These, as well as certain triploid mutants (e.g., *O. semi-gigas*), never breed true and can only occupy a somewhat temporary and aberrant place in evolutionary descent. Tetraploid forms, however (e.g., *O. gigas*), breed true and evidently represent a condition of considerable evolutionary significance. The author recognizes that the most frequent type of mutation in most organisms is locus change. He discusses general characteristics of locus change; nature of "mass mutations;" origin of duplicate genes. Seeming infrequency of these simple Mendelian factor mutations in *Oenothera* is probably due to masking by lethal factors.—III. Forms having an extra chromosome. As regards 15-chromosome forms of *Oenothera*, several of the types have probably arisen from *O. Lamarckiana* as the result of different chromosomes becoming the extra one. Others, closely related to *O. lata*, probably have same extra chromosome. Differences between forms of the latter group are accounted for partly by presence of other mutational characters in addition to the extra chromosome, "and partly by fresh rearrangements of the 15 chromosomes."—IV. Non-

disjunction in *Drosophila*. Bridges' work on primary and secondary non-disjunction of X-chromosomes is considered in detail and attention called to the fact that in *Drosophila* and other animals individuals containing an extra chromosome show no external peculiarity, whereas in the 15-chromosome forms of *Oenothera* external characters are always directly affected.—V. Parallel mutations. Cases are discussed in *Oenothera* and in *Drosophila* (work of Metz) in which the same or similar mutations have originated independently in different species. "The evidence from these parallel mutations with similar linkage relationships shows that even the finer elements of the germplasm have maintained their relative positions and potentialities from species to species."—VI. Presumptive mutations in wild and cultivated plants. Mutation "is so common in flowering plants that it may be considered exceptional to find a species without any mutational varieties." Many examples are briefly described.—VII. Mutations in animals. Well known mutations in wild and domesticated forms are briefly described and discussed.—VIII. Limitations of the cell theory. Modern experimentalists tend to refute or ignore views of many paleontologists, anatomists, and others who deal with non-experimental data of evolution involving orthogenesis and inheritance of acquired characters. The author maintains both factors are necessary to account for evolution, and attempts to clarify the situation by distinguishing 2 general types of characters in higher organisms: (1) cell characters, or karyogenetic characters, which arise through mutation, are represented in every cell and are usually inherited as distinct units; (2) organism-as-a-whole characters, or organismal characters, which arise through impact of the environment or through orthogenesis, may apply only to localized portions in the life-cycle of the organism (show recapitulation), and "at first are not incorporated in the germplasm."—IX. The recapitulation theory. This principle, which is universally recognized, implies that at some stage in phylogeny an increase in the life-cycle took place by the addition of certain stages. This contrasts sharply with germinal (mutational) change, "which necessarily modifies every stage, at least internally as regards nuclear structure, but can hardly be held to * * * increase the number of stages in the life-cycle." Recapitulation implies inheritance of acquired characters. Applications of the principle in plant and animal kingdoms are discussed.—X. Inheritance of acquired characters. Recent experimental evidence is discussed and the point stressed that Neo-Lamarckian and mutation factors in evolution are not incompatible.—XI. General comparison of recapitulatory and karyogenetic characters. Cases in which mutational (karyogenetic) characters are superimposed on recapitulatory (organismal) characters are discussed. The latter always involve gradual adaptation to a new habitat, while the former do not. Mutational characters are stable from the outset, but fixation of organismal characters requires a number of generations; * * * in the process, altered metabolic products in the cytoplasm ultimately produce a modification of a chromatin element which is permanent in character."—XII. Orthogenetic characters. These stand midway between karyogenetic and organismal characters. Like the former, they are germinal in origin; and like the latter, they show recapitulation; but recapitulation is not adaptational. A bibliography of 187 titles is given.—*Merle C. Coulter*.

3185. GATES, R. R. Some points on the relation of cytology and genetics. Jour. Heredity 13: 75-76. 1922.—The author refers to certain points raised by E. Eleanor Carothers in a review of Sharp's Cytology, and points out that in many plants the search for chromosome tetrads is futile since they do not regularly occur. In *Oenothera* and *Lactuca* the heterotype division separates whole chromosomes. The only exception to this is that in *Lactuca* twisting of the chromosomes round each other occurs and apparently leads later to crossing over. There is definite evidence for this in *Lactuca*, but in *Oenothera* such twisting has never been seen and must be very rare if it occurs at all. Hence there is no known basis for genetical crossing over in *Oenothera* although there is clearly such a basis in *Lactuca*.—*R. R. Gates*.

3186. GHIGI, ALEXANDRE M. L'hybridisme dans la genèse des races domestiques d'oiseaux. [Hybridism in the origin of domestic races of birds.] Genetica 4: 364-374. 1922.—Crosses were made between different species of guinea-fowl, domestic poultry, pigeons, and geese. In most cases considerable difficulty was experienced in securing an F₂ generation as most of the hybrids appeared sterile. Both physiological and morphological causes are

thought to be responsible for the sterility. The races of domestic fowl are divided into 3 general types: (1) races somewhat similar in body type and producing white eggs; (2) races of variable body type and shape and producing brown eggs; (3) races developed from crosses of the first 2 types. Many characters were studied and cited to show the composite origin of modern races of fowls.—*F. A. Hays*.

3187. GOLDSMITH, WM. M. "The Catlin mark." *Jour. Heredity* 13: 67-71. 4 fig. 1922.—An account is given of the inheritance for 5 generations of a curious defect in the parietal bones of the skull. The defect varies in size from a hole 1 inch in diameter to a mere depression in the bone without a hole. The holes are larger during childhood than in later life. The defect causes only slight inconvenience and has no apparent effect on mentality.—*R. C. Cook*.

3188. GOUGH, G. C. Bud variation in potatoes. *Gard. Chron.* 71: 334. 1922.—Cases of a white variety throwing a colored tuber and *vice versa* are discussed and references and data on the subject from German literature are given.—*P. L. Ricker*.

3189. GOWEN, JOHN W. Report of progress on animal husbandry investigations in 1920. *Maine Agric. Exp. Sta. Bull.* 299. 85-120. Fig. 37-43. 1921.—The following subjects studied at the Maine Agricultural Experiment Station in 1920 are discussed: ability of different men to judge the dairy cow for milk yield; relative value of the 7-day and 365-day milk yield as a measure of the milking capacities of the cow; mean butter-fat yield of the different breeds and their advanced registry requirements; relation of twinning to age in dairy and beef cattle; progeny performances of Holstein-Friesian sires; inheritance of milk yield and butter-fat percentage as indicated by 1st-generation crosses; Mendelian experiment on the inheritance of milk yield and butter-fat percentage; the effect of modifying milk for butter-fat content on the content of the other solids.—*Sewall Wright*.

3190. GOWEN, JOHN W., and MILDRED R. COVELL. Studies in milk secretion. IX. On the performance of the progeny of Holstein-Friesian sires. *Maine Agric. Exp. Sta. Bull.* 300. 121-252. Fig. 44-45. 1921—Among 449 Holstein-Friesian bulls with 2 or more tested daughters in the advanced registry, the author finds that only 48 had daughters whose average was significantly above that of the breed and only 29 had daughters significantly below. He finds that the sires of high producers are slightly more inbred than the sires of low producers, but less inbred than a random group of sires. He concludes that inbreeding to the extent actually practiced is at least not detrimental. A study of the pedigrees of sires of high milkers, sires of low milkers, and random sires indicate that the appearance of an animal in a 4-generation pedigree gives no appreciable indication of true worth as a sire. Similar conclusions are reached with respect to butter-fat percentage. Tables are presented showing the records of sires in considerable detail.—*Sewall Wright*.

3191. GREENE, ELIZABETH. A study of 150 adolescent runaways. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 413-415. Williams & Wilkins Co.: Baltimore, 1923.—Among the so-called delinquent girls who pass through the Mental Clinic of the New York Probation and Protective Association the largest group is that of the runaways. This group is essentially interesting from a eugenical point of view but is by no means a homogeneous one. Within it are found true wanderers, hyperkinetics, and inadequates.—The statistical facts show a group of young girls, the oldest 23, the youngest 14, who left home for various reasons. The largest number have been factory workers, but they are by no means a defective group. Over $\frac{1}{2}$ fall into the normal or dull normal classes and about $\frac{1}{4}$ are defective. While only $\frac{1}{5}$ are foreign born, a very large group are the children of immigrants, in fact a much larger group than in the general population of New York State.—Most of these girls are adolescents, restless and impatient of authority; yet it seems fairly evident that their wanderings are more dependent upon inherited traits and individual characteristics than upon any other one cause.—*Elizabeth Greene*.

3192. GRIER, N. M. **Variation in the flower of the wild carrot.** (*Daucus Carota* L.) *Torrey* 22: 64-66. 1922.—Umbels of the wild carrot often show 1 or more purple central florets. Some report these florets always present; others that they occur in 50 per cent of the specimens. Actual count of 6148 specimens shows them present in 1609. The number of purple florets per umbel varies. No genetic studies of the material have been made.—*P. C. Mangelsdorf*.

3193. HARLAND, S. C. **Inheritance of certain characters in the cowpea** (*Vigna sinensis*). *Jour. Genetics* 12: 254. 1922.—Since the publication of his former paper [see *Bot. Absts.* 3, Entry 1003] the author has obtained from Vilmorin of Paris a cowpea with another type of seed-coat pattern; this type he designates "Very Small-eye." A cross of Small-eye (*dY*) by Very Small-eye (*Dy*) gave, in F_2 , a 9 : 3 : 4 ratio as follows: 9 *DY* (Watson) : 3 *dY* (Small-eye) : 3 *Dy* (Very Small-eye) : 1 *dy* (Very Small-eye). The Small-eye may be regarded as due to a factor *Y*, dominant to its absence. The factor *D* has no effect on seed-coat pattern except in the presence of *Y*, but is also a factor for dark flower color.—*H. N. Vinall*.

3194. HARRIS, J. A., and H. R. LEWIS. **The interrelationship of the egg records of various periods during the first and second year of the White Leghorn fowl.** *Poultry Sci.* 1: 97-107. 3 fig. 1922.—Two-year records on 443 Single Comb White Leghorns in the First International Egg Laying and Breeding Contest of Vineland, New Jersey, are studied. Comparison of correlation coefficients for monthly vs. annual record and for monthly vs. production for the remaining 11 months of the year in 2nd year records in general agrees with similar studies on pullet year records. Regression of annual production of the 2nd year on monthly production of the same year is roughly linear. Second year records may be predicted from 2nd year monthly records with about the same degree of accuracy as pullet year records may be predicted in the White Leghorns.—*F. A. Hays*.

3195. HAYDEN, C. C. **A case of twinning in dairy cattle.** *Jour. Heredity* 13: 22-24. 4 fig. 1922.—A Holstein cow bore 5 sets of twins and 2 singles, the latter females. Her daughter, sister, granddam, and great-granddam each bore 1 set of twins. Of the 9 sets 3 were males and 6 were male and free-martin.—*C. C. Hayden*.

3196. HAYS, F. A. **Inbreeding animals.** *Delaware Agric. Exp. Sta. Bull.* 123. 44 p., 9 fig. 1919.—Inbreeding Guernsey disclosed no appreciable relation between milk yield, or butter-fat, and the degree of inbreeding. The amount of May Rose breeding seemed to be a more important factor. Experiments in inbreeding swine (108 litters) indicated that inbreeding reduces the certainty of pregnancy, reduces size of litter, increases the death rate at all ages, and reduces the rate of gain after birth (but not birth weight) as compared with outbred or crossbred hogs.—*Sewall Wright*.

3197. HERWERDEN, M. A. VAN. [Dutch rev. of: JOLLOS, V. *Experimentelle Protistenstudien. I. Untersuchungen über Variabilität und Vererbung bei Infusorien.* (Experimental studies on Protista. I. Investigations on the variability and heredity of infusoria.) *Arch. Protistenk.* 43: 1-222. 1921.] *Genetica* 4: 468-470. 1922.

3198. HERWERDEN, M. A. VAN. [Dutch rev. of: MULLER, H. J. *Variation due to changes in the individual gene.* *Amer. Nat.* 56: 32-50. 1921.] *Genetica* 4: 474-475. 1922.

3199. HOLLAND, T. H., and M. K. BAMBER. **Rubber** (investigation at the Peradeniya Experiment Station, Ceylon.) *Tropic. Agric.* 58: 258-263. 1922.—In a study of individual rubber tree yield at the Experiment Station, Peradeniya, trees were grown from Tree No. 2 of Henaratgoda, which has given largest recorded yield of rubber in Ceylon. Ninety trees per acre were grown. Except for air and light, environmental conditions were very similar for all trees. The trees were divided into 4 classes, yielding respectively 5-6, 4-5, 3-4, and 2-3 pounds and containing respectively 7, 42, 76, and 36 trees. Girth was apparently correlated with

yield.—In a study of 2- and 3- day tapping trials percentages of yield of the alternate-day tapping blocks, which were obtained from blocks tapped every third day, decreased in proportion to the increased speed at which the alternate-day tapping reached the base of the tree.—The effect of different fertilizer treatments upon yield of rubber trees is given.—*Walter Scott Malloch.*

3200. HOLLE, G. L. J. *Zaadselectie bij Hevea.* [Seed selection in Hevea.] Arch. Rubbercult. Nederland.-Indië. 4: 392-396. 1920.—Seed from a number of trees of known yield were planted, and all daughter trees large enough tapped at the age of 4 years. Several mother trees of modest yield produced a considerable number of daughter trees of high yield and a number of mother trees of high yield produced daughters with small yields. Cross pollination is blamed for this condition and vegetative reproduction is recommended as a surer means of securing high-yielding trees.—*C. D. LaRue.*

3201. HOLMES, S. J., and J. C. GOFF. *The selective elimination of male infants under different environmental influences.* 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 233-251. Williams & Wilkins Co.: Baltimore, 1923.—More males than females die in the 1st year of life from nearly all causes. It was found that in countries in which the infant death rate has been reduced, the ratio of male deaths to female deaths increases. This ratio is higher in countries with low infant mortality than in those with high infant mortality. It is higher for legitimate than for illegitimate infants, and in the U. S. A. it is higher for infants of native-born parents than for those of foreign-born parents. It is much higher in whites than in negroes, and it has generally been higher in cities than in the country except in cases in which the rural infant mortality is greater than the urban. All those environmental conditions that decrease infant mortality increase the relative mortality of males as compared with that of females. On the other hand in passing to periods in the development of the individual in which infant mortality is high the ratio of male to female deaths increases. This ratio is higher in the 1st month than subsequently and gradually decreases through the succeeding months of the 1st year and the early years of childhood. It is especially high for still births and higher still for early abortions. These results point to a constitutional inferiority of the male sex that is greatest in early embryos and becomes relatively less in later development and in the years after birth. Natural selection discriminates against the male on the basis of his inherited constitution. But he "is suffered to continue in existence by virtue of a peculiar mechanism of sex determination which insures his continued production." "The way in which natural selection discriminates between the stronger and weaker sex gives us a clue as to how it acts as between the stronger and weaker members of the same sex. With a severe death rate doubtless more of the congenitally weak perish, just as more boys perish than girls under the same conditions. With a mild death rate, a death rate that results from removing, so far as possible, all the external causes of mortality, it is probable that in each sex the death rate is based more strictly on inherent differences of constitution, as it is in the case of the relative mortality of the two sexes. In relation to natural selection, we may say, then, that what the male is to the female, a congenitally weak infant of either sex is to a congenitally strong one of the same sex. If this is true, as infant mortality increases it eliminates a larger number of weaklings, but it becomes less stringently selective. It takes more of the relatively strong along with the weak. With fewer deaths there is less proportionate loss of the strong, and those who perish, despite the improvements of conditions of life, represent a group with relatively low congenital vigor."—*S. J. Holmes.*

3202. HUNT, HARRISON R. *Matrimonial views of college students.* Jour. Heredity 13: 14-21. 1922.—Unsigned questionnaires were returned properly filled out by 63 women and 265 men of the University of Mississippi, from which it is concluded that in general the attitude of the students is morally and eugenically good.—*R. C. Cook.*

3203. HURST, C. C. *The genetics of fecundity in the domestic hen.* 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 212-216. Williams &

Wilkins Co.: Baltimore, 1923.—The report includes 1882 pullet year records with White Wyandottes and White Leghorns. Five pairs of factors influencing fecundity are described: (1) *E*, a dominant factor for early sexual maturity; (2) *W*, a dominant factor for fast winter production; (3) *S*, a dominant factor for fast spring production; (4) *M*, a recessive factor for fast autumn production; (5) *H*, a recessive factor for non-broodiness.—Two pairs of factors affecting egg character are described: (1) *N*, a dominant factor for small egg weight; (2) *C*, a dominant factor for brown egg color. A gross divergence of less than 2 per cent from expected ratios is reported. No sex linkage was discovered in any of the factors.—*F. A. Hays*.

3204. HUTCHISON, C. B. **The linkage of certain aleurone and endosperm factors in maize and their relation to other linkage groups.** Cornell Agric. Exp. Sta. Mem. 60. 1421-1463. 1922.—Evidence is here presented showing the order of the known genes in 1 chromosome of maize to be *I-C-Sh-Wx* with a very close linkage between *I* and *C*. Tests of different members of the *I-C-Sh-Wx* chromosome group with 5 other recognized groups indicate that this group is independent of the others though with 2 of these there still remains a possibility that it lies in the end region of one or the other. Nine characters not identified with any group as yet were tested with the several members of the *I-C-Sh-Wx* group and found independent of it.—*J. H. Kempton*.

3205. IKENO, S. **Vererbungsversuche über die Blütenfarbe bei *Portulaca grandiflora*.** [Investigations on flower color in *Portulaca grandiflora*.] Zeitschr. Indukt. Abstamm.- u. Vererb. 29: 122-135. 1922.—This is a résumé of a paper appearing in Jour. Coll. Agric. Imp. Univ. Tokyo 8: Part 1. 1921.—In it are described crosses between plants having orange, yellow red, purple, and white flowers. Orange by white gives orange hybrids, which on selfing give 3 orange to 1 white. Orange by red gives red hybrids, which, when selfed, give 3 reds to 1 orange. Purple by red gives purple, and selfed gives 3 purple to 1 red. Purple by white gives purple hybrids segregating in the ratio of 9 purple: 3 orange: 4 white. Since this is a dihybrid ratio and reds are missing the author concludes that the factor modifying red to form purple is in the same chromosome as the one which modifies orange to form red. Subsequent cultures confirm this hypothesis and show a cross-over ratio of about 15 per cent. The author designates the described factors as follows; *CCrb rb gg* = orange; *CCGG rb rb* = yellow; *CCggRb Rb* = red; *CC gg RB RB* = purple. Four white genotypes are mentioned for 2 of which the following tested formulae are given: white I = *cc rb rb*; white II = *cc RB RB*. White I × orange gives orange which segregates into 3 orange: 1 white. White II × orange gives purple which segregates into 9 purple: 3 orange: 4 white. White III by orange gives orange which segregates into 9 orange; 3 pseudo-white: 4 white. White III and pseudo-white are still under investigation.—*Flora M. Scott*.

3206. JONES, D. F. **Selective fertilization and the rate of pollentube growth.** Biol. Bull. 43: 167-174. 2 fig. 1922.—The author has previously shown [see Bot. Absts. 6, Entry 1700] that in maize the plant's own pollen is somewhat more efficient in completing fertilization than pollen from plants of a somewhat different genotype, the superiority of self-fertilization being greater as germinal differences increase. He now demonstrates that this selective action is due in part, at least, to differences in rate of pollen-tube growth. All the silks of the ear were trimmed off to an even brush, and a mixture of own and foreign pollen applied, using reciprocal crosses as controls. Thus pollen-tubes would have to traverse a considerably greater distance to reach the lower ovules of the ear than the upper. This resulted in relatively fewer cross-fertilized seed near the base of the ear than near the tip, indicating that own pollen-tubes grow faster than foreign pollen-tubes. The author discusses additional evidence provided by the work of Miller, Balls, Heribert-Nilsson, and Correns. "The discrimination which works against the bringing together of individuals of unlike germplasm has been demonstrated by representatives of four distinct orders in the two main classes of angiosperms."—*Merle C. Coulter*.

3207. JONES, L. R., and J. C. WALKER. **Yellows—resistant cabbage varieties. Some necessary precautions for seedsmen to consider in the production and distribution of seeds of new special strains.** Seed World 13: 20–21. 1 fig. 1923.—This serious disease occurs in the central states from Kansas to New Jersey and as far north as central Wisconsin, southern Minnesota, and southern New York. Resistant plants are secured through mass selection from "sick" soil. A high degree of resistance may thus be acquired but it is never absolute; hence continued selection is necessary. Seedsmen are advised to secure stock seed from resistant "mother heads" and to confirm this resistance by trial on "sick" soil before placing such seed in a cabbage seed-growing locality, under proper isolation for 1 generation's increase. The increase crop of seed should be held over for 1 year and its resistant quality proved.—*J. A. Faris.*

3208. KAPPERT, H. [German rev. of: MOL, W. E. DE. **Over het voorkomen van heteroploide variëteiten van *Hyacinthus orientalis* L. in de Hollandsche kulturen.** (The occurrence of heteroploid varieties of *Hyacinthus orientalis* in Dutch cultures.) *Genetica* 3: 97–192. 1921 (see Bot. Absts. 10, Entry 1072).] *Zeitschr. Indukt. Abstamm.- u. Vererb.* 29: 138–139. 1922.

3209. KEITH, A. **Our nearest living relatives.** [Rev. of: GREGORY, WM. K. *The origin and evolution of the human dentition.* xviii + 548 p., 15 pl. Williams and Wilkins Co.: Baltimore, 1922.] *Nature* 110: 834–836. 1922.

3210. KEMPTON, J. H. **Linkage between brachysm and adherence in maize.** *Amer. Nat.* 56: 461–464. 1922.—The loci of the recessive genes for brachytic (short internodes), and for adherent grains, gave, in a progeny of nearly 400 plants from selfed ears, 22 per cent of crossing over. Over 500 plants resulting from a back cross gave, however, 30 per cent. In a 2nd experiment, with a larger number of plants from selfed ears, the crossing over was about 17 per cent.—*John Belling.*

3211. KIRCHNER, O. VON. **Über Selbstbestäubung bei den Orchideen.** [Self-pollination in orchids.] *Flora* 115: 103–129. 1922.—The extent and success of self-pollination is generally underestimated in accounts of orchids. The investigations of the author bring the list of species in which it may occur to 15 for European and 106 for foreign orchids. There are 10 types of orchid flower which permit or necessitate self-pollination. In the majority of cases it results in fertile seed.—*A. G. Stokey.*

3212. KLAPHAAK, PETER J., and H. H. BARTLETT. **A preliminary notice of genetical studies of resistance to mildew in *Oenothera*.** *Amer. Jour. Bot.* 9: 446–458. 1922.—In all 5 strains of *Oenothera* used the eggs differed from the sperms, the former being α gametes, the latter β gametes, except in a few rare cases when metacenic plants are produced. The factor for immunity (*I*) to *Erysiphe Polygoni* DC. is dominant; entering the zygote from either side, the plant produced is immune. The factor for susceptibility is designated by *i*. The genetic constitutions of the 5 strains, with regard to the factors for immunity and susceptibility, and their reactions to the mildew, are as follows: *O. pratincola* hyb. *immunis*, $\alpha i \beta I$, immune; *O. cinerescens*, $\alpha I \beta i$, immune; \times *O. mississippiensis* (called "Cartersville" by deVries), $\alpha i \beta i$, susceptible; "*O. biennis* Chicago" (a strain of *O. pratincola* used by deVries), $\alpha i \beta i$, susceptible; *O. pratincola* ("Lexington C") $\alpha i \beta i$, susceptible. These strains were self pollinated and all possible crosses between them were made. In every case the reaction of the hybrid to the mildew conformed exactly to expectation according to the formulation above, as: *O. pratincola* hyb. *immunis* \times *O. cinerescens*, $\alpha i \beta i$, susceptible. Of the total of 20 hybrids, 13 were susceptible, 3 had a single factor for immunity derived from the maternal parent, 3 had a single factor for immunity derived from the paternal parent, and 1 only had double immunity derived from both parents. Because of the peculiar type of heterogametism, immunity due to a single factor must breed as true as that due to a factor pair. The F_2 generation, by self pollination of the F_1 plants, was like that of the F_1 generation, as would be expected.—*Frieda Cobb Blanchard.*

3213. KIRCHNER, O. VON. Zur Selbstäubung der Orchidaceen. [Self-pollination in orchids.] Ber. Deutsch. Bot. Ges. 40: 317-321. 1922.—A study of living *Listera cordata* R. Br. discloses no self-pollination. The author's assumption concerning autogamy of *Liparis Loeselii* is confirmed. He also confirms H. Müller's notes on self-pollination in *Epipactis microphylla* Sw. Powdery character of pollen makes self-pollination possible. Nectar content and time of beginning of selfpollination distinguished the author's specimens from those described by H. Müller. The author's former notes on self-pollination in *Epipactis latifolia* All. var. *viridiflora* Irm. were opposed to H. Müller's description indicating no self-pollination. A recent description by Zimmermann indicates the possibility of regional differences perhaps of generic value.—Helen D. Hill.

3214. KOEHLER, OTTO. [German rev. of: COLLIER, W. A. Einführung in die Variationsstatistik, mit besonderer Berücksichtigung der Biologie. (Introduction to the statistical study of variation with special regard to biology.) 72 p., 8 fig. Julius Springer: Berlin, 1921.] Zeitschr. Indukt. Abstamm.- u. Vererb. 29: 199-200. 1922.—Koehler considers that Collier's book does not go far enough for geneticists accustomed to the use of biometric methods and deals too summarily with its subject for those who need an introduction to such methods. Its principal usefulness, he considers, is in its collection of formulae.—Sewall Wright.

3215. LAUGHLIN, H. H. Nativity of institutional inmates. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 402-406. Williams & Wilkins Co.: Baltimore, 1923.—This study is the result of a special institutional survey made of the state and federal custodial institutions for all types of the socially inadequate. There was allotted, for each nativity group, a quota based upon its total numbers in the population of the U. S. A. In summarizing the matter for all types of institutions, the following quota-fulfillments in custodial institutions are found: (1) native born, both parents native born, 89.08 per cent; (2) native born, 1 parent native born, 1 parent foreign born, 120.60 per cent; (3) Native born, both parents foreign born, 104.28 per cent; (4) Foreign born, both parents foreign born, 134.42 per cent. This seems to indicate that on the whole the recent immigration is not so sound as the older, and that in order to select immigrants of greatest value, it will be necessary to select on the basis of family stocks as well as individual merit.—Harry H. Laughlin.

3216. LAUGHLIN, H. H. Present status of eugenical sterilization in the United States. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 286-291. Williams & Wilkins Co.: Baltimore, 1923.—Fifteen states have enacted laws in reference to eugenical sterilization. The main theme of these statutes is eugenical rather than punitive. The individual laws vary greatly in the details and extent of applicability. The result is that several of the statutes were declared unconstitutional because running counter to certain provisions of the Bill of Rights. Others, more carefully drawn, were sustained by the courts, particularly when punishment was not involved. Prior to Jan. 1, 1921, thousands of persons had been legally sterilized under the laws in the several states, notably in California. Eugenical sterilization is shown to be legally possible, and its application awaits only the demand for and the enactment of suitable legislation. A descriptive and statistical chart is appended.—Harry H. Laughlin.

3217. LAUGHLIN, H. H. The science and the practical application of eugenics. Jour. Heredity 13: 93-96. 1 fig. 1922.—This paper sets forth the 2 phases of eugenics,—the science and the practical application. An outline is given of the present and, if current tendencies continue, of future coordination between the underlying principles of eugenics and its practical application by families and nations. A short history of Galton's coinage of the word 'eugenics' is included. There is given also an explanation of the diagrammatic scheme, showing the relation of eugenics to other sciences. This appears as an explanation of the text figure, which originally was printed on each certificate awarded to exhibitors by the Second International Congress of Eugenics. The paper concludes with an exposition of the likenesses and differences between plant and animal breeding on the one hand and eugenics on the other. It shows that

in both systems the underlying biological principles are the same, but that whereas in breeding plants and animals, mankind does not consider the elements of love, courtship, and fidelity; in eugenics, mate selection and elimination of defectives must observe the most considerate regard for morality and the highest social order. Research and education are the 2 keys to the science and practice of eugenics.—*H. H. Laughlin.*

3218. LÉCAILLON, A. Sur les caractères d'un hybride mâle provenant de l'union d'un Canard Pilet mâle (*Dafla acuta* L.) et d'un Canard sauvage femelle (*Anas boschas* L.). [Concerning the characters of a hybrid male resulting from the mating of a male pintail duck with a female wild duck.] *Compt. Rend. Acad. Sci. Paris* 174: 885-887. 1922.—The females of the 2 species are very similar, but the males are easily distinguished. The species can be crossed without difficulty. The male hybrid obtained in 1920 showed some male pintail, some wild male, and some intermediate characters, analogous to the results in a male hybrid of duck called "musqué" and Egyptian goose. The characters used were color, color pattern, and tail form.—*Helen D. Hill.*

3219. LEGRAND, LOUIS. A simple explanation of the hereditary mechanism. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 129-137, 3 diagr. Williams and Wilkins Co.: Baltimore, 1923.—An attempt is made to explain the constitution of the hereditary mechanism and its operation in development. A distinction is made between fixed characters, which are exhibited by all members of a species or larger group, and unfixed ones, which vary among individuals and from generation to generation. Fixed characters have their basis in the cytoplasm, unfixed in the nuclei. The unfixed plasmas (nuclei) are further subdivided into racial, ancestral, and individual portions, and their degree of fixity is supposed to depend upon the extent of the zone of contact with the cytoplasm. Latency and recessiveness are due to exclusion of elements from this zone, and sex depends upon the relative area of contact of female and male nuclear contributions. This organization of the cell is preserved throughout development, and the interactions "between both sorts of plasmas, their contacts, their mode of attraction and fixation, are therefore what constitutes life."—*R. E. Clausen.*

3220. LESAGE, PIERRE. Sur la persistance des caractères provoqués par la salure. [On the persistence of characters induced by saltiness.] *Compt. Rend. Acad. Sci. Paris* 176: 257-260. 1923.—Pot cultures of *Lepidium sativum* were grown continuously from 1911 to 1922, one series being watered continuously with normal water and the other with seawater. These were compared for height of plant, number and weight of seeds produced, shape of seed as obtained by dividing the length by the breadth, etc. The sea water cultures proved much less vigorous. A comparison, under uniform conditions from 1916 to 1921, was made of the check series and cultures obtained from sowing seed saved from the plants watered with salt water and also from seed saved from cultures 1 generation removed from the salt water treatment. There was a slight apparent persistence in the characters which appeared as a result of the salt water treatment.—*H. K. Hayes.*

3221. LEWIS, FREDERICK T. A note on symmetry as a factor in the evolution of plants and animals. *Amer. Nat.* 57: 5-41. 13 fig. 1923.—The author attempts to show that there is a special tendency to produce symmetrical forms in nature, and that departures from symmetry are perhaps transient phases destined to be replaced by some other type of symmetry. He discusses at length flora structure and deviations in *Campanula*, and concludes that the tricarpetate *Campanulas* are peculiarly variable on account of an imperfectly symmetrical arrangement and that the principal types centering around it represent attainments of more symmetrical and sometimes more stable forms, such as are seen in *Campanula medium*, *Platycodon*, *Canarina*, *Michauxia*, *Phyteuma*, and *Jasione*. He then discusses symmetry in the aortic arches, particularly on the basis of studies of sheep embryos made in collaboration with G. H. Jackson, Jr., which show that an early symmetrical arrangement is soon lost as development proceeds, and ultimately passes into a very different arrangement which is nearly sym-

metrical. Normal and variant conditions in other mammals are described, and the relation of veins to corresponding arteries is considered briefly. Probable trends of evolution on the basis of attainment of more symmetrical arrangements are pointed out. In the disposition of the principal viscera he shows that the adult condition is reached by a dextral rotation from an early bilateral condition. The general conclusion is reached that nature is ill at ease in the presence of asymmetry; and that when one condition of symmetry is lost, another may arise from it. In a postscript he contrasts his ideas with those of Conklin.—*R. E. Clausen.*

3222. LILLIE, FRANK R. **Supplementary notes on twins in cattle.** *Biol. Bull.* 44: 47-78. 13 fig. 1923.—Various points regarding the free-martin left somewhat indefinite in a former paper are here discussed in the light of additional data. (1) Two additional cases of 2-sexed twins where female is normal are described. In these there is no vascular anastomosis between chorions. (2) The sex-ratios of twins, counting free-martins as females, turns out to be essentially that of species, i.e., about 120 males to 100 females. (3) One case of possible monozygotic twinning was found. Only 1 corpus luteum was present, but there may have been 2 ova in 1 follicle. (4) The degree of modification of a free-martin is not in proportion to size of vascular connection, some of the smallest connections giving the largest modification, and vice versa; it is a case of an "all-or-none" reaction. (5) In a previous paper, seminal vesicles in foetal free-martins were overlooked [see *Bot. Absts.* 1, Entry 1260]. More careful dissection shows them to be almost always present. (6) The earliest stage of the free-martin which was found is 3.75 cm. long. It is already extensively modified and must have begun to change not later than at the 3.0 cm. stage. The earliest appearance of sex differentiation of testis is at 2.5 cm. stage. The onset of change in free-martin coincides closely with differentiation of testis of male twin. (7) A general discussion considers Minoura's experiments on fowls, Keller and Tandler's work on cattle and goat twins, Hartman's "reciprocal free-martins," and Doncaster's interpretation of tortoise-shell tomcat.—*H. H. Newman.*

3223. LITTLE, C. C. **The inheritance of a predisposition to cancer in man.** 2nd. Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 186-190. Williams & Wilkins Co.: Baltimore, 1923.—Tabulation of family histories on file at the Eugenics Record Office of the Carnegie Institution of Washington show that there is clear evidence for the inheritance of a predisposition to formation of "cancer" in man. For this analysis all types of malignant tumors are lumped together under the term "cancer." The influence of inheritance is shown by the occurrence of a marked excess of "cancerous" individuals, over rate of general population, in (1) sibs of "cancerous" individuals, (2) progeny of "cancerous" mothers by non-cancerous fathers, (3) progeny of non-cancerous mothers by "cancerous" fathers. The fact of inheritance is clear, but the type of inheritance needs further investigation. It does not appear to be simple Mendelian inheritance. This does not, however, preclude possibility that it will be found to be dependent upon multiple Mendelizing factors.—*C. C. Little.*

3224. LOTSY, J. P. **Interspecific sterility.** *Nature* 110: 843. 1922. Comment on Bateson's letter. [*Nature* 110: 76: 1922.]

3225. LUSH, JAY L. **Hereditary notch in the ears of Jersey cattle.** *Jour. Heredity* 13: 8-13. 9 pl. 1922.—A sire is reported with a peculiar notch in the under side of the ear, which looks like a "cropped ear," used by stockmen as a mark. Many of his calves are born with similarly notched ears; it is not known whether his sire or dam had this mark. The manner of inheritance indicates that it is a single dominant factor, independent of sex. The notches in the ears of the calves are of all sizes, from that of the sire's to a slight flattening of the lower side. The importance to genetics of studying non-economic characters is commented on.—*R. C. Cook.*

3226. McCLUNG, C. E. **Evolution of the chromosome complex.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 65-75. Williams & Wilkins Co.: Baltimore, 1923.—The author indicates that the chromosome theory of heredity now serves the biologist much as the atomic theory does the chemist. All facts bearing upon chromosomes are,

therefore, of great importance. He points out, accordingly, the significant facts derived from extensive studies by his students and himself upon most of the North American species of the orthopteran family Acrididae. The great precision and definiteness of chromosome organization in this group is indicated by the fact that a common number is almost universal. Apparent variations are explainable and serve only to strengthen the conception of constancy. From this it follows that the members of a complex in any species are individually homologous with those of any other, and that all have been derived by direct descent from earlier members of this ancient family.—Generic and specific differences of form, size, structure, and behavior are noted and confirm the theory of chromosome individuality. The significance of these facts in ontogenetic, phylogenetic, and taxonomic studies is indicated. An ultimate analysis of factorial differences upon a physiological basis is suggested.—*C. E. McClung.*

3227. MALLOCH, WALTER SCOTT. **Value of the hemp plant for investigating sex inheritance.** Jour. Heredity 13: 277-283. 1922.—Its relatively low chromosome number (10 haploid), ease of hybridization, large number of seed produced, adaptation to field and greenhouse conditions, and possibility of a large number of variations, suggest hemp as a plant particularly adapted for an investigation of sex inheritance. A simple leafed form and a sectorial chimera are described. Criticism is offered of Schaffner's explanation of sexuality in hemp.—*Walter Scott Malloch.*

3228. METZ, C. W. **Chromosome studies on the Diptera. IV. Incomplete synapsis of chromosomes in *Dasyllis grossa* Fabr.** Biol. Bull. 43: 253-266. 2 pl. 1922.—Cytological study of *Dasyllis* indicates that in the male, and perhaps in the female, 3 of the 5 pairs of chromosomes undergo synapsis only at their ends, the median portions not fusing at all during the growth stages. Possible bearing on cases of inherited decrease or absence of crossing over is discussed.—*A. H. Sturtevant.*

3229. MOORE, C. R. **On the physiological properties of the gonads as controllers of somatic and psychical characteristics: V. The effects of gonadectomy in the guinea pig, on growth, bone lengths, and weight of organs of internal secretion.** Biol. Bull. 43: 285-312. 1 fig. 1922. The author studied growth curves of normal males and females, castrated males, and spayed females. The animals were killed when 360 days old; thyroids, hypophysis, adrenals, and spleen were weighed, and femora, tibiae, and fibulae measured. For all characters studied there was sufficient variability within each series to show that small numbers of individuals cannot give reliable results. There was apparently a slight effect of gonadectomy on most of the characters studied; the only striking results were that gonadectomy causes a distinct decrease in weight of adrenals in both sexes, and a clear increase in bone length in females.—*A. H. Sturtevant.*

3230. MORGAN, T. H. **The bearing of Mendelism on the origin of species.** Sci. Monthly 16: 237-247. Illus. 1923.—In this general discussion of the evidence which genetics offers on the origin of species, the author points out that the species concept may in certain cases be incapable of genetic interpretation, and that different systems of classification may be desirable for taxonomists and evolutionists. He argues that the evidence of Mendelian inheritance in domesticated animals and plants, and the fact that mutant characters arising under observation obey Mendelian laws, indicate that mutants have furnished the basis for artificial selection. He states that mutants may give rise to minute differences as well as large ones and that the former, now accurately distinguishable by pedigree culture methods from non-heritable fluctuations, may provide the material for organic evolution. He calls attention to the multiple effects of changes in single genes and argues that the more deep seated physiological effects may be the basis of selection. The relatively trivial superficial characters associated with these changes are seized upon as species criteria by taxonomists. He rejects the view that mutations represent losses of germinal material, and that dominance relations are of vital significance in the interpretation of the evolutionary value of mutations. He shows that crossability and the sterility of interspecific hybrids may depend upon a variety of circum-

stances, that sterility of F_1 hybrids cannot be expected to arise in the manner stipulated by Bateson, "the production of an indubitably sterile hybrid from completely fertile parents, which have arisen under critical observation from a common origin," but that attention should be focused upon the origin of differences which tend to interfere with normal conjugation of chromosomes. He describes the evidence from parallel mutation in different species, and argues that it indicates that mutation is not wholly a random process.—*R. E. Clausen.*

3231. MULLER, H. J. **Mutation.** 2nd Internat. Congress Eugenics Vol. I. Eugenics, genetics and the family. 106-112. Williams & Wilkins Co.: Baltimore, 1923.—Since the theory was proposed by Muller (1917), and is being proved by Shull (1921), that so-called "mutations" in *Oenothera*, when not chromosome aberrations, are really cases of crossing over of genes linked with the balanced lethals there, it becomes necessary to rebuild the whole theory of mutation, discarding the ideas based on *Oenothera* work and founding the theory instead upon those cases in *Drosophila* and elsewhere which can be proved to consist of changes in the genes themselves. The newer data already give evidence of at least 14 proximate principles, which, taken collectively, may be considered to constitute the new theory of mutation: (1) most genes have an extremely high stability, probably greater than that of radium atoms; (2) certain genes, however, are vastly more mutable than others; (3) external agents cannot ordinarily increase mutability enough to cause obvious "production" of mutations; (4) losses of genes occur, but not all mutations are losses; (5) a given gene can mutate in different directions, and its different mutations may even affect different characters, but (6) its mutations occur preferentially, being oftener in certain directions and magnitudes; (7) its stability and preferential direction may become altered through mutation; (8) mutation usually occurs in only 1 kind of gene at a time, and (9) in only 1 allelomorph; (10) mutation may occur at almost any time during the life-history; (11) the mutant genes tend to be recessive; (12) most mutations are deleterious in their effects; (13) visible variations caused by mutation are oftener small than large, and the smaller changes usually have greater survival value; (14) most mutations produce changes either too small to be visible or too large to be viable.—It is especially important now to obtain data upon the rate and kinds of mutations, as affected by various internal and external conditions. Such data, obtained by Muller and Altenburg (1919, 1920) for *Drosophila* under normal conditions, already give results of interest for evolutionists and eugenists—indicating necessity of periodic inbreeding, accompanied by selection, to prevent permanent stoppage of evolution through accumulation of lethal factors.—*H. J. Muller.*

3232. MYERSON, A. **Inheritance of mental diseases.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 218-225. Williams & Wilkins Co.: Baltimore, 1923.—There is no such entity as insanity, and the various mental diseases have different biological relationships. Thus the important disease, general paresis, has the relationship of syphilis; the organic diseases of the brain, especially the important group due to arterial disease, have the relationship of arterio-sclerosis. There is much evidence to show that these diseases are as common in normal families as in the abnormal. The situation in regard to feeble-mindedness and epilepsy is exactly the same, i.e., there is no entity feeble-mindedness and no entity epilepsy. Each type of feeble-mindedness and each type of epilepsy has to be considered in its familial relationships by itself.—Certain types of mental diseases show interesting and important familial relationships. The paranoid diseases, dementia praecox and manic depressive insanity, occur frequently in members of the same family group. Cases are cited to show the transition in type of mental disease which occurs from generation to generation, and also to show the types of mental diseases that occur amongst brothers and sisters. Statistics are cited to show that certain types of mental disease such as dementia praecox tend more or less to eliminate themselves because of the great reduction in the marriage rate of the individuals suffering from these diseases. The author believes that in the mental diseases which run in families, heredity of the type involved in the color of hair and eyes is not present, a germplasm injury or deviation is operating, and the matter is one for clinical medicine rather than for statistician or the biologist.—*A. Myerson.*

3233. NACCARATI, SANTE. The morphologic characteristics of psychoneuroses. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 330-340. Williams & Wilkins Co.: Baltimore, 1923.—The author, following the methods of Viola in the differentiation of the morphologic types, has found that psychoneurotics are encountered more frequently among the 2 opposite types, viz., microsplanchnic and macrosplanchnic. Normosplanchnic individuals are less likely to become psychoneurotics if put under unfavorable environmental conditions. His study made on 100 Italian psychoneurotics has also shown that microsplanchnic subjects tend to develop the asthenic forms of psychoneurosis, whereas macrosplanchnics tend to develop the emotional types of psychoneurosis. From the eugenic point of view the author warns against marriage between individuals possessing the same morphological defects, as the offspring is likely to be neurotic. From the social and hygienic standpoint he warns individuals presenting macrosplanchny and microsplanchny in excess to avoid occupations and happenings requiring unusual mental and physical strain. This precaution might have reduced the number of so-called "functionally disabled" during the war.—*Sante Naccarati*.

3234. NACHTSHEIM, H. [German rev. of: (1) RIMSKY-KORSAKOW, M. *Beobachtungen über Variabilität und Vererbung bei den Schlupfwespen*. (Observations on variation and heredity in ichneumon flies.) Arb. Naturf. Ges. Petersburg 51: 89-111. 1920. (2) WHITING, P. W. (a) Rearing meal moths and parasitic wasps for experimental purposes. Jour. Heredity 12: 255-261. 1921. (b) Heredity in wasps. A study of heredity in a parthenogenetic insect, the parasitic wasp, *Hadrobracon*. Jour. Heredity 12: 262-266. 1921. (c) Sex-determination and biology of a parasitic wasp, *Hadrobracon brevicornis* (Wesmael). Biol. Bull. 34: 250-256. 1918. (See Bot. Absts. 1, Entry 53). (d) Studies on the parasitic wasp, *Hadrobracon brevicornis* (Wesmael). I. Genetics of an orange-eyed mutation and the production of mosaic males from fertilized eggs. Biol. Bull. 41: 42-54. 1921. (See Bot. Absts. 11, Entry 365). (e) Studies on the parasitic wasp, *Hadrobracon brevicornis* (Wesmael). II. A lethal factor linked with orange. Biol. Bull. 41: 153-155. 1921.] Zeitschr. Indukt. Abstamm.- u. Vererb. 29: 89-92. 1922.—Wing-length in *Prestwichia aquatica*,—an ichneumon the larvae of which parasitize eggs of the water beetle, *Dytiscus*,—is a sex limited character, being short in all males, but in females either long ("macropterous"), or short ("brachypterous"). The males arise from unfertilized eggs. It was found by Rinsky-Korsakow that macropterous P_1 females, crossed by males from brachypterous stock, yielded macropterous daughters. These F_1 females, back crossed to males from the recessive brachypterous stock, yielded macropterous and brachypterous female segregants; backcrossed to males from the dominant macropterous stock their daughters were all macropterous. The reciprocal P_1 cross yielded macropterous F_1 females, as expected, in 1 of the 5 attempted crosses, but in the 4 others brachypterous daughters appeared, which bred true to type. The exceptions are perhaps not surprising in view of the admitted difficulty of obtaining virgin females (copulation occurred within the *Dytiscus* egg and isolation of pupae was usually necessary). *Prestwichia solitaria* lays its eggs in Odonata eggs, is brachypterous, and, unlike *aquatica*, has no dark tip on the abdomen. Only 1 of 11 crosses with *P. aquatica* attempted by Rinsky-Korsakow succeeded. In this, a cross of *P. solitaria* ♀ by *P. aquatica* ♂, F_1 females were produced that possessed the instinct of laying in *Dytiscus* eggs, that had moderately long (variable) wings, and dark tipped abdomen. (The haploid brothers produced at the same time were of course light tipped, and, like all *Prestwichia* males, brachypterous.) The F_1 females, backcrossed to the recessive *P. aquatica*, yielded female segregants of the 2 opposite types with regard to laying habits, and also with regard to abdomen coloration, and having variable wing length. The F_1 females backcrossed to *P. solitaria* gave females showing only the characters of *P. solitaria*. The males from both backcrosses were of both dark and light tipped types.—The author reviews Whiting's experiments with the wasp *Hadrobracon brevicornis*, parasitic on the mealworm. The reviewer points out that this form is much more favorable for genetic work than *Prestwichia*, and says that he can fully corroborate Whiting's account of breeding methods, on the basis of his own experiments now under way. He describes breeding methods, influence of environment, sex-linkoid inheritance of orange eye (due to males arising from unfertilized eggs) and of the linked lethal factor, and mosaic males apparently arising from nonfusion of parental pronuclei.

He anticipates that further significant facts will soon be forthcoming in explanation of these "most unique hereditary relationships" existing in this "ideal object."—*H. J. Muller.*

3235. NICHOLSON, C. **Crimson cowslips.** *Gard. Chron.* 69: 301. 1921.—No reference is made in the text to crimson cowslips, but a discussion occurs of characters of hybrids, natural and artificial, between the cowslip, oxlip (*Primula elatior*), and wild *Primula*. Particular reference is made to caulescent forms.—*L. L. Burlingame.*

3236. NOYES, HILDA H., and GEORGE W. NOYES. **The Oneida Community experiment in stirpiculture.** 2nd Internat. Congress Eugenics Vol. I. Eugenics, genetics and the family. 374–386. Williams & Wilkins Co.: Baltimore, 1923.—Noyes first published his views regarding human "stirpiculture" in February, 1849. For 27 years after its foundation the Oneida Community could not undertake an experiment in scientific propagation, but in 1868 it found itself in a situation favorable for such an experiment. About 100 men and women took part, of whom 81 became parents. Fifty-eight living children were born. The Oneida Community was a product of successive selections, some of the resulting characteristics of the group being hardiness, longevity, native ability, faculty of agreement. The standard of character aimed at was one in which (1) the spiritual, (2) the intellectual, (3) the moral, and (4) the physical departments of human nature were developed to the fullest extent compatible with the above stated order of precedence. The experiment was directed by a Committee of "central members," Noyes himself exercising the preponderating influence. In a majority of cases application was made to the Committee by couples desiring to become parents, and the degree of selection exercised was considerable. The death-rate among the 81 selected parents was 22.5 per cent less than that of the group as a whole. The children received exceptional care, and at the reorganization of the Community as a joint-stock company on January 1, 1881, the women and children were amply provided for.—Some of the outstanding results of the experiment are (1) no mothers were lost during the experiment from causes directly or indirectly due to childbirth; (2) no deaf and dumb, blind, crippled, or idiotic children were born; (3) of the 58 stirpicultural children, born 1869–1879, 52 were living on September 26, 1921.—*H. H. Noyes and G. W. Noyes.*

3237. OCCHIALINII, ODDO. **Deux nouvelles variétés de Gardénia.** [Two new varieties of *Gardenia*.] *Rev. Hort.* 95: 274–276. 1923.—Two new varieties of *Gardenia* produced by Guido Mariotti, of Nervi (Italy), by artificial fertilization are minutely described. The noteworthy characteristics of each variety are emphasized and their flowers are illustrated.—*Richard Wellington.*

3238. OVEREEM, CASPAR VAN. **Über Formen mit abweichender Chromosomenzahl bei *Oenothera*.** [On *Oenotheras* with varying chromosome numbers.] *Beih. Bot. Centralbl.* Abt. I. 39: 1–80. 15 pl. 1922.—Reduction divisions in *Oenothera Lamarckiana semigigas* give fertile gametes only when 7 or 14 chromosomes are present. Variation in the normal chromosome numbers always gives variation in habit and structure and a definite form always carries the same chromosome number. Pollen of forms with 15 chromosomes is identical with that of the mother species since gametes with 8 chromosomes break down. Forms with varying chromosome numbers are the products of definite chromosome combinations. Variation in somatic counts was not found and fragmentation of chromosomes, if present, are believed to be artifacts. Although the chromosomes of *Oenothera* differ only slightly in form and size it is possible to detect differences. *O. Lamarckiana lata* shows unmistakable *gigas* characters in contrast to other forms with 15 chromosomes. *O. Lamarckiana gigas* is cytologically and anatomically a double *Lamarckiana*; it is not constant when selfed and its variation rests on a cytological basis. Hybrids of *gigas* are not uniform and as triploid forms are not constant. The appearance of 2 forms, *O. bienniformis* and *O. de Vriesii*, with typical *biennis* characters from a race of *Lamarckiana* gives a new argument for the theory of Davis that *O. Lamarckiana* of de Vries is a hybrid with some *biennis* form in its ancestry. Both of these forms are constant, although

complicated hybrids, and breed true because sterility, both zygotic and gametic, eliminates the possibility of variants from the types. A very full *Oenothera* bibliography is included.—*B. M. Davis.*

3239. [PALMER, E. F., Director.] [Plant breeding in] Rept. Hort. Exp. Sta. Vineland Sta. Ontario 1919: 8-22. 1921.—In the peach breeding work [PALMER, E. F., and F. S. REEVES p. 8-13] all of the earlier seedlings were rigidly culled and only the very best and most promising ones, constituting about 1 per cent of the total number, were retained for further study and possibly for distribution. Yellow flesh \times white flesh gives white flesh. Yellow flesh color is recessive. St. John, Fitzgerald, Elberta, Millionaire produce seedlings very true to type except in season of ripening and adhesion of flesh to stone. In this breeding work a large tent covering the entire tree was used. It was observed that cheese cloth gave better results than cotton fabric because it let in more light and air and yet was sufficiently dense to give a desirable shade or protection from the hot sun.—From the strawberry breeding work which involved several thousand individuals, 27 constitute the final selection and these will be further tested.—The raspberry and blackberry breeding work for 1919 consisted of selfing and crossing species and varieties and the taking of notes regarding the questions of self-fertility and self-sterility.—The cucumber breeding work is a continuation of previous efforts to secure a green house strain that will set a large number of fruits without the aid of artificial pollination. Three varieties, viz., Suttons Everyday, Princess and Davis Perfect were used in the parentage. A strain that seems very promising has been isolated and if by further testing this strain proves sufficiently profitable and stable it will be given to the public for a wider trial.—The sweet corn breeding has only recently been started. The experiment involves five garden varieties, viz., Golden Bantam, Charlevoit, Cooke, Stowells Evergreen and Black Mexican.—*L. R. Detjen.*

3240. PARHON, C. J., and C. [PARHON]. A pseudohermaphroditic cock. *Endocrinology* 6: 383-386. 1922.—A bird described as a hen that laid eggs and crowed but never brooded was autopsied. The plumage was female and the comb and wattles were male-type. An oval body somewhat lobulated was found on the right side at level of the genital glands. Its structure was testicular and active spermatogenesis was discovered. A tri-lobed body occupied the left side. This body resembled a testis in microscopic sections. Structures resembling the oviduct of a hen were found on both right and left sides. No ova were discovered. The adrenals were normal. The thymus was well developed. The thyroids were the size of a lentil. Broodiness is thought by these writers to depend on endocrine modifications.—*F. A. Hays.*

3241. PAYNE, F., and MARTHA DENNY. A gynandromorph in *Drosophila melanogaster*. *Amer. Nat.* 56: 383-384. 1922.—In the F_2 of a cross of a yellow white female by a garnet male appeared a mosaic individual with 1 garnet and 1 white eye. It was male throughout and fertile, and genetic tests proved that all its germ cells were white garnet. Two possible explanations are given: (1) the garnet eye was derived from a cell in which during somatogenesis the white gene either mutated to red or was lost or inactivated; (2) the mosaic individual was derived from a binucleated egg-cell fertilized by 2 Y-bearing sperm.—*Alexander Weinstein.*

3242. PEAKE, H. J. E. The study of man. *Nature* 110: 516-521. 1922.—The contrast is pointed out between the "evolutionary school" and the "historical school" of anthropology, both believing in evolution, but the latter assuming that a given culture complex evolves but once and is subsequently transmitted from one people to another. The modern tendency is not to assume an independent origin for any custom until it has been proved that such could not have been introduced from some other area.—An increasing interest of sociologists and economists in anthropology, which is defined as "the study of the origin and evolution of man and his works" and considered as a department of zoology, is noted. The ways in which backward peoples are studied have great value for the anthropologist. "The time seems to have arrived when anthropologists should not concentrate so exclusively upon these lowly cultures, but might carry on their researches into those civilizations which have advanced further in their evolution." Great need exists for anthropological studies in China, Japan,

and India. Such studies by Indian and British students would tend to lessen the gap between these 2 peoples. Evil results of lack of anthropological point of view are noted on both sides. A renewed plea is made for a full training in anthropology for candidates for the Indian civil service. The need for an institution in India, similar to those at Athens and Rome, for post graduate study in Indian problems, is pointed out. The urgency of the anthropological problems in the near East is emphasized, as also the value of anthropological factors in efforts towards mutual understanding in connection with the League of Nations and Versailles Treaty. There is also need for anthropological study of Christendom, including the British Isles. Much of the ill feeling engendered everywhere in the world is the product of misunderstanding due to a lack of the anthropological point of view.—*William K. Gregory.*

3243. POPENOE, PAUL. *Eugenics and Islam*. 2nd Internat. Congress Eugenics. Vol. II. *Eugenics in race and state*. 443-448. Williams & Wilkins Co.: Baltimore, 1923.—This paper discusses beliefs and practices of Arabs thought by the author to be of eugenic value. They include sound ideas of the importance of heredity and genealogy, consanguineous marriage, emphasis on necessity of marriage and parenthood, and subsidies distributed by religious foundations to the superior part of the population. On the dysgenic side, war, slavery with accompanying concubinage, and indiscriminate charity are mentioned. Polygamy is held to operate both eugenically and dysgenically.—*Paul Popenoe.*

3244. POPENOE, PAUL. *Twins raised apart*. Jour. Heredity 13: 142-144. 1 fig. 1922.—An account is given of the lives of 2 girls, evidently identical twins, who were separated at an early age. In his summary the author states that "When 2 individuals are separated in infancy, brought up as differently as were the twin sisters described above, and still manifest such mental similarities, it is impossible to resist the conclusion that the psychical make-up of the individual is very largely settled by the time he is born."—*R. C. Cook.*

3245. POPENOE, WILSON. *The tree Dahlia of Guatemala*. Jour. Heredity 11: 265-268. 1920.—Four types of tree Dahlias are found in Guatemala; single and double-flowered whites and single and double pinks are most common. Climatic conditions have hitherto restricted the growing of these plants to warmer regions. They are however so variable that the author thinks they would offer the nurseryman excellent material for experimental breeding. They attain a height of 15-18 feet and have beautiful flowers 4-5 inches in diameter.—*Edith Lang.*

3246. PRASAD, RAM. *Note on the probability of an inter-relation between the length of the stigma and that of the fibre in some forms of the genus Gossypium*. Agric. Res. Inst. Pusa Bull. 137. 7 p., 1 pl. 1922.—A yellow-flowered variety of cotton, improved by selection, was found to have become contaminated by accidental hybridization with a white-flowered variety having shorter fiber. Yellow being dominant, roguing on basis of petal color was impracticable. The presumable heterozygotes, having yellow flowers and short fiber, were found to have also shorter stigmas. Several varieties and strains of Asiatic and American cottons were then examined and a general correlation between varietal means for stigma length and fiber length was detected.—*T. H. Kearney.*

3247. PRING, G. H. *A new hybrid Nymphaea*. Ann. Missouri Bot. Gard. 9: 325-327. Pl. 20-22. 1922.—The new fertile hybrid named "Mrs. G. H. Pring," Pring was obtained from the cross *N. ovalifolia* × *N. "Mrs. Edwards Whitaker"*.—*J. Ben Hill.*

3248. REUTER, M. *Hermaphroditismus beim Wild*. [Hermaphroditism in game.] Zeitschr. Forst.- u. Jagdw. 53: 669-685. 1921.—A general discussion is presented amplified with examples of hermaphroditism in game animals and in feathered game.—*J. Roeser.*

3249. RICHMOND, I. J. *A. N. Jones—plant breeder*. Jour. Heredity 13: 103-107. 4 fig. 1922.—An account is given of the plant breeding work of A. N. Jones, Batavia, New York. The ancestry of many of Jones' wheat hybrids and a short note on his work in bean breeding

are included. Vegetative propagation of wheat by root separation was practiced by Jones to increase his stock of valuable forms. Thus, from a single grain planted in July, 1888, he harvested 27.5 pounds of wheat the following summer.—*R. C. Cook.*

3250. ROBBINS, RAINARD B. **Selection through the choice of seeds from dominant plants of an allogamous population.** *Genetics* 7: 508-512. 1922.—The author considers the problem of selection involved in choosing seed from plants showing a certain dominant character, while no effort is made to influence the source of pollen.—*Merle C. Coulter.*

3251. ROSANOFF, AARON J. **Inheritance of mental disorders.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 170-173. Williams & Wilkins Co.: Baltimore, 1923.—The following facts concerning the inheritance of mental disorders are considered: (1) heritable nature of certain mental disorders; (2) atavistic heredity; (3) dissimilar heredity; (4) constitutional mental disorders behave like Mendelian recessives in their manner of transmission by heredity; (5) clinically distinguished entities bear to one another and to normal mental states some sort of relationship, as shown particularly by so-called transitional, mixed, and borderline cases; (6) each clinical entity represents a mental trait or group of traits varying quantitatively within wide limits; (7) each seems to present possibilities of qualitative variation which has led clinicians to the conception of neuropathic equivalents; (8) each mental trait, as exhibited by the clinical entities, seems to present 2 aspects for consideration, a temperamental aspect, whereby it is qualitatively distinguishable from other traits, and an intellectual aspect, which is not specific for a given trait and which seems to vary only quantitatively. Some problems in eugenics in relation to mental disorders are briefly discussed. One of the most urgent tasks of fundamental research is judged to be the devising of methods for the more precise measurement of temperamental traits.—*Aaron J. Rosanoff.*

3252. SADLER, WILLIAM S. **Endocrines, defective germ-plasm, and hereditary defectiveness.** 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 341-350. Williams & Wilkins Co.: Baltimore, 1923.—The present status of opinion in America regarding the relative frequency of defective germ plasm and disturbances of the functions of the internal secretory glands as the cause of mental defectiveness, social delinquency, and certain of the insanities is discussed. Is dementia praecox an inheritance or an acquirement? The relation of this, the chief form of insanity, to disturbances of the endocrine system of the body is reviewed. A consideration is given as to what extent the dullards and backward children of this and the next generation may expect to find relief and help in the administration of hormones or ductless gland substances from the lower animals and to the fact that mental defectiveness and other hereditary abnormalities are so frequently associated with disfunction of some sort in the endocrine system. The author then treats of the relation of hormones in prenatal life to deformity and the possible inheritance of acquired characters, and a discussion of Guyer's recent work in this connection. Consideration is given to alcohol and syphilis in their possible rôle as racial poisons in relation to apparent inherent defectiveness. Suggestions are made for further research and experimental inquiry as to the rôle of the hormones of the endocrine system in relation to hereditary defectiveness.—*William S. Sadler.*

3253. SALAMAN, REDCLIFFE N. **The influence of size and character of seed on the yield of potatoes.** *Jour. Agric. Sci.* 12: 182-196. 1922.—Potato seed pieces of different sizes, (26, 12, 8, 6, 4, and 3 pieces per pound, mixed unselected, and pieces with outgrowths of various sizes), were planted on the checker-board system. The yield data are carefully analyzed, from which it is concluded that the total yield of potatoes varies directly with the weight of the seed piece. Seed pieces of 2 ounces in weight were the most remunerative. There is no correlation between the presence of secondary growth in the seed set, and the existence of the same in the resultant crop; in fact, some of the best results were obtained from sets with outgrowths. An inverse ratio between the size of the seed piece and the percentage of heavy tubers in the resultant crop was found; this, and the productivity of secondary growths, may be correlated with immaturity of the seed tubers.—*G. R. Bisby.*

3254. SANDSTEN, E. P., and C. M. TOMPKINS. **Degeneration in Colorado potatoes.** Colorado Agric. Exp. Sta. Bull. 278. 15 p., *illus.* 1922.—Plots of Russet Burbank and Brown Beauty varieties of potatoes were planted using best hand selected seed, best culls, and poorest culls, which gave, respectively the best average, the next best, and the worst yields. The authors state that degeneration in Colorado potatoes is caused primarily by lack of proper seed selection, and that "degeneration is not of a permanent nature." It is considered that deformed tubers derived from good stock will produce normal tubers under favorable conditions.—*G. R. Bisby.*

3255. SAUNDERS, E. R. **Address to the Botanical Section.** Rept. British Assoc. Adv. Sci. 1920: 169-190. 1920.—This address briefly reviews progress of genetics since Mendel, calling particular attention to: (a) Effects of numerous factors on same character. Under this head the writer cites her own work with stocks to show that hairiness depends on the simultaneous presence of at least 4 dominant factors, in the absence of any 1 of which the plant is glabrous. The obverse of this picture is presented by Nilsson-Ehle's discovery that the ligule in the oat is dependent on the presence of any 1 of 5 factors, the ligule being absent only when all 5 are recessive. (b) Effect of 1 factor on widely different characters of the organism. In support of this the speaker cites Heribert-Nilsson's willow crosses from which that author concluded that the specific differences depend on a very few factor differences but that each factor influences a number of characters, although perhaps the results might be said only to prove factor differences in a few pairs of chromosomes. In this connection it is also shown that in *Datura* so-called specific differences segregate in the same way in which varietal ones do in the cross between *D. Stramonium* and *D. Tatula*. (c) Linkage phenomena. Under this head are cited the case of linkage between the factor for plastic color in stocks with factors for sap color intensity and that of the linkage of the factors for flower color, standard form, and pollen shape in the sweet pea. Following this, mention is made of the phenomena of crossing over as exhibited in these plants. This leads the author into a discussion of some length as to the explanation of crossing over. She points out that if it could be shown that segregations take place at more than one time in the life history it would be possible to explain crossing over on the reduplication hypothesis, although she says nothing about how this might explain the original linkage. There follows a sympathetic outline of the chromosome theory of crossing over and linkage as presented by Morgan and his colleagues. She points out, however, that there are cases known in which the present theory is apparently inadequate. She cites the case of stock crosses involving the white-cream and single-double factor pairs in which hybrid plants produce no pollen carrying either of the dominant (white and single) factors. She inclines to reject Morgan's suggestion of lethal factors and to regard pre-meiotic segregation as a more probable hypothesis. The paper concludes with some observations on the relative share of nuclei and cytoplasm in the organic response to environmental stimuli during development.—*L. L. Burlingame.*

3256. SAX, KARL. **Sterility in wheat hybrids. II. Chromosome behavior in partially sterile hybrids.** Genetics 7: 513-552. 3 pl. 1922.—The chromosome numbers obtained by Sakamura [see Bot. Absts. 3, Entry 285] in root-tips were confirmed in pollen mother cells. In *Triticum monococcum*, 7 bivalents were found at the late prophase and metaphase of the 1st division. The attachment of the fibres was subterminal. In the pollen mother cells of *T. durum* and *T. polonicum* there were 14 bivalents. In *T. Spelta* and *T. vulgare*, 21 bivalents were seen before the 1st division. There was apparently little difference in the sizes of the individual chromosomes. Sakamura's count of *Secale cereale* was confirmed, 7 bivalents being noted. In the cross of *T. monococcum* by *T. turgidum*, at the 1st division, about 7 bivalents and approximately 7 univalents were seen, the latter usually at the poles. The univalents did not divide until the 2nd division; a result differing from that found in the crosses between wheat with 14 pairs and wheat with 21 pairs of chromosomes, in which Kihara's findings [see Bot. Absts. 2, Entry 946; 4, Entry 627] were confirmed, namely that the 7 univalents divide at the equator after the 14 bivalents have divided, and do not divide again. In the F_1 plants from the cross of wheat with 7 pairs and wheat with 14 pairs, only about 2-3 per cent of the pollen grains

appeared normal; while in the crosses of 14-pair by 21-pair wheat, about 80 per cent appeared perfect. The pollen-grains increase in volume in the uncrossed wheats, as the number of chromosomes increases; but usually in less than arithmetical proportion. The pollen size is much more variable in the F_1 of the cross between wheats with 14 and 21 pairs, than in crosses between species with the same number of chromosomes. In the F_1 of crosses, pollen, ovule, and embryo abortions are looked on as mainly due to harmful chromosome combinations. The greater sterility in certain F_2 plants is regarded as caused, in addition, by somatic weakness.—*John Belling.*

3257. SAX, KARL. Sterility in wheat hybrids. III. Endosperm development and F_2 sterility. *Genetics* 7: 553-558. 1922.—*Triticum durum* and *T. vulgare* were crossed both ways. The parent varieties had respectively 2.7 and 2.2 grains per spikelet; while the F_1 plants averaged 0.6 and 0.5 in the 2 crosses. The individual weights of the grains borne on the F_1 plants varied much more than did those of the parent plants. From a single F_1 plant, 78 grains germinated; but 17 of these seedlings failed to flower; and of the 61 plants which flowered, 14 set no grain. Only 1 (or 2) of these F_2 plants had as much fertility as the grandparents. The mean number of grains per spikelet in the 61 plants which flowered was 0.8, with a standard deviation of over 0.6. Among the 47 plants which set seed, there was about zero correlation between the weight of the grain from which a plant grew and the number of grains it produced per spikelet.—*John Belling.*

3258. SCHAFFNIT, E. Neuere Untersuchungen über die Brennfleckenkrankheit der Bohnen. [Recent investigations of the anthracnose of beans.] *Beitr. Pflanzenzücht.* 6: 25-34. 1922.—The author's observations on spore germination, appressoria formation, penetration of host, development of the pathogen within, and the effect upon the host tissues are presented. Cell changes following invasion involve enlargement of nucleus and nucleolus, and conversion of the chlorophyll to "phaophytin." The cytoplasm becomes granular and crumbly, but the starch remains unaltered. Paraphysis-like bodies distinct from spines were observed among the conidiophores. Weather and soil conditions as well as methods of planting favorable for the development and spread of the pathogen are pointed out. The greater prevalence of the disease on bush than on pole beans is due in part to greater humidity of air near the ground. Attempts are being made to breed a resistant erect type with fleshy tender pods containing white seed. Not much difference was observed in the amount of disease on inoculated plants fertilized with unbalanced solutions or when over-nourished or under-nourished with either nitrogen, phosphoric acid, or potassium, although there were considerable morphological and anatomical differences. Over-fertilizing with nitrogen aids the development of the fibrovascular bundles while under-feeding hinders it. The phloem develops strongly with potash over-feeding, weakly with under-feeding. Plants over-fertilized with phosphoric acid were injured by the treatment. There was a greater development of woodiness in the suture tissues of pods in case of plants over-fertilized with either nitrogen or potash as compared with those under-fertilized, while the reverse was true when phosphoric acid was used. It was found that infection and spore formation followed inoculation of susceptible varieties within 8 days while it took 30 days in case of resistant varieties. The starch in the cells of resistant and immune varieties is converted to sugar much more slowly than in susceptible ones. Hydrolysis of protein is accelerated through the action of the enzyme of expressed sap of susceptible beans. There is a correlation between the degree of resistance and the kinetic energy of catalase reaction. The curve of rapidity of action for very susceptible varieties is almost horizontal while for immune varieties it falls off rapidly. The curve for moderately susceptible ones lies between the 2.—*M. F. Barrus.*

3259. SCHULTZ, ADOLPH H. Zygodactyly and its inheritance. *Jour. Heredity* 13: 113-117. 4 fig., 3 charts. 1922.—Webbing between fingers and toes is called zygodactyly. It is normally present in early development and may in rare instances persist throughout life as a developmental arrest. In the foot the persistence of the webbing seems to occur always between the 2nd and 3rd toes. Skin-fusion between these toes is found in many marsupials and in the

Siamang apes. When present in man the tendon of the long extensor muscle for toes two and three is unsplit for an unusually long distance. In no zygodactyl family does the anomaly skip a generation. The chance for the female to transmit webbed toes is very much less than for the male, and female progeny in general is less apt to inherit zygodactyly than male progeny.—A. H. Schultz.

3260. SHAMEL, A. D. A bud variation of the Le Grande Manitou Dahlia. Jour. Heredity 10: 367-368. 1 fig. 1919.—The typical flowers of this Dahlia have white petals striped and speckled with violet. On 2 plants of this variety there have been produced self-colored violet flowers, having the number, shape, and size of the petals different from the typical flowers on the same plants.—Edith Lang.

3261. SHERWOOD, R. M. Correlation between external body characters and annual egg production in White Leghorn fowls. Texas Agric. Exp. Sta. Bull. 295. 12 p. 1922.—A study was made on 28 White Leghorn hens near the close of their first laying year. The correlation coefficients obtained follow:

Characters correlated	Correlation
Color of shanks—annual egg-production.....	-0.622 ± 0.037
Color of beak—annual egg-production.....	-0.603 ± 0.038
Pliability of pubic bones—annual egg-production.....	+0.472 ± 0.046
Handling qualities—annual egg-production.....	+0.431 ± 0.048
Number of primary wing feathers molted—annual egg-production.....	-0.522 ± 0.043
Body weight—annual egg-production.....	+0.009 ± 0.060
Width of pelvic arch—body weight.....	+0.216 ± 0.057
Width of pelvic arch—annual egg-production.....	+0.210 ± 0.057
Ratio of width of pelvic arch to weight—annual egg-production...	+0.178 ± 0.058
Capacity—body weight.....	+0.468 ± 0.047
Capacity—annual egg-production.....	+0.093 ± 0.059
Ratio of capacity to weight—annual egg-production.....	+0.100 ± 0.059
Depth of body—body weight.....	+0.645 ± 0.035
Depth of body—annual egg-production.....	+0.174 ± 0.058
Ratio of depth of body to weight—annual egg-production.....	+0.149 ± 0.058
Length of keel—body weight.....	+0.384 ± 0.051
Length of keel—annual egg-production.....	+0.208 ± 0.057
Ratio of length of keel to weight—annual egg-production.....	+0.120 ± 0.059

3262. SHULL, A. FRANKLIN. Sex determination in rotifers. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 138-141. Williams & Wilkins Co.: Baltimore, 1923.—The term "sex determination" as applied to factors affecting mode of reproduction in rotifers is justified, since sex in these animals is much more closely related to the life cycle than in aphids and Cladocera. Factors affecting life cycle, and hence sex, of rotifers are heredity, chemical substances, nutrition, and long-continued absence of bisexual reproduction. The effect on the life cycle is produced suddenly in the maturation of egg, but does not affect the chromosome number. The change is probably of a chemical nature, and may be merely 1 stage in a series of gradual changes. A metabolic theory may not be favored by results on rotifers, but is certainly not opposed by them. However, the author does not think of a critical change as occurring at a given "metabolic level," this expression being probably inapplicable to rotifers and perhaps representing unessential features in other animals.—A. Franklin Shull.

3263. SINOTO, YOSITO. On the nuclear divisions and partial sterility in *Oenothera Lamarckiana*, Ser. Bot. Mag. Tokyo 36: 92-98. 1922.—The studies were based on a culture derived from *O. Lamarckiana* now growing wild in Japan. Counts of more than 1,000 pollen mother-cells showed about 50 per cent with pairing of chromosomes or with regular nuclear plates.

This percentage is believed to correspond to the 50 per cent of perfect pollen grains. The following irregularities were noted in the distribution of chromosomes; 8+6 and 9+5 noted in both heterotypic and homotypic mitoses; division or fragmentation of the chromosomes on spindles suggesting degeneration; chromosomes in both divisions left outside of the anaphasic group either to degenerate or to form small extra nuclei; non-disjunction; more than 14 chromosomes occasionally formed in the heterotypic mitosis. He reports for somatic mitoses the segmentation of the spirem first into 7 sections and then the transverse division of each section to give the diploid number of 14 chromosomes which are thus held to be paired end to end. Seed germination occurred in about 35 per cent of the seed-like structures. Among the seedlings *albida*- and *oblonga*-like forms appeared and *nanella* was in high percentage.—*B. M. Davis.*

3264. SIRKS, M. J. [Dutch rev. of: LEHMANN, E. *Die Theorien der Oenotheraforschung. Grundlagen zur experimentellen Vererbungs- und Entwicklungslehre.* (Theory in Oenothera studies. Foundation for the experimental study of heredity and development.) 526 p. 207 fig. Gustav Fischer: Jena, 1922.] *Genetica* 4: 470-474. 1922.

3265. SIRKS, M. J. [Dutch rev. of: STOMPS, T. J. *De stoffelijke basis der erfelijkheid bij planten en dieren.* (The material basis of heredity in plants and animals.) 270 p., 24 fig. Erven F. Bohn: Haarlem, 1922 (see Bot. Absts. 12, Entry 420).] *Genetica* 4: 543-544. 1922.

3266. SIRKS, M. J. [Dutch rev. of: TSCHULOK, E. *Deszendenzlehre (Entwicklungslehre). Ein Lehrbuch auf historisch-kritischer Grundlage.* (The doctrine of descent (evolution). A text book on the historical critical basis.) 324 p. G. Fischer: Jena, 1922.] *Genetica* 4: 556. 1922.

3267. SPÄRCK, R. *The conditions of sex-change in the oyster (Ostrea edulis).* *Nature* 110: 480. 1922.—In the Limfjord, on account of lower temperature, attainment of sexual maturity is delayed and duration of male stage is prolonged beyond that found by Orton (see Bot. Absts. 12, Entry 1810). Duration of female stage is shortened and observations on marked specimens show that change from female to male condition may take place in less than a week. Decrease in number of oysters in northern stations is accounted for by effect of lower temperature on breeding.—*R. E. Clausen.*

3268. SPERLICH, A. [German rev. of: SPERLICH, ADOLPH. *Über phyletische Potenz. (On phyletic potency.)* Sitzungsber. Akad. Wiss. Wien [Math. Nat. Kl.] 128: 379-475. 4 pl., 4 fig. 1919.] *Zeitschr. Indukt. Abstamm.- u. Vererb.* 29: 93-96. 1922.

3269. TERRY, R. J., and LEE D. CADY. *Comparison of the incidence of the supracondyloid process in groups with normal and abnormal mentality.* 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 174-177. Williams & Wilkins Co.: Baltimore, 1923.—There are in the literature reports indicating a very much greater frequency of the variation known as the supracondyloid process of the humerus among insane people than in those of normal mentality. Results of recent studies in living subjects do not bear out this conclusion. The incidence of persons presenting a supracondyloid process of 3 mm. or more in height in 515 adult whites, apparently mentally normal, was 1.16 per cent; in 1,000 insane whites, 1.2 per cent for process 3 mm. or more in height. It is to be noted that the insane patients were taken at random and included a large number with no family history of insanity.—*R. J. Terry.*

3270. THAYER, PAUL. *A variation in the Downing gooseberry.* *Jour. Heredity* 13: 284. 1922.—Goosebeery plants were found in a Downing plantation in Ohio which differed from Downing in that the leaves were long and narrow instead of nearly as broad as long and the bushes completely or nearly barren. It is suggested that this variation may be due to an obscure disease or possibly is a spurious strain or variety like the off-type lemon trees found by Shamel.—*Richard Wellington.*

3271. TOWER, WILLIAM LAWRENCE. **Darwinism. An analysis by observation and experiment. A digest and preliminary statement of results.** *Genetica* 4: 417-442. 1922.—An account is given of several observations and experiments designed to determine whether those individuals which survive and reach maturity do so because they are superior to their fellows, as postulated by the hypothesis of natural selection, or because they chanced to fall under more favorable conditions of life. Studies of mimicry in Lepidoptera based upon 220 censuses of 10 plots in the valley of the Rio Motzorongo in Mexico in which 2,219,754 pairs of wings were obtained in an 8-year period showed that only 0.50 per cent of elimination was due to vertebrate predacious enemies which were assumed to act selectively, and that the percentage of elimination in model and mimic was the same. In the same collection of wings comparisons of eliminated members of species, supposedly protectively colored, with the non-eliminated individuals disclosed no difference between the 2 groups. Observations of habits of protectively colored species also failed to demonstrate that they make use of their protective resemblance as a means of concealment. Stocks of *Leptinotarsa panamensis*, a species the eggs of which have a very thin shell highly susceptible to desiccation, were taken from their normal habitat and transported to 13 stations selected for variation in moisture conditions. The beetles became established in moist stations, but failed in the drier ones because the eggs dried up; there was no evidence of differential survival. Seeds of *Solanum rostratum*, *S. Herthwigii*, and *S. lanceolatum* were sown on plots in the natural condition and on others prepared by removal of vegetation. Under natural conditions 10,335 seed out of 260,000 germinated; on prepared plots 228,742 out of 260,000 germinated. Populations of 4 species of beetles, *Leptinotarsa signaticollis*, *L. undecimlineata*, *L. diversa*, and *L. decemlineata*, were counted and separated in each case into 2 lots,—one returned to a plot in the natural condition for aestivation, the other to a finely spaded and prepared plot. Under favorable conditions 67,977 out of 86,070 survived; under natural conditions only 5,709 out of 86,070 survived. The author concludes that all these observations and experiments show that elimination under normal conditions is a function of chance position relative to eliminating forces and that there is no evidence of survival based upon adaptive characteristics.—*R. E. Clausen.*

3272. TRABUT, LOUIS. **Sur les origines du figuier.** [On the origin of the fig.] *Rev. Bot. Appl.* 2: 393-396. 1922.—There has been an uncertainty in regard to the native habitat of *Ficus Carica*, the generally admitted mother species of the cultivated fig. The author believes this species has been derived by the intercrossing of a rather large number of species. This hypothesis is based upon the fact that the flowers are fertilized indiscriminately by the insect *Blastophaga* and that innumerable cultivated varieties exist.—*Richard Wellington.*

3273. TRESIDDER, DONALD B. **Oestrus and fecundity in the guinea-pig.** *Amer. Nat.* 56: 347-359. 1922.—A dioestrus cycle every 16 days, with variations, continues throughout the year in non-pregnant female guinea-pigs. Copulation prolongs dioestrus in multiples of 15 days; underfeeding also prolongs it especially when it occurs late in the cycle. Sexual activity lasts 24 hours; the females usually mate most freely during the early part of the period, although the behavior varies. Macroscopical signs of heat are unreliable. Fall matings are most favorable, for which the males are partially responsible. Young females constantly with males were found to mate earlier than those isolated. Successful mating may occur 1-6 hours after parturition. The writer found the average number of fetuses per pregnancy to be 3. There is a close agreement between the number of corpora lutea in an ovary and the number of implantations in the corresponding horn of the uterus, although migration of ova and the absorption of embryos are not uncommon. The writer has found that palpating guinea-pigs reveals with certainty, (1) the number of embryos after the 15th day, and (2) the presence of large cystic ovaries.—*H. W. Feldman.*

3274. TURESSON, GÖTE. **The genotypical response of the plant species to the habitat.** *Hereditas* 3: 15-350. 79 fig. 1922.—Shade and sun forms, succulent and thin-leaved forms, inland and coastal forms, dwarf salt-marsh and taller lowland forms were grown in cultures under like conditions. If under like conditions they were identical, the differences found under various conditions were attributable to habitat. If, however, they still showed mor-

phological or habit differences, the different forms were crossed and the F_1 and F_2 generations studied. In this way it was possible to distinguish between mere habitat types and hereditary types. Records were made of character of leaf, of leaf margin, of inflorescence, of angle of stem, etc. In this study an attempt was made to ascertain whether the existence in nature of such forms is the result of an advantageous response on the part of the individual or whether these forms are brought into existence through a genotypical response of the species-population to definite habitat conditions." Shade and pasture forms of *Lysimachia vulgaris* were found to be only habitat forms, while the shade forms and pasture forms of *L. nummularia* remained distinct when grown in a similar environment. *Dactylis glomerata* var. *lobata*, the shade form, although resembling the sun form when grown together under identical conditions did not lose its distinctive character and is therefore regarded as an hereditary shade form and one not due entirely to environment.—A comparison was made of the salt marsh dwarf forms transferred and compared with the taller lowland form. *Aster tripolium* var. *diffusus* and the ordinary *A. tripolium* showed what seemed to be hereditary differences, although habitat modification was also shown. *Succisa pratensis* var. *nana* from the natural salt marshes seemed to be made up both of the hereditary dwarf form and of habitat dwarfs. *Centaurea jacea* var. *humilis* from salt meadows was made up of a heterogeneous assemblage of diverse, genetically different types. Habitat conditions in the salt meadows produce a dwarf growth and make the whole population appear homogeneous. A comparison was made of succulent and thin-leaved types. *Solanum dulcaria* showed hereditary differences of 3 distinct types. Various types of *Matricaria inodora*, *Leontodon autumnalis*, and *Melandrium rubrum* indicated heritable differences. The salt plants along the coast cannot be considered entirely facultative halophytes, but should be considered obligate halophytes. *Atriplex litorale*, *A. patulura*, *A. sarcophyllum*, *Armeria vulgaris*, and *Hieracium umbellatum* showed both modificatory and hereditary biotypes. There was ample evidence of hereditary differences in the different sets of individuals. In some cases the habitat types were more homogeneous in the field than in cultures. Cultures showed the degree of masking due to habitat. The habitat type, although it may appear as homogeneous, may be represented by many distinct genotypes. This supports the theory of Nägeli rather than Lamarek. The genotypic constitution of the plant is regarded as of primary importance. Where the habitat alternates sharply the type also alternates sharply. The morphological parallelism between the modification and the hereditary variation offers proof of control of environmental factors. Where a habitat, demanding dwarf forms, is inhabited largely by hereditary non-dwarf forms, no doubt would seem to remain as to the influence of habitat factors upon the genotypical composition of the species population in certain habitats. But in the majority of cases investigated not the habitat modifications but the corresponding hereditary type was found to populate the area. If organisms are able to respond rapidly to special demands the type showing habitat modification would be expected, but if only a limited degree of modification is possible hereditary habitat types would dominate. The factor which demands extreme modification in the habitat form may easily become a limiting factor for such forms, but would not operate as a limiting factor on the hereditary forms. If the term species is limited to the isolated units of hereditary forms the species lose one of the most characteristic qualities,—the ability to respond genotypically to a wide range of habitat. The Linnean species represents an ecological unit of great importance. In order to distinguish between ecological and purely genetical units the term "ecospecies" has been proposed to cover the Linnean species or genotype compounds as they are realized in nature. The total sum of possible combinations in a genotype compound may be termed a "coenospecies." When this is narrowed down by the ecological combination limits, it may be called an "ecospecies." The ecospecies are made up of habitat types, or what might be called varieties. These ecological subtypes may be termed ecotypes. It indicates the product arising as a result of the genotypical response of an ecospecies to a particular habitat. An ecospecies may populate many different habitats and produce many different ecotypes. The ecotype may in turn be made of "ecophenes" which represent each of the reaction types of the ecotype arising through the modifying influences of the combinations of extreme habitat factors given in nature. The genetical analogies of a cenospecies is a "genospecies," of an ecotype is a genotype and phenotype, and of an ecophene is a "genophene."—H. L. Shantz.

3277. VICARI, E. M. Hybridization and behavior. 2nd Internat. Congress Eugenics Vol. II. Eugenics in race and state. 75-77. Williams & Wilkins Co.: Baltimore, 1923.—This investigation deals with the inheritance of behavior traits from the genetic standpoint. Two homozygous races of mice were crossed: Japanese waltzing (inbred for 50 generations) and albino (inbred for 25 generations). The waltzers are very active due to their continual whirling habit; the albinos do not whirl and are more or less sluggish. The results are based on 45 Japs, 75 albinos, and 110 F₁ hybrids. In learning a simple maze problem the 2 parent races are somewhat similar with respect to (1) the number of perfect trials, (2) the number of consecutive perfect trials, (3) the average time per trial. Using the same apparatus and criterion of measurement the hybrids are neither like either parent nor intermediate between them; they are superior. This is shown in (1) the number of consecutive perfect trials, (2) the total number of perfect trials, (3) the length of time in going through the maze. The facts show that the phenomenon of heterosis may also be found in behavior traits.—E. M. Vicari.

3278. VUILLEMIN, PAUL. Disjonction et combinaison des caractères des parents dans un hybrid. [Segregation and combination of parent characters in a hybrid.] *Compt. Rend. Acad. Sci. Paris* 175: 353-355. 1922.—Hybrids from a cross between a 5-spurred and a spurless *Aquilegia* show the dominance of the spur character. The influence of the recessive character was measured by the decrease in the number of spurs on the flowers of each succeeding generation. Two factors modify the type of flowers: (1) segregation of characters transmitted by the parents; (2) increasing the combination of characters. The combination of dominant and recessive characters is emphasized by the increasing preponderance of flowers with 3 spurs.—H. C. McPhee.

3279. WAGENSEIL, F. [German rev. of: KLATT, B. *Mendelismus, Domestikation und Kraniologie*. Mendelism, domestication, and cranology. *Arch. Anthropol.* 18: 225-250. 4 fig. 1920.] *Zeitschr. Indukt. Abstamm.- u. Vererb.* 29: 213. 1922.

3280. WALTER, H. E. *Genetics: an introduction to the study of heredity*. Rev. ed., xvi + 354 p., 92 fig., 6 diagr. Macmillan Co.: New York and London, 1922.—His text book is designed to present the salient points of genetics in an elementary manner. The general plan in the revised edition remains the same as in the 1st edition, but the subject matter has been worked over to bring in recent advances in genetics. The revised edition is divided into 15 chapters, instead of 12; the subject matter has been enlarged from 262 to 336 pages; and the number of figures increased from 72 to 92. The revised edition opens with a general orientation which is followed by a discussion of variation. A treatment of the origin of heritable differences then leads to a prolonged discussion of the inheritance of acquired characters. The author concludes this discussion with the same statement as in his previous edition, that the weight of evidence is against belief in the inheritance of acquired characters. Mendelism is next considered; independent unit characters, segregation, and dominance are characterized as the trinity of Mendelian principles. In the chapter on pure lines and selection the results of numerous selection experiments are described and in the next chapter on the factor hypothesis the conclusion is reached that selection is effective (1) by isolation of pure lines; (2) by elimination or addition of modifying genes; and (3) by mutation of genes. Blending inheritance is developed as an expression of the action of multiple factors. The following chapter discusses atavism and reversion, and methods of animal and plant breeding. The chapter on the carriers of the heritage is shifted from 2nd to 10th place in the revised edition. It is followed

by a chapter on the architecture of the germplasm which is new and which gives a brief account of the *Drosophila* investigations. At this point another new chapter on somatogenesis, "the hereditary tunnel," is inserted in which the main features of development are set forth. The chapter on sex determination has been rewritten and enlarged. The book closes with chapters on the application to man and human conservation. A list of books and recent general works is included.—*R. E. Clausen.*

3281. WEATHERWAX, PAUL. **A rare carbohydrate in waxy maize.** *Genetics* 7: 568–572. 1922.—The endosperm of the Chinese waxy type of maize has been shown to consist entirely of a hitherto rare and ephemeral carbohydrate, erythrodextrin, a dextrin which stains red with iodine. The value of this discovery in the genetic analysis of this character is pointed out and the further suggestion is advanced that a consideration of the fundamental physical and chemical nature of the endosperm of sweet corn would harmonize the somewhat divergent views of maize inheritance now in existence. The Asiatic distribution of the cereals having the carbohydrate erythrodextrin is noted, but no significance is attached to this fact.—*J. H. Kempton.*

3282. WHITING, P. W. **Heredity in the honey bee.** *Jour. Heredity* 13: 2–8. 3 pl. 1922.—Inheritance in the honey bee is recognized as of crisscross type due to the fact that drones arise from unfertilized eggs and thus inherit maternal characters only. The 3 castes, workers, queens, and drones, are strikingly different from each other. Queens and drones show degeneration of worker instincts, due to "parasitic life on worker colony." Great specialization of the 3 casts is noted, and the problems of heredity involved in the inheritance of these differences are discussed from the point of view of genetics, phylogeny, and physiology. Determination of sex is not due to the source of the germinal material, but to its quantity,—a simplex genetic assortment producing a male, a duplex assortment a female, either a queen or worker, depending on the feeding. The high specialization of the honey bee colony has made for greater efficiency.—*R. C. Cook.*

3283. WHITING, P. W. **The analysis of genetic differences through haploid parthenogenesis.** 2nd Internat. Congress Eugenics Vol. I. Eugenics, genetics and the family. 102–105. Williams & Wilkins Co.: Baltimore, 1923.—The parasitic wasp, *Hadrobracon*, reproduces males by haploid parthenogenesis, produces females sexually; also virgin females produce only males. These latter occur in a 1:1 ratio from a heterozygous mother. A variation affecting venation has its genetic basis in a single Mendelian difference, but its appearance depends upon temperature, food, and chance conditions of growth. One stock, unaffected by 8 generations of selection, shows the variation in 93 per cent of individuals. Another shows it in practically none, while there are indications that it is possible to isolate another stock with less than 1 per cent showing variation. A system of inbreeding and crossing to type stock, tests genetic constitution of each male whatever his apparent character. This system should eliminate all differences from type except the one under consideration. A sexual generation, resulting from a cross to type stock, is alternated with a parthenogenetic generation showing segregation. From the results of this type of analysis the theory is advanced, although not as yet entirely demonstrated, that whether a genetic character difference from type appears in all of the individuals possessing the genetic potentiality of showing it or in a very high ratio of the individuals or even in less than 1 per cent, the factorial basis may be a single Mendelian unit.—*P. W. Whiting.*

3284. WIELENSIEK, S. J. [Dutch rev. of: SALAMAN, R. N., and J. W. LESLEY. **Some information on the heredity of immunity from wart disease.** Rept. Internat. Potato Conference 1921: 105–111. 1922 (see Bot. Absts. 11, Entry 2899).] *Genetica* 4: 541–542. 1922.

3285. WRIGHT, SEWALL. **Another pedigree of webbed toes.** *Jour. Heredity* 13: 118. 1922.—A pedigree submitted by Dr. Ira S. Wile is presented in which the mode of inheritance is evidently as a dominant unit, with no relation to sex. Other pedigrees have been presented

in the Journal of Heredity in which inheritance of the character corresponds exactly with the transmission of the Y-chromosome. It is not especially surprising that the webbing is inherited differently in different families. Night-blindness, for instance, is a sex-linked factor in some families, and a simple dominant in others.—*R. C. Cook.*

3286. WRIGHT, SEWALL. The effects of inbreeding and crossbreeding on guinea pigs. III. Crosses between highly inbred families. U. S. Dept. Agric. Bull. 1121. 61 p., 27 fig. 1922.—Experiments for 15 years on the effects of inbreeding on guinea pigs include: the records of 23 inbred families, each descended from an original pair (over 25,000 animals); a control stock in which inbreeding was avoided (over 4,000 animals); and crosses among the inbred families (nearly 5,000 animals). Inbreeding has been carried on for over 20 generations, without obvious degeneration. On the average a decline in all the elements of vigor has occurred. A conspicuous differentiation among families has been brought to light and increased by inbreeding. Crosses between the inbred families involve: (1) first crosses between different families; (2) progeny of a first cross mated with others of a different cross; (3) brother-sister matings of crossbreds; (4) brother-sister matings continued to 2nd generation; (5) inbred females mated with unrelated crossbred males; (6) crossbred females mated with unrelated inbred males; (7) heavy animals from crossbreds selected and inbred; (8) animals from large litters mated. Seasonal fluctuations were corrected for, by comparing the average of each experiment, for the entire period in which it was maintained, with the estimated record of the total inbred stock produced simultaneously. "Crosses between different inbred families have resulted in a marked improvement over both parental stocks in every respect, due allowance having been made for the effects of size of litter on the other characters. This improvement appears to its full extent in the progeny of the first cross, in the case of adult weight (about 12 per cent) and resistance to tuberculosis (about 20 per cent). The mortality between birth and weaning is found to depend about three-fourths on the breeding of the young and one-fourth on that of the dam. There is thus a marked improvement in the first cross (about 11 per cent) in spite of the inbred dam, but there is some additional advance in the progeny of a crossbred dam with an unrelated male. In the rate of gain between birth and weaning, the breeding of the dam and of the young are about equally important. An improvement of about 16 per cent was obtained in this respect. Birth weight depends largely on the dam—about three-fourths—and only one-fourth on the breeding of the young. There is thus only a slight improvement before the second generation in which it amounted to some 9 per cent. The mortality at birth is almost wholly a maternal affair. Crossbreeding of the dam adds about 7 per cent to the chances of the young. The heredity of the young also counts for nothing in frequency or size of litter. The sire is somewhat more responsible than the dam in the former case; the dam seems to be wholly responsible in the latter. Frequency of litter was increased over 30 per cent and size of litter over 10 per cent when both sire and dam were crossbred." "Analysis of the various crosses, indicates that the results are all the direct or indirect consequence of the Mendelian mechanism of heredity. The fundamental effect of inbreeding is the automatic increase in homozygosis in all respects. An average decline in vigor is the consequence of the observed fact that recessive factors, more extensively brought into expression by an increase in homozygosis, are more likely to be deleterious than are their dominant allelomorphs. The differentiation among the families is due to the chance fixation of different combinations of the factors present in the original heterozygous stock. Crossing results in improvement because each family in general supplies some dominant factors lacking in the others. Dominance or even imperfect dominance in each unit character is built up into a pronounced improvement over both parent stocks in the complex characters actually observed. A certain portion of the increase in vigor of the first cross between inbred families is maintained on resuming random mating." The writer points to important application of inbreeding, followed by cross-breeding and resumed inbreeding, in the improvement of livestock. Progress by ordinary selection of individuals is very slow, because environment is relatively more important in determining the individuality of the animal, in economic characters, such as growth, fertility, and disease resistance.—*H. W. Feldman.*

3287. WRIGHT, SEWALL. **The effects of inbreeding on guinea-pigs.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 266-269. Williams & Wilkins Co.: Baltimore, 1923.—In experiments involving over 35,000 guinea-pigs it has been found that inbreeding has resulted in a decline in the average vigor in every respect studied, including frequency and size of litters, growth from birth to maturity, mortality at birth and later, and resistance to tuberculosis. Certain families, however, have remained vigorous after more than 20 generations of brother-sister mating. There has been a marked genetic differentiation. In general, a particular combination of vigor in some respects, with weakness in others, has become characteristic of each of 23 families. There is no correlation between the standing of a family in one respect and in others. On crossing 2 families, there is marked improvement in every respect either in the 1st or 2nd generation, depending on how far the character pertains to the young and how far to the dam or sire. The results are shown to be in accord with the Mendelian theory of inbreeding.—*Sewall Wright*.

3288. WOLLENWEBER, H. W. **Die verschiedenen Methoden der Kartoffelzüchtung unter Berücksichtigung der Krankheitsforschung.** [The different methods of potato breeding in connection with disease investigations.] Beitr. Pflanzenzücht. 6: 35-44. 1922.—Potato culture may be divided into 5 periods: (1) introduction during the 16th century; (2) dissemination and development as a field crop up to and including the 17th century; (3) describing varieties and selecting against disease, 1776-1819; (4) introducing better varieties, investigating diseases and beginning of crossing, first half of 19th century; (5) developing, distributing, breeding, and selecting disease resistant strains, second half of 19th century. Methods being used for potato improvement are selection, cross breeding, and introduction from other countries. Qualities sought are freedom from disease, adaptability to soil and climate, yield, starch content, keeping quality in storage, and special time of ripening. Qualities of the tubers depend upon size, shape, color of flesh, number and prominence of eyes. Very little has been written regarding methods of cross pollinating. The author briefly describes his method and mentions the difficulties connected with it. Besides the technique of cross breeding, the worker must be intimately acquainted with the diseases. A large number of interesting problems are suggested for the breeder of disease-resistant varieties of potatoes.—*Charles Chupp*.

3290. ZELENY, CHARLES. **Reverse mutation.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 113-114. Williams & Wilkins Co.: Baltimore, 1923.—Reverse mutations in bar series of multiple allelomorphs of *Drosophila* are more frequent than original ones. This frequency is not due to recent origin. The large shift from ultra-bar to full is as frequent as smaller shifts from bar to full and ultra-bar to bar. Direction of selection is not a factor. Mutations occur in germ plasms of both males and females and are not confined to a single period. The different components of the bar series are definite entities. They do not grade into one another and their origin is not a factor in their behavior.—*Charles Zeleny*.

3297. ARISZ, W. H. Over den invloed van zwaar tappen op de chemische samenstelling van de latex. [The influence of severe tapping on the chemical constitution of latex.] Arch. Rubbercult. Nederland.-Indië 4: 27-29. 1920.—Trees of *Hevea brasiliensis* were severely tapped with the following results: (1) The ratio of resinous substances to rubber remained unchanged; (2) For the 1st fortnight the concentration of organic substances in the serum was unchanged, then the amount of organic substances decreased; (3) At first, the content of nitrogenous substances was unchanged, later it decreased by as much as 50 per cent; (4) The concentration of inorganic substances in the serum remained practically constant.—C. D. LaRue.

3298. BARSS, A. F. Biochemical problems in agriculture with special references to fruit. Sci. Agric. 3: 100-104. 1922.—A plea is made for more exact and searching methods of research in fruits to include physiological and genetical studies as opposed to the ordinary field experiments. A few of the more important problems requiring study are outlined.—T. G. Major.

3299. BARTLETT, R. G. Picking, grading, and packing bananas. Agric. Gaz. New South Wales 33: 897-899. 1922.

3300. BEVAN, W. Olive trees in the forests. Cyprus Agric. Jour. 17: 64. 1922.—From the Aetomouti and Carpass forests of Cyprus during the past 21 years 780,861 wild olive trees have been transplanted into olive orchards and budded with scions of desirable cultivated varieties.—Wm. Stuart.

3301. BOBILIOFF, W. De reactie van *Hevea* latex. [The reaction of *Hevea* latex.] Arch. Rubbercult. Nederland.-Indië 3: 408-410. 1919.—Latex from many trees of various ages was examined. The latex of *Hevea* generally gives an alkaline reaction. Very few trees have neutral latex.—Carl D. LaRue.

3302. BOBILIOFF, W. Over de correlatie tusschen de productie en het aantal rijen der melksapvaten in den bast van *Hevea brasiliensis*. [The correlation between production and the number of rows of latex-vessels in the bark of *Hevea brasiliensis*.] Arch. Rubbercult.

Nederland-Indië 4: 383-390. 1920.—The coefficient of correlation between yield of rubber and the number of rows of latex vessels in the bark is found by the author to be 0.55 ± 0.051 . Data from 491 trees were used in the computation.—C. D. LaRue.

3303. BOBILIOFF, W. Over den oorsprong van het melksap van *Hevea brasiliensis* on grond van proeven met geringde boomen. [The origin of the latex of *Hevea brasiliensis* as indicated by experiments with ringed trees.] Arch. Rubbercult. Nederland-Indië 4: 221-234. 1920.—When trees are girdled just above the ground a small decrease in yield is noted for a time, but later an increase is observed. This indicates that the main portion of the latex is derived from the trunk, not from the roots. The increase observed is probably due to cutting off the flow of food to the roots. Trees girdled above the tapping area show a decrease in yield. Trees girdled both at the root crown and above the tapping area show a much greater decrease in yield than when girdled above only. Pollarded trees show a still greater diminution in yield. The fact that a tree may continue to give a high yield of latex when all communication between the latex vessels of the trunk and those of the roots are interrupted is taken as an indication that in budded trees the stock will not influence the scion so far as yield is concerned.—C. D. LaRue.

3304. BUCK, F. E. Plant breeding problems as related to horticulture. Sci. Agric. 3: 86-92. 1922.—This is a discussion of the breeding work being carried out in British Columbia on strawberries, raspberries, pears, tomatoes, peas, kale, broccoli, globe artichoke, flowers, and lawn grasses. The strictly "research" phase of horticultural experimentation is also treated in a general way.—T. G. Major.

3305. CAMPBELL, J. A. Lemon culture. New Zealand Jour. Agric. 24: 205-210. 1 fig. 1922.—The importance of careful handling and marketing are discussed. Suggestions from a large California grower are given under the following headings: Varieties, blossoming period, picking, washing, storing, coloring, temperature and storage houses, resorting, grading, and packing.—N. J. Giddings.

3306. CASTELLA, F. DE. Resistant stocks. Jour. Dept. Agric. Victoria 19: 278-289, 490-499. 1921.—The present situation with regard to stocks resistant to the attacks of phyloxera is discussed. Resistance in American grapes is defined and explained. The resistant characteristics, soil preferences, climatic adaptation, and union affinities are discussed for all known species and hybrids of resistant stocks. Of the 18 species of American grapes 4 are predominantly important: *Vitis riparia*, *V. rupestris*, *V. berlandieri* and *V. cordifolia*. *Vitis californica* is the only American species which is not resistant. Few pure forms of American species are used. No one stock is ideal on account of varying adaptability. The author selects 5 fundamental stocks for Victorian (Australia) conditions, viz.: *Rupestris du Lot*, *Riparia* × *Rupestris* 3309, *Riparia* × *Rupestris* 3306, *Vinifera* × *Rupestris* A. R. G. 1, *Vinifera* × *Rupestris* 1202.—Irrigation is said to reduce the activity of phyloxera, but will not kill the insect unless submergence continues for 40 days.—Wm. E. Lawrence.

3307. HEDRICK, U. P. The pears of New York. Rept. New York Agric. Exp. Sta. 1921²: xi + 636. Frontispiece, 80 pl. (colored). 1921.—The aim of this volume as stated by the author is: "To give an account of the history and uses of the pear; to depict the botanical characters of cultivated pears; to describe pear growing in the country and more particularly in New York; and, lastly, to give in full detail the synonymy, bibliography, economic status and full descriptions of the most important cultivated pears with brief notices of varieties of minor importance . . . Biographical sketches of men who have been most prominent in pear growing in the United States are to be found in the footnotes."—The 3 species of pears of chief horticultural interest are *Pyrus communis* Linn., *P. nivalis* Jacq., and *P. serotina* Rehd. In America the pear is not grown so extensively as the apple and peach, scarcely more than the cherry and plum. Conditions of climate, pests, season of ripening, taste, and trade, account for its status of culture.—Details of gross structure of the pear of value to the systematist,

and notes as to disease resistance and susceptibility, adaptation to certain climatic and soil conditions, self-fertility or sterility, season of blooming and ripening, and adaptation to dwarf and standard stocks are given. Detailed descriptions and discussions of 91 varieties are given, and several hundred are briefly mentioned as minor varieties.—*J. H. Gourley.*

3308. JONG, A. W. K. DE. *Tapproeven bij Hevea brasiliensis.* [Tapping experiments on *Hevea brasiliensis.*] Arch. Rubbercult. Nederland.-Indië 4: 32-36. 1920.—A series of tapping experiments carried on for 6½ years is described. Different tapping systems (9) were used, and the conclusion was drawn that 2 left cuts on 1 quarter seemed the best system for conditions at Buitenzorg, Java, where the experiments were made.—*C. D. LaRue.*

3309. KERLE, W. D. The production of peanuts. A neglected industry. Agric. Gaz. New South Wales 33: 855-858. 1922.

3310. LARUE, CARL D. *Bark thickness in Hevea brasiliensis.* Arch. Rubbercult. Nederland.-Indië 4: 45-63. 1920.—The thickness of bark of *Hevea* trees decreases rapidly between points 1 and 3 feet from the ground. From the 3 foot to the 5 foot level, the increase is much slower, individual trees varying greatly. Measurements of 161 trees gave a mean thickness of 1.53 mm. left uncut in tapping. When tapping on a cut is stopped, the bark renews with great rapidity, being ⅓ the thickness of the original bark within 9-12 months. There is a correlation of 0.26 ± 0.019 .—*C. D. LaRue.*

3311. MAGNESS, J. R. The handling, shipping, and cold storage of Bartlett pears in the Pacific coast states. U. S. Dept. Agric. Bull. 1072. 16 p. 1922.—As a result of chemical and physiological studies of the past 2 years, it has been found that for fresh fruit shipment, delay of initial picking until 2 weeks after the lenticels become corked over yields a superior eating product. Pears should show a yellow ground color beneath the green before being picked for canning or storage purposes. If held at 30°F., fruit can be kept for several months. Conditions under which fruit is grown parallel its qualities; in general the districts with fairly high temperature and low humidity during the growing season produce pears with best carrying and keeping qualities.—*A. Dorothy Bergnet.*

3312. POPENOE, WILSON. The Capulin cherry. Jour. Heredity 13: 51-62. 7 fig. 1922.—The improvement of the wild black cherry, *Prunus serotina*, indigenous from Nova Scotia to Peru, has been neglected in North America, but in tropical America some excellent horticultural varieties have been developed. The best of these, Capulins, are found in the tablelands of Ecuador and Peru. Relatively inferior forms are in cultivation as far north as Mexico. Recent experiments in Ecuador indicate that propagation of the superior forms by grafting is quite feasible, and there appears to be no reason why they should not be adapted for cultivation in the U. S. A., particularly in regions where the European cherries do not thrive.—*R. C. Cook.*

3313. RAVAZ, I. et G. VERGE. *Nouvelles recherches sur les porte-greffes.* [New researches on Phylloxera-resistant grape stocks.] Ann. Ecole Nation. Agric. Montpellier 17: 227-241. 1918/1919 [1922].—These investigations confirm the phylloxera-resistant quality of *Riparia*, *Rupestris*, *Riparia* × *Rupestris*, *Riparia* × *Berlandieri*, *Rupestris* × *Berlandieri* and *Vinifera* × *Berlandieri*. Several new hybrids have given promising results.—*F. F. Halma.*

3314. ROBERTSON, W. H. Economic field problems relating to horticulture. Sci. Agric. 3: 155-156. 1922.—A brief discussion is given of soil, variety, insect and disease control, storage, precooling, and shipping problems.—*T. G. Major.*

3315. STOFFERT. *Beerenobstau nach neuzeitlichen Grundsätzen.* [Berry culture according to modern principles.] Mitteil. Deutsch. Landw. Ges. 37: 685-686. 1922.—A brief review is given of the history of berry culture in Germany, the size of the industry and the requirements for successful culture being emphasized.—*A. J. Pieters.*

3316. VRIES, O. DE. *Latex en rubber van individueele boomen. I. [Latex and rubber from individual trees. I.]* Arch. Rubbercult. Nederland.-Indië 4: 249-267. 1920.—This is a discussion of methods for obtaining data concerning latex and rubber from individual trees. Attention is called to the great variation in the properties of latex and rubber from different trees and to the desirability of the study of such variation.—*C. D. LaRue.*

3317. VRIES, O. DE. *Latex en rubber van individueele boomen. II. [Latex and rubber from individual trees. II.]* Arch. Rubbercult. Nederland.-Indië 4: 361-379. 1920.—The behavior of the latex from different trees is not always alike. The changes usually observed in the latex when a new tapping cut is opened on a tree are sometimes lacking. Within a year a given tree may show many variations in the properties of latex and rubber.—*C. D. LaRue.*

3318. WESTER, P. J. *The breadfruit.* Jour. Heredity 13: 129-135. 3 fig. 1922.—The author states that, "considering its potential value as an abundant source of nourishing and palatable food, there is no tropical fruit today so neglected as the breadfruit." An account of its introduction into the West Indies is given, and its uses are described. The yield is said to be 25 tons per hectare per annum. Lists of breadfruit varieties from Fiji, the Carolines, the Society, and the Marquesas Islands are given. The article closes with an appeal for the financing of an expedition to the South Seas to save the superior varieties which are rapidly becoming extinct.—*R. C. Cook.*

3319. WHITE, C. T. *An Australian citrus relative.* Jour. Heredity 13: 119-121. 1 fig. 1922.—All species of the genus *Microcitrus* are indigenous to Australia. Of these, one of the most interesting and least known is the Russel River Lime (*M. inodora*). Fruit of this and of Meston's Mangosteen (*Graciviana mestoni*) were collected in 1922 in northwest Queensland, one of the wettest parts of Australia. *G. mestoni* grows on the slopes of the Bellenden Ker Range, at an altitude of 2000-4700 feet. *M. inodora* was found in the dense rain forest at the foot of the range, and many trees were fruiting heavily. It forms a shrub or small tree 8-12 feet high. The fruit is 8-celled, bright lemon yellow when ripe, oblong, and may be smooth or ribbed. The larger fruits are $2\frac{1}{2}$ x $1\frac{1}{4}$ inches, but the average is somewhat smaller.—*R. C. Cook.*

FLORICULTURE AND ORNAMENTAL HORTICULTURE

3320. ANONYMOUS. *Clematis Jackmani.* Nation. Nurseryman 31: 9. 1923.

3321. BEVAN, W. *Otto of roses.—Distillation at Malikouri, 1922.* Cyprus Agric. Jour. 17: 68. 1922.—The departmental still at Malikouri extracted April 24-May 14, 1922, 130 drams of rose oil from 1416 okes of roses, a somewhat lower percentage than that of previous years. An attempt is being made to establish a commercial rose oil industry.—*Wm. Stuart.*

3322. BOYNTON, KENNETH R. *Anoda hastata.* Addisonia 7: 27-28. Pl. 238 (colored). 1922.—An ornamental, annual, herbaceous species of the family Malvaceae, native of Mexico, Central America, and the West Indies. It may be grown in flower beds in the open as far north as New York.—*T. J. Fitzpatrick.*

3323. BOYNTON, KENNETH R. *Aria latifolia.* Addisonia 7: 1. Pl. 225 (colored). 1922.—A beam-tree of the mountain ash group of the apple family, native of central Europe, was 1st found in the 18th century in the forest of Fontainebleau and is supposed to be a hybrid. It is a deciduous tree and hardy in the latitude of New York, where it has been grown for many years.—*T. J. Fitzpatrick.*

3324. BOYNTON, KENNETH R. *Billbergia saundersii.* Addisonia 7: 7. Pl. 228 (colored). 1922.—This is an ornamental epiphytic herb of the family Bromeliaceae, native of Brazil.

In 1871 it was exhibited before the Royal Horticultural Society of England by W. W. Saunders, after whom it was named.—*T. J. Fitzpatrick.*

3325. BOYNTON, KENNETH R. *Styrax japonica*. *Addisonia* 7: 13. *Pl. 231 (colored)*. 1922.—This shrub or small tree, with bellshaped, nodding, white flowers, is a native of China and Japan. It was introduced into England in 1862 and into the U. S. A. shortly before 1891.—*T. J. Fitzpatrick.*

3326. BOYNTON, KENNETH R. *Verbena erinoides*. *Addisonia* 7: 11. *Pl. 230 (colored)*. 1922.—This moss verbena, a native of Peru and Chile, is a branching annual herb, ornamental and suitable for borders.—*T. J. Fitzpatrick.*

3327. BRITTON, N. L. *Crotalaria retusa*. *Addisonia* 7: 47. *Pl. 248 (colored)*. 1922.—This ornamental annual species is a native of tropical regions, and extends northward into southern Florida and Bermuda.—*T. J. Fitzpatrick.*

3328. BRITTON, N. L. *Polystachya minuta*. *Addisonia* 7: 19. *Pl. 234 (colored)*. 1922.—This epiphytic orchid, native of Florida, the West Indies, and South America, is the type species of this large genus. The type locality is French Guiana.—*T. J. Fitzpatrick.*

3329. BRITTON, N. L. *Xylophylla epiphyllanthus*. *Addisonia* 7: 31, 32. *Pl. 240 (colored)*. 1922.—This ornamental shrub, native of the West Indies is a member of the Euphorbiaceae. In Jamaica there are 10 species of this genus, only 1 of which, *Xylophylla epiphyllanthus*, occurs in the other West Indian Islands and in Brazil.—*T. J. Fitzpatrick.*

3330. FAIRCHILD, DAVID. *Garden for the propagation of tropical and subtropical plants*. *Science* 57: 166–168. 1923.—The Chapman Field air station of 850 acres, located on Biscayne Bay, near Miami, Florida, has been turned over to the U. S. Department of Agriculture. This tract will be used for the experimental cultivation and distribution of tropical plants useful for food or for their products. A test orchard and arboretum will be built up to preserve such valuable and beautiful trees and shrubs of foreign countries as are adapted to the soil and climate.—*C. J. Lyon.*

3331. FOX, HELEN M. *Lilium candidum*. *Addisonia* 7: 51, 52. *Pl. 250 (colored)*. 1922.—The Madonna lily, native of the regions about the Mediterranean and the Black sea, is a handsome garden species and is frequently cultivated.—*T. J. Fitzpatrick.*

3332. FOX, HELEN M. *Lilium croceum*. *Addisonia* 7: 63, 64. *Pl. 256 (colored)*. 1922.—This attractive lily, native of the alpine regions of Europe, has long been in cultivation and a number of varieties are grown. Crosses with *Lilium tigrinum* have been obtained.—*T. J. Fitzpatrick.*

3333. FOX, HELEN M. *Lilium speciosum*. *Addisonia* 7: 55, 56. *Pl. 252 (colored)*. 1922.—This handsome species, native of China and Corea, 1st imported to Europe in 1832, later to the U. S. A., is a favorite garden plant.—*T. J. Fitzpatrick.*

3334. GILMORE, MELVIN R. *State historical parks of North Dakota*. *Collections State Hist. Soc. North Dakota* 6: 226–266. 1920.—The function of such a park, particularly regarding the preservation of native plants, is discussed and a list is given of “trees, shrubs, vines, herbaceous flowering plants and grasses native to North Dakota and suitable and desirable for use in planting of parks.” Many notes descriptive of the plants, their habits, and their use by the Indians are included.—*O. A. Stevens.*

3335. GLEASON, H. A. *Hamamelis mollis*. *Addisonia* 7: 9, 10. *Pl. 229 (colored)*. 1922.—This shrub, known as the Chinese witch-hazel, is a native of the provinces Hupeh and

Kiangsi, China, and it is occasionally planted in America. All species of this genus are worthy of cultivation.—*T. J. Fitzpatrick.*

3336. GLEASON, H. A. *Lopezia hirsuta*. *Addisonia* 7: 35, 36. *Pl. 242 (colored)*. 1922.—This small shrub of the Onagraceae, native of central and southern Mexico, and recently introduced into the U. S. A., is easily cultivated in conservatories.—*T. J. Fitzpatrick.*

3337. GLEASON, H. A. *Trichosporum pulchrum*. *Addisonia* 7: 43, 44. *Pl. 246 (colored)*. 1922.—This ornamental epiphyte belonging to the Gesneriaceae, native of Java, and suitable for warm-house cultivation, was discovered nearly a century ago and shortly afterwards introduced into English horticulture. It has only recently received attention in the U. S. A.—*T. J. Fitzpatrick.*

3338. GLOVER, C. C. *Quamasia esculenta*. *Addisonia* 7: 29, 30. *Pl. 239 (colored)*. 1922.—This ornamental wild hyacinth, a native of the central U. S. A., is hardy under cultivation, easily transplanted, and has an edible bulb.—*T. J. Fitzpatrick.*

3339. HOLLICK, ARTHUR. *Alnus rugosa*. *Addisonia* 7: 25, 26. *Pl. 237 (colored)*. 1922.—This is an ornamental shrub, native of eastern U. S. A. from Maine to Florida and westward to Minnesota and Texas.—*T. J. Fitzpatrick.*

3340. MACKENZIE, K. K. *Viburnum cassioides*. *Addisonia* 7: 17. *Pl. 233 (colored)*. 1922.—This viburnum is found in low damp grounds and ranges from Newfoundland to Manitoba and southward through eastern and central U. S. A. to North Carolina. It is of medium quality as an ornamental shrub. The fruit is edible, but of little value.—*T. J. Fitzpatrick.*

3341. ROSE, J. N. *Echinocereus baileyi*. *Addisonia* 7: 41. *Pl. 245 (colored)*. 1922.—This ornamental species of the cactus family, native to Oklahoma, was 1st discovered in 1904.—*T. J. Fitzpatrick.*

3342. RUSK, HESTER M. *Lilium warleyense*. *Addisonia* 7: 57, 58. *Pl. 253 (colored)*. 1922.—This species, native of central China, and discovered in 1907, is hardy and winters in the open as far north as New England.—*T. J. Fitzpatrick.*

3343. SMALL, JOHN K. *Aconogonum polystachyum*. *Addisonia* 7: 21, 22. *Pl. 235 (colored)*. 1922.—This species of the Polygonaceae, native of central Asia, is quite ornamental and is suitable for mass effect in late borders. The article includes remarks on related species.—*T. J. Fitzpatrick.*

3344. SMALL, J. K. *Tradescantia virginiana*. *Addisonia* 7: 15, 16. *Pl. 232 (colored)*. 1922.—The common spiderwort is a native of eastern U. S. A., readily adaptive to many soils quite ornamental, and easily cultivated. It was introduced into England at least as early as the forepart of the 15th century. Linnaeus made it the type of the genus.—*T. J. Fitzpatrick.*

3345. STOUT, A. B. *Lilium canadense*. *Addisonia* 7: 61, 62. *Pl. 255 (colored)*. 1922.—This species is native to the eastern portion of North America and obtains even greater distribution in cultivation. It is used in cross breeding. Seeds readily develop, but seedlings remain below the surface the 1st year. In transplanting, the old and new bulb with connecting rootstock kept intact should be moved in late autumn.—*T. J. Fitzpatrick.*

3346. STOUT, A. B. *Lilium Parryi*. *Addisonia* 7: 49, 50. *Pl. 249 (colored)*. 1922.—This beautiful species, native of southern California, 1st noted by Dr. C. C. Parry in July, 1876, has received some attention from horticulturists but is worthy of more.—*T. J. Fitzpatrick.*

3347. STOUT, A. B. *Lilium superbum*. Addisonia 7: 59, 60. Pl. 254 (colored). 1922.—A variable species, native of eastern North America, has long been cultivated in Europe and in the U. S. A. When established after transplanting it maintains itself with little care. Hybrids have been produced with *Lilium canadense*.—T. J. Fitzpatrick.

3348. STOUT, A. B. *Lilium tigrinum*. Addisonia 7: 53, 54. Pl. 251 (colored). 1922.—This favorite garden lily, native of China and Japan, was 1st introduced into England in 1804, later into the U. S. A. Several varieties are now grown. The cultivated forms do not seed, new plants being obtained from bulblets which develop in the axils of the leaves.—T. J. Fitzpatrick.

3349. STOUT, A. B. *Nicotiana Forgetiana*. Addisonia 7: 5, 6. Pl. 227 (colored). 1922.—This highly ornamental herb, native of southern Brazil, was discovered in 1901 by Louis Forget and propagated in England by Sander and Sons. It hybridizes readily, giving a rich variety of brilliant colors.—T. J. Fitzpatrick.

3350. TAYLOR, W. H. A valuable form of barberry. New Zealand Jour. Agric. 24: 159-161. 1922.—This barberry plant, probably a form of *Berberis vulgaris*, forms a very dense hedge, 10-12 feet high and 3-4 feet thick. It blossoms profusely but rarely produces fruits, hence is not disseminated by birds. Propagation is by cuttings. It produces many suckers, but these are always close to the stool.—N. J. Giddings.

3351. WILSON, PERCY. *Amorphophallus bulbifer*. Addisonia 7: 33. Pl. 241 (colored). 1922.—This species of the Arum family, native of Asia, is easily grown in gardens. Though not popular because of the ill-smelling flower, it is frequently kept as a curiosity.—T. J. Fitzpatrick.

3352. WILSON, PERCY. *Anthurium scandens*. Addisonia 7: 23, 24. Pl. 226 (colored). 1922.—This epiphytic species of the Araceae, native of the West Indies and tropical America, was 1st figured and described by Plumier. Only a few species of this genus are cultivated.—T. J. Fitzpatrick.

VEGETABLE CULTURE

3353. BONSTEEL, J. A. Soils of eastern Virginia and their uses for truck crop production. U. S. Dept. Agric. Bull. 1005. 70 p., 1 pl., 2 fig., 6 maps. 1922.

3354. HARVEY, R. B., and R. C. WRIGHT. Frost injury to tomatoes. U. S. Dept. Agric. Bull. 1099. 10 p., 1 fig. 1922.—The frost injury to tomatoes in transit from the southern states in late winter was studied mainly, but field studies are included. A difference of only 0.89°F. was found in the freezing points between certain varieties and the average of 19 commercial varieties was 30.46°F. No consistent difference was found between early and late varieties or between ripe and full grown green tomatoes of the same variety. Undercooling to 22.63°F. was found possible, when the fruit would remain unfrozen for a limited time; but a slight jar is liable to cause freezing. A thick skin with little tendency to crack is considered an important factor in frost resistance. In the field such covering favors undercooling by preventing inoculation of the tissue from ice formed on the surface. Tomatoes on the vine freeze on the upper stem-end 1st, partly because the dew is deposited on the upper end thus tending to inoculate the surrounding tissues and partly because ripe parts may freeze more easily than green parts of the same fruit.—J. T. Buchholz.

3355. MOODIE, A. W. S., J. DOUGLASS, and B. M. ARTHUR. Field experiments with sweet potatoes. Agric. Gaz. New South Wales 33: 859-862. 1922.—In a comparison of varieties imported from the U. S. A. and the local variety Pink, the imported varieties outyielded the local in 2 out of 3 cases.—L. R. Waldron.

3356. THOMPSON, H. C., and JAMES H. BEATTIE. Sweet potato storage studies. U. S. Dept. Agric. Bull. 1063. 18 p., 4 fig. 1922.—With careful handling sweet potatoes can be stored and kept for 4 months with shrinkage and decay losses nearly $\frac{1}{2}$ that accompanying ordinary commercial handling. Those stored in houses as opposed to banks or pits, not injured in harvesting, with no sorting during storage, and kept from 50–55°F. while in storage showed considerably lower losses than usual. In the experiments all the leading varieties were tested.—A. Dorothy Bergnet.

HORTICULTURE-PRODUCTS

3357. BEVAN, W. Ground nuts from Cyprus.—Cyprus Agric. Jour. 17: 45. 1922.—Cyprus-grown ground nuts examined at the Imperial Institute, London, proved sufficiently satisfactory to justify their further cultivation. The analysis of the kernels showed 5.3 per cent moisture and 49.5 per cent of oil equivalent to 52.3 per cent from the moisture-free kernels.—Wm. Stuart.

3358. HOGG, S. A. The market for passion fruit pulp. Agric. Gaz. New South Wales 33: 899. 1922.—In 1921 pulp totaling in value £10,000 was exported to London and to the U. S. A.—L. R. Waldron.

3359. REED, J. B. By-products from crushing peanuts. U. S. Dept. Agric. Bull. 1096. 12 p., 1 fig. 1922.—Data are given on relative amounts of protein, oil, sugar, starches, and fiber in by-products from peanut crushing by various industrial processes.—J. T. Buchholz

3360. VENTRE, JULES, et EMILE BOUFFARD. La potasse et les vins anormaux de 1921. [Potassium and the abnormal wines of 1921.] Ann. Ecole Nation. Agric. Montpellier 17: 169–190. Tables 1–3. 1918–1919 [1922].—The abnormality of many of the red and white wines produced in 1921 is attributed to their high potassium content. Due to drought potassium accumulated in the soil and the grapes were supplied with an excessive amount.—F. F. Halma.

MORPHOLOGY, ANATOMY AND HISTOLOGY OF VASCULAR PLANTS

E. W. SINNOTT, *Editor*

(See also in this issue Entries 2920, 2990, 2992, 2993, 3009, 3010, 3011, 3012, 3014, 3021, 3125, 3164, 3221, 3258, 3410, 3452, 3581, 3599, 3608)

3361. BOBILIOFF, W. Enkele gegevens over de hernieuwing van den bast bij *Hevea brasiliensis*. [Some data on bark renewal in *Hevea brasiliensis*.] Arch. Rubbercult. Nederland-Indië 4: 239–247. 1920.—A year after a section of bark has been cut away in tapping, the renewed bark has developed nearly as many rows of latex vessels as there were in the original bark. In the renewed bark the ratio of the soft to hard parts is greater than in the original bark. As the bark grows older, rows of latex vessels toward the outside are destroyed by the development of stone cells. At the same time, new rows of vessels are developed by the cambium and as a result the number of rows of vessels remains practically constant.—C. D. LaRue.

3362. BREWSTER, A. A. Mucilage cells and raphides of *Hibbertia*. Australian Nat. 5: 76. 1923.—Needle-like crystals of calcium oxalate in fagot-like bundles are common throughout plants of *Hibbertia*. Mucilage cells in the petals seem to be for water storage.—T. C. Frye.

3363. COOK, O. F. Figs with misplaced scales. Jour. Heredity 13: 122–123. 2 fig. 1922.—The fruit of the fig represents a hollow branch with flowers on the inside, and normally small scales or bracts surround the aperture and the base of the stalk. In a seedling fig orchard at Bard, California, many abnormal figs were found with scales scattered over the surface of the fruit. Some fruits had only 1 or 2 misplaced scales. In others, the scales formed a regular spiral sequence or formed a distinct rim as though 2 fruits were partially formed, one inside the

other. The fleshy wall of the fruit evidently represents a series of internode elements completely fused, although the scales remain distinct.—*R. C. Cook.*

3364. DEMETER, KARL. Vergleichende Asclepiadeenstudien. [A comparative study of the Asclepiadaceae.] *Flora* 115: 130-176. 15 fig. 1922.—This is a study of the morphology of the flower and inflorescence of the Apocynaceae and the Asclepiadaceae. It supports the classification proposed by de Jussieu combining the 2 families into 1—the Apocynaceae.—*A. G. Stokey.*

3365. GAISBERG, E. VON. Zur Deutung der Monokotylenblätter als Phyllodien. [On the significance of monocotyl leaves as phyllodes.] *Flora* 115: 177-190. 3 pl. 1922.—The author, who disputes Arber's theory [Bot. Absts. 10, Entry 1816] that inverse bundles are an indication of phyllode morphology, believes that monocotyl leaves, especially those with expanded blades, represent another type of modification of a dicotyl leaf. The history of development gives no support for the phyllode theory, for in families where phyllodes appear, they are demonstrable as phyllodes in the history of development. This favors Goebel's view that a leaf of *Juncus*, like those of *Cranitzia* and *Ottoa*, is derived by reduction from a compound leaf. Inverse bundles are due to strong growth of the under side. The narrow leaves of certain *Eryngium* species, cited by Arber as of great importance for the phyllode theory since they have bundles inversely oriented, can be derived from the palmately-veined forms by stretching until the veins gradually become parallel; or, as Möbius believes, they may correspond to the expanded mid-rib or rachis of pinnate forms, the pinnae having been reduced. The leaves with expanded blades may have come from a radially formed leaf by broadening into a flat shape. The appendages formed at the tip of *Pontederia* leaves are not the vanishing remains of blades, but a later outgrowth, and so are not an argument for the phyllode theory.—*Anna M. Starr.*

3366. GLÜCK, H. Über die knöllchenartigen Niederblätter an dem Rhizom von *Marsilia hirsuta* A. Br. [The tubercle-like cataphylls on the rhizome of *Marsilia hirsuta*.] *Flora* 115: 251-258. 2 fig. 1922.—The land form of *Marsilia hirsuta* develops small, more or less globular cataphylls which are rich in starch. They appear singly on the rhizome or crowded on short lateral branches.—*A. G. Stokey.*

3367. HALL, WINSOME. Storage tracheides of stem of *Villarsia*. *Australian Nat.* 5: 84. 1923.—These tracheids are 5-9 cells long, often branched, full of pits, and abundant in pith and cortex.—*T. C. Frye.*

3368. KEUCHENIUS, P. E. Onderzoekingen over de bast-anatomie van *Hevea*. [Investigations on the bark-structure of *Hevea*.] *Arch. Rubbercult. Nederland.-Indië* 4: 5-24. 1920.—The average yearly increase in number of rings of latex vessels is from 3.13 ± 0.28 on good soil to 1.74 ± 0.12 on poor soil. The average number of rings of latex vessels for each mm. of bark from the cambium to the 5th mm. from the cambium is given.—*C. D. LaRue.*

3369. WELCH, M. B. The occurrence of oil ducts in certain *Eucalypts* and *Angophoras*. *Proc. Linnean Soc. New South Wales* 46: 475-486. Pl. 42-46, 7 text fig. 1921.—Oil ducts, not previously described, are formed by the linking up of a chain of short secretory cavities (corresponding in size and formation to the oil glands in the leaf) in the stems and leaves, both normal and abnormal, of certain *Eucalypts* and *Angophoras*, including: *E. Abergiana* F. v. M., *E. calophylla* R. Br., *E. corymbosa* Sm., *E. citriodora* Hook., *E. dichromophloia* F. v. M., *E. eximia* Schau., *E. ferruginea* Schau., *E. ficifolia* F. v. M., *E. Foelscheana* F. v. M., *E. haematoxylon* J. H. M., *E. intermedia* R. T. B., *E. latifolia* F. v. M., *E. maculata* Hook., *E. pellata* Benth., *E. pyrophora* Benth., *E. terminalis* F. v. M., *E. trachyphloia*, *E. Watsoniana* F. v. M., and in *Angophora lanceolata* Cav. Oil ducts have not yet been found in any other genera of the *Leptospermae*, and their occurrence is purely specific. There is no direct connection between these central ducts and the leaf, petiole or stem oil glands, though both structures apparently possess an oil of similar nature. These ducts are not continuous in stem and leaves, but show

a break at the petiole. They are variable in diameter and length, ranging from 0.3 mm. to less than 0.03 mm. in diameter and from over 100 mm. to less than 1 mm. in length. They apparently function as storage reservoirs. These ducts apparently do not occur in the roots nor have they been observed in the lower portions of the stems of seedlings. In the stem, they occur in the pith only. In the leaves, they are usually 2 in number and are found only in the mid-rib. The presence of these central canals in a very limited number of Eucalypts, all belonging to the class Corymbosae, indicates their primitive character, and their occurrence also in 1 species of *Angophora* shows apparently a close phylogenetic affinity between *Angophora* and *Eucalyptus*.—*Eloise Gerry*.

3370. ZIJP, C. VAN. *Microtechnische mededelingen*. [Microtechnical notes.] Arch. Rubbercult. Nederland.-Indië 4: 65-68. 1920.—Benzidine chloride is recommended for coloring lignified elements in the bark of *Hevea brasiliensis*, and Sudan III for staining latex-vessels.—*C. D. LaRue*.

MORPHOLOGY AND TAXONOMY OF ALGAE

E. N. TRANSEAU, *Editor*

L. H. TIFFANY, *Assistant Editor*

(See in this issue Entries 3022, 3033, 3149, 3230, 3274, 3412, 3413, 3646)

MORPHOLOGY AND TAXONOMY OF BRYOPHYTES

ALEXANDER W. EVANS, *Editor*

(See also in this issue Entries 3033, 3149, 3230, 3274)

3371. ANONYMOUS. *Nouvelles*. Rev. Bryologique 49: 48. 1922.—Among other items of interest the discovery of *Lophozia decolorans* (Limpr.) Steph., a species new to France, is announced; it was found by Knight and Nicholson in the department of Haute-Savoie.—*A. W. Evans*.

3372. AMANN, J. *Le Thamnium mediterraneum en France*. Rev. Bryologique 49: 44-46. 1922.—The author calls attention to the discovery, in southern France, of *Thamnium mediterraneum* Bottini, a species hitherto known only from the island of Giglio, Italy. He discusses the features that distinguish this species from the widely distributed *T. alopecurum* (L.) Bryol. Eur. and compares it also with the curious submerged *T. Lemani* Schnetzler of Lake Geneva and with *T. angustifolium* Holt of England.—*A. W. Evans*.

3373. ANDREWS, A. LE ROY. Further bryophytes from North Carolina (and Tennessee). Bryologist 24: 49-58. 1921.—This article is based on a collection of bryophytes made by the author during the summer of 1919 in Buncombe, Jackson, Avery and McDowell Counties, North Carolina, and in Carter County, Tennessee. It is supplementary to previous lists, upon which there are several critical notes. The list included in the paper gives the species not hitherto reported from the region and is made up of 27 hepatics, 3 sphagna and 56 mosses, with data regarding habitat and geographic distribution for nearly every species. Many of the records represent marked extensions of range. In the case of *Grimmia Doniana* and *Plagiothecium Muellerianum* systematic notes are appended, the brood-bodies of the latter species being reported and described for the 1st time.—*E. B. Chamberlain*.

3374. BAILEY, JOHN W. *Adventures in Mossland*.—A hunt for *Desmatodon latifolius* (Hedw.) Brid. Bryologist 24: 86-88. 1921.—The author gives a semi-popular account of a hunt for *Desmatodon latifolius* near Ellensburg, Washington. Although he had collected this rare moss in the vicinity several years ago he failed to find it again, but discovered a number of even rarer species. Incidentally notes are included on the habitats of mosses growing on irrigated areas, greasewood trunks, and basalt.—*E. B. Chamberlain*.

3375. BARTRAM, EDWIN B. Some rare mosses from northeastern Pennsylvania. *Bryologist* 24: 88-89. 1921.—The author gives an account of the mosses growing on wooded limestone ledges and cliffs at the base of Indian Rock, Monroe County, Pennsylvania. He mentions 17 species, all uncommon in the general region and some of much rarity, *Didymodon rubellus* (Hoffm.) B. & S. being definitely reported for the 1st time from the state.—*E. B. Chamberlain*.

3376. CONKLIN, GEORGE H. Report of the curator of the hepatic department for 1921. *Bryologist* 25: 23. 1922.—The following specimens, representing extensions of range, are listed among the additions to the herbarium of the Sullivant Moss Society: *Diplophyllum gymnostomophilum* from Wisconsin, *Lophozia obtusa* from British Columbia and Oregon, and *Neesiella rupestris* from California.—*A. W. Evans*.

3377. DISMIER, G. Localités nouvelles de Muscinées rares ou peu connues en France. [New localities in France for rare or little known bryophytes.] *Rev. Bryologique* 48: 49-52. 1921.—In this report, which is based largely on the author's own collections in various parts of France, 11 hepatics, 4 peat mosses and 34 true mosses are enumerated. The species are accompanied by full data regarding localities, several of which represent interesting extensions of range.—*A. W. Evans*.

3378. EVANS, ALEXANDER WILLIAM. Corsiniaceae, Targioniaceae, Sauteriaceae, Rebouliaceae, Marchantiaceae. *North Amer. Flora* 14: 29-66. 1923.—The author presents a taxonomic treatment of these families of the Marchantiales in accord with the other groups treated in this work. Keys are given for generic and specific identification, descriptions are included for the characterization of the families, genera and species, and synonyms, type locality, distribution, illustrations and exsiccata are cited for each species. The family Corsiniaceae is represented by 1 genus, *Corsinia*, with 1 species; Targioniaceae by 2 genera, *Targionia* and *Cyathodium*, with 1 species each; Sauteriaceae by 3 genera, *Clevea*, *Sauteria*, and *Peltolepis*, with 1 species each; Rebouliaceae by 5 genera, *Plagiochasma* (5 species), *Grimaldia* (4 species), *Cryptomitrium* (1 species), *Reboulia* (1 species), and *Asterella* (15 species); Marchantiaceae by 6 genera, *Lunularia* (1 species), *Conocephalum* (1 species), *Dumortiera* (2 species), *Bucegia* (1 species), *Preissia* (1 species), and *Marchantia* (5 species). No new species are characterized and no new combinations are made. This author is responsible for the ordinal description of the Marchantiales and the key to the 6 families. This precedes the treatment of the Ricciaceae [see *Bot. Absts.* 12, Entry 3383].—*E. B. Payson*.

3379. GRIER, N. M. The mosses of Washington County, Pennsylvania. *Bryologist* 25: 9-12. 1922.—This article includes a list, without annotations, of 123 species or varieties of mosses from Washington County in western Pennsylvania. This represents a revision of an earlier printed list by A. LINN and A. SIMONTON, with the addition of 13 species reported by JENNINGS. The revision was facilitated by the study of the original specimens, now in the possession of Washington and Jefferson College. A footnote gives a brief biographical notice of J. S. Simonton.—*E. B. Chamberlain*.

3380. GROUT, A. J. Mosses of a Staten Island house and lot. *Bryologist* 24: 64. 1921.—The author lists 20 mosses collected in a single day from a 87 x 150 ft. house lot on Staten Island, New York, and comments upon the absence from the island of arboreal mosses, although records of 25 years ago indicated their presence.—*E. B. Chamberlain*.

3381. HAYNES, CAROLINE COVENTRY, and MARSHALL AVERY HOWE. Sphaerocarpaceae, Riellaceae. *North Amer. Flora* 14: 2-8. 1923.—The authors present a taxonomic treatment of the order Sphaerocarpaceae and of the 2 families included under it, the Sphaerocarpaceae being represented by the genera *Sphaerocarpos* (with 4 species) and *Geothallus* (1 species) and the Riellaceae by the genus *Riella* (1 species). Keys are furnished for family, generic and specific discrimination. Descriptions are given for each category recognized; synonyms, type

locality, distribution, illustrations and standard exsiccati are cited. No new species or new combinations are included. The treatment of the order Sphaerocarpaceae is preceded by an unassigned characterization of the Division Bryophyta and the Class Hepaticae.—*E. B. Payson*.

3382. HENRY, R. *Le Lophozia Kunzeana* (Hüb.) Evans dans les Vosges et liste des muscinées recueillies au Honeck. [*Lophozia Kunzeana* in the Vosges Mountains and a list of the bryophytes collected at Honeck.] *Rev. Bryologique* 48: 60-62. 1921.—The discovery of *Lophozia Kunzeana* forma *plicata* at Honeck in the Vosges Mountains is announced, this being the 2nd French station for the species. The other bryophytes reported from the same general region include 15 mosses and 10 hepatics. Full data regarding localities are given under each.—*A. W. Evans*.

3383. HOWE, MARSHALL AVERY. *Ricciaceae*. *North Amer. Flora* 14: 11-27. 1923.—A taxonomic treatment of the family Ricciaceae of the Marchantiales is presented by the author. This contains descriptions of the family; of the 3 genera, *Riccia*, *Ricciocarpus* and *Oxymitra*; and of their species, *Riccia* being represented by 25 and the other 2 genera by 1 apiece. Synonyms, type locality, distribution, illustrations and exsiccati are cited for each species. No new species are described and no new combinations are made.—*E. B. Payson*.

3384. INGHAM, W. *Georgian mosses*. *Rev. Bryologique* 48: 43. 1921.—Under the above title 14 mosses from British Columbia are listed, no more definite data regarding localities being given. The list was based on collections made by A. Brinkman.—*A. W. Evans*.

3385. POTIER DE LA VARDE, R. *Musci madurenses* (contribution à la flore bryologique de l'Inde méridionale). [*Mosses of Madura* (contribution to the moss flora of southern India).] *Rev. Bryologique* 49: 33-44. 13 fig. 1922.—The present report is based primarily on a collection of mosses bearing the title, "*Musci madurenses* Indiae meridionalis exsiccati," and distributed by Foreau, with the collaboration of André, Roiné and Vellé, all of whom are missionaries in the district of Madura in southern India. The specimens were first studied by Cardot, and the new species were distributed under his manuscript names. Since there was no immediate prospect that these new species would be published by their author, Potier de la Varde has, with the sanction of Cardot, prepared an account of the entire collection, the new species appearing under their joint authorship. In this first installment of the work, 23 species are enumerated, with full data regarding stations and collectors and usually with critical remarks. The following are proposed as new: *Campylopus Andreanus*, *C. Roinei*, *Dicranella denticulata*, *D. stricticaulis*, *Dicranum dilatinerve*, *Hyophila validinervis*, *H. viridula*, *Syrrophodon calymperoides*, *S. leucophanoides*, *Thysanomitrium Depallieri*, *T. Foreanum*, *T. leioneuron*, and *Weisia macrospora*. All the new species are illustrated.—*A. W. Evans*.

MORPHOLOGY AND TAXONOMY OF FUNGI, LICHENS, BACTERIA, AND MYXOMYCETES

H. M. FITZPATRICK, *Editor*

D. S. WELCH, *Assistant Editor*

(See also in this issue Entries 2978, 3414, 3435, 3436, 3437, 3465, 3496, 3497, 3509, 3519, 3552)

FUNGI

3386. ANONYMOUS. *Pathological herbarium notes* 5. U. S. Dept. Agric. Bur. Plant Indust. Office Path. Collections. 7 p. 1922.—In this number the 2386 accessions to the herbarium added between April 1 to November 1, 1922, are listed.—*H. M. Fitzpatrick*.

3387. ARTHUR, JOSEPH CHARLES. (*Uredinales*) *Aecidiaceae*. *North Amer. Flora* 7: 481-540, 541-604. 1922.—The author with his collaborators continues his treatment of the North American rusts. Keys to the species of each genus are included. Each species is charac-

terized by the citation of synonyms, a specific description, citation of host plants, type locality, distribution, illustrations, and standard exsiccati. The treatment of the genus *Klebahnia*, continued from the previous part, is completed. *Bullaria* with 66 species is treated in collaboration with EDWIN BUTTERWORTH MAINS. Forty-seven of these species are new combinations in the genus. *Teleutospora* with 11 species is offered in collaboration with GUY RICHARD BISBY. Eight new specific combinations are made. *Micropuccinia* with 149 species and 86 new specific combinations is published in collaboration with HERBERT SPENCER JACKSON. A key is given to the form genera *Uromyces* (10 species), *Puccinia* (43 species), *Uredo*, *Aecidium*, *Peridermium*, and *Caeoma*. No new species are characterized or new combinations made in these form genera.—E. B. Payson.

3388. BULLER, A. H. R. *Researches on fungi. Vol. II. Further investigations upon the production and liberation of spores in Hymenomycetes xii + 492 p., 157 fig.* Longmans, Green and Co.: London, 1922.—A comparison of the basidium of the Hymenomycetes with that of the Gastromycetes shows that the former is to be regarded as a much specialized organ for spore discharge. In all the Hymenomycetes studied the discharge of the spore from the basidium is preceded by the exudation of a small droplet of fluid substance from the hilum and followed soon by the collapse of the basidium. In the development of the spore a longer time is required for those having thick, pigmented or sculptured walls. After attaining their full size spores take still longer to ripen. Abnormal or sterile fruit-bodies are often caused by parasites or unknown agencies. Changes in condition may greatly affect size of fruit-bodies of *Coprinus lagopus*. *Marasmius oreades* may be successfully cultivated for food. *Hydnum septentrionale* probably liberates its spores in a constant stream, as do the Hymenomycetes in general. In the autumn *Fomes fomentarius* develops its new annual tube layer and the spores are liberated the following spring; each annual layer may produce spores 4 years in succession. This species shows a striking adaptation in its response to the action of gravity. *Fomes applanatus* attacks upwards of 50 species of trees, liberates about 30 billion spores in 24 hours and has a spore-fall period of over 6 months (the longest known). In the Hymenomycetes in general the most watery fruit-bodies have the shortest spore-fall period. In order to maintain themselves it is necessary for wood-destroying fungi to produce vast numbers of spores. In the Hydnaceae, Tremellaceae and Clavariaceae the form of the fruit body is intimately correlated with the size and spore-discharging power of the basidia. *Dacryomyces deliquescens* has oidial and basidial fruit-bodies which have been regarded by some as different species. The galls formed by *Exobasidium* enable the parasite to extend its hymenial surface. The red squirrel of North America collects fleshy fungi in autumn, stores them in dry places and eats them during the winter. Slugs feed upon most species of fleshy fungi growing in woods, even poisonous species being eaten. The slug uses its sense of smell in locating fungi. The Agaricineae are divided into two types, based on the organization of the hymenium, (1) the Aequi-hymeniiferae or Non-Coprinus type and (2) the Inaequi-hymeniiferae or Coprinus type. In the *Panaeolus* sub-type, of which *Panaeolus campanulatus* is taken as an example, the gills are mottled, and each area is found to give rise to successive generations of basidia which ripen their spores and then collapse. The areas are thus constantly changing. The author has figured the hymenium during several stages, giving a complete and detailed analysis of the elements and their behavior. The same is done for *Stropharia semiglobata*, *Anellaria separata* and *Psalliota (Agaricus) campestris*. A very detailed account of the morphology and biology of the last named species is given, and the hymenium is figured and minutely described. *Secotium agaricoides* resembles a puff-ball but is closely related to *Psalliota*.—D. S. Welch.

3389. BÜREN, GÜNTHER VON. *Weitere Untersuchungen über die Entwicklungsgeschichte und Biologie der Protomycetaceen.* [Further investigations of the development and biology of the Protomycetaceae.] Beitr. Kryptogamenflora Schweiz 5: 1-94. Pl. 1-2 (1 colored), fig. 1-27. 1922.—The long continued investigations on which this paper was based constitute a detailed cultural and morphological study of the species of the Protomycetaceae. Cross inoculations on a wide range of host plants show that *Protomyces macrosporus* Unger is represented by at least seven distinct races or biologic species as follows: f. spp. *Aegopodii*, *Heraclei*,

Chaerophylli, *Chaerefolii*, *Carvi*, *Ligustici*, and *Laserpitii*. The species is confined in its parasitism to the Umbelliferae but the various strains possess a relatively wide host range. Another species, *P. inundatus* Dang., is confined to a single host species, *Apium nodiflorum*. Several species of *Protomyces* occur on members of the Compositae. In addition to *P. pachydermus* Thüm. on *Taraxacum officinale* and *P. Kreuthensis* Kühn on *Aposeris foetida*, four new species are described and figured by the author; *P. Kriegerianus* on *Leontodon*, *P. Picridis* on *Picris*, and *P. Crepidicola* and *P. paludosae* on *Crepis*. In *Protomyces* and *Protomycopsis* the spores develop in the elongated endospore, and in *Protomyces* they copulate in pairs at maturity. In *Volkartia* they develop in the chlamydospore before the elongation of the endospore. In the genus *Taphridium*, also included in this family, the endospore fails to elongate. These points furnish the bases for generic separation. The author describes as new, *Protomycopsis Leucanthemi* Magnus and *P. Arnoldii* Magnus on *Chrysanthemum* and *Leontodon*, respectively, *P. Chrysanthemi* on *Chrysanthemum alpinum* and *P. Leontodontis* on *Leontodon autumnalis*. In the genus *Volkartia*, the species *V. umbelliferarum* (Rostr.) v. Büren and *V. rhaetica* Maire are discussed. A colored plate pictures the characteristic lesions produced on the host by various species. The copulation of spores in *Protomyces* is illustrated, the spores being shown as uninucleate and nuclear fusion following cell fusion.—H. M. Fitzpatrick.

3390. FONTOYNONT, M., et P. SALVAT. Sur une Actinomycose du Rat à Madagascar. [An actinomycosis of the rat in Madagascar.] Bull. Soc. Path. Exotique 15: 596-607. Fig. 1. 1922.—The *Actinomyces* concurrently described by Langeron [Bot. Absts. 12, Entry 3393] is here treated at length. The symptoms are described in detail and a discussion of the parasite in the host and in pure culture is given. The best growth was secured in peptone glycerin gelatin with the addition of 4 per cent glucose or maltose, and in coagulated serum; in various vegetable glycerin media (potato, carrot, and turnip) less abundant growth was secured. Inoculation experiments were performed on rabbits, guinea-pigs, and rats.—G. H. Godfrey.

3391. JUEL, H. O. Cytologische Pilzstudien. II. Zur Kenntnis einiger Hemiasceen. [Cytological studies in the fungi. II. Concerning some Hemiascaceae.] Nov. Act. Reg. Soc. Sci. Upsal. Ser. 4, 5: 1-43. Pl. 1-2, fig. 1-4. 1921.—The nuclear divisions in *Endomyces decipiens* are shown to be mitotic, not amitotic as described by other authors for related forms and apparently the reduction division occurs in the ascus. In the author's previous studies on *Dipodascus albidus* no mitotic figures were seen. Reexamination of his preparations has resulted in the discovery of a fusion nucleus in spireme, and another showing the telophase of the first division. Both are figured. It is called to attention that von Büren has separated the species of *Taphridium* into two groups including in the genus *Volkartia* Maire (emend.), *V. umbelliferarum* and *V. rhaetica*, while retaining *T. algeriense* in *Taphridium*. No adverse comment is made on the recognition of two genera, but it is pointed out that *T. umbelliferarum* is the type species of *Taphridium*. Therefore as *V. rhaetica* Maire is congeneric with it *Volkartia* is a synonym for *Taphridium*, and a new genus name is necessary for the species *T. algeriense*. In *T. umbelliferarum* as in other members of the Protomycetaceae the spores are formed in a peripheral layer. Two nuclear divisions were seen to take place and it is thought that a third follows. Conjugate divisions apparently take place in the vegetative cells of the species of *Taphrina* investigated. In the asci of most of the species 3 typical mitoses occur. In *T. aurea* these divisions may be amitotic. In this species and in *T. carnea*, only one of the eight nuclei is incorporated in a spore. The ascogenous cell of *Taphrina* may be considered a chlamydospore which soon germinates, the endospore growing out into an ascus. The *Endomyces* type may have arisen from the *Dipodascus* type by a reduction in the number of nuclei. In like manner the *Taphrina* type may be derived from the type present in the Protomycetaceae.—D. S. Welch.

3392. KILLIAN, CH. Le développement du Stigmatia Robertiani Fries. [The development of Stigmatia Robertiani Fries.] Rev. Gén. Bot. 34: 577-588. Pl. 14-17, fig. 1. 1922.—The fruit-bodies of this fungus are found on the surface of the leaves of *Geranium Robertianum*. The fungus is confined to the surface of the epidermal layer and there is no appreciable injury to the neighboring cells. No conidial fructification has been observed. There is a thickening

of the layer of hyphae in certain places to form carpophores and within these, archicarps are formed which quickly become ascogonia, there being one in each carpophore. An antheridium develops from a neighboring cell and fertilization takes place. Ascogenous hyphae develop bearing ascus hooks. They are very short and do not branch. In the simplicity of its sexual apparatus *Stigmatea* resembles the Erysiphaceae. A remarkable similarity is also seen when this form is compared with *Dothidella Ulmi* and *Cryptomyces Pteridis*. The lack of conidia in *S. Robertiani* is compensated for by the abundant development of ascogenous tissue. The leaves of the host remain alive all winter and conditions are favorable for continuous growth. Since there is abundant and continued growth of carpophores a complicated system of ascogenous hyphae is not necessary for a continuous production of asci and spores.—*D. S. Welch*.

3393. LANGERON, MAURICE. *Actinomyces Salvati* n. sp. nouveau *Microsiphoné malgache*. [A new microsiphon from Madagascar.] Bull. Soc. Path. Exotique 15: 526-528. 1922.—Salvat, Director of the Pasteur Institute of Tananarive in 1910, obtained cultures of a microsiphon from lesions in a rat [Bot. Absts. 12, Entry 3390.] These were submitted to Langeron for identification who describes it as a new species *Actinomyces Salvati*. Langeron agrees with Breed and Conn that *Actinomyces* Meyen, 1828, and *Actinomyces* Harz, 1877, are not synonymous, and places this organism in the genus *Actinomyces*.—*G. H. Godfrey*.

3394. LANGERON, MAURICE. Sur un champignon d'une otomycose brésilienne: *Sterigmatocystis Hortai* n. sp. [A fungus associated with a case of ear mycosis in Brazil.] Bull. Soc. Path. Exotique 15: 383-384. Fig. 1. 1922.—The fungus found in connection with a case of ear mycosis in Brazil was entrusted to the author for identification. It was found to be a *Sterigmatocystis*, the organism being found in a bit of the dried membrane found in the ear of the patient and in pure cultures derived from this source. The name *Sterigmatocystis Hortai* is proposed and a description given.—*G. H. Godfrey*.

3395. LANGERON, MAURICE, et P. HORTA. Note complémentaire sur le *Cladosporium Wernecki* Horta, 1921. [Complementary note on *Cladosporium Wernecki* Horta.] Bull. Soc. Path. Exotique 15: 381-383. Fig. 1. 1922.—A full description of an organism producing lesions on a patient in Brazil, the symptoms of which were described in a previous paper. The fungus shows a remarkable polymorphism. On glucose or maltose gelatine a Fumago-form appears, with roundish minutely porose elements, thick walls, sometimes distinctly colored; on carrot, a Dematium-form appears, with mycelium formed of short elements which give rise to blastospores, simple or septate, which themselves may bud. It results in the production of innumerable yeast-like forms, which give the culture a moist shiny appearance. Finally in carrot bouillon there appears a delicate mycelium which gives rise to a large quantity of conidia of the *Cladosporium* type. This polymorphism agrees with the findings of other workers in connection with organisms from similar sources, and confirms the authors in their determination of the fungus as a *Cladosporium*.—*G. H. Godfrey*.

3396. LEGER, MARCEL, et MAURICE NOGUE. Mycose à *Scopulariopsis* chez deux malades ayant des lésions cutanées rapellant la lèpre. [Mycosis due to *Scopulariopsis* in the case of two patients having cutaneous lesions resembling leprosy.] Bull. Soc. Path. Exotique 15: 654-661. Fig. 1-3. 1922.—Two patients at the hospital at Dakar showed symptoms of dermatosis which were clinically similar, and which developed the same fungus when cultured. The fungus is classified with the Fungi Imperfecti, family Conidioporeae, sub-family Sporophoreae, after the classification of Vuillemin. It differs from Vuillemin's *Acremonium potronii*, and also from Castellani's *Scedosporium*, found in cases of mycosis. The writer considers that he is dealing with a *Scopulariopsis*, his species being different from several described by Brumpt. He proposes the name *Scopulariopsis leproides* and gives cultural and morphological descriptions, clinical observations and treatment.—*G. H. Godfrey*.

3397. LEVINE, MICHAEL. The origin and development of lamellae in *Agaricus campestris* and in certain species of *Coprinus*. Amer. Jour. Bot. 9: 509-533. 2 pl., 25 fig., 12 text diagr. 1922.—Previous work on the development of the Basidiomycetes is discussed at some length.

Agaricus campestris var. *Bohemia* and var. *Columbia* (?); *Coprinus ephemerus* and *C. stercorarius* were studied. The first species was grown in a mushroom cellar, the last two on agar. Material was studied both in the fresh condition and after fixation in a variety of killing fluids. The development of all 3 species was found to be similar in general to that previously described by the author for *Coprinus micaceus*. Certain conflicting results reported by other workers are thought to be due to shrinkage and consequent tearing of the tissue produced by the fixing agent. No primary annular gill cavity was found in any of the species. The primordium of the hymenium arises as pockets of palisade cells which increase in number and form small arches. The interhyphal spaces enclosed between them are the beginnings of the gill cavities. The vertical plate of hyphae between the two arches is the rudimentary trama. The palisade cells forming the vertical walls of the arch are the rudiments of the adjacent hymenia of 2 gills. Secondary or short gills arise in a similar manner, from new pockets of palisade cells intercalated at the margin of the pileus. The short gills are attached to the stipe fundament from the beginning and do not grow downward between two old gills.—E. W. Sinnott.

3398. NANNIZZI, ARTURO. Sulla forma ascofora dell'*Oidium quercinum* Thüm. [On the ascospore form of the *Oidium quercinum* Thüm.] Riv. Patol. Veg. 12: 87-90. 1922.—Perithecia of *Microsphaera quercina* (Schw.) Burr. were found on *Quercus sessiliflora* and *Q. pedunculata* under conditions which seem to offer confirmation to the hypothesis of Peglion that they develop during periods of cool weather following prolonged warm weather.—F. M. Blodgett.

3399. ОТА, М. Sur deux especes nouvelles de Dermatophytes en Mandchourie: *Microsporum ferrugineum* et *Trichophyton pedis* n. sp. [Two new species of dermatophytes in Manchuria.] Bull. Soc. Path. Exotique 15: 588-596. Fig. 1-4. 1922.—(1) A skin disease due to *Microsporum ferrugineum* is very common in Manchuria, especially among children, causing infantile baldness and a disease of the smooth skin. On the scalp it causes scaly spots which vary from 1 to several cm. in diameter and from which the hair pulls out easily. Microscopic examination of the roots of hairs from diseased spots show the presence of mycelial elements upon the surface and within the bulb. Abundant mycelium is also found within the scales. The organism is very similar to *Microsporum equinum* and *M. flavescens* but differs morphologically. Inoculations on guinea pigs were negative.—(2) In four cases of "dyshydrose" of the foot, *Trichophyton pedis* n. sp. was found. It resembles *T. niveum*, but its cultural characteristics are very different. Two types were observed, one brownish and the other violaceous in color, distinguished as *Trichophyton a* and *Trichophyton b*. The differences between the genera *Trichophyton* and *Epidermophyton* are solely clinical, there being no distinct botanical differences. It also resembles *Trichophyton ectothrix*.—G. H. Godfrey.

3400. PARKS, HAROLD E. The genus *Neotoma* in the Santa Cruz mountains Jour. Mammalogy 3: 241-253. 1922.—Along with notes on the habits of the wood rat, interesting information is given regarding the use of various species of Hymenogastraceae for food. The holes which the rat makes to get these fungi offer a very good means of locating the fructifications, as only the fully ripe, galatinizing ones are sought by the rats.—C. H. Dodge.

3401. PETCH, T. Additions to Ceylon fungi. II. Ann. Roy. Bot. Gard. Peradeniya 7: 279-322. 1922.—This paper contains the descriptions of the following new species: *Clitocybe sordida*, *Omphalia straminea*, *Hygrophorus diversicolor*, *H. mutabilis*, *H. similis*, *Russula fusco-grisea*, *Cantharellus decurrens*, *Phlebophora hyalina*, *Claudopus repens*, *Pluteus flavomarginatus*, *Pholiota badia*, *Boletus xylophilus*, *B. sylvestris*, *Polyporus inornatus*, *Fomes imitator*, *Poria endoxantha*, *P. rubescens*, *P. albocitrina*, *P. sulphurea*, *Hydnum fragile*, *H. nigrescens*, *Corticium hypochroum*, *Kordyana commelinae*, *Porothelium reticulatum*, *Cyphella flagellata*, *C. grisea*, *Dendrocypella* (gen. nov.) *setosa*, *Clavaria xylarioides*, *C. rosolana*, *C. violacea*, *Pistillaria actiniceps*, *Uromyces anotidis*, *Blastophora hedyotidis*, *Phragmidium zeylanicum*, *Uredo hyperici-japonici*, *U. meliosmae*, *U. cassiae-bicapsularis*, *U. argyreiae*, *U. phyllanthi-reticulati*, *U. cudraniae*, *U. marisci*, *U. caricicola*, *U. panici-villosi*, *U. dendrocalami*, *U. lophatheri*, *Eurotium orientale*, *Zukalia rubi*, *Zukaliopsis heveae*, *Physalospora cyperi*, *Trichosphaeria*

sparsibarba, *Desmotascus cocoes*, *Rosellinia albocincta*, *Sordaria citrina*, *S. pilosa*, *S. byssiseda*, *Sphaerella mappiae*, *S. vernoniae*, *S. senecionis*, *S. lobeliae*, *Bertia turbinata*, *B. tessellata*, *Massarina biconica*, *Lentomitia ovalis*, *Eutypa conjuncta*, *Peroneutypa variabilis*, *Melanconiella stellata*, *Thyridaria pteridis*, *Oligostroma strychni*, *Phaeodothis isachnes*, *Cladothyrium reticulatum*, *Micropetella confluens*, *Amazonia peregrina*, **Phaeoglossum** (gen. nov.) *zeylanicum*, *Phyllosticta mayilae*, *Phoma durionis*, *P. justiciae*, *P. aterrima*, *Phomopsis phaseoli*, *P. cocoes*, *Cytospora discoidea*, *Ascochyta lobeliae*, *A. cyphomandrae*, *Hendersonia obesa*, *H. rosicola*, *H. heveae*, *Asterostomella aberiae*, *Phacodiscula cudraniae*, *Gloeosporium litseae*, *G. impatientis*, *G. cryptum*, *Colletotrichum paucisetum*, *Septogloeum dumasiae*, *Acremonium roseum*, *Verticillium niveum*, *Trichothecium parasiticum*, *Monacrosporium ovatum*, *Trichocladium olivaceum*, *Septonema exaltatum*, *S. hormiscioides*, *Heterosporium wikstroemiae*, *Helminthosporium extensum*, *H. ampullaceum*, *Tubercularia nigro-maculans*, and *Tubercularia viridis*. Numerous other previously described species are recorded from Ceylon.—*E. D. Merrill*.

3402. PETCH, T. **Interim notes on entomogenous fungi.** *Ann. Roy. Bot. Gard. Peradeniya* 7: 323-327. 1922.—This paper consists of the original description of *Torrubiella tenuis* from Ceylon, *T. sublineata* from Chili, *T. barda* from Chili, and *Aschersonia intermedia* from Chili.—*E. D. Merrill*.

3403. PETCH, T. **Studies in entomogenous Fungi. II. The genera Hypocrella and Aschersonia.** *Ann. Roy. Bot. Gard. Peradeniya* 7: 167-278. Pl. 2-7. 1921.—A general monographic treatment of the known species in the two genera named, with keys, descriptions, geographic distribution, etc. Twenty-nine species of *Hypocrella* and thirteen of *Aschersonia* are fully described and discussed. Four others of the first genus and three of the last are indicated as not having been seen by the author. Three species of *Hypocrella* are considered as doubtful, while about twenty-four species placed by various authors in the two genera are excluded. The following new names appear: *Hypocrella olivacea* Petch, *H. ceramichroa* Petch (*Hypozygon* Berk. & Br.), *H. nectrioides* Thaxter, *H. oxystoma* Petch (*Hypocrea* B. & C.), *H. tubulata* Petch, *H. andropogonis* Petch (*Aschersonia* P. Henn.), *Aschersonia brunnea* Petch, *A. flava* Petch, *A. colomnifera* Petch, and *A. acutispora* Petch.—*E. D. Merrill*.

3404. RAYNAUD, M., J. MONTELLIER, et A. LACROIX. **Un case de mycétome de pied à Nocardia madurae, chez un indigène algérien.** [A case of mycetoma of the foot in an Algerian native.] *Bull. Soc. Path. Exotique* 15: 379-381. 1922.—The authors report another case of mycetoma, the sixth observed in Algeria. The clinical history of the case is given in some detail. Attempts to culture the organism were at first unsuccessful, even on the most diverse culture media. Finally cultures were obtained in tubes of Sabouraud glucose gelatine containing blood, incubated at 27°C. Growth occurred after fifteen days. Transfers to tubes of the same medium gave typical reddish cultures of *Nocardia madurae*.—*G. H. Godfrey*.

3405. REICHENSBERGER, A. **Neue eigenartige Parasiten von Termiten.** [A peculiar new parasite of Termites.] *Soc. Fribourgeoise Sci. Nat. Bull.* 26. (1-12 of separate.) 1922.—The author describes *Termitaria Thaxteri* n. sp. on *Eutermes Ripperti*, *E. arenarius* and *Cornitermes cumulans*, and discusses other species of *Termitaria*.—*C. W. Dodge*.

BACTERIA

3406. LIPMAN, JACOB G., and SELMAN A. WAKSMAN. **The oxidation of selenium by a new group of autotrophic microorganisms.** *Science* 57: 60. 1923.—This is a preliminary announcement of the finding of a new autotrophic form of bacteria. It is a minute, rod-shaped bacterium, capable of obtaining its energy only from the oxidation of selenium to selenic acid.—*C. J. Lyon*.

3407. MILLER, E. C. L., and G. F. REDDISH. **Specific terms for the proteolytic activity of anaerobes.** *Science* 57: 23-24. 1923.—It is proposed to qualify the term "proteolytic" by such specific terms as sarcolytic (dissolution of flesh), peptolytic (dissolution of peptone), gelatinolytic (dissolution of gelatin), etc., in the interests of greater accuracy.—*C. J. Lyon*.

3408. OLITSKY, PETER K., and FREDERICK L. GATES. *Investigations on the bacteriology of epidemic influenza*. Science 57: 159-166. 1923.—The investigations have resulted in the isolation, from the naso-pharyngeal secretions of influenza patients, of a new organism, *Bacterium pneumosintes*. This organism is filterable, anaerobic and pathogenic for rabbits, producing infection comparable to influenza in man. Animals injected with living or killed organisms are thereafter immune. Subcutaneous injections of killed cultures into men induced the formation of specific antibodies. The blood serum of recovered influenza patients contains agglutinins for the isolated organism but that of normal persons does not. It seems reasonable, though not at this time desirable, to claim this organism to be the cause of epidemic influenza.—C. J. Lyon.

PALEOBOTANY AND EVOLUTIONARY HISTORY

E. W. BERRY, *Editor*

(See also in this issue Entries 2986, 2990, 3339, 3365, 3581)

3409. BERRY, EDWARD W. *Tertiary plants from the Andes of Cajamarca, Peru*. Amer. Jour. Sci. 5: 239-246. Fig. 1-6. 1923. The author describes the new species *Goniopteris Bravoi*, *Filicites peruanus*, and *Myrcia cajamarcana*, late Tertiary plants, from tuffs exposed near Jadibamba in the Department of Cajamarca in northern Peru. These indicate considerable uplift since they were fossilized.—E. W. Berry.

3410. BERRY, EDWARD W. *Sagenopteris, a Mesozoic representative of the Hydropteraceae*. Bot. Gaz. 74: 329-331. Fig. 1. 1922.—The author reports the occurrence of Marsilia-like sporocarps in the lower part of the Blairmore formation of western Canada. The name *S. canadensis* is given to the material, although the writer suggests that these sporocarps doubtless belong to the widely distributed *S. elliptica* Fontaine. This material, the author believes, confirms his earlier opinion that *Sagenopteris* is related to the recent Hydropteraceae.—B. W. Wells.

3411. CARPENTIER, A. *Revue des travaux de paléontologie végétale publiés dans le cours des années 1910-1919. 1^{re} Partie: Paléozoïque. (Suite.)* [Review of the works in vegetable paleontology published during the years 1910-1919. Pt. I. Paleozoic. Rev. Gén. Bot. 33: 437-448, 471-477, 558-576, 653-672, 771-791. 1921. 34: 65-70, 124-133, 166-170, 237-250, 300-310, 367-375, 417-424, 463-470, 508-518, 556-563, 604-611. 1922.

3412. CHAPMAN, F. *On a fossil filamentous alga and sponge-spicules forming opal nodules at Richmond River, N. S. W.* Proc. Roy. Soc. Victoria 34: (N. S.): 167-171. Fig. 1-2. 1922.—Microscopical examination of sections of common opal from the diatomaceous deposits of the Richmond River at Tintenbar, New South Wales, disclosed a spicule-rock originating from fresh-water sponges and the matted thalli of a confervoid fresh water alga now silicified. This rare form is described and named *Cladophora richmondiensis*. It is attributed to the late Cenozoic, probably Pleistocene. The spicule-rock contained spicules of the *Spongilla* type. A very few traces of amphidiscs of the *Spongilla capewelli* type were seen. A few appear to resemble *Meyenia*, including a portion of what appeared to be the head of a birotulate spicule with a denticulate margin resembling *Meyenia ramsayi*.—Eloise Gerry.

3413. CHANEY, R. W. *A fossil flora from the Puente formation of the Monterey group*. Amer. Jour. Sci. 2: 90-92. 1921 [see Bot. Absts. 10, Entry 1264].—This formation is from the lower or middle portion of the Miocene of southern California. The previously known flora was made up of marine algae. Recent collections contain forms referable to the modern genera of marine algae, *Desmerestia* and *Lessonia*, and the following 16 forms referable to vascular land plants of moist situations: *Aralia whitneyi*, *Bumelia florissanti* (?), *Crataegus* (?) sp., *Fagopsis longifolia*, *Ficus arenaceae formis*, *Ficus* cf. *purpureaensis*, *Fraxinus mespilifolia*, *Fraxinus ungeri* (?), *Laurus saliciformis*, *Nelumbo* (?), *Planera myricaefolia*, *Populus crassa*, *Salix* n. sp., *Sapindus* n. sp., *Sterculea* cf. *engleri*, and *Zizyphus piperoides* (?).—T. J. Fitzpatrick.

3414. EDWARDS, W. N. An Eocene microthyriaceous fungus from Mull, Scotland. Trans. British Mycol. Soc. 8: 66-72. Pl. 8. 1922.—The author describes *Phragmothyrites eocaenica* from coniferous leaves found in the Eocene of Mull, and considers it to be related to the existing genus *Phragmothyrium* von Höhnelt.—E. W. Berry.

3415. FENNEMAN, NEVIN M. Recent work in paleobotany. Science 57: 44-45. 1923.—The report of the Committee on Paleobotany of the Division of Geology and Geography of the National Research Council for 1921-1922 calls attention to the extended application of microscopic study of carbonaceous deposits and its practical bearing on the coal and oil industries, to the increase in instruction in paleobotany in the past year in two; and to the comparatively uncultivated field of microchemistry of plant residues.—C. J. Lyon.

3416. KERNER MARILAUN, FRITZ. Bauxite und Braunkohlen als Wertmesser der Tertiärklimate in Dalmatien. [Bauxite and wood coal as an indicator of tertiary climate in Dalmatia.] Sitzungsber. Akad. Wiss. Wien [Math.-nat. Kl.] Abt. 1, 130: 35-70. 1921 [1922].—A technically geological and meteorological presentation of the evidence as to the character of the early Tertiary climate in southern Europe afforded by the plant remains in alluvial deposit in Dalmatia. This part of Europe was at that time an archipelago, in which at various distances from the sea the climatic and floral features of seacoast, coastal plain and forest were found. First emerging from the sea in Paleocene times, it was submerged again in early Eocene, becoming a littoral region, then a mountainous coast in late Eocene; and finally a tidal flood plain and delta region in Oligocene.—The coal-containing deposits are from early Oligocene and Pliocene.—F. Weiss.

3417. KOZŁOWSKI, ANIELA. Sur les céréales fossiles néolithiques en Pologne. [Fossil cereals from the neolithic period in Poland.] Bull. Acad. Polonaise des Sci. et Lettres Cl. Math. Nat. Ser. B. Sci. Nat. 1920: 7-14. 1920.—This paper considers the first discoveries of neolithic cultivated cereals in Poland. From the caves of Ojców near Krakow and from loess layers in Złota near Sandomierz in connection with neolithic culture, the following species of wheat and rye were found: *Triticum monococcum*, *T. compactum*, *T. vulgare*, *T. Spelta*, *T. dicoccum* and *Secale cereale*. Of the wheat, the most interesting is *T. Spelta*, found for the first time in the neolithic period in Europe. Because *T. Spelta* was found together with *T. compactum* and *T. vulgare* (the last appearing in different forms), it is probable that at that time it was a natural cross. *Secale cereale* was also found for the first time in the neolithic period. Up to the time of this research it had been known only from the Bronze Age.—Aniela Kozłowska.

3418. KRYSHTOPOVICH, A. Pleuromeia and Hausmannia in Eastern Siberia, with a summary of recent contributions to the paleobotany of the region. Amer. Jour. Sci. 5: 200-208. Fig. 1-7. 1923.—This paper records stems and sporophylls of *Pleuromeia sternbergii* (Münster) Corda, an older Mesozoic survival of the Paleozoic Lepidophyta from the Triassic of Cape Jitkoff near Vladivostok in eastern Siberia. This species has been hitherto known only from the Bunter or lower Trias of central Europe. The author describes the well marked new species, *Hausmannia ussuriensis* of the lower Jurassic (tentatively referred to the Lias) from the western shore of Amur gulf near Vladivostok. In addition the author reviews recent, mostly inaccessible, contributions to the paleobotany of the region and lists both Jurassic and Permian plants from this district.—E. W. Berry.

3419. SCOTT, D. H. The early history of the land flora. Nature 110: 606-607, 638-640. 1922.—“Early history” is used to cover the Devonian and Lower Carboniferous periods, various plants of which are briefly discussed.—The morphology and probable relationships of *Rhynia*, *Hornea* and *Asteroxylon* are discussed. The discovery of these has quite changed our knowledge of early Devonian plants. The chief conclusion reached is that the main phyla are distinct.—O. A. Stevens.

3420. WALKOM, A. B. On the occurrence of Ototamites in Australia, with descriptions of specimens from Western Australia. Proc. Linn. Soc. New South Wales 46: 147-153. 1 pl. 1921.—A collection of *Ototamites* was examined from 3 miles north of the Mingenew Railway

Station (W. A.) at an altitude of 627 feet. The specimens were found in a ferruginous sandstone lying almost horizontally and little known stratigraphically. There were about 70 feet of sandstone associated with marine beds of Jurassic age below the plant-bearing bed. It is doubtful whether these were above or below the sandstone. Three species of *Otozamites* which were recognized are discussed: *O. Bechei*, *O. Feistmantli* and *O. bengalensis*. In addition there were coniferous fragments, *Pagiophyllum* (?) sp. and *Elatocladus* (?) sp., a doubtful cone, and indeterminate fragments of wood. The occurrence of *Otozamites* throughout Australia is discussed, and their significance with reference to early climatic conditions as indicated by the flora of the "red beds" is suggested.—*Eloise Gerry*.

DISEASES CAUSED BY FUNGI

3421. ANONYMOUS. Downy mildew in South Australia. Jour. Dept. Agric. Victoria 19: 499. 1921.—This is a brief note on the occurrence of the disease.—*F. V. Rand*.

3422. BEVAN, W. *Peronospora* campaign 1922. Cyprus Agric. Jour. 17: 84-85. 1922.—An account is given of five demonstrational spraying experiments undertaken by the Cyprus Department of Agriculture for the control of *Peronospora*. Three methods of treatment were tried in each vineyard. One lot of vines was sprayed with Bordeaux mixture; another, with Antiperonosporini; and the third with Solomia, claimed to be a new fungicide and insecticide non-poisonous and harmless to vegetation. On the first two plots sulphur was applied as a preventive of *Oidium*, but none was used on the Solomia plot. Three, and in some cases, four applications of spray materials were made during the season. Owing to dry weather unsprayed vines showed but little injury from *Peronospora* or *Oidium*, hence the results secured were not as marked as they otherwise would have been. Nevertheless the general appearance of the sprayed vines was superior to that of the unsprayed and no *Peronospora* infection was noted.—*W. Stuart*.

3423. BISBY, G. R., J. F. HIGHAM, and H. GROH. Potato seed treatment tests in Manitoba. Sci. Agric. 3: 219-221. 1923.—Seed treatment for *Rhizoctonia* is apparently of little value in Manitoba, but early digging tends to reduce the number of sclerotia on the progeny. Treatment of tubers with formalin and corrosive sublimate checked black scurf and increased the yield. Copper sulphate is neither dependable nor safe.—*T. G. Major*.

3424. BRITTLEBANK, C. C. Seed-borne diseases. "Take All," *Ophiobolus graminis*, Sacc.: "Flag Smut," *Urocystis tritici* Koern. Jour. Dept. Agric. Victoria 19: 447. 1921.—This is a brief account of the first appearance of "flag smut" and "take all" in the United States.—*Lillian C. Cash*.

3425. COLE, C. F. A new citrus disease. (*Pythiacystis citrophthora*.) Jour. Dept. Agric. Victoria 19: 363-366. 1921.—This is a notice of the first appearance of this disease in Victoria. A description of the effects of the disease and methods of treatment are given.—*Wm. E. Lawrence*.

3426. CUNNINGHAM, G. H. The second hand fruit-case as a source of fungous-disease infection. New Zealand Jour. Agric. 24: 241-243. 1922.—Infection was readily secured by inoculations with material of the brown rot fungus (*Sclerotinia cinerea* Schroet.) from fruit-cases a month after they had contained diseased fruits. All old cases should be carefully disinfected.—*N. J. Giddings*.

3427. DORAN, WM. L. **Effect of external and internal factors on the germination of fungous spores.** Bull. Torrey Bot. Club 49: 313-340. Fig. 1-2. 1922.—The germination of spores of several different types and of seven species of fungi was studied. For parasitic fungi, germination was better when the spores were obtained from the living host rather than from artificial media. The more mature the spore, the more easily it can be germinated. A study of longevity of spores showed that viability decreased rapidly with age, the rate of such decrease depending partly on storage conditions. Temperature relations are such that spores of Phycomycetes can germinate at the lowest minimum temperature, followed in order by urediniospores, aeciospores, and teliospores of Uredinales. The optimum temperatures, however, do not form an exactly parallel series. The time required for spore germination is decreased by approach of all conditions to an optimum. Germination takes place in either light or darkness, and in some cases in water vapor alone, that is, without precipitated moisture.—P. A. Munz.

3428. HOWITT, J. E. **Two diseases new to Ontario.** Sci. Agric. 3: 189. 1923.—Pink root of onions, caused by *Fusarium mali* Taub., and white rot of grapes, caused by *Coniothyrium diplodiella* (Speg.) Sacc. are reported as causing losses in Ontario.—T. G. Major.

3429. KAUFFMAN, C. H., and H. M. KERBER. **A study of the white heart-rot of locust, caused by *Trametes robinophila*.** Amer. Jour. Bot. 9: 493-508. 3 fig. 1922.—A locust tree attacked by this fungus was carefully studied and the diseased area in the wood traced. This may be divided roughly into 3 zones; the black border zone, a fine but distinct brownish-black line separating decayed from apparently sound wood; the lesser decayed portion, still solid in texture but much softer and lighter in texture than sound wood; and the last stages of decay, where the wood is dry and crumbling. These zones and their various constituent elements were tested for cellulose and lignin, and the lignin was found to disappear progressively as decay advanced. The normal wood and that of the 3 diseased zones was also studied histologically. The black border zone seemed quite normal except for holes in the cell walls caused by hyphae, but no mycelium was observable here. The blackish substance seems to be insoluble and its cause and character are unknown. In the lesser decayed zone the hypha holes are notably larger but no hyphae are present. In the badly decayed area the parenchyma cells and vessels are broken down and the wood is held together chiefly by the fibers. No mycelium was found here. In the apparently sound wood just outside the blackish zone, however, mycelium was found in abundance, particularly in ray cells and wood parenchyma. Compression tests of sound wood and of the apparently sound wood just outside the decayed zone showed that the latter was markedly weaker, presumably because of this "advance rot." The problem as to what becomes of the mycelium in the decayed wood is discussed.—E. W. Sinnott.

3430. MANARESI, ANGELO. **La "Sphaerotheca Mors-uvae" (Schw.) Berk. nell' Emilia.** [*Sphaerotheca Mors-Uvae* in Emilia.] Riv. Patol. Veg. 12: 83-84. 1922.—Gooseberry mildew is reported for the first time from Emilia (in Italy) in the summer of 1922 although growers said it had been present for about two years.—F. M. Blodgett.

3431. MELCHERS, LEO E., and JOHN H. PARKER. **Rust resistance in winter-wheat varieties.** U. S. Dept. Agric. Bull. 1046. 32 p., 11 pl. 1922.—Field experiments to determine the resistance to black stem rust (*Puccinia graminis tritici*) of about 100 varieties and strains of winter wheat,—many of them pure-line selections, and a few of them varieties of spring wheat,—were conducted in a rust nursery at Manhattan, Kansas, during the period 1915-17. Special methods were developed for producing severe rust epidemics under the prevailing climatic conditions of Kansas. All winter-wheat varieties grown were found to be susceptible to stem rust except Kanred and two very similar pure-line selections, P1066 and P1068. Plumpness of kernels is usually reduced by severe rust attack. Of spring wheats, Black Persian was the only bread-wheat (*Triticum vulgare*) which was found resistant, but of the durum or macaroni wheats (*T. durum*) there were several resistant varieties. Strains of emmer and einkorn gave some evidences of rust-resistance. In the non-resistant varieties prominent flecks are nearly always present in 8-12 days after inoculation, and most frequently small

uredinia are produced, but in these three varieties which are very rust-resistant flecks are very rarely visible and no uredinia were found. Reports are also given of these varieties in other states where they were in nearly all cases rust-resistant. Distinct strains of stem rust complicate the problem. Perhaps this is why these varieties were not resistant in S. D. and Minn. In Kansas, Kanred yields 3-5 bushels more per acre than the varieties commonly grown. It also ripens earlier and thus escapes some damage by drought and hot wind. It suffers less from winter injury and is equal to the common varieties in milling and baking qualities. Kanred has also proved very satisfactory with farmers and under experimental conditions in Okla., Texas, Nebr., Eastern Colo., and some other states.—*J. T. Buchholz.*

3432. NANGERONI, G. L. *Un oidio delle Cinerarie*. [An *Oidium* of *Cinerarias*.] Riv. Patol. Veg. 12: 85-86. 1922.—An *Oidium* was found attacking young *Cinerarias* but as the perithecial stage was not found the fungus was not determined. It was controlled by sulfuring and the removal of affected leaves.—*F. M. Blodgett.*

3433. RAVAZ, L., et G. VERGE. *Sur la germination des spores du mildiou de la vigne*. [The germination of spores of grape mildew.] Ann. Ecole Nation. Agric. Montpellier 17: 242-245. 1918/1919.—It was found that Bordeaux mixture prevents the germination of mildew (*Plasmopara viticola* (B. & C.) Berl. & DeT.) spores for a long time.—*F. F. Halma.*

3434. SPAULDING, PERLEY. *Investigations of the white pine blister rust*. U. S. Dept. Agric. Bull. 957. 100 p., 6 pl., 13 fig. 1922.—*Cronartium ribicola* has been found on 11 species of white pine but is not known to attack any of the pitch pines. Practically all of the cultivated species of *Ribes* and most of the wild ones have been infected naturally in every extensive outbreak area. The outbreaks of the parasite show that most of the newly formed aecia on the pines are located on nodes and internodes that are three years old or over. The aeciospores are not known to infect pines but readily infect *Ribes* leaves miles away from their source; the urediniospores are not known to infect pines but infect *Ribes* at a distance of several hundred yards. The sporidia produced by the teleospores are not known to infect *Ribes* but do infect pines. Infection by the latter is limited to between 100 and 600 yards and generally only under favorable weather conditions as they are very short lived and easily killed by desiccation. The fungus commonly overwinters on the pine by means of the mycelium, presumably in the needles and very certainly in the bark of the infected white pines. Occasionally it may overwinter by means of the aeciospores in cankers of pine bark or by the urediniospores on *Ribes* leaves, but the aeciospores produced by the overwintered mycelium in the pine bark are the principal source of infection of *Ribes* in the spring. The aeciospores carry the disease far and wide to new *Ribes* leaves and, once started, the urediniospores intensify the disease among the *Ribes* plants. The sporidia carry the disease back to those pines which are near infected *Ribes* bushes. High humidity of the air is necessary for any of the spore forms to germinate and produce infection. Periods of moist weather of 54 hours or longer occurring after June 1 may cause infection in or about the bases of the leaf fascicles of the pines. Wind has been recognized as the most efficient and active agent in the dissemination of spores, though insects and animals such as mice and squirrels are possible means of spread. Control experiments in America and Europe are discussed together with the present status of the problem of control.—*J. T. Buchholz.*

3435. STEVENS, F. L. *The Helminthosporium foot-rot of wheat, with observations on the morphology of Helminthosporium and on the occurrence of saltation in the genus*. Bull. Illinois Nat. Hist. Surv. 14: 77-185. Pl. vii-xxiv, fig. 1-23 and A-Y. 1922.—The symptoms include a rotting of the basal portion of the stem. No weft of superficial mycelium or black incrustation as described for "take-all" were observed. Various fungi were isolated by plating methods, but *Helminthosporium* was the only one constantly found. Growth on various agars is described in detail. Several *Helminthosporium* strains isolated were compared. Rice tubes gave very striking and distinctive colors with a number of the *Helminthosporiums*. The colors varied in different regions of the tube. Other grain media gave color reactions. The important constituents for color reactions seem to be in the aleurone

layer. Cereal seeds (wheat, oats, corn, rye, and barley) were disinfected and sprouted in moist chambers. These were inoculated and all became infected. Corn shoots gave the most luxuriant growth.—A study was made of environmental factors which induced variations. The quantity of nutriment available influenced growth characters. Inhibitory influences increased sporulation. Increased humidity of media (rice) increased growth, but decreased formation of sclerotia. Decreased air humidity resulted in increasing the number of conidia per conidiophore, in reducing the modal mean and length and in increasing the variability.—The optimum growth temperature was found to be about 25°C. Light caused no variations.—Nutritional conditions affected conidial length, septation and shape.—An extensive study was made of the morphology of the mycelium, conidiophores and conidia under standard conditions which are described. The cells of the mycelium are multinucleate.—Special mathematical formulae are given for determining accurately the “coefficient of longitudinal eccentricity” and “coefficient of cylindricity” of the conidia.—“The etiological relation of *Helminthosporium* (H No. 1) to foot-rot was demonstrated by its constant presence, by the absence of other parasites, and by its proved ability to cause infections and rotting under various conditions.”—Many strains of *Helminthosporium* differing morphologically were found to infect and cause rotting in the wheat seedlings. Other fungi tested sometimes infected but did not produce general rotting. “Wheat, corn, barley, rye, sorghum, Sudan-grass, and millet are more or less susceptible to rot by *Helminthosporium*.”—The second part of the article is devoted to an extensive study of saltation within the genus *Helminthosporium*.—“Saltation, possibly mutation, is common in certain races of *Helminthosporium*. Saltation is evidenced in general colony character; rate of growth; conidial production; conidial clusters; conidial length, and breadth; septation, and shape; mycelial characters, color, zonation, and sclerotial formation. Certain saltants differed so markedly from their parents as to far exceed the usually accepted specific limits. Certain correlations and tendencies of characters in saltation were noted. The saltants were, in the main, permanent in character. They were permanent through the conidia. What appeared to be reversions sometimes occurred. Efforts to produce saltations artificially failed. The saltation was not due to mixed plantings, and cannot be induced by implanting or wounding. They are not due to parasites. Saltations in abundance were derived from single conidium cultures. Numerous variations in test tube cultures are reported as probable examples of saltations.”—It is the writer's conclusion that the *Helminthosporium* causing foot-rot belongs to the *Helminthosporium sativum* group which consists of a large number of elementary species.—An extensive bibliography is appended.—H. W. Anderson.

3436. WEBER, GEORGE F. II. *Septoria* diseases of wheat. *Phytopathology* 12: 537-585. Pl. 33-36, fig. 1-16. 1922.—There are 2 distinct diseases of wheat (*Triticum* sp.) produced by species of *Septoria*, (1) the “glume blotch” produced by *S. nodorum* Berk. and (2) the leaf disease produced by *S. Tritici* Desm., here designated “speckled leaf blotch.” Both diseases are quite generally distributed over Europe and North America; and either one may occasionally cause serious loss. The disease produced by *S. nodorum* has been designated “glume blotch” because of the distinct, dark brown, dead areas produced on the glumes and lemmas; but, under conditions specially favoring infection, it also attacks the leaves, the nodes, the culm, and the rachis. The diseased nodes become dark brown to almost black. On the culm the diseased areas are lighter in color and may extend over an entire internode. Inoculations were made by spraying water suspensions of pycnosporos on plants of 41 species or varieties of cereals and related grasses. Infections resulted on all the species of *Triticum*, on *Secale cereale*, and on *Poa pratensis*. In nature infections may occur during any season of the year when the temperature is sufficiently high to allow spore germination. Pycnidia formed in the fall contained pycnosporos that gave 100 per cent germination the following spring. The physiological reactions of the fungus have been studied in cultures and the results throw much light on some characteristics of the disease produced by it.—The “speckled leaf blotch,” produced by *S. Tritici*, is typically a leaf disease. No other parts of the plants are attacked. In the fall, circular or oval, light green areas, thickly dotted with the black pycnidia of the fungus, appear on the leaves of the young plants. After growth starts in the spring the spots gradually elongate

and change to a reddish-brown color. They are at first delimited by the larger veins, but finally involve and kill the entire leaf. Often the entire seedling plant is killed. The fungus was isolated and studied in cultures. Inoculations were made on wheat with conidia and pycnospores from cultures and with pycnospores from the host plants and the disease was reproduced in all cases. Further inoculations were made on about 40 species of cereals and grasses. Infections resulted on the leaf and leaf sheath of *Triticum* sp., on *Secale cereale*, and on *Poa pratensis* but not on any other plants inoculated. Plants of 245 varieties of winter wheat were inoculated and 100 per cent infection was obtained on all varieties. The fungous hyphae are intercellular. The pycnidia develop in the substomatal cavity.—*B. B. Higgins.*

DISEASES CAUSED BY BACTERIA

3437. GARDNER, MAX W., and JAMES B. KENDRICK. **Bacterial spot of cowpea.** *Science* 57: 275. 1923.—This rather destructive disease from Indiana is marked by maroon spots on nearly all parts of *Vigna sinensis* (L.) Endl. By isolations and inoculations the cause has been determined to be a new species, *Bacterium vignae* n. sp. Detailed morphological and cultural characteristics are given. The group number is 211.2322033. Control of the disease lies in the use of seeds from disease-free pods.—*C. J. Lyon.*

3438. RAND, FREDERICK V. **Bacterial wilt or Stewart's disease of corn.** *The Canner* 56¹⁰, Pt. II: 164-166. 1 fig. 1923.—This paper gives some of the practical results of investigations by F. V. Rand and L. C. Cash relative to bacterial wilt of corn (*Aplanobacter Stewarti* (EFS) McCul.). This is a disease of the middle and southern U. S. A. The symptoms, cause, damage done, and relation to soil and climatic conditions are discussed. Numerous data seem to indicate that soil transmission is largely a negligible factor. Seed transmission occurs but is not as important as formerly supposed, save in introducing the disease. Experimental results show that insect dissemination must be reckoned with. A close correlation exists between resistance to wilt and the length of time required to reach maturity, the late varieties being most resistant. The only practical methods of control so far known consist in planting resistant sorts, or growing susceptible varieties only in the northern border states where the disease is not known to occur.—*Frederick V. Rand.*

DISEASES CAUSED BY ANIMAL PARASITES (INSECTS NEMAS, PROTOZOANS, ETC.)

3439. DEMAREE, J. B. **Kernel-spot of the pecan and its cause.** *U. S. Dept. Agric. Bull.* 1102. 15 p., 5 fig. 1922.—According to the results of this investigation pecan kernel-spot is not due to the fungus *Coniothyrium caryogenum* Rand but to punctures of southern stink bugs (*Nezara viridula*). In 200 out of 250 clusters of Schley and Curtis pecans which were incased with wire, from five to seven specimens of the bugs were confined 5-8 weeks and 50 were left without the insects as controls. None of the latter showed any signs of kernel-spots, while of the nuts caged with bugs 97.6 per cent bore typical kernel-spot. Nuts with which bugs were confined in the laboratory developed kernel-spot in 65 hours but no microorganisms developed from these spots in Petri dish culture. No one organism was found constant in pecan kernels affected with kernel-spot. In 416 cultures of kernel-spots, 265 remained sterile, 71 grew fungi and 80 developed bacteria. Eight species of fungi and 3 of bacteria which were isolated are considered saprophytic; none of these produced typical kernel-spots. The cause of kernel-spots is "attributed entirely to the mechanical rupturing of the host cells, to the sucking of the the plant juices, to the injection of toxic substances into the tissues, or to all three types of injury." Possible control measures are suggested.—*J. T. Buchholz.*

3440. FELT, E. P. **A new gall midge on rushes (Dipt., Cecidomyiidae.).** *Entomol. News* 33: 166-168. 1922.—This is a description of a gall midge reared from *Juncus dudleyi* collected at Centralia, Illinois. The gall is not described, but the author indicates that it is a deformation of the fruit. This is the first definite record from *Juncus*.—*O. A. Stevens.*

3441. FRANÇA, C. Sur les flagellés parasites des latex (à propos de la note de M. Franchini). [On the flagellates of the latex.] Bull. Soc. Path. Exotique 15: 408-410. 1922.—The author refers to Franchini's discussion of his last paper on flagellosis of the Euphorbias, and defends his earlier position with regard to the rôle of the insect *Stenocephalus agilis* as the carrier of the disease in Portugal. *Stenocephalus* is considered the primitive host, in which the leptomonads develop to the metacyclic salivary forms. Besides this insect it is possible that others may transmit the disease mechanically to plants on which they feed.—G. H. Godfrey.

3442. FRANCHINI, G. Essais d'inoculation de différents protozoaires dans le latex des euphorbes. [Attempts to inoculate different protozoa into the latex of the Euphorbias.] Bull. Soc. Path. Exotique 15: 792-795. Fig. 1-2. 1922.—In a previous paper the author, with Laveran, demonstrated the possibility of infecting certain Euphorbias with cultures of *Herpetomonas ctenocephali* var. *Chattoni*. He here describes other experiments along the same line, in which flagellates from diverse sources were used to inoculate several different species of *Euphorbia*. The plants were enclosed in such a way as to prevent the entrance of insects, and check plants were provided. Two plants of *Euphorbia ipecacuanha* were infected with cultures of the kala-azar organism of Indian origin. The parasites appeared 15 to 20 days after inoculation into the latex; at first rare, they finally became numerous. Three months after the inoculation the parasites were still not infrequent. The plants turned yellow and most of the leaves fell; the stalks were arrested in their development, and the sprouts wilted, while the check plants remained in good condition. The latex of the sick plants was very pale, thin, and starch bodies were rare. Typical parasites in different stages of division and of development were readily found in the latex of the diseased plants; and, in sections of the smaller branches, also in the lactiferous vessels and even in the tissues of the plant. A plant of *Euphorbia geniculata* was successfully inoculated with *Herpetomonas Muscae-domesticae*. The parasites found in the latex resembled those in the other case described. Other inoculation attempts were mostly negative. It is considered of great interest, however, that plants were infected with protozoa of human origin.—G. H. Godfrey.

3443. FRANCHINI, G. Flagelles et amibes d'une Urticacee exotique, *Ficus parietalis*. [Flagellates and amoebae of an exotic species of the Urticaceae.] Bull. Soc. Path. Exotique 15: 399-404. Fig. 1-3. 1922.—The writer reports on a flagellate in the fruits of *Ficus parietalis* in the greenhouses of the Paris Museum. The affected fruits appear yellowish, the peel is fleshy and the inside spongy. The grayish latex is very abundant, the reaction acid. Fresh mounts of the latex show an elongate parasite sometimes with a very fine flagellum. In addition to this form which belongs close to the *Herpetomonas* group, numerous trypanosomes were seen. These were mostly larger than those found in the Euphorbias. Similar forms to those found in the fruits were seen in latex from the trunk, branches, and leaves of the plant. Cultures were made from fruits and from the trunk on Nöller plates and in Yoshida tubes, and good growth was secured, especially in the former. Histological studies of sections of fruits gave interesting results. Iron-haematoxylin and eosin were the best stains. The thick cortical substance was not invaded uniformly by the parasites, but here and there little islets of tissue were full of them. The spongy medullary tissue was completely invaded.—G. H. Godfrey.

3444. FRANCHINI, G. Sur une amibe particulière d'une Asclépiadacée. (*Chlorocodon Whitei*.) [A specific amoeba of one of the Asclepiadaceae.] Bull. Soc. Path. Exotique 15: 393-398. Fig. 1-3. 1922.—An amoeba, differing from those previously described is reported in *Chlorocodon Whitei*, from the greenhouse of the Paris Museum. Vegetative forms show accentuated amoeboid movements, sometimes with the emission of pseudopods. The nucleus is round or diffuse, with rare vacuoles. Smaller encysted forms with thicker protoplasm have 1 to several nuclei and differentiated ectoplasm and endoplasm. Cultures on Nöller's medium show growth on the third day at 24°C. in the form of a light scum. Some of the cultured amoebae are seen to be mobile. After 10 to 15 days numerous amoebae variable in size were observed. The largest possessed long pseudopods and appeared in clumps. Some very slender amoebae measured 60-80 $\mu \times$ 4-10 μ . They showed the nucleus in one end, or, in division stages, one at

each end. Sometimes the nucleus is almost as long as the organism. Other amoebae with several pseudopods show several nuclei. Small and medium forms and encysted forms have 1 to several nuclei. Bacteria were never seen within the protoplasm of the parasites, even after contaminations were purposely introduced into the cultures. Multiplication of the amoebae took place more abundantly in the depths of the culture than on the surface. Stained mounts showed differentiation between ectoplasm and endoplasm in the large vegetative forms, and the long pseudopods were mostly ectoplasmic in structure. The nucleus is surrounded by a nuclear membrane and possesses a round nucleole. The zone between the membrane and the nucleole stains feebly and is never granular, in all respects resembling the form seen in the latex. Division is by mitosis, instead of by schizogony. These amoebae do not ingest either red blood corpuscles or bacteria from the medium.—The author is convinced that the amoebae belong to one species which he calls *Amoeba Chlorocodonis*. It lies near the group *Vahlkampfia*, differing in some respects, including the seeming lack of a flagellate stage. Nothing is known as to the possibility of an animal host, except that the organism does not ingest red blood corpuscles. In this respect it differs from other amoebae studied, especially those found in the latex of Apocynaceae.—*G. H. Godfrey*.

3445. FRANCHINI, G. Sur une amibe de la laitue (*Lactuca sativa*). [An amoeba from lettuce.] Bull. Soc. Path. Exotique 15: 784-787. Fig. 1. 1922.—The writer examined numerous lettuce plants in the vicinity of Bologna, finding bacteria in some but no flagellates. In a single instance amoebae were found in a plant that appeared sick, but that did not differ from other plants injured by the heat. The amoebae differed in form and dimensions, showed some movement, delicate protoplasm, rare vacuoles, and no differentiation between ectoplasm and endoplasm. The nuclei possessed nucleoli. Division forms were seen in stained mounts. Cultures were secured on Nöller's medium at about 30°C. The amoebae multiplied, and forms similar to those in the latex were seen. Some of them ingested red blood corpuscles, but this was less manifest than with those from certain Apocynaceae and Urticaceae. Encysted forms were rarely seen. It follows from the above that one can find amoebae in the Compositae, as well as in the other latex bearing plants. Another Composite, *Lactuca virosa*, was examined, without, however, finding the parasites.—Reference is made to a paper by MUSGRAVE, W. E. and M. T. CLEGG [Amoebas: Their Cultivation and Etiologic Significance. Bur. Gov. Lab. Manila Publ. 31. 3-95. 1904.] in which they describe an amoeba found on lettuce leaves. Cultures were made on ordinary bouillon and on solid media. Experimental inoculations were performed on monkeys, and an amoebic dysentery produced. This was in a region near Manila, Philippine Islands, where amoebic dysentery is common. It is believed by the author that the present case is similar to those described in other latex bearing plants, and that the organism was deposited on the plants by insect carriers and penetrated to the interior through lesions. The organism is called *Amoeba lactucae* n. sp.—*G. H. Godfrey*.

INFECTIOUS CHLOROSIS (MOSAIC AND PEACH YELLOWS GROUPS, ETC.)

3446. SCHULTZ, EUGENE S., and DONALD FOLSOM. A "spindling-tuber disease" of Irish potatoes. Science 57: 149. 1923.—It has been found that spindle shaped tubers are not necessarily the result of reversion or "running-out" but are the result of an infectious disease. This disease has been transmitted by tuber grafts, leaf-mutilation inoculation and in other ways. No mention is made of the specific causal organism. The tubers perpetuate the disease, which slowly reduces the yield from year to year if spindling tubers are used for propagation.—*C. J. Lyon*.

3447. SMITH, KENNETH M. Mosaic disease in plants. Nature 110: 668. 1922.—This is a brief note reporting the finding, in the tissue of potato plants, bodies apparently similar to those described in maize by Kunkel.—*O. A. Stevens*.

NON-PARASITIC DISEASES

3448. BALLARD, W. S., J. R. MAGNESS, and LON A. HAWKINS. Internal browning of the yellow Newtown apple. U. S. Dept. Agric. Bull. 1104. 24 p., 2 pl. 1922.—Certain apples when kept through a long season in cold storage develop in the fruit flesh a brown discolora-

tion called "internal browning." This trouble is not caused by a parasitic organism, but by physiological conditions within the fruit. Yellow Newtown apples from the Pajaro valley are most susceptible. Here the growing season is cool with high humidity, and the soil is very fertile. Storage at 32°F. causes much greater injury than at 36°-40°F., the latter temperatures very largely preventing serious commercial losses in yellow Newtown apples. Usually the browning increases upon removal from storage. It develops mainly in orchards having high fertility and located in the California coastal fog belt. Orchard fertilizer treatments carried on for four years have neither produced nor prevented browning. The same tree does not bear fruit susceptible to browning year after year, and fruit from a single tree varies during any one year. Apples of large size, high in sugar and acid content and from branches girdled during the growing season browned more easily than normal fruit from the same tree. Partial defoliation tends to prevent the browning. Light crops of large fruit with coarse texture favor internal browning but when heavy crops are produced little browning develops.—*J. T. Buchholz.*

DISEASES OF UNKNOWN CAUSE

3449. KEUCHENIUS, P. E. Onderzoekingen over bruine bastziekte. [Investigations of the brown bast disease.] Arch. Rubbereult. Nederland.-Indië 4: 1-3. 1920.—Bacteria were isolated from the bark of *Hevea brasiliensis* affected with the brown bast disease. Conclusive results have not been secured with inoculations of these bacteria.—*C. D. LaRue.*

GENERAL AND MISCELLANEOUS PATHOLOGICAL LITERATURE

3450. APPEL. Die Steigerung der Ernteerträge durch Beizen des Saatgutes. [Increasing yields by seed treatment.] Mitteil. Deutsch. Landw. Ges. 38: 37-39. 1923.—In this address the speaker reviews and discusses apparatus and chemicals used in Germany for the treating of seed against diseases.—*A. J. Pieters.*

3451. BEDFORD, H. W. The asal of cotton and its causes in the Sudan. Wellcome Tropic. Res. Lab. Khartoum Entomol. Sec. Bull. 17. 8 p., 2 fig. 1921.—"Asal is a term widely used in the Sudan for any gummy or sticky substance found on a plant." The asal on the cotton plant is either an exudate from the plant itself caused by an unhealthy condition, or is due to the secretions or excretions of certain insects which feed upon the plants. The plant-asal can be determined by examining the depressions and cups on the leaves and bracts and noting whether an excessive secretion is taking place from these sources; and by the entire or relative absence of asal-producing insects. In conjunction with the excessive secretion of asal, the leaves of the plant turn yellow and drop off in large numbers, together with bracts, flowers and young bolls. Insect-asal is due to the cotton aphid (*Aphis gossypii* Glover), the dura aphid, white fly, and cotton thrips (*Heliothrips indicus* Bagnall).—*Lillian C. Cash.*

3452. COOK, MELVILLE T. The origin and structure of plant galls. Science 57: 6-14. 1923.—Important conclusions developed here include those dealing with the stimulus in the case of insect galls, the nature of the resulting responses, the conditions of the plant cells that allow or qualify response, the classification of galls and the stages in their development. Galls caused by the following organisms are discussed: *Bacterium tumefaciens* (crown gall), *Bacillus radicola* (root tubercles); *Plasmodiophora brassicae* ("club root" disease); *Gymnosporangium juniperi-virginianae*, *G. globosum*, *Rhizoctonia solani*; *Pontania salicis*, *P. pomum*; and insects, including members of the Aphidae, Diptera, Acarina and Cynipidae.—*C. J. Lyon.*

3454. EASTHAM, J. W. Fungicides. Sci. Agric. 3: 190-191. 1923.—Immunity and resistance to disease and recent developments in the use of fungicides in British Columbia are briefly discussed.—*T. G. Major.*

3455. PALMER, R., and W. P. WESTELL. Pests of the garden and orchard, farm and forest: a practical guide for the use of the estate owner, farmer, fruit grower, and gardener, concerning the insects, birds, and other animals, fungoid diseases and weeds, affecting agriculture, horticulture, and forestry; together with remedial and preventive measures. *Roy. 8vo.*, 418 p., 47 pl. (3 col.) Henry J. Drane: London, 1922.—The author aims to give in a concise and yet comprehensive way all the important pests and diseases which injure economic plants, giving information which will enable the reader to identify the cause of the trouble and eradicate it most effectively.—Part I deals with insect pests listed under their common names. A popular description of the various species is given together with the nature of the injury and the specific treatment. Part II deals in a similar way with animals other than insects. In Part III the chief characteristics and treatment for the most prevalent fungous diseases are given. Part IV deals with obnoxious weeds and methods for their destruction; Part V, with insecticides and fungicides, including the chemicals used, methods of preparing, soil sterilization, and antidotes for the poisons used in agriculture; Parts VI and VII give tables, including a table for the identification of the more important insects and diseases, and a spray calendar.—*Lillian C. Cash.*

3456. ROBEL. Heidekrankheit reiner Föhrenbestockung. [Heath disease of pure pine (*P. sylvestris*) stands.] *Zeitschr. Forst.-u. Jagdw.* 53: 321-348. 1921.—This disease attacks pure pine stands during the 4th to 10th years. It results from the destructive combination of the needle-shedding fungus (*Lophodermium pinastri*) due to the increased use of exotic seed, and a succession of dry years, which keeps the stands from closing up and encourages the entrance of heather. It occurs mostly in arid regions with sand and lime soils, and soils deficient in colloids. The root system of heather forms a dense superficial mat, which forces the pine to root in the same manner and makes it dependent entirely upon the occurrence of timely rains. It is believed that the heath humus at the same time has a toxic effect upon the pine through the medium of the nutrient materials in the soil. Careful and continuous soil cultivation will keep out heather, but this is financially impossible. Closed stands, which must be the goal of all combat measures, are necessary to prevent the entrance of heather.—*J. Roeser.*

3457. SECRÉTAIR, CHARLES. Notes séricicoles. [Notes on silk production.] *Ann. Ecole Nation. Agric. Montpellier* 17: 191-226. 1918/1919.—Silkworms showed symptoms of the fatal disease called "grasserie" when fed even part of the time with leaves of *Scorzonera Hispanica* or of *Maclura*. The results of the study of this disease were inconclusive. A bibliography on the feeding and diseases of the silkworm is appended.—*F. F. Halma.*

Med.* 18: 31-33. 1923.—A brief résumé of the history of milk sickness with reference to *Eupatorium urticaefolium* as the causative factor is followed by an account of some experimental work which seems to confirm the Eupatorium theory. A history of an outbreak of the disease at Paxton, Illinois is given.—*C. D. Marsh.*

3461. JOHNSON, E. P. Oak poisoning—a reply. *Vet. Med.* 18: 70-71. 1923.—In reply to a preceding article which intimated that shinnery poisoning was really haemorrhagic septicemia, the author points out differences between haemorrhagic septicemia and oak poisoning.—*C. D. Marsh.*

3462. KEENAN, GEORGE L. Significance of wheat hairs in microscopical examination of flour. *U. S. Dept. Agric. Bull.* 1130. 7 p., 5 fig. 1923.—The author shows a significant relationship between wheat-hair count and the flour classified according to milling practices. For analytical purposes, milling processes employed in a given sample should be known; but, in general, flours made from purified middlings material show a low hair count, while flours containing lower-grade mill stocks show a much higher hair count.—*J. T. Buchholz.*

3463. PETRIE, JAMES M. The active principle of *Erythrophloeum Labouchei*. (Includes a section by PETRIE, J. M., and H. PRIESTLEY. Physiological action of *E. Labouchei*.) *Proc. Linn. Soc. New South Wales.* 46: 333-348. Pl. 23-24. 2 text fig. 1921.—*Erythrophloeum Labouchei*, *Labouchei chlorostachya* v. Mueller, *E. chlorostachys* (F. v. M.) Ballin (Leguminosæ) is the ironwood or ironbark tree endemic in northern Australia and Queensland. Twelve species of this genus are known. *E. guineense*, the Nkasa or "doom or ordeal tree" of western and central Africa has wood used for poison arrows and infusions. It contains a very poisonous alkaloid erythrophleine, as do *E. coumunga* of Madagascar and *E. Fordi* of China. No poisonous material was found in *E. densiflorum* (Elmer) Merrill of the Philippine Islands. The wood of the Australian species is red and exceedingly hard, probably the hardest of all Australian timbers. It was used by the aborigines for womerahs and spear heads and has long been known to be poisonous. Much stock is killed by eating the leaves. The poison absolutely destroys the optic nerve, even a splinter of wood being dangerous and in powdered form the wood produces violent and irresistible sneezing. The formula of erythrophleine has been provisionally given as $C_{23}H_{43}O_7N$. Air dried leaves and a few beans were used in this study of the Australian species. Leaf powder was extracted with alcohol and ether and the alkaloid precipitated. From the leaves 0.002 per cent of amorphous white alkaloid was obtained and 0.03 per cent of apparently identical material from the beans. This is insoluble in water but soluble in alcohol, ether, ethyl acetate, chloroform, amyl alcohol and acidulated water. Solutions were red, strongly alkaline and bitter. Their chemical characteristics are discussed. The physiological action was observed as follows: powdered leaves are a violent external irritant and cause sneezing; solutions administered to animals cause a complete change in heart-rhythm and respiration, blood-pressure rises, and convulsive movements occur. The results obtained would refer the alkaloid to the digitalis group in its pharmacological action and it closely resembles the descriptions of erythrophleine. The properties exhibited by these alkaloids are those hitherto known to belong only to certain glucosides. A possible analogy to myrticolorin, a flavone glucoside with an astringent and very bitter taste is suggested in connection with the properties observed for the extract from *E. Labouchei*.—*Eloise Gerry.*

PHYSIOLOGY

B. M. DUGGAR, *Editor*

WILLIAM J. ROBBINS, *Assistant Editor*

(See also in this issue Entries 2924, 2933, 2993, 2998, 3005, 3150, 3164, 3226, 3258, 3281, 3297, 3303, 3354, 3406, 3407, 3427, 3448, 3452, 3581)

GENERAL

3464. ANONYMOUS. Chemistry of the plant cell. [Rev. of: GRAFE, VICTOR. *Chemie der Pflanzenzelle*. (Chemistry of the plant cell.) viii + 421 p. Gebrüder Borntraeger; Berlin,

1922.] *Nature* 110: 403-404. 1922.—The subject is treated mainly from the point of view of physical chemistry and the book shows lack of proportion and of arrangement.—*O. A. Stevens.*

3465. ANONYMOUS. *Physiology of the growing plant.* [Rev. of: MOLLIARD, M. *Encyclopedie scientifique: Bibliotheque de physiologie et de pathologie végétales: Nutrition de la plante.* 1. *Echanges d'eau et des substances minerales.* [Scientific encyclopedia: Plant physiology and pathology: 1. Transport of water and mineral substances.] *xiv* + 395 p. 2. *Formation des substances terrires.* [2. Formation of food materials.] *vi* + 438 p. Gaston Doin: Paris, 1921.] *Nature* 109: 769. 1922.—The reviewer finds that these volumes "give to the chemist much information that he does not possess although it may be well known to the botanist, and they give to the botanist a survey of chemical relationships which he might not find so easily elsewhere." It is also found, as might be expected in so extensive a treatise, that much recent work is not included, notably in the section on soils. It is suggested that adequate references should be furnished.—*B. M. Duggar.*

3466. CONARD, H. S. *Yeasts.* [Rev. of: GUILLIERMOND, A. T. *Les levures. (The yeasts.)* II. 565 p. Paris, 1912. Translated and thoroughly revised in collaboration with the original author by F. W. TANNER. *xix* + 424 p. New York, 1920 (see Bot. Absts. 8, Entry 2057).] *Bot. Gaz.* 74: 335-336. 1922.—The reviewer highly commends the original work for its "terse statements of observation and carefully balanced discussion." Regarding the later American edition the reviewer believes the translation to have been poorly done, so badly done in fact that "no one can safely use it without a copy of the original at hand." [See also Bot. Absts. 11, Entry 2742.]—*B. W. Wells.*

3467. ERRERA, L. [Published by] *Recueil de L'Institut Botanique Léo Errera.* 4: 1-653. 6 pl., 34 fig. 1920.—This volume contains reprints of 36 articles contributed by members of this botanical institute to various journals between 1884 and 1898. The majority of the articles are those contributed by Léo Errera but the following authors are also included: G. CLAUTRIAU, E. DE WILDEMAN, E. LAURENT, G. BULLOT, FR. VAN RYSSSELBERGHE, J. MASSART, J. BORDET, E. HECKEL. The majority of these articles are of physiological significance, and it is of interest to have them brought together in a single volume.—*B. M. Duggar.*

3468. FERNBACH, M. *Sur l'achèvement de la fermentation des vins restés doux.* [The completion of fermentation in wines remaining sweet.] *Bull. Officiel Direction Recherches Sci. et Indust. et Inventions* 1922²⁸: 74-79. 1922.

3469. HALLIBURTON, W. D. *The essentials of chemical physiology for the use of students.* 11th ed., demy 8 vo, *xi* + 343 p. Longmans Green & Co.: London, 1922.

3470. PAULI, WO. *Colloid chemistry of the proteins. Part 1.* Translated by P. C. L. THORNE. 140 p., 27 fig. Churchill: London; P. Blakiston's Son & Co.: Philadelphia, 1922.—This book summarizes much of the work of the author, particularly on the behavior of albumin and certain other proteins in acid and alkaline solutions, and is based on lectures delivered in 1912-13. To a degree the relevant work of other authors is included, but no attempt has been made either by the author or the translator to bring the work strictly up to date. Besides general considerations, the topics treated are conditions of stability, the electric charge on natural soluble albumin, the isoelectric reaction, salts of acids and albumin, salts of albumin and bases, alterations of state in alkali proteins, and migration velocity of the ions in salts of the globulins.—*B. M. Duggar.*

3471. PEARL, RAYMOND. *The biology of death.* 275 p. 64 fig. Lippincott Co.: Philadelphia, 1922.—From evidence adduced from general and experimental biology and from vital statistics the author attempts to establish the hypotheses that "natural death is not a necessary or inevitable consequence of life" but rather "a by-product of progressive evolution—the price we pay for differentiation and specialization of structure and function;" that

"the duration of life is an inherited character of an individual;" that "probably . . . environmental circumstances play their part in determining the duration of life largely . . . by influencing the rate at which the vital patrimony is spent."—*Carl Epling.*

3472. WINTERSTEIN, HANS [Editor]. *Handbuch der vergleichenden Physiologie. I. Physiologie der Körpersäfte, Physiologie der Atmung.* (2nd part. [Handbook of comparative physiology. I. Physiology of body fluids, physiology of respiration (2nd part).] 1052 p., 180 fig. Gustav Fischer: Jena, 1921.—The 2nd half of volume 1 of this work is devoted to 2 phases of the subject: (1) the physico-chemical phenomena of respiration, by Hans Winterstein; and (2) the mechanics and control of respiration, by EDWARD BABÁK. After a general introductory discussion, 20 pages are devoted to the phenomena of respiration in plants including such topics as gas exchange, the tissue atmosphere, and the oxygen reserve. The remainder of the 1st division treats of respiratory phenomena in the various groups of animals from protozoans to vertebrates. In the 2nd division of the subject there is no relation to plant work.—*B. M. Duggar.*

DIFFUSION, PERMEABILITY, ADSORPTION

3473. BETHE, A. *Der Einfluss der H-Ionenkonzentration auf die Permeabilität toter Membranen, auf die Adsorption an Eiweissolen und auf den Stoffaustausch der Zellen und Gewebe.* [The effect of hydrogen-ion concentration on the permeability of dead membranes, on adsorption by protein sols, and on the metabolism of cells and tissues.] *Biochem. Zeitschr.* 127: 18-33 Fig. 1-4. 1922.—This is a study of the dialysis relations of a number of acid, basic, and amphoteric stains to solutions of varying H-ion concentrations, to protein sols (gelatine, serum, and milk) and to yeast, bacteria, and cells of higher plants. The usual parchment membrane method was employed. The data were based on colorimetric determinations. A very marked relation between H-ion concentration and permeability was noted. Dialysis of acid stains was increased by an acid reaction and decreased by an alkaline condition. The reverse held for basic stains. Increased adsorption by proteins occurred when an acid stain in acid solution was used. A negative adsorption was found in the case of acid stains in alkaline solutions. The opposite results were obtained with basic dyes. The phenomena were reversible. Results obtained with living, single celled organisms are regarded as partially confirmatory. Cells of higher plants (*Spirogyra*, carrot, and epidermis of carnation) were also used. The author concludes that cell content rather than the plasma membrane is the determining factor in penetration of stains, and he considers that the results with living cells in general support the theory of H-ion concentration as a factor in vital staining.—*W. W. Bonns.*

3474. COLLANDER, R. *Über die Permeabilität pflanzlicher Protoplasten für Sulfosäurefarbstoffe.* [The permeability of plant protoplasts for sulphonic acid dyestuffs.] *Jahrb. Wiss. Bot.* 60: 354-410. 1921.—There is considerable disagreement in the literature concerning the permeability of acid dyes. The problem here is a quantitative consideration of all cases, including the penetration of the dye into the cell, non-penetration, and loss of natural color by the cell. The dyes used (cyanol extra, orange G, Säuregrün, Lichtgrün, Ponceau GG, Wallviolett S, brilliant orange R, Metalingelb Ia, Echtröt A, Tuchscharlach G) are listed in respect to relative reducibility in dextrose and NaHSO_3 , relative diffusibility in agar and gelatine, surface tension (by means of a stalagmometer), capillary quotient, and their partition coefficient between a mixture of diamylamine, oleic acid, and almond oil, on the one hand, and water, on the other.—In determining the concentration of the dye taken up by the cells, hand sections were cut 200-800 microns in thickness and placed in a concentrated solution. After a definite period of time the sections were removed and examined under the microscope, using the original concentrated dye for a medium. This was then diluted by definite amounts until the lightest of the cells were just perceptibly lighter than the surrounding medium, thus determining the concentration of the dye within the cells. To check his results the author then plasmolyzed the tissue in a salt solution. Detailed data are given (using the first 5 of the dyes mentioned) for the following plants: *Allium Cepa*, *Agreecum eburneum*, *Avena sativa*,

Begonia sp., *Beta vulgaris*, *Boehmeria gigantea*, *Brassica napus*, *Centaurea montana*, *Chrysanthemum* sp., *Coleus hybridus*, *Daucus carota*, *Dianthus* sp., *Elodea densa*, *Eupatorium grandiflorum*, *Helianthus annuus*, *H. doronicoides*, *H. orientalis*, *Lemna minor*, *Lepidium sativum*, *Malva borealis*, *Oxalis* sp., *Pistia stratiotes*, *Pisum sativum*, *Pothos aurea*, *Primula sinensis*, *Rheum raponticum*, *Rhoeo discolor*, *Senecio cruentus*, *Spirogyra* sp., *Trapaeolum majus*, *Tulipa Gesneriana*, *Vicia faba*, *Zingiber zerumbet*. These experiments show that most plant cells, put into concentrated solutions of easily diffusible sulphonic acid dyes, allow the dye to penetrate only in $\frac{1}{8}$, $\frac{1}{16}$, $\frac{1}{32}$, $\frac{1}{64}$, or $\frac{1}{128}$ the original concentration, and that different plants and different histological elements of the same plant behave very differently toward a given dye. The author thinks this is due to individual differences in permeability and not to H-ion concentration. As regards the other dyes, those soluble in diamylaminol seem to be the most permeable.—A series of experiments on the concentration of the dye solution surrounding the tissue (the technique was by color comparison) showed that the lack of coloration in most of the cells was due to non-penetration rather than to penetration and subsequent reduction of the dye to a colorless compound. Controls with dead material and agar showed that any decolorization of the solution was due to adsorption of the dye by cell membranes, etc. The possibility is discussed that the relative non-penetration may be explained by Donnan's theory of membrane equilibrium, but experiments with dyes in salt solutions show that this is not the case. Work on the effect of other factors show that: (1) low temperature retards penetration, and the temperature coefficient is greater than the coefficient of diffusion; (2) narcotics retard penetration, (3) as also OH ions, but (4) polyvalent cations have no effect.—After a considerable discussion of Ruhland's ultra filter theory, Bethe's vital staining theory, Nirenstein's lipid theory, Overton's lipid theory, Traube's surface tension theory, and the electrical theory of ion permeability, the author concludes that the above results are in accord with Overton's lipid theory, with the conception of absorption, as also with the assumption that the varying permeability for dye-stuffs is dependent on electrical forces.—S. F. Cook.

3475. CROZIER, W. J. Cell penetration by acids. V. Note on the estimation of permeability changes. Jour. Gen. Physiol. 4: 723-731. Fig. 1-2. 1922.—A method is described for measuring the time of penetration of acids into the mantle tissue of *Chromodoris zebra*. The penetration of acid (dichloroacetic) into the mantle tissue is accelerated after faradic stimulation and an artificial stretching of the tissue. Brief treatment by anaesthetics retards the penetration of acid. The spontaneous outward diffusion of intracellular pigment is an inadequate criterion of permeability. Artificial tension accelerates the outward diffusion of intracellular pigment.—O. L. Inman.

3476. CROZIER, W. J. Cell penetration by acids. VI. The chloroacetic acids. Jour. Gen. Physiol. 5: 65-79. Fig. 1-9. 1922.—Measurements of the penetration of tissue taken from *Chromodoris zebra* are believed to show that a determining factor in penetration involves the establishment of a critical pH (near 3.5) in relation to superficial cell proteins. The rapidity with which this state is produced depends upon acid strength and upon some property of the acid influencing the speed of the absorption; hence it is necessary to compare acids within groups of chemical relationship. The actual speed of penetration observed with any acid is dependent upon 2 influences: (1) preliminary chemical combination with the outer protoplasm, followed by (2) diffusion.—O. L. Inman.

3477. DAVIS, CHARLES E., EARLE T. OAKES, and HAROLD H. BROWNE. Viscosity of gelatin solutions. Jour. Amer. Chem. Soc. 43: 1526-1533. 1921.

3478. EWART, A. J. On the changes of volume in a mixture of dry seeds and water. Proc. Roy. Soc. Victoria 34: 172-179. 1922.—Marked changes of the total volume are shown when dry seeds (peas, lentils, beans, barley) absorb water. If the seed coat wrinkles there is first an expansion, then a contraction, and then a final rise which is due to the production of gas in the seed. The changes are not the result of alterations of temperature. The wrinkling is due to unequally rapid absorption, partial vacuums forming under the wrinkles, this hasten-

ing the intake of water. If the seed coat does not wrinkle there is no preliminary expansion, and the contraction is due, as in gelatine, to the compression of the absorbed water.—Using methods similar to those with seeds, the contraction obtained with gelatin indicated a pressure of 20 atmospheres, but with seeds as much as 50 to 120 atmospheres were indicated. This may be due partly to the greater imbibition pressure of organized cellulose, as compared with gelatin, and partly to the influence of solutes increasing the internal pressure of the water within the seeds.—*Eloise Gerry.*

3479. HARVEY, NEWTON E. **The permeability of cells for oxygen and its significance for the theory of stimulation.** Jour. Gen. Physiol. 5: 215-222. 1922.—By use of the ciliated gill of *Mytilus*, of muscle, liver, and nerve of a frog it is demonstrated by the indicator method that living cells are as freely permeable to oxygen as dead cells and that sudden admission of oxygen to a cell cannot account for increased oxidation as a result of stimulation. Oxygen penetrates as readily as carbon dioxide among the acids and ammonia among the alkalis. More oxygen may enter a cell at high pressure, but the reacting substances (chromogen and oxidase) are kept apart by some phase boundary as long as the cell is alive. Increased oxygen concentration eventually produces injury to the cell.—*O. L. Inman.*

3480. JACOBS, M. H. **The influence of ammonium salts on cell reaction.** Jour. Gen. Physiol. 5: 181-188. 1922.—That the pH within the cell may bear no necessary relation to the pH of the medium to which the cell is exposed is shown by the fact that cells of the flowers of a hybrid *Rhododendron* with natural indicator, starfish eggs stained with neutral red, and an artificial cell in which living frog skin is used all show that increased intracellular alkalinity may be brought about by solutions of a decidedly acid reaction which contain ammonium salts. This depends upon the fact that NH_4OH is a weak base and permits a certain degree of hydrolysis of its salts, also that living cells are freely permeable to NH_4OH (or NH_3 ?) and not to mineral and many organic acids, and presumably not, at least to the same extent, to ammonium salts as such.—*O. L. Inman.*

3481. OSTERHOUT, W. J. V. **Some aspects of selective absorption.** Jour. Gen. Physiol. 5: 225-230. Table 1. 1922.—By use of the cell sap of *Valonia* it is shown that a mechanism exists which prevents certain substances (Na , Mg , Ca , SO_4) from reaching as high a concentration inside the cell as in the sea water which surrounds the cell. Potassium is trapped and accumulates in the cell in a concentration far in excess of that found in the surrounding sea water. Practically all the K in the cell exists as KCl . The concentration of Cl does not differ greatly within and without the cell. The concentrations of the various ions were determined by chemical analyses.—*O. L. Inman.*

3482. REDFERN, GLADYS M. **On the course of absorption and the position of equilibrium in the intake of dyes by discs of plant tissue.** Ann. Bot. 36: 511-522. 8 fig. 1922.—Discs 1 mm. thick of carrot, potato, artichoke, and turnip were placed in the dye solution and the amount of absorption was determined colorimetrically. Series of experiments were made with neutral red, methylene blue, methyl violet, aniline blue, eosin, and Congo red on both living and killed tissue, and the absorption curves obtained in all cases. The curves showed that equilibrium is reached more rapidly the more concentrated the dye and that the basic dyes penetrate more rapidly than the acid dyes. There was no difference in the rapidity of absorption between living and dead tissue. After mathematical analysis, the author concludes that the relation between the final internal and external concentrations of the dye may be expressed by the adsorption equation and that, consequently, adsorption must play an important part in dye penetration.—*S. F. Cook.*

3483. RUDOLFS, W. **Effect of seeds upon hydrogen-ion concentration of solutions.** Bot. Gaz. 74: 215-220. 1922.—The author finds that immersing seeds such as corn, wheat, lupine and watermelon in single salt solutions of relatively high concentration (2-7 atmospheres) induces an increase of the H -ion content. This increase reaches a maximum, the value of

which is constant for each species. In dilute solutions (0.5–0.001 atmospheres) the increase was not so great. The writer believes "that the primary factor, and the only one which could account for the rapid reaction changes in the single salt solutions here used, is that directly related to the ion absorption by the seeds, the H-ion concentration increasing as the cations are removed from solution by absorption at a more rapid rate than the anions."—*B. W. Wells.*

3484. SMITH, C. R. Osmosis and swelling of gelatin. *Jour. Amer. Chem. Soc.* 43: 1350–1366. 1921.—Gelatin was prepared free from electrolytes. The osmotic pressure of this gelatin in water is proportional to the concentration. When this gelatin sol is put into a collodion membrane and is immersed in isohydric solutions of univalent acids, or polyvalent acids ionizing as univalent acids, the same osmotic pressure is produced. Also when it is immersed in univalent bases the same osmotic pressure is produced at the same hydroxyl-ion concentration.—"Minimum osmotic pressure is produced at the iso-electric point where it is not combined with acids or alkalies. With increasing hydrogen-ion or hydroxyl-ion concentration the osmotic pressure increases to a maximum and then diminishes."—"The maximum osmotic pressure for 0.5 gm. of gelatin per 100 cc. at 10° in univalent acids or polyvalent acids ionizing as univalent acids, is reached at a hydrogen-ion concentration of 0.8 to 1.0×10^{-3} , and amounts to about 158 mm. of water. In univalent bases the maximum is reached at 0.2×10^{-3} hydroxyl-ion concentration and amounts to about 165 mm."—"Using bivalent acids or bases ionizing as such, the maximum osmotic pressure is reached at the same hydrogen-ion or hydroxyl-ion concentration as with univalent acids or bases, respectively, but amounts to about 55 mm."—"When dry gelatin is immersed in univalent acids, or polyvalent acids ionizing as univalent, it combines with equivalent amounts at the same hydrogen-ion concentration. The amount of swelling is approximately the same for all, its maximum occurring at about 4×10^{-3} hydrogen-ion concentration when one gm. of air-dry gelatin occupies a volume of 46 cc. Bivalent ionizing acids give much less swelling with a maximum at about the same point, and combine in somewhat greater equivalent amounts."—"The salt ions do not combine with gelatin but increase the absorption of acids or alkalies. They decrease swelling."—"The swelling of gelatin is the result of osmotic pressure within the jelly, with the jelly acting as an imperfectly resisting membrane, the more so when highly swollen. While the osmotic pressure at the optimum concentration of the univalent acids and bases is the same, the swelling is much less in alkalies because of the weakened membrane effect. Bivalent sulfuric acid gives the same swelling as bivalent calcium or barium hydroxide when the swelling is small and the solution is not too great."—*J. M. Brannon.*

WATER RELATIONS

3485. BURGERSTEIN, ALFRED. *Die Transpiration der Pflanzen. Zweiter Teil (Ergänzungsband).* [Transpiration. Part II.] 264 p., 18 fig. Gustav Fischer: Jena, 1920.—Burgerstein's 1st volume, *Die Transpiration der Pflanzen, Eine physiologische Monograph*, a critical summary of the work on transpiration up to that date, was published in 1904. The present volume is a continuation of that work and brings the review of literature down to the beginning of 1920. In the 1st volume 393 papers were cited and in this 2nd, an additional 505. The present volume has 32 chapters, as follows: Chap. 1 is a discussion of relative transpiration, specific transpiration, correlative transpiration, etc.; Chap. 2 includes a discussion of cobalt-paper methods, methods of collecting transpired water, automatic weighing devices and other instruments used in measuring transpiration; Chap. 3, gives new methods of measuring stomatal openings, such as the alcohol fixation method, the potometer method, the infiltration method, and the gas diffusion method; Chap. 4 discusses potometers and atmometers; Chap. 5, physics of transpiration; Chap. 6, influence of outer and inner factors, of CO₂ content of the air, and of wilting on stomatal opening, the effect of stomatal opening on rate of transpiration and the effects of diurnal changes; Chap. 7 considers the influence of external factors such as light and soil moisture on the formation and number of stomata; Chap. 8 deals with the transpiration of correlative leaves, young and old leaves, leaves in different positions on the stem, upper and lower surface, red and green leaves; Chap. 9 is on the transpiration of flowers; Chap. 10, the influence of light on transpiration; Chap. 11, the influence of air tem-

perature; Chap. 12, the influence of air humidity; Chap. 13, the influence of air movement; Chap. 14, the influence of elevation; Chap. 15, the influence of soil water content; Chap. 16 gives the influence of chemicals on transpiration, especially acids and alkalis, salts, nutrients, Bordeaux mixture, carbon dioxide, hydrogen, sulphuric acid, ether and chloroform; Chap. 17 considers the amount of transpiration of different ecological plant types; Chap. 18 treats of the determination of transpiration in different seasons and times of day; Chap. 19, of the amount of transpiration in the Mediterranean region; Chap. 20, of the amount of transpiration in the moist, warm, tropical region; Chap. 21, of the influence of transpiration on the leaf movement of Marantaceae; Chap. 22, of transpiration of bearded and beardless heads; Chap. 23 discusses the influence of transpiration on the formation of the fruiting bodies of fungi; Chap. 24 gives the influence of fungous infection on the transpiration of food plants; Chap. 25 considers the water requirement of agricultural plants; Chap. 26, the wilting of plants and the water content of the soil; Chap. 27 treats of miscellaneous features; Chap. 28, of guttation; Chap. 29, of the varied protective arrangements for decreasing the loss by transpiration; Chap. 30 considers transpiration as a necessary evil; Chap. 31, means favoring transpiration; Chap. 32, compiled material. Literature is cited. [See also Bot. Absts. 12, Entry 3490.]-H. L. Shantz.

3486. DIXON, H. H. **Transport of organic substances in plants.** *Nature* 110: 547-551. 1922.—The generally accepted view that the bast serves for the downward transport of materials was supported especially by Czapek's work. Deleano, however, found that leaves apparently similar often behave differently with regard to starch depletion, and showed that a leaf may be depleted in 35 hours without transport, and that depletion continues if the petioles have been killed by heat or chloroform vapor. This indicates that living elements are not essential, while Czapek believed that they were.—Apparently none of the earlier investigators made estimates of the actual amounts transported or the velocity necessary. Calculations indicate rates (20 cm. to 140 cm. per hour) which seem quite impossible in the bast. The tracheae of the wood are naturally suggested as possible channels. A reversal of the transpiration current has long been known to take place under certain conditions. It may be demonstrated by cutting the tip of a potato leaf under eosin, or by placing one side of a *Sambucus* petiole in eosin.—The work of Ricca on *Mimosa* shows that the transmission of stimuli can scarcely be by pressure waves through the bast as believed by Haberlandt. From the work of Ricca, Boyce-Jensen, Páal and Stark it appears that such transmission probably is by hormones set free in the transpiration current. The mechanism of the downward stream is unknown, but the work of Thoday on volume changes in leaves suggests a means. If these changes are accompanied by changes of permeability of the plasmatic membranes, the necessary rate of flow through the tracheae could be produced. The function of the bast may be to supply the materials to the tracheae.—O. A. Stevens.

3487. GORTNER, ROSS AIKEN, and WALTER F. HOFFMAN. **Determination of moisture content of expressed plant tissue fluids.** *Bot. Gaz.* 74: 308-313. 1922.—The purpose of this paper is to recommend the use of refractometers, comparable to those used by sugar manufacturers, in the determination of the moisture-solute ratio of plant sap. The authors used a high grade Abbé refractometer provided with a special sugar scale which was carefully standardized by the Bureau of Standards [U. S. A.]. This method surpasses the older one in that only 2 or 3 drops of sap are required; direct readings are made; volatile substances which may occur in the sap are included in the estimate. They believe the refractometer reading to "more nearly express the true value of the moisture content than can be obtained by any known method."—B. W. Wells.

3488. NICHOLS, G. E. **The Musch rain-correcting mounting for porous porcelain atmometers.** *Science* 57: 26-28. 1923.—This describes a modification of the Livingston-Thone mounting (see *Science* 52: 85-87. 1920.) Instead of the short mercury column being held in place in the upper part of a straight glass tube by glass wool, the tube is bent like a J and the mercury rests in the curve. The long arm leading up from the water reservoir to the atmometer

eter has a side arm connecting to it about $1\frac{1}{2}$ inches from the bottom of the J and extending outward and upward. This side arm holds the mercury when the whole apparatus is inverted to fill the atmometer or remove air bubbles. This modification has been thoroughly tested in the field.—*C. J. Lyon.*

3489. SAYRE, J. D. **Physiology of stomata of *Rumex patientia*.** *Science* 57: 205-206. 1923.—This is a concise list of conclusions regarding the behavior of the stomata of *Rumex patientia*. Most important is the fact that it is the acidity of the guard cells that controls the opening and closing of the stoma. The acidity, itself controlled by light, affects the point of equilibrium of the starch-sugar change in the guard cells and this regulates the osmotic pressures therein.—*C. J. Lyon.*

3490. SHANTZ, H. L. **Transpiration of plants.** [Rev. of: BURGERSTEIN, A. *Die Transpiration der Pflanzen. Zweiter Teil. (The transpiration of plants.)* Jena, 1920 (see Bot. Absts. 12, Entry 3485).] *Bot. Gaz.* 73: 239-241. 1922.—Following the abstract of the volume the author states that "this work is a valuable summary and no investigation of transpiration is feasible without consulting it."—*B. W. Wells.*

MINERAL NUTRIENTS AND SALT RELATIONS

3491. ARRHENIUS, OLAF. **Absorption of nutrients and plant growth in relation to hydrogen ion concentration.** *Jour. Gen. Physiol.* 5: 81-87. *Fig. 1-6.* 1922.—By means of water culture experiments with radishes and wheat it is shown that the absorption of nutrient salt depends much upon the pH of the substrate. At maximal growth of the plant the salt intake is at a minimum. In unbalanced solutions salt intake may be greater, and different ions are differently affected. The intake of water is independent of the absorption of salts.—*O. L. Inman.*

3492. FERLAND, J. **Les matières minérales des plantes.** [The mineral content of plants.] *Sci. Agri.* 3: 229-230. 1923.—The ash content of plants and the function of the various minerals is outlined.—*T. G. Major.*

3493. GERICKE, W. F. **Protective power against salt injury of large root systems of wheat seedlings.** *Bot. Gaz.* 74: 204-209. 1922.—In this experiment wheat seedlings with roots 70-80 cm. long (class A) and seedlings with roots 8-10 cm. long (class B) were tested in 3 nutrient solutions varying in their salt content, the physiological values of which were known and were rated "good," "medium," "poor." Growth, judged from dry weight data, in the case of class A plants was approximately equal in all 3 solutions, while in the case of class B plants striking differential results were obtained in the solutions which deviated from the theoretical optimum. The conclusion was reached that "the extent of the root system appears as an important factor that affects the magnitude of growth obtainable from a given nutrient solution."—*B. W. Wells.*

3494. KISSER, JOSEPH. **Über den mikrochemischen Nachweis gelöster Kalziumsalze in der Pflanze als Kalziumtartrat.** [Microchemical proof of a dissolved calcium salt in the plant as calcium tartrate.] *Beih. Bot. Centralbl.* I Abt. 39: 116-127. 1922.—With a solution of the calcium salt in water, the neutral tartrate gives a beautiful crystalline precipitate of calcium tartrate. Heating hastens the reaction. Because of their size and good reflection of light, these crystals are very distinct.—With this method, of the plants investigated, 7 were rich in the calcium salt, 4 contained a medium quantity, and 5 gave no trace.—*L. Pace.*

3495. LOEB, ROBERT F. **Radioactivity and physiological action of potassium.** *Jour. Gen. Physiol.* 3: 229-236. 1920.—It has been suggested that one of the important functions of the K ion in physiological phenomena is dependent on its slight radioactive properties. The writer finds that with respect to their influence on development of sea urchin eggs and antagonistic action in salt solutions the radioactive elements Th and Ur are of no value as sub-

stitutes for K, while the non-radioactive elements Cs and Rb are very effective substitutes.—*Otis F. Curtis.*

3496. MELLON, RALPH R. Spontaneous agglutinability of bacteria in relation to antagonistic action of certain cations. (Abstract.) *Absts. Bact.* 6: 484. 1922.—Spontaneous agglutinability of 5 pure-line cultures of *B. diphtheriae* is shown to be a function of growth cycle developments.—*D. Reddick.*

3497. NĚMEC, ANTONÍN, und VÁCLAV KÁŠ. Über den Einfluss des Selen auf die Entwicklung einiger Schimmelpilze aus der Gattung *Penicillium*. [On the influence of selenium on the development of some mildews of the genus *Penicillium*.] *Biochem. Zeitschr.* 114: 12–22. 1921.—The writers used a modification of Raulin's nutrient solution, to which a small amount of $ZnSO_4$ and $MnCO_3$ had been added. To this standard nutrient solution Na_2SeO_3 was added in amounts varying from 1 billionth gm. in 100 cc. of solution to 1 ten thousandth gm. in 100 cc. They found that the dry weight of the mycelium of *P. Roqueforti* increased with the increase of selenium, while *P. candidum* produced the greatest dry weight in the solution having 1 ten millionth gm. of Na_2SeO_3 per 100 cc. of nutrient solution. There was also an increase in ash as the dry weight increased, but the 2 were not identical. In all cultures in which selenium was used there was a decrease of phosphorus in the ash even though the total ash content was higher than in the control.—*F. G. Gustafson.*

3498. SEVERY, HAZEL W. The occurrence of copper and zinc in certain marine animals. *Jour. Biol. Chem.* 55: 79–92. 1923.

3499. STEEL, THOMAS. The occurrence of calcium oxalate in the gidgee wattle (*Acacia Cambagei* Baker). *Proc. Linn. Soc. New South Wales* 46: 256–258. 1921.—Indication of unusual quantities of calcium in the ash of gidgee led the author to determine the amount present as calcium oxalate in the timber and bark. Oxalate is calculated as $C_2O_4Ca + H_2O$. The oxalate precipitate obtained was ignited completely and weighed as CaO. In the analysis ash soluble in acid, sand, potash, lime as oxalate, total CaO, calcium oxalate and water were determined. The proportions of calcium oxalate in the bark are the highest known to be recorded for any plant. Barks from 6 other species of *Acacia* were examined. Although varying amounts were found none showed as high a percentage as *A. Cambagei*. A variable amount of lime was present in combination other than oxalate. The bark of *A. decora* contained a comparatively large amount of ash insoluble in acid and was high in iron and alumina.—*Eloise Gerry.*

3500. WALTON, GEORGE PELHAM. Specific acidity of water extract and oxalate content of foliage of African sorrel. *Bot. Gaz.* 74: 158–173. *Fig. 1.* 1922.—A method is described which makes possible the identification of the principal sources of acidity characterizing the water extract of plant tissues. In the case of *Rumex abyssinicus* (African sorrel) it was found that “only two compounds of oxalic acid, potassium binoxalate and calcium oxalate monohydrate, occur in the leaves examined. The percentages in which these salts occur are computed from the data for acidity and total oxalate in the dried material.” Corroboration of results by crystallographic methods was obtained. The writer noted the presence of a natural indicator in the leaves.—*B. W. Wells.*

PHOTOSYNTHESIS

3501. ANONYMOUS. Photosynthesis. *Nature* 110: 856–857. 1922.—Brief notes are given of papers read at a joint meeting of the sections of chemistry and botany at the Hull meeting of the British Association.—*O. A. Stevens.*

3502. BORNEMANN. Die Kohlenstoff-Ernährung der Kulturpflanzen. [The carbon nutrition of cultivated plants.] *Fühlings Landw. Zeitg.* 70: 1–7. 1920.—This constitutes a reply to the criticism by Th. Pfeiffer, Breslau, of recent work by the author, who seeks to maintain

his view that increased production in the open field as well as in an enclosed area is possible through the production of CO₂ in the soil and its consequent diffusion upwards. Reference is made to the author's work "Kohlensäure und Pflanzenwachstum," Berlin, 1920. No new work is reported.—*C. C. Epling.*

METABOLISM (GENERAL)

3503. ANONYMOUS. [Rev. of: SHERMAN, H. C., and S. L. SMITH. *The vitamins.* iii + 273 p. (Amer. Chem. Soc. Monograph Series) Chemical Catalog Co.: New York, 1922 (see Bot. Absts. 12, Entry 3517).] *Nature* 110: 6. 1922.—This book includes a bibliography of the literature to the end of the year 1921.—*O. A. Stevens.*

3504. BAUGHMAN, WALTER F., and GEORGE S. JAMIESON. *The chemical composition of soya bean oil.* Jour. Amer. Chem. Soc. 44: 2947-2952. 1922.—The percentage composition of the different glycerides is as follows: Linolenic acid, 2.3; linolic, 51.5; oleic, 33.4; palmitic, 6.8; stearic, 4.4; arachidic, 0.7; lignoceric, 0.1; also unsaponifiable matter, 0.6 per cent.—*J. M. Brannon.*

3505. BOBILIOFF, W. *Onderzoekingen over het zetmeel van Hevea brasiliensis.* [The starch of *Hevea brasiliensis*.] Arch. Rubbercult. Nederland.-Indië 4: 71-118. 1920.—Starch occurs in the cortex and in the wood of this species, while the cambium contains none. Starch storage in cells surrounding the latex vessels, and its disappearance in the cortex, when the tree is tapped, suggest that there is a close relation between latex formation and starch supply. The large amount of starch normally stored indicates that there need be no fear of depletion of food supply by tapping even during the wintering season.—*C. D. LaRue.*

Soc. 44: 2952-2957. 1922.—The following percentage composition of glycerides is found: Oleic acid, 33.4; linolic, 57.5; palmitic, 3.5; stearic, 2.9; arachidic, 0.6; lignoceric, 0.4; also unsaponifiable matter, 1.2 per cent.—*J. M. Brannon.*

3509. LARSON, L. W., and W. P. LARSON. *Factors governing the fat content of bacteria and the influence of fat on pellicle formation.* Jour. Infect. Diseases 31: 407-415. 1922.—An historical résumé is given of methods in fat extraction, and those used in the present paper are outlined in detail. It is concluded that carbohydrates and glycerol are converted into fat or fat-like substances only when they are not fermented by the organism, and that pellicle formation by bacteria is probably determined by the surface tension of the medium on the one hand and the fat content of the bacteria on the other. The acid-fast staining properties of the tubercle bacillus are thought to be a quality function of fat or other substances present rather than one of quantity. It is further thought that the fat content of the tubercle bacillus bears no relation to pathogenicity, but this content is determined entirely by the action of the organism on the glycerol in the medium.—*R. V. Allison.*

3510. LINK, KARL, PAUL LINK, and W. E. TOTTINGHAM. *Effects of the method of desiccation on the carbohydrates of plant tissues.* Jour. Amer. Chem. Soc. 45: 439-447. 1923.—The tissues used in this work were beet leaves, ears of corn, corn stalks, corn seedlings, and potato tubers. These tissues were all collected on clear days and about noon.—The alcohol method of preserving plants was used as a standard. In this method a convenient quantity of tissue, depending upon the water, was put into enough alcohol to insure a concentration of 75 per cent alcohol after dilution by the water from the tissues. A little calcium carbonate

was added, in order to neutralize any acid which might have been present, and the mixture was heated for 1 hour on a steam bath at 78°.—The results from desiccation show that a temperature of 98° should not be employed for drying tissues when the sugar and starch content are high. A temperature of 65° can be used, in an air current, with tissues that can be dried rapidly. A temperature of 80° in a vacuum is superior to 65° in a vacuum. In the case of the ear of corn a previous heating in an autoclave to inhibit enzyme action is an advantage.—A well ventilated oven which has a large volume of air circulating over the tissues allows a lower drying temperature.—“The alcohol method of preservation gave the same analytical results for carbohydrates as desiccation at 80° in vacuum, in the case of beet leaves and corn ears. The methods are, therefore, equally efficient in checking enzyme action and stopping respiration.”—*J. M. Brannon.*

3511. NOYES, H. A., H. T. KING, and J. H. MARTSOLF. **Variations in the Concord grape during ripening.** Jour. Assoc. Official Agric. Chem. 6: 197-205. 1922.—Ripening Concord grapes vary greatly in composition; this variation can not be correlated with season and date of harvesting. The weight of the individual berry remains fairly constant during ripening, although it tends to increase slightly. The sugar content of the Concord grape and grape juice increases as ripening advances, while the acid content of the juice decreases as ripening advances. Changes in the acid and sugar content of the grape and grape juice are irregular from harvesting date to harvesting date. The tannin and coloring matter content of the grape juice is very irregular. Hot-pressing increases the tannin and coloring matter content of the grape juice.—*F. M. Schertz.*

3512. OELSNER, ALICE. **Die Ergebnisse der letzten Arbeiten von Professor Dr. Alfred Koch - Göttingen.** [The results of the last work of Prof. Dr. Alfred Koch at Göttingen.] Mitteil. Deutsch. Landw. Ges. 37: 497. 1922.—At the time of his death Koch was engaged in studying the effect of certain soil bacteria on organic phosphorus compounds. In this preliminary note it is stated that certain bacteria were found to have the ability to break down the organic phosphorus compounds so that 68.5 per cent of the phosphorus was recovered as inorganic phosphorus, and 31.5 was utilized in the body of the bacteria. The full report will appear in *Biochem. Zeitschr.*—*A. J. Pieters.*

3513. POWER, FREDERICK B., and VICTOR K. CHESTNUT. **Confirmation of the occurrence of linalyl esters in peaches.** (A note). Jour. Amer. Chem. Soc. 44: 2966-2967. 1922.

3514. POWER, FREDERICK B., and VICTOR K. CHESTNUT. **The odorous constituents of apples. 2. Evidence of the presence of geraniol.** Jour. Amer. Chem. Soc. 44: 2938-2942. 1922.—The odorous constituents of the apple consist chiefly of amyl esters. The distinctly core-like odor is due to the presence of the aliphatic terpene alcohol geraniol, which is present either in the free form or as an ester.—*J. M. Brannon.*

3515. POWER, FREDERICK B., and VICTOR K. CHESTNUT. **The odorous constituents of peaches.** Jour. Amer. Chem. Soc. 43: 1725-1738. 1921.—The odorous constituents of the peach are chiefly linalyl esters of formic, acetic, valeric, and caprylic acids. There is also a considerable portion of acetaldehyde and a small amount of higher aldehydes. Some volatile acids are also present.—*J. M. Brannon.*

Sci. 4: 397-405. 3 fig. 1922.—These are observations on the fixation of nitrogen by *A. chroococcum* grown in solutions of known reactions. The nitrogen fixed in the solutions of each reaction was determined and the changes in reaction during incubation were measured. It was found that the reaction of solutions below pH 8.0 changed very little, because no growth occurred below pH 6.0, and because the solutions in the region between 6.0 and 8.0 were highly buffered. The amount of nitrogen fixed was not greatly affected by reactions between pH values of 6.2 and 8.8, although reactions around pH 7.0 and 8.0 seemed to be most favorable. Slight changes outside of these values caused an abrupt decrease in fixation. The work shows that no nitrogen fixation by *Azotobacter* may be expected in many soils, since it has repeatedly been shown that pH values below 6.0 are frequently encountered.—*H. S. Reed*.

3527. WOODMAN, HERBERT ERNEST. The chemistry of the strength of wheat flour. *Jour. Agric. Sci.* 12: 231-243. 1922.—Previous work on the gliadin and glutenin of weak and strong flours pointed to the identical chemical nature of these compounds in the 2 types of flour, but more recent work has indicated that 2 proteins may be quantitatively identical with regard to their amino-acid content and yet be 2 distinct proteins, by virtue of differences in the order of linkage of the amino-acids within the protein molecule. The racemisation method recently used in the investigation of proteins of blood serum, colostrum, and milk was utilized to determine whether or not the proteins mentioned above are identical. This method depends on the behavior of proteins in dilute alkaline solution. Such solutions kept at 37°C. suffer a progressive diminution in the value of their optical rotatory power. If the specific rotations are plotted against the time in hours during which the reaction is allowed to proceed, then the readings fall on a perfectly smooth curve. Since individual proteins display specific behavior quantitatively when racemized with dilute soda, this method may be used to test the identity or non-identity of two compounds.—By the method described above and by (1) determining the identity of their specific rotations in 70 per cent alcohol, and (2) by determining the identity of their combining capacities for alkali, by titration, the gliadins of weak and strong flour are shown to be identical, while by the racemisation method their glutenins are shown to be 2 distinct substances. The results of this experiment indicate that strong wheat synthesizes one type of glutenin and weak wheat a different type, while wheats of intermediate strength may contain varying proportions of the 2 glutenins.—*V. H. Young.*

3530. DENNY, F. E. Methods for the estimation of small amounts of starch in plant tissues. *Jour. Assoc. Official Agric. Chem.* 6: 175-191. 1922.—Of the 3 methods found to be most suitable, the absorbed-iodine method is the most convenient, as results are obtained by it in the shortest time. The reduction method (using the Scales modification) gave promise of being improved to give greater sensitiveness, since the range from 0 to 1 per cent can be split up into more distinct steps by means of it than by the others. The residual iodine method also exhibits possibilities. The methods described, applied to cantaloupe seed powders, cover a range of 0 to 1 per cent starch by steps of about 0.1 per cent. The principal method used consisted essentially in dissolving the starch in concentrated CaCl_2 solution, precipitating the starch under a standard set of conditions, titrating the iodine taken up by the starch, and comparing the values thus obtained with those given by known amounts of starch under the same conditions. Detailed descriptions of the methods are given together with results obtained by their use. The methods are recommended only for tissues containing small amounts of starch.—*F. M. Schertz.*

3531. EULER, H. V., I. LAURIN, and A. PETTERSON. Anpassung einer Oberhete an das Gärsubstrat Galaktose. [Adaptation of top yeast to the substrate galactose.] *Biochem. Zeitschr.* 114: 277-291. 1921.—The writers found that under normal conditions top yeast SB

II fermented cane sugar 50 times faster than galactose. The addition of a water extract of dried yeast increased the rate of galactose fermentation several fold. Seemingly the yeast extract served as an activator or co-enzyme to the zymase. By treating the yeast with a 2 per cent galactose solution for several days it was adapted to the galactose, and the rate of fermentation of the latter was increased 7 times, so that the ratio of galactose fermentation to that of cane sugar was 1: 6.5 instead of 1: 50.—*F. G. Gustafson.*

3532. FALK, K. G., and GRACE MCGUIRE. **Studies on enzyme action. XXI. Banana gel and banana sucrase.** Jour. Biol. Chem. 54: 655-669. 1922.—Results are reported on the relation between gel formation and sucrase content of extracts from banana pulp, obtained by means of solutions of NaCl and of other salts; also the sucrase content of the gel and of the solution, with the gel prepared by the action of pancreatin on banana pulp extract, and the separation of the gel substance and the sucrase substance by various treatments.—Gel formation decreased with increase in NaCl concentration in the extracting liquids. Solutions of NaCl and of other salts extracted more sucrase than did water alone. It is concluded, mainly on this basis, that the gel-forming property and the sucrase-forming property of the banana are due to different substances. Both properties are destroyed by boiling the solutions.—It is concluded that a definite enzyme property is not a soluble molecule or an insoluble molecule as such, but that the simplest chemical interpretation is that enzyme action is due to certain groupings present at one time with soluble and at another time with insoluble material.—*G. B. Rigg.*

3533. FENGER, FREDERIC. **A comparison between the chemical and physiological characteristics of pepsin and rennin.** Jour. Amer. Chem. Soc. 45: 249-255. 1923.—The properties of pepsin and rennin are different. Pepsin is coagulated by heat and is colloidal in nature. Rennin is a decomposition product of protein of the acid albumin type. It is not coagulated by boiling. "The former may be dialyzed, while the latter diffuses readily through parchment membranes." "Proteolytic or peptic activity does not seem to be a part of the true physiological characteristics of the milk-curdling enzyme."—*J. M. Brannon.*

3534. HAHN, A. **Über den Einfluss neutraler Alkalisalze auf diastatische Fermente. 4 Mitteilung.** [Influence of neutral salts on amylolytic enzymes. 4.] Zeitschr. Biol. 74: 217-228. 1922.—This is a summary of 3 previous papers [see Bot. Absts. 12, Entries 3535, 3536, 3537.] Certain new data are also given and the bearing of these results on the possible nature of enzymatic action is discussed. Ptyalin, diastase, and amylopsin can be precipitated at certain H-ion concentrations and can again be dissolved in HCl. Increasing or decreasing the H-ion concentration in reference to the precipitation optimum reduces the precipitation. The precipitation optimum for diastase in an acetate-tartaric acid solution is pH 3.63. All of the salts used have a protective effect against precipitation and accelerate activity in dilute concentrations of the buffers; at higher concentrations of the buffer the chlorides have the same effect, but the sulphates and nitrates have the opposite effect at H-ion concentration higher than the optimum. Sodium and potassium salts were tested. The optimum H-ion concentration for the action of ptyalin in phosphate and acetate buffer solutions is pH 6.4 and 5.6, respectively; for amylopsin pH 7.1 and 5.5, respectively; for diastase in acetate, pH 4.7. These results are comparable with the effect of certain salts and H-ion concentrations on colloids and seem to indicate that the effect of neutral salts on the activity of enzymes may be due to their action in decreasing, or increasing the total area of the colloidal enzyme solution.—*C. H. Arndt.*

3535. HAHN, A., und K. HARPUDE. **Über den Einfluss neutraler Alkalisalze auf diastatische Fermente. 1 Mitteilung.** [Influence of neutral salts on amylolytic enzymes. 1.] Zeitschr. Biol. 71: 287-301. 1920.—Data are given to show that salts may either inhibit, or accelerate, the activity of diastase and ptyalin. The particular effect is dependent upon the concentration and anion of the salt, the concentration and nature of the buffer, and the H-ion concentration of the solution.—*C. H. Arndt.*

3536. HAHN, A., und K. HARPUDE. Über den Einfluss neutraler Alkalisalze auf diastatische Fermente. 2 Mitteilung. [Influence of neutral salts on amylolytic enzymes. 2.] Zeitschr. Biol. 71: 302-310. 1920.—The authors were unable to find any evident relationship between the isoelectric point of the enzyme, as determined by its migration in an electric current, and its activity. The isoelectric point may lie either on the alkaline or the acid side of the optimum H-ion concentration.—C. H. Arndt.

3537. HAHN, A., und R. MICHALIK. Über den Einfluss neutraler Alkalisalze auf diastatische Fermente. 3 Mitteilung. [Influence of neutral salts on amylolytic enzymes. 3.] Zeitschr. Biol. 71: 10-18. 1921.—Neutral salts have the same effect on amylase as they had on ptyalin and diastase in the previously reported experiments. All 3 enzymes can be precipitated from solution at certain H-ion concentrations. The precipitation may be increased or decreased by the addition of the proper salt [see Bot. Absts. 12, Entry 3534].—C. H. Arndt.

3539. NELSON, J. M., and DAVID I. HITCHCOCK. The activity of adsorbed invertase. Jour. Amer. Chem. Soc. 43: 1956-1961. 1921.

3540. SHERMAN H. C., and MARY L. CALDWELL. Influence of amino acids in protecting amylase from inactivation by mercury. Jour. Amer. Chem. Soc. 44: 2923-2926. 1922.—The authors find that glycine and phenylalanine protect pancreatic amylase against small amounts of mercuric chloride.—J. M. Brannon.

3541. SHERMAN, H. C., and MARY L. CALDWELL. Influence of lysine upon the hydrolysis of starch by purified pancreatic amylase. Jour. Amer. Chem. Soc. 44: 2926-2930. 1922.—Lysine shows no effect upon the amylolytic action of pancreatic amylase, but exerts a favorable influence upon its saccharogenic action. Amylase, according to the authors' view, is protein in nature, and through hydrolysis it becomes inactivated. The presence of amino acids retards this hydrolysis. But lysine is not split off until after the amylolytic action has taken place and so does not exert its influence until after that stage.—J. M. Brannon.

3542. SHERMAN, H. C., and NELLIE M. NAYLOR. Influence of some organic compounds upon the hydrolysis of starch by salivary and pancreatic amylases. Jour. Amer. Chem. Soc. 44: 2957-2966. 1922.

3543. VOSBURGH, WARREN C. Some errors in the study of invertase action. Jour. Amer. Chem. Soc. 43: 1688-1693. 1921.—Invertase secretions are subject to loss in activity when diluted with distilled water. There is less loss when diluted with weak acids. Sucrose protects invertase from loss of activity. Sucrose is hydrolyzed by invertase faster when citrate buffer or acetate buffer is used as a source of the hydrogen ion than when either citric acid or acetic acid is used. Different invertase preparations vary in the magnitude of their losses on dilution.—J. M. Brannon.

3544. WALLACE, R. HEDGER. Vegetable rennet. Nature 110: 543. 1920.—A preliminary list of plants which have been used in place of rennet for the coagulation of milk is presented. The list includes: *Galium verum*, *Withania coagulans*, *Ficus Carica*, *Cynara cardunculus*, *Cynara scolymus*, *Carduus nutans*, *Cnicus benedictus*, *Drosera peltata*, *Datura Stramonium*, *Pisum sativum*, *Lupinus hirsutus*, *Ricinus hirsutus*, *Pinguicula vulgaris*, *Leucas cephalotes*, *Crotalaria Burhia*, *Rhazya stricta* and *Streblus asper*.—O. A. Stevens.

METABOLISM (RESPIRATION)

3545. PARKER, G. H. The calibration of the Osterhout respiratory apparatus for absolute quantities of carbon dioxide. Jour. Gen. Physiol. 4: 689-695. Fig. 1. 1922.—A method is given whereby minute absolute amounts of CO₂ may be measured by using the Osterhout

respiratory apparatus. Each particular apparatus must be calibrated since it has its own constant, but once this is done a formula, viz., $K = T \times W$, where K is the constant for the particular apparatus, T the time in seconds for change of indicator from one pH to another, and W the weight of CO_2 in hundred-thousandths mg. delivered per second. The expression may be stated thus, $\frac{K}{T} = W$.—O. L. Inman.

3546. PARKER, G. H. The excretion of CO_2 by relaxed and contracted sea anemones. Jour. Gen. Physiol. 5: 45-63. Fig. 1. 1922.—The metabolism of the sea anemone *Metridium marginatum*, as measured by the output of CO_2 in hundred-thousandths mg. per second by a gm. of living sea anemone showed that during the contracted state, the relaxed state, and the relaxing state, equivalent amounts of CO_2 were liberated, but that during the state of contraction there was an increase of CO_2 output, or increased metabolism. This has a direct bearing on the nature of the metabolic processes going on during a state of contraction, which state may be maintained for a long time in sea anemones and in some molluscs. A theoretical discussion of the relationship between tonus and tetanus is given.—O. L. Inman.

3547. RICHARDSON, A. C., and C. C. DOZLER. A safe method for securing anaerobiosis with hydrogen. IX. Jour. Infect. Diseases 31: 616-621. 1922.—A method whereby anaerobiosis with hydrogen is obtained with minimum risk to the operator is described in detail.—R. V. Allison.

3548. ROCKWELL, GEORGE E. The influence of carbon dioxide on the growth of bacteria. Jour. Infect. Diseases 32: 98-104. 1923.—It is pointed out that many, if not all obligatory aerobes are not obligatory, but may grow in the absence of oxygen provided the proper carbon dioxide tension is supplied. It is further noted that anaerobicity is concerned not only with the absence of oxygen but with the presence of carbon dioxide in practically all cases. Interesting studies are also presented upon partial tension strains and particularly the relation of the concentration of these 2 gases in the case of those cultures recently isolated from the host.—R. V. Allison.

3549. WOODMAN, HERBERT ERNEST. Comparative determinations of the digestibility and metabolisable energy of green oats and tares, oat and tare hay and oat and tare silage. Jour. Agric. Sci. 12: 144-165. 1922.—Tables of physiological interest are given.—V. H. Young.

ORGANISM AS A WHOLE

3550. DUFRÉNOY, J., et R. MOLINÉRY. Les sulfuraires. [Sulphur bacteria.] Presse thermale et climatique 63: 478-480. Fig. 1. 1922.—In the thermal springs of the Pyrenees (Barèges and Luchon) microscopic sulphur crystals form in the layer of sulphur bacteria floating on the water, while sulphur granules form inside the cells of *Thiothrix*. Sulphur formation is most active at temperatures of 40-50°C.—J. Dufrénoy.

3552. GREIG-SMITH, R. The high temperature organism of fermenting tan-bark. Proc. Linn. Soc. New South Wales 46: 76-98. 4 figs. 1921.—The fermentation of spent wattle-bark in the corrosion of white lead by the old Dutch process was caused by a stout rod-shaped bacterium having a terminal spore. Its optimum laboratory temperature was 60°C., although in the corroding stacks the temperature might rise to 80°. Raw spent wattle-bark was difficult to ferment and required preliminary treatment or "tempering," that is, the maintenance of a vigorous growth of active bacteria. As conditions which oxidise tannin substances favor fermentation of the raw bark, it is probable that residual tannins inhibit fermentation. During the corrosion process there was a comparatively slow and prolonged evolution of CO_2 , due mainly to bacteriological fermentation, the speed of which seemed to be regulated by

small amounts of nitrogenous matter in the bark. This conclusion was confirmed by experiments showing the influence of asparagin. The organism was found to be capable of decomposing sugar, such as dextrose or saccharose, when freshly isolated, but soon thereafter it required the addition of alkali to enable it to act. The spores were difficult to destroy, especially when in the pores of the bark; they lived after exposure to 186–205° for 2½ hours. It was not proved that the bacteria could ferment cellulose. There was no growth of the organism in media devoid of soluble sources of carbon, such as Uschinsky's solution. The constituent of the bark fermented is still unknown.—*Eloise Gerry.*

3553. HARLAN, HARRY V., and MERRITT N. POPE. **The germination of barley seeds harvested at different stages of growth.** Jour. Heredity 13: 72–74. 1 fig. 1922.—Barley kernels at Aberdeen normally mature about 26 days after flowering. The diastase which digests the starch endosperm is secreted by the epithelial layer of the scutellum. This layer assumes its form about the 14th day after flowering. Hand pollinated kernels germinated 5 days after flowering, when the entire kernel contained only 5 mgm. of dry matter. The mature kernel contains about 35 mgm. dry matter. All seeds that germinated produced normal plants.—*H. V. Harlan.*

ALLARD. **Effect of the relative length of day and night and other factors of the environment on growth and reproduction in plants.** Jour. Agr. Res. 18: 553–606. 1920 (see Bot. Absts. 5, Entry 22).] Monthly Weather Rev. 50: 423–424. 1922.

3555. KÜSTER, E. **Botanische Betrachtungen über Alter und Tod.** [Botanical observations on senescence and death.] Abhandl. Theoret. Biol. [Edited by JULIUS SCHAXEL.] 10: 1–44. 1921.—This paper represents some conclusions that are based on the observations of various authors from Pliny to the present time as to the facts of senescence and death in plants. The paper serves as an introduction to the many aspects of the literature, especially the more recent publications.—*C. C. Epling.*

3556. LOPEZ Y NEGRIN, J. **Die Anaphylaxie.** Authorized translation by C. RICHET *iv* + 221 p. Akademische Verlagsgesellschaft m. b. H.: Leipzig, 1920.

3557. MEGRAIL, EMERSON. **Factors influencing development of metachromatic granules in the diphtheria bacillus.** Jour. Infect. Diseases 31: 393–401. 1922.—Granule production in the diphtheria bacillus shows marks variation in response to the different media used. The influence of single versus confluent colonies as the source of smears as well as the effect of products of growth upon old as compared to young cultures were considered. The influence of temperature, water content of the substratum, oxygen pressure, and the presence of diphtheria toxin and toxin-antitoxin are also discussed.—*R. V. Allison.*

3558. REXHAUSEN, LUDWIG. **Über die Bedeutung der ektotrophen Mykorrhiza für die höheren Pflanzen.** [On the importance of ectotrophic mycorrhiza for higher plants.] Beiträge Biol. Pflanzen 14: 18–59. Pl. I–III, fig. 1–4. 1920.—By the use of microchemical tests and cultural studies with the mycorrhiza of *Picea* the writer sought to determine whether the ectotrophic mycorrhiza are parasitic or symbiotic in nature. He found that under certain conditions of culture the mycorrhiza fungi may be parasitic while under other conditions they may supply the roots with phosphorus and potassium as well as perhaps nitrogen and so may properly be regarded as beneficial to the host plant to a degree at least. The protective devices developed (tannin, certain wall thickenings) by the host against invasion by the fungus are considered. Text figures show the distribution of various chemicals in the roots under different conditions of culture. In his studies of the relation of *Monotropa* to the host fungus he finds that the fungus, by means of haustoria, does take certain substances (proteins and perhaps sugar) from the epidermis of the host. On the other hand, he is convinced, though no certain proof is available, that the epidermal cells do absorb the contents of dying hyphae

of the fungus.—Germination experiments with seeds of *Monotropa* have not been successful because of the necessity of the presence of the proper fungus and the difficulty of eliminating from the cultures other fungi which suppress the activity of the true fungus.—Orton L. Clark.

3559. TANNER, FRED W. **Microbiology of flax retting.** Bot. Gaz. 74: 174–185. 1922.—*Clostridium amylobacter* was isolated as the specific organism of retting flax. It is an anaerobic, spore-forming bacterium commonly present on flax stalks and widely distributed in nature. It hydrolyzes rapidly the carbohydrate “binders” in the flax stalk. The time interval was no less, and the action no more effective when the anaerobic *Clostridium* was associated with aerobic forms. Temperature is an important factor, the optimum being about 30°C. Shortening of the retting process and a better quality of fiber are produced by utilizing controlled conditions with an optimum environment. “Previous sterilization of the flax did not seem to affect the retting process. No real success was secured by the use of 15 common aerobic bacteria and 5 yeast-like fungi. Flax raised from seed was quickly retted, although the fiber was not in as good condition as that prepared from flax raised for fiber.”—B. W. Wells.

3560. WILSON, J. K. **The growth of soil bacteria in guttation water.** (Abstract.) Absts. Bact. 6: 484. 1922.—*Bacillus cereus*, *B. fluorescens*, *B. radiciola* and 2 unnamed species grew abundantly in sterilized guttation water.—D. Reddick.

GROWTH, DEVELOPMENT

3561. MASON, T. G. **Growth and abscission in sea island cotton.** Ann. Bot. 36: 457–484. 10 fig. 1922.—The factors responsible for the premature shedding of flower buds and bolls were studied. It is shown that the susceptibility to shedding is very small until growth in the main axis has nearly ceased. It is concluded that both cessation of growth and increased susceptibility to shedding are due to the diversion of food to the large number of more mature bolls on the lower part of the plant. This conclusion is supported by the fact that the removal of the more mature bolls lessens the shedding. In general it is believed that the amount of shedding is determined by the rate at which food is manufactured and by the rate at which it is used up, and that consequently any factor which causes a decrease in food manufacture causes an increase in shedding. In agreement with this it was found that shedding increased after the removal of leaves, daytime rain, lack of direct sunlight, etc.—W. P. Thompson.

3562. PRIESTLY, J. H., and W. H. PEARSALL. **Growth studies, III. A “volumometer” method of measuring the growth of roots.** Ann. Bot. 36: 485–489. 1 fig. 1922.—An account is given of an apparatus which is designed to measure the whole root system of a plant at intervals during an extended period. The roots are grown in a container to which the nutrient solution is admitted and from which it is removed through a tap at the bottom. Changes in volume of solution in successive readings give the increases in volume of the root system. There are many devices to secure accuracy and convenience in use.—W. P. Thompson.

TEMPERATURE RELATIONS

3563. ESTY, J. RUSSELL. **The heat resistance of *B. botulinus* spores.** Amer. Jour. Public Health 13: 108–113. 1923.—The heat resistance of spores of 112 strains of *B. botulinus* from various sources, including 81 Type A, 30 Type B, and 1 non-toxic, varies from 3 to 75 minutes at 105°C. In general, spores of Type A are more resistant than those of Type B. The maximum heat resistance of spores produced under optimum conditions of growth is 330 minutes at 100°C; 110 at 105°C; 33 at 110°C; 11 at 115°C; and 4 at 120°C. when heated in a phosphate solution of pH 7.0. These figures represent the shortest time at which no spores survived. The longest survival times under the same conditions mentioned above are 320, 100, 30, 10, and 4 minutes respectively. The resistance of different strains varies irrespective of the numbers of spores produced in the same medium; but the resistance of a given strain is markedly influenced by the number of spores heated, the larger the number in a suspension the greater the resistance.—C. A. Ludwig.

3564. ESTY, J. R., and K. F. MEYER. **The heat resistance of the spores of *B. botulinus* and allied anaerobes.** Jour. Infect. Diseases 31: 650-663. 1922.—The specific resistance to heat of the spores of a large number of strains from each of several different varieties of anaerobes was determined under varying conditions. It is thought that young spores, probably those of the first generation, are the most resistant to heat. Among other important observations it was noted that increasing the concentration of the solution up to a certain limit or, under other conditions, the dryness of the spores tended to increase the resistance to heat. Likewise, the thermal resistance of *B. botulinus* was found to be affected by the H-ion concentration of the solutions.—R. V. Allison.

3565. HUBERT, ERNEST E. **A simple apparatus for controlling temperatures.** Bot. Gaz. 74: 333-334. Fig. 1. 1922.—This electrically operated apparatus may be connected with an ordinary lighting circuit. Its main advantage according to the author "lies in the fact that the same current which passes through the heating units is used, after reducing the voltage to 6, 8 or 14 volts, to operate the relay." It is sensitive to within $\frac{1}{4}$ degree.—B. W. Wells.

3566. JOHNSTON, EARL S. **Moisture content of peach buds in relation to temperature evaluations.** Bot. Gaz. 74: 314-319. Fig. 1-2. 1922.—For 3 years from Jan. to March, data were obtained as follows: Ratio of water content to dry weight of buds; temperature indices summed from Jan. 1. The author presents graphs which bring out the definite relationship between air temperature and the rate of increase in the moisture content of peach fruit buds. The slope of the curve for 1 year was quite different from those of the other 2. The writer suggests that "some conditioning influences are at work before Jan. 1 that determine the slopes of these curves."—B. W. Wells.

3567. NEWTON, ROBERT. **A comparative study of winter wheat varieties with special reference to winter-killing.** Jour. Agric. Sci. 12: 1-19. Tables I-VI. 1922.—After reviewing work on the injury to plants from freezing and on the internal factors making for hardiness in plants, the author describes methods of work and results in an attempt to establish a chemical or physico-chemical measurement for winter wheat varieties. Studies were made of the physical constants of the cell sap and the content of dry matter, nitrogen, sugars, and starch. No constant relation was found between depression of the freezing point, specific conductivity, or H-ion concentration of the cell sap and relative frost hardiness. An attempt was made to differentiate between osmotic pressure due to electrolytes and that due to sugars. The latter accounted for 34 to 38 per cent of the total osmotic pressure of the sap. The ratio of that part of the osmotic pressure not due to sugars (designated P-Ps) to the corrected specific conductivity ($\times 10^3$) is not a constant, for this ratio varied from 0.96 to 1.07 in samples collected early in November and varied from 0.73 to 0.91 in samples collected December 9. The relation between dry matter and hardiness was not constant though 1 of the 2 tender varieties had the lowest percentage. All varieties increased in amino nitrogen and water-soluble nitrogen during the hardening process. The hardest variety had the largest content of water-soluble nitrogen, but the relation was not uniform throughout the series. The amount of sugar present did not correspond uniformly with the known hardiness and decreased from Nov. to Dec., the greatest decrease being in one of the two tender varieties. Sucrose is important as a storage product and is apparently the only disaccharid present. No starch was present in any of the varieties. The colloidal complex of fully hardened tissue was very resistant to freezing and could not be broken down by a freezing mixture with a theoretical temperature of -59.9°C . Such hardened tissues retain their water with great force. No appreciable amount of sap could be extracted under a pressure of 400 atmospheres though the tissues contained 70 per cent of moisture and were subjected to severe preliminary freezing.—V. H. Young.

TOXIC ACTION

3568. ATWOOD, W. M. **Physiological studies of the effects of formaldehyde on wheat.** Bot. Gaz. 74: 233-263. Fig. 1-12. 1922.—Formaldehyde slowly penetrates the seed coat. Within the germinating seed it reduces the diastatic activity, inhibits the function of the

catalases, and lessens respiration. The author suggests that "it is entirely possible that concentrations which do not materially injure germination percentages do materially disturb the physiological processes related to germination and subsequent growth." Regarding concentration, he indicates that the common 1-320 formula may be injurious through reduction of seedling vitality in the presence of germination. [See also Bot. Absts. 9, Entry 1044.]—*B. W. Wells.*

3569. OLDENBUSCH, CARRIE. Stimulation of plants by carbon disulphide. Bull. Torrey Bot. Club 49: 375-389. 1922.—Studies made on seeds and seedlings, on buds and certain fungi, showed the ability of carbon disulphide to stimulate when used in dilute amounts. Such was the case in dormant protoplasm of twigs, which quickly resumed growth; in active protoplasm of twigs, which quickly resumed growth; in active protoplasm of seedlings, which elongated more rapidly; and in conidia which germinated sooner and elongated more rapidly. This acceleration lasts for only a certain period and growth then tends to return to normal.—*P. A. Munz.*

3570. WILLIAMS, MAUD. On the influence of immersion in certain electrolytes upon cells of *Saxifraga umbrosa*. Ann. Bot. 36: 569-578. 3 fig. 1922.—The author uses the precipitation of the tannin within the cells by means of potassium dichromate as a criterion of the toxicity of electrolytes. This reaction can occur only after the tissue has been immersed in a given concentration of salt solution for a definite length of time. Beside potassium dichromate 6 salts are used: the chlorides, iodides, and nitrates of sodium and potassium. In her curves, the author plots $\log T$ against $\log C + 1$, where T is the "critical time" and C is concentration, and obtains straight lines. The equation here is: $\log T + k (\log C + 1) = K$. According to the results, different "monovalent cations and similar anions produce different effects while marked differences occur if the cation be kept constant and the anion varied, so that simple chemical action does not seem to explain the changes produced." The author therefore regards the results as due to adsorption and the precipitation of colloids.—*S. F. Cook.*

MISCELLANEOUS

3571. GREIG SMITH, R. Note upon the extraction of acids from cultures. Proc. Linn. Soc. New South Wales 46: 154-156. 1921.—The extraction of the fixed acids from bacterial or from yeast cultures is of the nature of a monomolecular reaction and should be continued until no more acid is extracted. The preparation of salts, such as those of barium, by neutralising the extracted acids until a pink color is obtained in the presence of phenolphthalein, may be faulty as the reaction is much slower than is generally supposed.—*Eloise Gerry.*

3572. LEWIS, J. M. The estimation of acidity. Proc. Roy. Soc. Victoria 33: 233-260. 11 fig. 1921.—The use of the electrometric method is discussed in detail.—*Eloise Gerry.*

3574. BORLASE, W., and ALEXANDER GREGG. The agricultural value of sea-sand. Jour. Ministry Agric. Great Britain 29: 591-599. 1922.—The dune and beach sands of Cornwall contain much calcium carbonate from the shells of the several species of mollusks abundant

on that coast. For centuries the Cornish farmers have carried the sand inland, and it is today in strong competition with burnt lime and ground limestone as a source of lime. Analysis of sands from 34 localities shows 22-950 pounds of CaO per ton, 19 of the samples analyzing more than 25 per cent CaO. There was no correlation between fineness and lime content. Experiments by the Cornwall County Council and the experience of individual farmers have demonstrated that these sands are at least as beneficial as commercial forms of lime to clover and grass, although like other forms of lime they may be deleterious to oats and mangolds. Since the soils of Cornwall are generally acid and purchased lime must be brought from South Devon or Somerset, the deposits of sea-sand are of great importance. An examination of the immense quantities of blown sand found elsewhere along the English coast is suggested.—*L. W. Kephart.*

3575. BOVING, P. A. **Soil microbiology—A résumé and an appeal.** *Sci. Agric.* 3: 75-78. 1922.—The writer discusses microorganisms and their relation to soil fertility.—*T. G. Major.*

3576. BROWN, H. D., and F. A. DALLYN. **Report on the fertilizer value of activated sludge.** *Ann. Rept. Provincial Bd. Health, Ontario, Canada.* 39: 130-155. 1920.—The activated sludge process, developed in the past 5 years, is the most promising method of converting urban sewage into a usable nitrogenous fertilizer. It is estimated 1,000 pounds of sludge can be recovered per million gallons of sewage and that approximately 15.4 per cent of the total available nitrogen in the sewage may be recovered as fertilizer base. From data on world production and costs of synthetic and non-synthetic ammoniates and from the known limitations of the former, it is concluded that there is a large prospective market for this material.—In the experimental work activated sludge was prepared by oxidizing the organic material of the raw sewage under aeration with a sludge culture, allowing the liquid to settle and drying and grinding the precipitate. A grayish powdery substance resulted which was quite inoffensive in odor and containing 4.5 per cent nitrogen. It was compared in fertilizing value with cyanamide, dried blood, sodium nitrate, ammonium sulphate, and tankage. Three series of plots were used receiving respectively 40, 80, and 120 pounds of nitrogen per acre in each of the above 6 forms, and 200 pounds each of superphosphates and potassium chloride. The indices used were flax, potatoes, peas, beans, tomatoes, cauliflower, cabbage, carrots, seed onions, lettuce, and tobacco. The results indicate that (1) the nitrogen in activated or dried sludge is readily available and assimilable; (2) the sludge is very beneficial when applied immediately prior to planting; (3) the sludge gives a rapid early growth which exceeds that of any commercial fertilizer used; and (4) the maturity of the plant is hastened.—Preliminary investigations indicate that the nitrogen content of the sludge can be considerably increased by more rapid and thorough drying and by introducing pure cultures of *Azotobacter* and nitrifying bacteria during activation.—*L. W. Kephart.*

3577. DESCH, C. H. **The nitrogen industry.** *Nature* 110: 670-671. 1922.—This is a summary of several addresses at the Hull meeting of the British Association, dealing with commercial fixation.—*O. A. Stevens.*

3578. MUKHERJEE, J. N. **Experiments on the theory of soil acidity.** *Nature* 110: 732. 1922.—Soil acidity is conceived to be due to the adsorption by soil gels (e. g. silica) of the anions, leaving the cations in a mobile second layer. The latter may be removed, in part, by replacement with a neutral salt. Silica was found to adsorb considerable quantities of acids. Aqueous extracts were neutral, but on shaking with KCl solution an acid extract was obtained. Simultaneous experiments on electro-osmosis demonstrated that the acids are not adsorbed as molecules, but as ions.—*Frank Thone.*

3579. POPE, HAROLD B. **Nauru and Ocean Island. Their phosphate deposits and workings.** *Jour. Dept. Agric. Victoria* 19: 450-469. 12 fig., 3 maps. 1921.—The bird theory regarding the origin of the deposits on these islands is generally accepted. The quality of the phosphate is particularly high, the average tribasic phosphate of lime content being from 5S

per cent to 88 per cent. An account of the discovery and the mining operations is given. [See also Bot. Absts. 12, Entry 874.]-*Wm. E. Lawrence.*

3580. WEISKE, F. *Die Wertverluste des Kalkstickstoffs beim Lagern.* [Loss in value of calcium nitrate in storage.] *Landw. Jahrb.* 54: 601-618. 1920.—The author reviews the literature and reports on a series of experiments on the loss in weight and in nitrogen as well as in the formation of dicyanamid-nitrogen in calcium nitrate. Vegetation experiments were carried on with white mustard. The results confirmed the conclusion drawn from previous experiments, that the formation of any considerable quantity of dicyanamid in the calcium nitrate materially reduces its value as a fertilizer.—*A. J. Pieters.*

TAXONOMY OF VASCULAR PLANTS

J. M. GREENMAN, *Editor*

(See also in this issue Entries 2962, 2992, 3012, 3019, 3020, 3027, 3034, 3035, 3036, 3115, 3144, 3147, 3149, 3230, 3274, 3319, 3364)

GENERAL

3581. MEZ, CARL, und KARL KIRSTEIN. *Sero-diagnostische Untersuchungen über die Gruppe der Gymnospermae.* [Sero-diagnostic studies on the groups of Gymnosperms.] *Beiträge Biol. Pflanzen* 14: 145-148. 1920.—The use of serums in testing out the protein relations of various groups of the gymnosperms led to the following results: Positive reactions were obtained between the Abietineae with *Selaginella* and *Magnolia*. The position of *Ginkgo* as a primitive member of gymnosperms is not borne out by the serum test. No reaction was found between *Ginkgo* and *Cycas*. One evolutionary series according to the authors is from Hepaticae to Lycopodiales eligulatae to Lycopodiales ligulatae to Coniferae to Ranales. Another series follows from Hepaticae to Filicales eusporangiatæ to Cycadofilicales to Cycadales to Bennettitales. A relationship between the protein of Gnetales and Coniferae was found. No reaction occurred between any of the Coniferae with Amentales and allied forms of Casuarinaceae, Fagaceae, Juglandaceae, Piperaceae, which confirms earlier results placing the Amentales in the series Ranales, Centrospermae, Myricales, Amentales. From the protein relationship certain morphological conclusions follow such as the homology of the ovuliferous scale of Abietineae and the ligule of Lycopodiales ligulatae.—*Orton L. Clark.*

3592. JOHNSTON, IVAN MURRAY. Undescribed plants mostly from Baja, California. Univ. California Publ. Bot. 7: 437-446. 1922.—The following new species, varieties, and combinations are proposed: *Ephedra peninsularis*, *Stenophyllus nesioticus*, *S. Sellowiana* (*Isolepis Sellowiana* Kunth), *Viscainoa geniculata* Greene var. *pinnata*, *Condalia Parryi* Web. var. *microphylla*, *Euphorbia dentosa*, *E. peninsularis*, *E. podagrica*, *Securinega capensis*, *S. fasciculata* (*Bernardia fasciculata* Wats.), *S. Hallii* (*Tretracoccus Hallii* Brandg.), *Mentzelia hirsutissima* Wats. var. *nesiotes*, *M. hirsutissima* Wats. var. *stenophylla* (*M. stenophylla* Urb. & Gilg.), *M. involucrata* Wats. var. *megalantha*, *M. tricuspidis* Gray var. *brevicornuta*, *Cryptantha inaequata*, *C. maritima* Greene var. *pilosa*, *C. racemosa* Greene var. *lignosa*, and *Houstonia australis*.—*W. A. Setchell*.

3593. MERRILL, E. D. Diagnoses of Hainan plants. Philippine Jour. Sci. 21: 337-355. 1922.—Thirty-seven new species of flowering plants are described; these are: *Rhaphidophora Maclurei*, *Disporum hainanense*, *Alpinia Maclurei*, *Piper Maclurei*, *Castanopsis hainanensis*, *Ficus palmatiloba*, *Debregeasia spiculifera*, *Aristolochia hainanensis*, *Fissistigma Maclurei*, *Machilus hainanensis*, *Phoebe hainanensis*, *Cryptocarya hainanensis*, *C. Maclurei*, *C. obtusifolia*, *Rhaphiolepis parvibracteolata*, *Bauhinia Moningeriae*, *Evodia hainanensis*, *Breynia rostrata*, *Antidesma hainanense*, *Mallotus Maclurei*, *Gomphandra hainanensis*, *Gonocaryum Maclurei*, *Meliosma angustifolia*, *Rhamnella hainanensis*, *Adenia Maclurei*, *Eugenia Maclurei*, *Rhododendron hainanense*, *Ardisia Maclurei*, *Sideroxylon rostratum*, *Diospyros cardiophylla*, *Wrightia hainanensis*, *Erycibe hainanensis*, *Radermachera hainanensis*, *Oreocharis flavida*, *Strobilanthes Maclurei*, *Lasianthus hainanensis*, and *Gynura Maclurei*. The study of recently collected material brings the list of Hainan species from about 350 previously known to somewhat over 1000.—*E. D. Merrill*.

3594. MERRILL, E. D. Notes on the flora of southeastern China. Philippine Jour. Sci. 21: 491-513. Fig. 1. 1922.—This paper is based largely on material from Kwangtung Province. It consists of records of species new to the province, with descriptions of 18 new species as follows: *Fokienia Maclurei*, *Polychroa Tsoongii*, *Loranthus Maclurei*, *Euchresta trifoliolata*, *Atalantia kwangtungensis*, *Chisochiton chinensis*, *Trigonostemon chinensis*, *Koeleruteria integrifoliola*, *Elaeocarpus glabripetalus*, *Eurya stenophylla*, *Shorea chinensis*, *Eugenia Tsoongii*, *Ligustrum Tsoongii*, *Tabernaemontana chinensis*, *Botryopleuron longispicatum*, *Thunbergia chinensis*, *Hedyotis platystipula*, and *Pentaphragma spicatum*. *Ichnocarpus volubilis* (Lour.) Merr. is adopted as the oldest name for *I. ovatifolius* A. DC.—*E. D. Merrill*.

3595. MERRILL, E. D. Additions to our knowledge of the Bornean flora. Philippine Jour. Sci. 21: 515-534. 1922.—Seven previously described species are for the first time recorded from Borneo and the following 19 are described as new: *Pothos mirabilis*, *Quercus borneensis*, *Ficus inaequipetiolata*, *Orophea myriantha*, *Lunasia gigantifolia*, *Chisocheton polyandrus*, *Aporosa grandistipula*, *Cyclostemon Castilloi*, *Zizyphus lenticellata*, *Sterculia acuminatissima*, *S. Hosei*, *S. longipetiolata*, *S. membranacea*, *S. Yatesi*, *Saurauia Agamae*, *Rinorea Castilloi*, *Tabernaemontana polysperma*, *Premna glandulosa*, and *Psychotria Agamae*.—*E. D. Merrill*.

3596. PAYSON, EDWIN BLAKE. Species of *Sisymbrium* native to America north of Mexico. Univ. Wyoming Publ. Bot. 1: 1-27. 1922.—The usual interpretation of the generic name *Sisymbrium* is accepted in the present paper and the application of this name to the water-cross, as has been made by certain American authors, is not approved. *Sisymbrium altissimum* L. is regarded as the generic type. The following general conclusions in regard to the

phylogeny of the species of *Sisymbrium* have been reached by a consideration of the American species: (1) An annual or biennial habit of growth is more primitive than the perennial habit; (2) a stipe or gynophore that raises the ovary above the torus is a primitive character; (3) a long, terete pod is more primitive than a short or compressed one; (4) in the primitive species the petals were probably purplish; (5) the racemose type of inflorescence is thought to be more primitive than the corymbose type; (6) the leaves of the ancestral species were probably entire and amplexicaul; (7) trichomes were not present in the more primitive species and their presence is held to be a sign of specialization. The genus is believed to have originated in Arizona and *S. ambiguum* is the most primitive species. A complete taxonomic treatment is given for the 11 species native to America north of Mexico. The following new species, new transfers and new names occur: *Sisymbrium ambiguum* (*Thelypodium ambiguum* Wats.), *S. juniperorum*, *S. aureum* (*Thelypodium aureum* Eastw.), *S. elegans* (*Thelypodium elegans* Jones), *S. Vaseyi* (*Thelypodium Vaseyi* Coulter), *S. Watsonii* (*S. Vaseyi* Wats.), *S. linearifolium* (*Streptanthus linearifolius* Gray).—*E. B. Payson.*

3597. REHDER, ALFRED. New species, varieties and combinations from the herbarium and the collections of the Arnold Arboretum. Jour. Arnold Arboretum 3: 207-224. 1922.—The present article contains the following new species, varieties, hybrids, combinations and names: *Juniperus squamata* var. *Meyeri*, *J. lucayana* var. *bedfordiana* (Loud.), *Pinus nigra* var. *cebennensis* (Godr.), *Potentilla fruticosa* var. *Purdomii*, *R. Maximowicziana* var. *Jackii* (Rehd.), *R. omeiensis* f. *chrysocarpa*, *Hamamelis virginiana* f. *rubescens*, *Skinmnia Reevesiana* f. *rubella* (Carr.), *R. Reevesiana* f. *variegata*, *S. Foremanii* var. *Rogersii* (Mast.), *Cotinus coggygria* f. *purpureus* (Dupuy-Jam.) × *Ilex Beanii*, *I. Macfadyenii* (Walp.), *Viburnum corymbosum* (Mill.), *Euscaphis japonica* var. *ternata*, *Acer stenolobum*, *A. cappadocicum* f. *rubrum* (Kirchn.), *A. Buergerianum* var. *trinerve* (Dipp.), *A. Opalus* var. *tomentosum* (Tausch), *A. Hersii*, *Aesculus discolor* var. *Koehnei*, *A. turbinata* var. *pubescens*, *Zizyphus jujuba* Mill. var. *inermis* (Bge.), *Rhamnus Alaternus* f. *argenteo-variegata* (West.), × *Ceanothus pallidus* var. *roseus* (Spach), × *C. pallidus* var. *plenus*, *Vitis Thunbergii* var. *sinuata* (Reg.), *V. Piasezkii* var. *Pagnuccii* (Romanet du Caill.), *Camellia elongata* (Rehd. & Wils.) and *Viburnum Sargentii* f. *flavum*. The synonymy of *Ilex vomitoria* Ait. and of *Ceanothus coerulea* Lag. and × *C. Delilianus* Spach is also discussed. [See Bot. Absts. 8, Entry 734; 10, Entry 370; 11, Entry 4862.]—*Alfred Rehder.*

3598. REHDER, ALFRED. Two new Asiatic poplars. Jour. Arnold Arboretum 3: 225-227. 1922.—*Populus Purdomii* from northwestern China and *P. koreana* from Korea are described.—*Alfred Rehder.*

3599. ROSEN, F. Über die Samen einiger Speisekürbisse. [Concerning the seeds of a few squashes.] Beitr. Biol. Pflanzen 14: 1-17. Fig. 1-24. 1920.—The many varieties of squashes may all be grouped under the 3 species: *Cucurbita Pepo* L., *C. maxima* Duch., and *C. moschata* Duch. The anatomical differences in the seeds of the first 2 species are discussed in detail as bearing on the origin of the different garden forms of squashes.—*Orton L. Clark.*

3600. SANDS, W. N. Botanical notes on the Brazil nut tree in Malaya. Malayan Agric. Jour. 10: 130-132. 1922.—Young [Bot. Gaz. 52: 226. 1911] discussed the origin of the Brazil nut and assigned it to *Bertholletia nobilis*. Petch [Ann. Roy. Bot. Gard. Peradeniya 5: 421. 1914] reported on the Brazil nut as cultivated in Ceylon and decided that the characters of *B. nobilis* and *B. excelsa* were alike exhibited in the tree at Peradeniya in such a way as to shake belief in the distinctness of the 2 species. Deshmukh [Gard. Bull. Straits Settlements 2: 435. 1921] did the same for trees in Singapore with the same result. In this paper Sands reports on trees at Kuala Lumpur, but gives no personal opinions.—*I. H. Burkill.*

3601. SARGENT, C. S. Notes on North American trees, X. Jour. Arnold Arboretum 3: 182-207. 1922.—This paper deals chiefly with *Crataegus* and the following species and varieties are described as new: *Crataegus swanensis*, *C. ohioensis*, *C. Warneri*, *C. poliophylla*, *C. steno-*

sepala, *C. abbreviata*, *C. desertorum*, *C. tripartita*, *C. anamesa*, *C. antiplasta*, *C. antimima*, *C. sutherlandensis*, *C. sutherlandensis* var. *spinescens*, *C. caeruleascens*, *C. ellipticifolia*, *C. marietensis*, *C. uvaldensis*, *C. rotundifolia* var. *aboriginum* (Sarg.), *C. rotundifolia* f. *rubescens*, *C. mercerensis*, *C. meiophylla*, *C. Margaretta* var. *Brownii* (Britt.), *C. Margaretta* var. *xanthocarpa*, *C. Harveyana*, *C. conjungens*, *C. choriophylla*, *C. Croomiana*, *C. Victorinii*, *C. carollensis*, *C. kingstonensis*, *Betula neolaskana*. A note on *Gleditsia texana* Sarg., which is considered a hybrid between *G. triacanthos* and *G. texana*, concludes the article. [See also Bot. Absts. 8, Entry 740; 10, Entry 372; 11, Entry 4865].—*Alfred Rehder*.

3602. SCHINZ, HANS, und ALBERT THELLUNG. Beiträge zur Kenntnis der afrikanischen Flora (XXX.) [Contributions to a knowledge of the African flora (XXX.)]. Vierteljahrsschr. Naturf. Ges. Zürich 55: 221-256. 1921.—The following new species and varieties are described: *Celosia Schaeferi* Schinz, *Cyathula hereroensis* Schinz, *Podalyria pulcherrima* Schinz, *Borbonia parviflora* Lam. var. *glabrescens* Schinz, *Buchenroedera Jacottetii* Schinz, *Argyrolobium glaucum* Schinz, *Rhynchosia Dinteri* Schinz, *R. Jacottetii* Schinz, *R. sordida* Schinz (*R. Orthodanum* Benth. *Orthodanum sordidum* E. Mey.), *Eriosema ellipticifolium* Schinz, *E. fasciculatum* Schinz, *Hermannia hyssopifolia* L. var. *integerrima* Schinz, *H. setosa* Schinz, *Gnidia clavata* Schinz, *G. psilotoides* Schinz, *Anticharis azurea* Dinter, *Vernonia pinifolia* (Lam.) Less. var. *canescens* (Rehm.) Thell., *V. hirsuta* (DC.) Sch. Bip. × *pinifolia* (Lam.) Less. Schlechter & Thell. hybr. nov. = *V. adulterina* Thell., *Aster Peglerae* Bolus var. *longipes* Thell., *Felicia erucifolia* Thell., *Chrysocoma subumbellata* Thell., *Helichrysum Moeserianum* Thell., *H. aretioides* Thell., *Lopholaena pauciflora* Thell., *L. longipes* (*Doria longipes* Harv.), *Othonna denticulata* Ait. var. (?) *Schlechteri* Thell., *Senecio achilleifolius* DC. var. *glandulososaber* Thell., *S. Serra* Sonder var. *longipedunculatus* (Volkens) Thell., *S. albanensis* DC. var. *pseudo-decurrens* Thell., *S. serratuloides* DC. var. *typicus* Thell., var. *Rehmannii* Thell., var. *Dieterleni* Thell., var. *Holubii* Thell., *S. isatiedus* DC. var. *typicus* Thell. var. *macrophyllus* Thell., *Ursinia Jacottetiana* Thell., *U. Bolusii* Thell., *Dicoma thyrsiflora* (Klatt) Thell., *Sonchus delagoënsis* Thell., *S. scapiformis* Thell., *Crepis hypochoeridea* (DC.) Thell. var. *Junodiana* (O. Hoffm.) Thell., var. *Woodii* Thell., var. *genuina* Thell.—*John H. Schaffner*.

3603. SCHINZ, HANS, und ALBERT THELLUNG. Weitere Beiträge zur Nomenklatur der Schweizerflora (VII.) (Beiträge zur Kenntnis der Schweizerflora XVIII.) [Further contributions to the nomenclature of the Swiss flora (VII.)] (Contributions to a knowledge of the Swiss flora XVIII.) Vierteljahrsschr. Naturf. Ges. Zürich 66: 257-317. 1921.—Various emendations and corrections of the names of Swiss plants are recorded. The following new combinations occur: *Trichophorum pumilum* Schinz & Thellung (*Scirpus pumilus* Vahl.), *Hymenobolus pauciflorus* Schinz & Thellung (*Capsella pauciflora* Koch), *Erysimum silvestre* (Crantz) Scop. subsp. *helveticum* (Jacq.) Schinz & Thellung and subsp. *Cheiranthus* (Pers.) Schinz & Thellung, *Viola montana* L. subsp. *Ruppii* (All. pro. spec. pro parte, Gaudin sub. *V. montana* pro parte) Schinz & Thellung, *Senecio capitatus* (Wahlenb.) Steudel var. *tomentosus* (DC.) Schinz & Thellung.—*John H. Schaffner*.

3604. SCHLECHTER, R. Beiträge zur Flora von Afrika XLIX. Campanulaceae-Lobeliaee novae africanae. (Contributions to the Flora of Africa XLIX. [New African Campanulaceae of the tribe Lobeliaee.] Bot. Jahrb. 57: 615-625. 1922.—The following species and varieties are described as new: *Lobelia Galpinii*, *L. omphalodoides*, *L. Seineri*, *L. dolichopus*, *L. ilysanthoides*, *L. Kirkii* R. E. Fries var. *microphylla*, *L. knysnensis*, *L. Ledermannii*, *L. odontoptera*, *L. pilosa*, *L. Rudatisii*, *L. Stolzii*, *L. transvaalensis*, *L. ardisiandroides*, *L. dichroma*, *L. Schaeferi*, and *Laurentia longiflora*.—*K. M. Wiegand*.

3605. SZABÓ, Z. Beiträge zur Flora von Afrika. XLIX. Diagnoses Cephalariarum novarum. [Contributions to the flora of Africa XLIX. Diagnoses of new Cephalarias.] Bot. Jahrb. 67: 641-644. 1922.—The following species are described as new: *Cephalaria Galpiniana*, *C. Zeyheriana*, *C. Wilmsiana*, *C. pungens*, *C. taurica*, *C. Sieberi*, and *C. rupestris* Griseb.—*K. M. Wiegand*.

3606. VILLAR, EMILIO del. *El género Gossypium en España*. [The genus *Gossypium* in Spain.] *Broteria Sér. Bot.* 20: 49-72. 1922.—The literature relating to the growth and occurrence of cotton in Spain contains many points that require clearing up, especially as regards the forms actually cultivated. The author's work is based upon collections made in Granada, Malaga, Cadiz, Seville, and Cordova, taken in connection with a digest of the information in some 30 publications, of which a list is given. A résumé of the various species proposed for cultivated cottons is given, with notes upon the validity of the different forms. The author concludes that, taking Schumann's classification as a basis only *Gossypium herbaceum* and *G. barbadense* or their hybrids have been grown in Spain, at least during the past 150 years. Reports of the occurrence of *G. arboreum* seem based upon a misreading of the Arabian author Abu-Zacaria. Of *G. herbaceum* only the variety *hirsutum* seems to occur in cultivation, though some strains indicate traces of hybridization with var. *indicum*. The author describes in detail material of *G. barbadense* representing the "tipo motrileño" of Clemente, no longer cultivated; material from Barrancho de Cantarrijan of the *barbadense* type that has survived cultivation for some 15 years in a semi-wild state; and the 2 sorts cultivated in Malaga under the name "Jumel" (*barbadense*) and "Upland" (*herbaceum*) with two hybrid forms.—*E. B. Chamberlain*.

3607. WINKLER, HUBERT. *Beiträge zur Flora von Papuasien. VIII. Die Urticaceen Papuasien*. [Contributions to the flora of Papuasias VIII. The Urticaceae of Papuasias.] *Bot. Jahrb.* 57: 501-608. 15 fig. 1922.—This region is very rich in Urticaceae many of which are endemic. Keys to the species are given, also extensive notes on structure and distribution. The following new species, varieties, combinations and names are proposed: *Laportea decumana* (Roxb.) Wedd. var. *pedunculata* (*L. pedunculata* Lauterb. & K. Schum.); *L. Schlechteri*; *L. Rechingeri*; *L. crenulata* Gaud. var. *nitida*, and var. *nervosa*; *L. mammosi-setosa*; *L. Warburgii*; *Pilea stenoneura*; *P. pellis crocodili*; *P. cuneata*; *L. plicatidentata*; *P. caudata*; *P. effusa*; *P. Schlechteri*; *P. papuana*; *P. Ledermanni*; *P. stellarioides*; *P. minutissima*; *Elatostema cyrtandra*; *E. Lauterbachii*; *E. articulatum*; *E. elegans*; *E. macrophyllum* Brongn. var. *majusculum* (*E. frutescens* (Bl.) Hassk. var. *majuscula* K. Schum.); *E. Pulleanum*; *E. serra*; *E. annulatum*; *E. novo-guineense* Warb. var. *latifolium*, var. *trapesoideum*, var. *stenopus*, and var. *uber*; *E. Ledermanni*, *E. macropus*; *E. subintegrum*; *E. sesquifolium* (Reinw.) Hassk. var. *ramosum*, and var. *caudatum*; *E. piliferum*; *E. cupulare*; *E. densum*; *E. Lingelshemii*, also its var. *adscendens* and var. *seriatum*; *E. peperomioides*; *E. tenuicaule*; *E. rudicaule*; *E. velutinicaule*; *E. Reiterianum*; *E. mongiense* Lauterb. var. *gracile*; *E. trichomanes*; *E. hymenophyllum*, and var. *Stollei*; *E. tricuspe*; *E. longicollum*; *E. fragile*; *E. barbarufa*; *E. Pellionianum* Gaud. var. *pedunculatum*, var. *effusum*, and var. *Novae-Britanniae* (*E. Novae-Britanniae* Lauterb.); *E. angulare*; *E. pauperatum*; *E. undulatum*; *E. Warburgii* (*Pellionia nigrescens* Warb.); *E. Hoffmannianum*; *E. peltifolium* (*Pellionia peltata* Ridl.); *E. Weinlandii* K. Schum. var. *vestitum*, var. *dispar*, var. *Kochii* (*Pellionia Kochii* Valet.), and var. *ylense* (*E. ylense* Hall. f.); *E. cauliflorum*; *E. Hallieri*; *E. paramelanum*; *E. inamoenum*; *E. lanceolatum*; *E. Hoelscherianum*; *E. Janowskyi*; *E. jabiense*; *E. pedunculatum* Forst. var. *angustum*; *E. Grünigii*, and var. *Krausei*; *E. frutescens* (Bl.) Hassk. var. *fuscifurfuracea*, var. *novoguineense* (*Procris frutescens* var. *novoguineense* Valet.), var. *sculptum*, and var. *caudatum*; *E. decurrens*; *E. rectangulare*; *Cypholophus rotundifolius*; *C. decipiens*, and var. *tenuifolius*; *C. pachycarpus*; *C. radicans*; *C. patens*; *C. reticulatus*; *C. Englerianus*; *C. velutinus*; *C. trapula*, and var. *hirsuta*; *C. Gjellerupii*; *C. Ledermanni*; *C. nummularis*; *C. chamaephyton*; *C. vaccinioides*; *C. Treubii*, *C. Friesianus* (*Pilea Friesiana* K. Schum.); *C. integer*; *C. Pulleanus*, *Pipturus verticillatus*; *P. subinteger*; *P. Ledermanni*; *P. Pullei*; *P. lithospermum*; *P. repandus* (Bl.) Wedd. var. *rufescens*; *Conocephalus hirsutus*; *C. subscaber*; *C. amboinensis* (Zipp.) Warb. var. *crassus*, and var. *longifolius*; *C. Parianus*; *C. Gjellerupii*; *Leucosyke rhodopleura* (*Villebrunia rhodopleura* Bl.); *L. montana*; *L. pulchra* (*Debregeasia pulchra* Ridl.); *Maoutia grandifolia* (*Pipturus grandifolius* Ridl.); *M. ambigua* Wedd. var. *Warburgii* (*M. Warburgii* Boerl.), var. *villosa*, var. *scyphochlamys*, and var. *Chalmersi*.—*K. M. Wiegand*.

3608. WOLF, W. *Notes on Alabama plants*. *Amer. Midland Nat.* 8: 104-127. Pl. 1-3. 1922.—A new genus of monotropoid plants, *Cryptophila* gen. nov., is described from Alabama.

Cryptophila pudica sp. nov. is the new species and *C. pudica* forma *maxima* f. nov. and *C. pudica* var. *Knapkei* var. nov. are also described. The genus is placed in a new tribe, viz., *Cryptophileae*. It differs from tribe *Eumonothepeae* in having a one-celled ovary (several-celled near the base) and indehiscent fruit; and from tribe *Pleuricosporeae* in having anthers opening by pores and indehiscent fruit. The plants seem to be true saprophytes. They grow, flower, and fruit under a cover of leaves. The habitat is given as the xerophile mixed forest of the upland. The flowering scapes make their appearance in October and November; anthesis occurs in March and April; and fruit matures in July and August. Nothing is known of the geographical range. The type specimens were collected in St. Bernard, Cullman County, Alabama, and have been deposited in the herbarium of St. Bernard College.—Ray C. Friesner.

REVISIONS AND MONOGRAPHS

3609. JEPSON, WILLIS L. **Revision of the California species of the genus *Arctostaphylos*.** Madroño 1: 76-96. Fig. 1-3. 1922.—The author deals with 23 species and 10 varieties, giving descriptions, synonymy, geographical, ecological and taxonomic notes and a key. The following new species, varieties and combinations are made: *A. glauca* Lindl. var. *eremicola*, *A. mariposa* Dudley var. *bivisum*, *A. patula* Greene var. *incarnata*, *A. manzanita* Parry var. *apiculata*, *A. pastillosa*, *A. nummularia* Gray var. *myrtifolia* (*A. myrtifolia* Parry), *A. sensitiva*, *A. glandulosa* Eastw. var. *vestita* (*A. vestita* Eastw.), *A. glandulosa* Eastw. var. *crassifolia*, *A. glandulosa* Eastw. var. *virgata* (*A. virgata* Eastw.), *A. Andersonii* Gray var. *auriculata* (*A. auriculata* Eastw.), *A. Andersonii* Gray var. *pechoensis* (*A. pechoensis* Dudley). The author utilizes the biological reaction of the various forms to fire as a support for the conception of species that he has adopted.—Roxana Stinchfield Ferris.

3610. JEPSON, WILLIS L. **Revision of the California species of the genus *Downingia* Torr.** Madroño 1: 98-102. Fig. 1-4. 1923.—Critical diagnoses and a key to the 7 species of *Downingia* recognized by the author are given and the following new variety and new combination are made: *D. pulchella* Torr. var. *arcana*, *D. bicornuta* Gray var. *montana* (*D. montana* Greene).—Roxana Stinchfield Ferris.

3611. MACKENZIE, K. K. **A monograph of the California species of the genus *Carex*.** Erythea 8: 7-95. Fig. 1-51. 1922.—This work rests primarily upon an extensive series of specimens of both the early and the recent collectors in California. In addition to the formal diagnoses there is critical discussion of relationships and of doubtful points, full citation of localities, references to the literature for each species, and a general bibliography. One hundred and twenty-six species are described, 10 being new: *Carex stenoptera*, *C. Dudleyi*, *C. fracta*, *C. Tracyi*, *C. unilateralis*, *C. Helleri*, *C. paucicostata*, *C. breviligulata*, *C. montereyensis*, and *C. flaccifolia*. One new combination is made: *Carex ormantha* (*C. echinata* Murr. var. *ormantha* Fernald).—W. L. Jepson.

3612. PAYSON, EDWIN BLAKE. **A synoptical revision of the genus *Cleomella*.** Univ. Wyoming Publ. Bot. 1: 29-46. 1922.—*Cleomella* is a Capparidaceous genus that extends from Oregon and central Idaho to south-central Mexico and from Texas to California. Eighteen species are recognized provisionally and a key to these is provided. Descriptions are given for each species and specimens and synonyms are cited. *C. mexicana* Moc. & Sessé is the generic type. The following new species are described: *C. Macbrideana* and *C. mojaviensis*.—E. B. Payson.

3613. WILSON, ERNEST HENRY, and ALFRED REHDER. **A monograph of *Azaleas*, *Rhododendron* subgenus *Anthodendron*.** Publ. Arnold Arboretum 9. 8 vo. 3 + 219 p. Cambridge, Massachusetts, 1921.—The work is divided into 2 parts: The *Azaleas of the Old World* by E. H. Wilson (pp. 1-105) and the *Azaleas of North America* by A. Rehder (pp. 107-205) followed by an index to both parts. In the first part E. H. Wilson gives, after short introductory chapters on the history, distribution and classification, a systematic enumeration of all species, varieties and forms spontaneous as well as cultivated of the *Azaleas* of the Old

World with keys to the sections, (among which is the new section *Sciadorhodion* Rehd. & Wils.) and to the species, and a complete synonymy under each recognized group and a citation of specimens examined followed by detailed remarks on the history, distribution, taxonomic characters, cultivation etc. Four sections and 34 species with numerous varieties and forms are recognized by the author and the following new species, varieties, forms, hybrids, combinations and names are proposed: *Rhododendron indicum* f. *polypetalum* (Maxim.), f. *laciniatum*, (Mak.), *R. Kanehirai*, *R. obtusum* f. *macrostemon* (Maxim.), f. *amoenum* (Lindl.), f. *japonicum* (Maxim.), var. *Kaempferi* (Planch.), var. *Kaempferi* f. *albiflorum*, f. *multicolor*, f. *plenum*, f. *Komatsui* (Nak.), f. *monstrosum*, f. *cryptopetalum* (Maxim.), f. *mikawanum* (Mak.), × *R. Sanderi*, *R. Simsii* var. *vittatum* (Fort.), var. *vittatum* f. *Bealii* (Fort.), var. *eriocarpum* (Hay.), *R. phoeniceum* f. *semiduplex*, f. *Smithii* (Sweet), f. *splendens* (D. Don), var. *calycinum* (Lindl.), var. *calycinum* f. *Maxwellii* (Hort. Wezelenburg), *R. mucronatum* f. *Noordtianum* (Wittm.), f. *Mattapan* (Hovey), f. *narcissiflorum* (Planch.), f. *sekidera* (Komatsu), var. *ripense* (Mak.), f. *amethystinum*, f. *plenum* (Sims), *R. linearifolium* var. *macrosepalum* f. *dianthiflorum* (Carr.), f. *decandrum*, *R. reticulatum* var. *albiflorum* (Mak.), f. *pentandrum*, × *R. mixtum*, *R. japonicum* f. *aureum*, *R. luteum* var. *macranthum* (Bean). In the second part, A. Rehder, gives, after a short introduction dealing with the classification history and distribution, a systematic enumeration of the species, varieties and forms spontaneous and cultivated of the Azaleas of North America of which 17 species belonging to 2 sections are recognized; a key to the species precedes the enumeration and under each group the complete synonymy and a description is given followed by a citation of specimens examined and by detailed remarks. This enumeration of the American species is followed by a chapter on hybrids of the subgenus including those of the Old World preceded by a short historical sketch on the origin of the cultivated hybrids; all the hybrids known are enumerated with remarks on their history and distinguishing characters. A list of doubtful names and of illustrations of garden forms (exclusive of Indian Azaleas) not mentioned elsewhere in the book concludes the second part, in which the following new species, varieties, forms and hybrids are proposed: *R. canadense* f. *albiflorum* (Rand & Redf.), f. *viridifolium* Fernald, *R. occidentale* var. *sonomense* (Greene), *R. calendulaceum* f. *aurantium* (Sweet), *R. nudiflorum* var. *glandiferum* (Porter), *R. roseum* (Loisel.), *R. alabamense*, *R. canescens* f. *subglabrum*, var. *candidum*, *R. atlanticum* (Ashe), f. *neglectum* (Ashe), var. *luteo-album* (Coker), *R. serrulatum* f. *molliculum*, var. *georgianum*, *R. viscosum* f. *rhodanthum*, var. *glaucum* f. *rubescens* (Sweet), var. *tomentosum* (Dum.-Cour.), var. *montanum*, var. *montanum* f. *coerulescens*, var. *aemilans*, *R. arborescens* var. *Richardsonii*, × *R. gandavense* (K. Koch), var. *plenum*, × *R. Anneliesae*, × *R. viscossepalum* (Gard. Chron.), var. *Daviesii* (Gard. Chron.), × *R. norbitonense* var. *aureum* (Paxt.), var. *broughtonianum* (André), × *R. Crouxii* (Croux), f. *plenum*. Incidentally the new name *R. Adamsii* is proposed for *R. fragrans* Maxim. not Paxt. (*Azalea fragrans* Adams).—A. Rehder.

FLORISTICS AND PLANT DISTRIBUTION

3614. ANONYMOUS. Schedae ad Floram Romaniae exsiccatam, a museo botanico Universitatis Clusienensis editam. Centuria 1 et 2. [Exsiccatae illustrating the flora of Roumania, edited by the Botanical Museum of the University of Cluj.] Bull. Inform. Grăd. Bot. Muz. Bot. Univ. 1: 1-24. 1921; 2: 18-36. 1922.—Among the 2 centuries of plants issued under the above title the following numbers are especially noteworthy: no. 80, *Melampyrum nemorosum* L. subsp. *romanicum* Borza n. subsp. with original diagnosis; no. 82, *Plantago Schwarzenbergiana* Schur. f. *macrophylla* and f. *microphylla* Schur. with critical notes by Al. Borza; no. 99, *Centaurea dacica* Borza n. sp. with original diagnosis; no. 151, *Castalia Lotus* (L.) Tratt. from the region of Oradea Mare, the only known European locality; no. 179, × *Anchusa Procopiani* Gagul. n. hyb., a hybrid between *Anchusa procera* Besser and *A. ochroleuca* M. B. with original diagnosis; no. 194, *Leontopodium alpinum* Cass. f. *laxiflorum* (Roch) Borza, and f. *intregaldense* Borza with critical notes.—M. Tiesenhausen.

3615. ANONYMOUS. [Rev. of: ACHARIYAR, RAI BAHADAR K. RANGA, assisted by C. TADULINGA MUDALIYAR. A handbook of some south Indian grasses. vi + 318 p. Butter-

worth and Co.: Calcutta; Constable and Co.; London, 1921 (see Bot. Absts. 11, Entry 3426).] Nature 110: 376. 1922.—[See also Bot. Absts. 11, Entry 2321.]

3616. BLATTER, E. *Flora Arabica, Part III. Campanulaceae-Verbenaceae*. Rec. Bot. Surv. India 8: 283-365. 1921.—This consists of a list of species with bibliographic citations, synonyms, citation of specimens, distribution, and local names. No new names appear.—*E. D. Merrill*.

3617. BORZA, A. *Note critice asupra speciei colective Melampyrum nemorosum și formele intrudite din România*. [Critical observations on the collective species *Melampyrum nemorosum* and the related forms in Roumania.] Bul. Soc. Științe Cluj 1: 141-148. 1921.—Two species of *Melampyrum* are found in Roumania, which have colored bracts. These are: *M. bihariense* A. Kerner and *M. nemorosum* L. subsp. *romanicum* Borza. Of the latter two forms occur which the author designates as *M. nemorosum* subsp. *romanicum* Borza proles *aestivalis coronense* (Ove Dahl) Borza, and *M. nemorosum* subsp. *romanicum* Borza var. *viride* (Schur) Borza. The author endeavors in this way to eliminate the confusion which has hitherto prevailed in regard to this species-complex.—*M. Tiesenhausen*.

3618. COCKS, R. S. *A list of the shrubs of Louisiana*. Jour. Arnold Arboretum 3: 173-182. 1922.—The author presents a systematic list of the shrubs found in Louisiana with notes on their distribution and flowering and fruiting time.—*Alfred Rehder*.

3619. BURTT DAVY JOSEPH. *The distribution and origin of Salix in South Africa*. Jour. Ecology 10: 62-86. 6 fig. 1922.—The dimorphic character of the leaves presents a difficulty in distinguishing the willows of Africa. The present author distinguishes 22 named species and varieties, 20 being local endemics usually occurring in one river basin only. Six occur in South Africa, 12 in tropical Africa and Madagascar while 1 species only is common to South and central Africa. Each drainage basin usually carries 1 species only. The isolation of species has been brought about by: (1) the intermittent flow of streams, (2) the regular and prolonged character of the dry season on the watersheds and, (3) the density of the tropical rain-forest vegetation. Isolation is clearly connected with the evolution of distinct types. Hybrids are rare. The species are not relics but modern types apparently descended from *Salix safsaf* of tropical Africa and Syria which has given rise to a western and an eastern group. The migration in tropical Africa has been up the Nile basin and along the Congo and Zambesi river systems while in South Africa it has been around the coast. Of the 22 recognized species and varieties two varieties, namely, *S. mucronata* Thunb. var. *integra* and *S. mucronata* Thunb. var. *caffra* are new.—*Geo. D. Fuller*.

3620. EWART, A. J. *Contributions to the flora of Australia, No. 29*. Proc. Roy. Soc. Victoria (N. S.) 33: 226-232. 2 text fig. 1921.—The following plants and their source are included: *Asperula scoparia* Hook. f. var. *elongata* Benth., *Bartsia Trixago* L., *Bassia quinque-cuspis* F. v. M. var. *villosa* Benth., *Beyeria virgata* n. sp. (figured), *Claytonia perfoliata* Don., *Eleusine indica* Gaertn., *Erica lusitanica* Rud., *Eucalyptus miniata* A. Cunn., *Frankenia setosa* W. V. Fitzg., *Grevillea ceratocarpa* Diels., *G. incrassata* Diels, *Kyllingia intermedia* R. Br., *Medicago echinus* DC., *M. minima* L., *Microcala filiformis* Hoff. & Link., *Muscari botryoides* Mill., *M. racemosum* Mill., *Notholaena distans* R. Br., *Panicum piligerum* F. v. M., *P. repens* L., *Pimelea Husseyana* F. v. M., *Polygonum articulatum* R. Br., *Psammomya* Diels & Loes., *Ptilotus* R. Br., and *Trichinium* R. Br., *Sclerochloa dura* Beauv., *Selaginella stolonifera* Spring, *Suriana maritima* L.—*Eloise Gerry*.

3621. FISCHER, C. E. C. *A survey of the flora of the Anaimalai Hills in the Coimbatore District, Madras Presidency*. Rec. Bot. Surv. India 9: 1-218. Pl. 1-5, map, index I-XXI. 1921.—A simple enumeration of the 1828 species found in the area. No new names appear. The introduction contains notes on the topography, geology, climate, peoples, botanical history, and the general characters of the flora.—*E. D. Merrill*.

3622. GAMBLE, J. S. *Flora of the Presidency of Madras. Part V.* p. 769-962. Adlard and Son and West Newman: London, 1923.—This part includes the families Ebenaceae to Scrophulariaceae ending with the genus *Ilysanthes*. The following new combinations are indicated: *Linociera zeylanica* (L. *purpurea* Vahl), *Rejoua dichotoma* (*Tabernaemontana dichotoma* Roxb.), *Brachystelma brevitubulatum* (*Ceropegia brevitubulata* Bedd.), *Cordia evolutior* (C. *fulvosa* var. *evolutior* C. B. Clarke), and *Torenia travancorica* (T. *asiatica* Hook. f., in part).—J. M. Greenman.

3623. HOLMBOE, JENS. Den gamle lind med flogrognen ved "Stiftsgaarden" i Bergen. [The old *Tilia* with the "flogrogn" (*Sorbus*) at "Stiftsgaarden" in Bergen.] *Naturen* 46: 111-119. Fig. 1-4. 1922.

3624. HOLMBOE, JENS. Dverg-aalegraeset (*Zostera nana* Roth.) og dets forekomst ved den norske kyst. [*Zostera nana* and its occurrence on the Norwegian coast.] *Naturen* 46: 313-320. Fig. 1-4. 1922.

3625. HOLMBOE, JENS. *Leontodon hispidus* L., en sen indvandrer i Vestlandets og Sørlandets flora. [*Leontodon hispidus* L., a late immigrant in the flora of western and southern Norway.] *Bergens Mus. Aarb. Naturv. Raekke* 1920/1921²: 1-11. Fig. 1, 1 map. 1922.—This plant was discovered as new to Norway in 1833 and was later found to occur in 2 different parts of the country, viz. on small areas in western Norway on the islands of southwestern Hordaland, the Haugesund peninsula and on Karmøyen, as well as a single occurrence in southern Norway on the Barland peninsula near Kragerø. The occurrence and distribution is thoroughly discussed and also the European distribution. The author is of the opinion that the plant has far from reached its northern limit, and the reason for its peculiar distribution is that the plant has immigrated comparatively recently. His opinion is that *Leontodon hispidus* has immigrated to western Norway from England or Scotland, and to the Kragerø district from Denmark or Sweden. The length of the period elapsed since the immigration is uncertain, but is perhaps not long, even according to human chronology.—K. Münster Ström.

3626. KELLER, ROBERT. Studien ueber die geographische Verbreitung schweizerischer Arten und Formen des Genus *Rubus*. [Studies on the geographical distribution of the Swiss species and forms of the genus *Rubus*.] *Vierteljahrsschr. Naturf. Ges. Zürich* 64: 519-538. 1919.—This is the 4th contribution on the subject and gives habitats and localities of species, varieties, and forms, besides Latin descriptions of 8 new forms. Those described as new are: *R. cuspidifer* f. *harpagonifer* Sudre & Keller, *R. tomentosus* f. *inuncatus* Rob. Keller, *R. foliosus* f. *conjungens* Rob. Keller, *R. foliosus* f. *rhenanus* Rob. Keller, *R. furvus* f. *pallidus* Rob. Keller, *R. furvus* f. *pallidistamineus* Sudre & Keller, *R. tereticaulis* f. *subangulatus* Rob. Keller, *R. tereticaulis* f. *densispinus*, Rob. Keller.—John H. Schaffner.

3627. LAWSON, P. B. A list of the grasses of Douglas County. *Trans. Kansas Acad. Sci.* 30: 336-339. 1919/21 [1922].—The author presents a list, without annotations, of 107 grasses in Douglas County, Kansas, made in connection with a study of leaf hoppers.—F. C. Gates.

3628. LONG, BAYARD. *Sonchus uliginosus* occurring in the Philadelphia area. *Torreyia* 22: 91-98. 1922.—*Sonchus uliginosus* Bieb., a species of the Caucasus region, first discovered in Pennsylvania by H. W. Pretz along a railroad embankment near Allentown on Sept. 22, 1917, has since been reported from many stations in Northampton, Lehigh, Bucks, and Philadelphia Counties in Pennsylvania and Newcastle County, Delaware, lying within a rectangle about 70 miles north and south by 30 miles east and west, with its center of frequency in Bucks Co. The species is thoroughly established, and threatens to become a persistent weed. The mode of introduction cannot be determined. This species has been reduced by some students to *S. arvensis* L. var. *glabrescens* Günth., Grab. & Wimm., but appears to be distinct.—J. C. Nelson.

3629. MACKENZIE, KENNETH K. The records of *Limnobia Spongia* in the northern United States. *Torrey* 22: 102-104. 1922.—*Limnobia Spongia* (Bosc) Richard, with its center of distribution in the southern United States, is an extremely rare and local plant in the northern States, where it has not been collected for nearly 25 years. Knieskern's report for New Jersey has not been confirmed. Three authentic specimens are known to exist from New York, 4 from Delaware, 1 from Virginia, 2 from Illinois and 4 from Missouri. No specimen from Indiana is known.—J. C. Nelson.

3630. MAIDEN, J. H. An alphabetical list of Victorian eucalypts. *Proc. Roy. Soc. Victoria*, (N. S.) 34: 73-84. 1922.—This supplements A Census of Victorian Eucalypts and Their Economics [Rept. Australian Assoc. Adv. Sci. 14: 294. 1913] by R. T. Baker. Sixty-two species are considered to be indigenous.—Eloise Gerry.

3631. MAIDEN, J. H. A few notes on the botany of Lord Howe Island (Sixth paper). *Proc. Linn. Soc. New South Wales* 45: 564-566. 1921.—The 1920 collections of J. L. Boorman and others for the National Herbarium, Sydney, are reported. These include known forms and a number of new records for the following presumably indigenous species: *Malvastrum tricuspidatum* A. Gray, *Erythraea australis* R. Br., *Mesembryanthemum australe* Sol., *Kyllinga monocephala* Rottb., *Adiantum formosum* R. Br., *Howea Forsteriana* Becc. (rachises and leaflets variegated). Characteristics of hybrid Howeas are discussed. New records for the following introduced plants are reported: *Ageratum conyzoides* L. (garden escape), *Galinsoga parviflora* Cav., *Aster subulatus* Michx., *Eupatorium cannabinum* L., *Sisymbrium officinale* L., *Stachys arvensis* L., *Datura Stramonium* L., *Nicotiana alata* Link & Otto (garden escape), *Daucus brachiatus* Sieb., *Asparagus plumosus* var. *nanus* Baker (garden escape), *Dactyloctenium aegyptiacum* Willd.—Eloise Gerry.

3632. MAIDEN, J. H. The forest flora of New South Wales. Vol. VII. Parts 61-70. p. i-xvii. John Spence: Sydney, 1922.—The author has issued a title-page and general index for Vol. VII of the above work.—J. M. Greenman.

3633. MENEZES, CARLOS A. DE. Subsídios para o estudo da Flora do Archipelago da Madeira. [Materials for the study of the Madeiran flora.] *Broteria Sér. Bot.* 20: 113-119. 1922.—This article aims to distinguish species or varieties not occurring in the Flora do Archipelago da Madeira (1914) and to correct errors in that work. Twenty species or varieties are mentioned, of which 13 represent new localities for, or introductions into the flora mentioned. The author proposes 6 forms as new: *Sinapidendron sempervivifolium*, *Ononis Costae*, *Sempervivum Barreti*, *Myosotis Welwitschii* Boiss. & Reut. var. *madeirensis*, *Semele androgyna* (L.) Kth. var. *macrophylla*, *Asparagus Loweii* Kth. var. *portomonizensis*.—E. B. Chamberlain.

3634. MOXLEY, GEORGE L. *Brickellia microphylla* (Nutt.) Gray. *Bull. Southern California Acad. Sci.* 20: 34-35. 1921.—Localities are given for this and other plants in southern California and a new combination, *Thelypteris Feei* (C. Chr.) Moxley (*Dryopteris Feei* C. Chr.) is made.—Roxana Stinchfield Ferris.

3635. NELSON, JAMES C. Additions to the flora of western Oregon during 1921.—*Torrey* 22: 98-102. 1922.—A list is presented of 28 species found growing spontaneously, of which 18 are introduced. The total number of species reported by the author which are not included in Piper & Beattie's Flora of the Northwest Coast has now reached 371. Corrections and range-extensions of 18 species previously reported are appended.—J. C. Nelson.

3636. PARKER, R. N. On the supposed occurrence of *Salix alba*, Linn. in the Northwest Himalaya. *Indian Forester* 48: 444-445, 1922.—The author states "that as far as known *S. alba* Linn. is not found, either wild or cultivated in N.-W. India."—E. N. Munns.

3637. RIKLI, M. Die arktisch-subarktischen Arten der Gattung *Phyllodoce* Salisb. [The Arctic-subarctic species of the genus *Phyllodoce* Salisb.] Vierteljahrsschr. Naturf. Ges. Zurich 66: 324-334. 15 fig. 1921.—The author presents a systematic treatment with descriptive notes and maps showing the distribution of the species.—*John H. Schaffner*.

3638. TOVEY, J. R. The Australian species of *Carex* in the National Herbarium of Victoria. Proc. Roy. Soc. Victoria (N. S.) 34: 42-48. 1921.—The systematic arrangement of Australian species of *Carex* according to Kükenthal in Engler's Pflanzenreich IV-20 (1909) is given, together with notes on the distribution of the species in the National Herbarium. This arrangement differs from Mueller's Census of Australian Plants.—*Eloise Gerry*.

3639. TOVEY, J. R., and P. F. MORRIS. Contributions from the National Herbarium of Victoria.—No. 1. Proc. Roy. Soc. Victoria (N. S.) 34: 207-212. Figs. 1-2. 1922.—Descriptions of 2 new species *Bossiaea Laidlawiana* (Leguminosae) and *Choretrum pendulum* (Santalaceae) are given together with several new records of regional distribution and the establishing of a new variety, *Helichrysum rosmarinifolium* Less. var. *ledifolium* (*H. ledifolium* Bth.) and a number of foreign plants in Victoria.—*Eloise Gerry*.

S. F. TRELEASE, *Assistant Editor*

3640. ANONYMOUS. Ten-year program of the New York Agricultural Experiment Station. Science 57: 16-17. 1923.

3641. CAMPBELL, ELMER GRANT. A pocket dissecting scope. Science 57: 179-180. 1923.—A new design is suggested and its advantages are noted. Two figures are given to show the parts in cross section.—*C. J. Lyon*.

3642. CONN, H. J. The preparation of staining solutions. Science 57: 15-16. 1923.—A request is made for the cooperation of biologists in putting the formulae of staining solutions on the basis of so many cc. of saturated solution per given volume of the desired solution.—*C. J. Lyon*.

3643. CONN, H. J. The standardization of biological stains. Science 57: 24-25. 1923.—Attention is called to the fact that this work is no longer carried on by the National Research Council, but by an independent commission.—*C. J. Lyon*.

3644. FONTANEL, P. Séchage des plantes pour l'herbiers. [The drying of plants for herbaria.] Sci. Agric. 3: 157-159, 192-193. 1922-23.—Methods of value in the drying of herbarium specimens are outlined.—*T. G. Major*.

3645. HILL, WM. H. Biochemical problems in agriculture as related to food. Sci. Agric. 3: 105-109. 1922.—A number of problems requiring study are suggested, including carbohydrate sources, manufacture and handling of desiccated fruits and vegetables, pectin from cull apples, value and rôle of yeast as a diet accessory, utilization of straw and sawdust for feeding purposes, and fibre-making possibilities of native grasses.—*T. G. Major*.

3646. MARTIN, GEORGE W. Food resources of the sea. Sci. Monthly 15: 455-480. 1922.—There is a limit to the number of human beings the earth can support. Not much has been done to utilize the food in the sea, especially the plants. In China and Japan and to a less extent in Europe a few of the algae are eaten. The plants of the sea must have mineral salts and light. The temperature is less variable than on land, and CO₂ is more plentiful. The benthos or shallow water group contains *Zostera marina*, a pondweed, and similar plants in

large quantities; *Ulva*, *Enteromorpha*, *Cladophora*, *Vaucheria*, *Lyngbya*, *Spirulina* are found in the shallow water, while *Fucus*, *Ascophyllum*, *Sargassum*, and other rock weeds where it is deeper. The *Laminarias* and their allies come in below tide level. In still deeper water the red algae appear along with others. The plankton contains many unicellular plants, especially the Diatoms and the Peridineae.—Peterson and his associates have concluded that the plankton plays little part in the nutrition of sea animals. These derive their food from the detritus of the sea bottom which is largely composed of the fine particles of decayed plants, primarily *Zostera*.—*L. Pace*.

3647. MOORE, BARRINGTON. **The proposed Roosevelt-Sequoia National Park and the Barbour bill.** *Science* 57: 82-84. 1923.—This is a defence of the Barbour bill against the attack made upon it in an article by Dr. Van Name (*Science* 56: 705-707. 1922). It is pointed out that the giant redwoods will receive as much protection as at present and that many scenic features will be added to the present Sequoia National Park, particularly in the nature of river canyons that are now threatened by water power development plans.—*C. J. Lyon*.

3648. VEITCH, ROBERT, and WILLIAM GREENWOOD. **The food plants or hosts of some Fijian insects.** *Proc. Linnean Soc. New South Wales* 46: 505-517. 1921.—In the investigation of sugar-cane pests in the Fiji Islands a number of food plant records were obtained for parasitic, predacious, and blood-sucking insects. About forty plants are included in the records.—*Eloise Gerry*.

3649. WOODFIN, J. C. **Vinegar making in small quantities.** *New Zealand Jour. Agric.* 24: 171-173. 1922.—Methods are described for making vinegar so as to retain flavor and keeping qualities.—*N. J. Giddings*.

(See also in this issue Entries 3726, 3736, 3738, 3761, 3796, 3800, 3803, 3815, 3868, 3966, 4003, 4266, 4331, 4356, 4409, 4423, 4434, 4435, 4581, 4608, 4613, 4616, 4621)

3650. ANONYMOUS. **Championship field wheat competition in the central-western district.** Agric. Gaz. New South Wales 34: 1-5. 1923.—The points judged were yield, cleanliness, appearance (30 points each), trueness to type, freedom from disease, and evenness (20 points each). Methods of cultivation are given.—*L. R. Waldron.*

3651. ANONYMOUS. **Championship field wheat competition in the Riverina.** Agric. Gaz. New South Wales 34: 81-84. 1923.—Crops were scored on apparent yield, trueness to type, freedom from disease, evenness, cleanliness, condition and appearance. A field sown to Federation secured first place.—*L. R. Waldron.*

3652. ANONYMOUS. **Electro-culture.** Jour. Ministry Agric. Great Britain 29: 792-796. 1922.—A general summary is given of the results of field experiments from 1915 to 1920 on the influence of electrical discharge on plant growth, the work from 1918 on being under the direction of the Electro-Culture Committee.—“ * * * Of the fourteen positive results of experiments extending over six years, only three are less than 10 per cent, while of the four negative results none reaches 10 per cent. Of the ten positive results with spring sown cereals only two are less than 10 per cent, and six show an increase of 30 per cent, or over; while of the two negative results both show decreases of less than 10 per cent. The results of field experiments with these spring crops show an average increase of 22 per cent. The effect of electrification in increasing the yield of spring-sown oats and barley has thus been demonstrated. A beneficial effect on clover-hay is probable, while that on winter-sown wheat is uncertain.”—Alternating current is usually as effective as, or more effective than, direct current. An upward current through the plant increases growth in the same way as a downward current. A discharge applied for the first month only of the growing season may be at least as effective as one continued throughout the growing season.—*M. B. McKay.*

3653. ANONYMOUS. **Lumber from sugar-cane waste.** Sci. Amer. 126: 398. 1922.—The lumber, “celotex,” is made from the cane fiber, or bagasse, remaining after the juice has been extracted. It is waterproof and has high insulating qualities, making it useful in the manufacture of refrigerators, fireless cookers, the walls of storage plants, etc. It also has many uses in house construction.—*Chas. H. Otis.*

3654. ANONYMOUS. **The regrassing experiments in Central Otago.** New Zealand Jour. Agric. 26: 97-100. 1 fig. 1923.—A report by a special committee is presented concerning results of experiments outlined in Vol. 26 of the Journal.—*N. J. Giddings.*

3655. ANDERSON, B. G. **Experiments with dark tobacco and other crops.** Virginia Agric. Exp. Sta. Bull. 231. 19 p., 4 fig. 1923.—Soil management, fertilizing, liming, and choice of varieties for dark tobacco and other field crops, grown in experimental plots at Appomattox, Virginia, are discussed.—*F. D. Fromme.*

3656. ATKINSON, ESMOND H. **Weeds and their identification.** New Zealand Jour. Agric. 25: 290-292. 1 fig. 1922.—Field horsetail, *Equisetum arvense*, is an introduced weed which may cause trouble. The plant is described in some detail.—*N. J. Giddings.*

3657. ATKINSON, ESMOND H. **Weeds and their identification.** New Zealand Jour. Agric. 25: 351-353. 1 fig. 1922.—Japanese wineberry, *Rubus phoenicolasius* Maxim, is described as a weed in some localities. It should be comparatively easy to eradicate.—*N. J. Giddings.*

3658. ATKINSON, ESMOND H. **Weeds and their identification.** New Zealand Jour. Agric. 24: 360-364. 2 fig. 1922.—Cape honey flower (*Melianthus major* L.), originally introduced from South Africa, has found favorable conditions for growth and spread in New Zealand. It has been declared a weed. The plant is described in some detail.—*N. J. Giddings.*

3659. BAILEY, E. M. **Commercial feeding stuffs.** Connecticut Agric. Exp. Sta. Bull. 238. 329-361. 1922.—This bulletin reports the analyses of 159 official samples of feeding stuffs taken by the Station Agent and 57 samples submitted by individuals. A table is included giving coefficients of digestibility and net energy values of the feeding stuffs analyzed.—*Henry Dorsey.*

3660. BARNUM, CLYDE C. **The control of wild morning glory.** California Agric. Exp. Sta. Circ. 256. 22 p., 12 fig. 1923.—The persistent growth of this plant after repeated cuttings is due to the large food reserves in the roots, which must be exhausted in order to kill the plant. Thorough cultivation during 1 growing season kills the plant in 1 year. The interval between cuttings should not be longer than 5 days, thus precluding the appearance of green leaves. Alfalfa, which yields profitable crops at the same time may kill out morning glory in 2-3 years, but straw or other cover does not check its growth. Hogs sometimes kill out morning glory by eating its roots, a method used extensively in the eastern states. Sheep aid by grazing on green parts of the plant. Salt brine kills the weed, but is recommended only for soil not used for growing crops. The use of sodium arsenite is not justified by the present investigations. Commercial weed-killers, largely solutions of sodium arsenite, are too expensive and it is not known just when they should be applied. For small patches carbon bisulfid is very satisfactory.—*A. R. C. Haas.*

3661. BARTLETT, H. **Wheat crop competition, 1922.** Forbes and Parks P. and A. associations. Agric. Gaz. New South Wales 34: 15-23. 1923.—A general discussion of the contests is presented, emphasizing particularly the importance of fallowing, value of superphosphate, methods of cultivation, varieties, and seasonal conditions. Marshall's No. 3, Yandilla King, Canberra, and Hard Federation were the leading varieties. Contestants were scored on yield, type and purity, freedom from disease, evenness, cleanliness, and condition and appearance. Foot-rot and take-all are spreading and are expected to cause increased losses in the future.—*L. R. Waldron.*

3662. BEVAN, W. **Chemical fertilizers.** Cyprus Agr. Jour. 18: 1-7. 1923.—It is claimed that the importation of commercial fertilizers has very materially increased during 1922. As considerations in using chemical manures, the author emphasizes manner and time of

application and quantity and type to be applied. Suggested amounts are given in tabular form for each agricultural crop.—*W. Stuart.*

3663. BEVAN, W. **Comfrey: A prolific forage crop.** *Cyprus Agric. Jour.* 18: 7-8. 1923.—Comfrey is claimed to be native on the slopes of the Caucasian Mountains. The usual practice is to propagate from sets or from rooted plants. First year yields sometimes equal 50 tons per acre. Plants should not be allowed to flower. Cures of milk fever, foot-and-mouth disease wounds, etc., are ascribed to comfrey.—*W. Stuart.*

3664. BEVAN, W. **Ground nut cultivation in Cyprus.** *Cyprus Agric. Jour.* 18: 13. 1923.—Successful production by the Cyprus Agricultural Department, has resulted in commercial growing. It is claimed that the Cyprus grown nuts are usually much superior in shape, size, and flavor to those imported from Egypt, and that as a result an export trade to Egypt is developing.—*W. Stuart.*

3665. BLAKELY, W. F. **Weeds of New South Wales.** *Agric. Gaz. New South Wales* 34: 116-120. 2 fig. 1923.—*Cleome spinosa* and *Silene quinquevulnera* are discussed and means of control are suggested.—*L. R. Waldron.*

3666. BROWN, H. B., and J. F. O'KELLY. **Report of the agronomy department.** *Ann. Rept. Mississippi Agric. Exp. Sta.* 34: 16-22. 1921.—No consistent gain has resulted from any form or quantity of lime in a rotation of cotton, corn, and oats followed by a legume. In crop rotation work, plots cropped to corn continuously with cowpeas at last cultivation gave an increase of 7.7 bushels of corn over plots without the legume. Cowpeas and residual effect of 5 tons manure per acre applied the year before gave an increase of 9.8 bushels corn per acre on soil naturally poorer than the check plot. Plots in cotton continuously yielded 767 pounds more seed cotton to the acre where 5 tons manure were applied annually.—*J. F. O'Kelly.*

3667. CAUTHEN, E. F. **Comparison of peanut meal, cotton seed meal, velvet bean meal, ammonium sulphate, and nitrate of soda, as fertilizers for corn and cotton.** *Alabama Agric. Exp. Sta. Bull.* 215. 8 p. 1921.—Yields from 3 tests with cotton and 2 with corn indicate that the effectiveness of these fertilizers as sources of nitrogen increases in the following order: velvet bean meal, 54; peanut meal, 87; cotton seed meal, 80; sulphate of ammonia (for corn only), 94; nitrate of soda, 100.—*W. A. Gardner.*

3668. COCKAYNE, L. **An economic investigation of the Montane Tussock-grassland of New Zealand.** *New Zealand Jour. Agric.* 24: 321-334; 25: 1-11, 129-144. 16 fig. 1922.—The area under consideration consists of more than a half million acres at the base of the mountains and extending to an elevation of 3000 feet. It formerly supported a fairly dense cover of tussock grasses and various other plants which are listed. At present the land is largely barren dunes and the flora is very limited. The area has a limited rainfall, reported as not more than 14 inches in the most arid portions. The sun is bright and temperatures above 100°F. are frequent in summer. There are also violent winds which accelerate evaporation and are an important factor in erosion. The soil is comparatively rich. Excessive sheep grazing and burning combined with the depredations of rabbits destroyed many of the better forage plants and broke up the soil cover so that barren areas resulted. Experiments were designed to find out the principles, methods, and suitable plants upon which regrassing depends and whether regrassing can be accomplished. Seed was sown with and without harrowing. Spring and fall seedings were tried. The plots were located at altitudes of 1000-3000 feet, and included 1 part of the most seriously depleted area. A portion of each plot was not sown to determine whether locally growing plants might help materially in the regrassing. Some sowing was also done outside the enclosures. Merely keeping the land free from live stock did not give favorable results. Seed of the following plants appear to be well established at the end of the 2nd season: Chewings fescue (*Festuca rubra*), cocksfoot (*Dactylis glomerata*), tall

fescue (*Festuca elatior*), chicory (*Cichorium intybus*), lucerne (*Medicago sativa*), and yarrow (*Achillea millefolium*).—*N. J. Giddings*.

3669. COMMITTEE ON THE STANDARDIZATION OF FIELD EXPERIMENTS. Bibliography of standardization of field experiments. Jour. Amer. Soc. Agron. 15: 33-40. 1923.—The references (155) are cited which were presented as part of a report at the meeting of the Society held at Washington, D. C., Nov. 21, 1922.—*F. M. Schertz*.

3670. CROOKS, J. T. J. The possibilities of Assam as a sugar-producing country. Internat. Sugar Jour. 25: 176-178. 1923.—A brief description is given of the soil, climate, vegetation, pests, and labor conditions. A few varieties of cane are grown commercially, principally seedlings from Java, Barbados, and Mauritius. These are not very successful and suggestions are made for experimenting with some of the seedling canes produced at the Coimbatore station in India such as CO 213, CO 214, and others.—*Caroline Rumbold*.

3671. DE BAUFRE, WM. L. The heating value of corn. Jour. Amer. Soc. Agron. 15: 1-6. 1923.—The heating value of Nebraska corn (10 per cent moisture) is approximately 6,700 B. t. u. per pound while the corresponding value for Pittsburg, Kansas coal is 11,800 per pound. Consequently the heating value of 50 bushels of corn on the cob, or of 63 bushels of shelled corn, is about equivalent to 1 ton of bituminous coal.—*F. M. Schertz*.

3672. DORPF-PETERSEN, K. Beretning fra Statsfrøkontrollen for det 51 Arbejdsaar. [Report of the State Control Station for the 51st year.] Tidsskr. Planteavl 28: 668-731. 1922.—This report deals particularly with the clover and grass seed situation in Denmark from July 1, 1921, to June 30, 1922. Voluminous statistics are presented.—*Albert A. Hansen*.

3673. DOWNING, R. G. Field experiments with winter fodders. Grafton experiment farm. Agric. Gaz. New South Wales 34: 39-40. 1923.—Sunrise oats and vetches or peas have been found the most satisfactory combination for winter feed, resulting in an increased yield per acre of more than 2 tons over oats alone. Vetches and peas give about equal results when averaged over a period of years in combination with the cereals. Barley makes too slow a growth compared with oats and wheat and consequently gives a lessened yield. An application of 100 pounds of superphosphate per acre has been the best manurial treatment, giving a net profit of over £1 per acre.—*L. R. Waldron*.

3674. DUNSHEE, CARROLL F. Results of rice experiments in 1922. California Agric. Exp. Sta. Bull. 354. 401-415. 1923.—In plots submerged 8 inches no barnyard grass (*Echinochloa crus-galli*) appeared above the surface of the water. There was a scattering of the grass in the plots submerged 6 inches while a considerable quantity came through 4 inches of water. Plots submerged 2 inches were very foul with barnyard grass. Water weeds other than the various types of barnyard grass were not controlled to any extent by continuous submergence.—Plots submerged immediately after being drilled yielded a very inferior stand. Early seeding dates furnished most favorable conditions for increased yields. When land is free from alkali, little change occurs in the water by passing over the rice fields; but when soil contains soluble salts or alkali, some of this matter is carried away in drainage. How much goes into the subsoil is not known. Rice culture during 4 preceding years has not removed enough of the alkali to make the soil safe for sensitive crops.—*A. R. C. Haas*.

3675. FERRIS, E. B. Cotton experiments, 1922. Mississippi Agric. Exp. Sta. Circ. 46. 8 p. 1923.—Comparative results are given of standard varieties grown on the sandy loam soils of South Mississippi. Nitrates, as usual on these soils, produced profitable gains. Acid phosphate produced considerable increase but basic slag and raw phosphate rock were less efficient. A significant increase was produced by kainit and the leaves of the plants on the kainit plots were retained much better than on plots receiving no kainit. The increases due to sulphate of potash and to the double sulphate of potash and magnesia were practically the same.—*J. F. O'Kelly*.

3676. FOY, NELSON R. **Agricultural root seeds.** New Zealand Jour. Agric. 25: 293-296. 2 fig. 1922.—The germination, purity, size and color, and adulteration of the seed of cultivated species of *Brassica* are discussed.—N. J. Giddings.

3677. FOY, NELSON R. **Cocksfoot seed.** New Zealand Jour. Agric. 25: 165-167. 1 fig. 1922.—A report is presented on production, germination, weight, and purity of the seed of *Dactylis glomerata*.—N. J. Giddings.

3678. FOY, NELSON R. **Modern seed testing.** New Zealand Jour. Agric. 26: 65-72. 6 fig. 1923.—Equipment and methods of seed testing used in the New Zealand inspection work are described.—N. J. Giddings.

3679. FOY, NELSON R. **Seed testing notes.** New Zealand Jour. Agric. 24: 299-301. 1 fig. 1922.—Perennial rye grass, *Lolium perenne*, is discussed as to its germination, impurities, adulteration, and weight.—N. J. Giddings.

3680. FOY, NELSON R. **Seed testing notes. "Cheap" mixtures.** New Zealand Jour. Agric. 24: 224-225. 1922.—The author gives an analysis of a cheap, bargain mixture to show the worthlessness and expensiveness of such seed.—N. J. Giddings.

3681. GARDNER, F. D., C. F. NOLL, and R. D. LEWIS. **Forty years' results with fertilizers. General fertilizer experiments.** Pennsylvania Agric. Exp. Sta. Bull. 175. 23 p., 3 fig. 1922.—The author tabulates and summarizes the data from experiments initiated in 1882, the plan consisting in 144 1-acre plots arranged in 4 tiers. The plots are separated by 2-foot strips of blue-grass sod and the tiers by grass roadways. The crops grown are corn, oats, wheat, and mixed clover and timothy, each 1 year. On the 4 tiers there are growing all 4 crops each year. The plot treatments regarding cultivation, seeding, etc., conform to those of good farm practice, all plots receiving the same treatment except as to materials applied. Except burnt lime, which was applied only once in 4 years to corn, the fertilizers have been applied on alternate years to corn and wheat, the oats, clover and timothy receiving nothing. Mixed horse and cow manures with litter have been applied to sod before corn at irregular periods in the spring, and in the fall to oat stubble before winter wheat, but for any given application the manure has been of one kind and uniform. Nitrogen, in the form of nitrate of soda, dried blood, and sulphate of ammonia, has been applied at 24, 48, and 72 pounds an acre. Account has been taken of the phosphoric acid in the dried blood. Phosphoric acid has been applied uniformly at 48 pounds an acre. Muriate of potash has been applied to corn at the rate of 200 pounds an acre, with burnt lime at the rate of 2 tons an acre once in 4 years and with ground limestone at the same rate, applied on alternate years to corn and wheat.—The results show that the average yield of the untreated plots for the past 8 years has been only 57.6 per cent of that during the first 8 years of the experiment. Phosphoric acid is the first limiting factor in this soil, which is mainly a Hagerstown silt loam, and until this element is supplied, potash and nitrogen give little increase in yields. Plots receiving phosphoric acid alone have yielded 43.8 per cent more than the nearest checks. Potash alone has increased yields but 13.8 per cent, but when added to phosphoric acid has given an increase of 29.6 per cent over phosphoric acid alone. The authors believe that half the amount of potash used would have given as good results. Phosphoric acid and potash without nitrogen have given a greater net return than combinations including nitrogen and have practically maintained the fertility for the duration of the experiment. Nitrogen at 24 pounds per acre has not increased yields when used alone or in combination with any fertilizers. Possibly a lower rate of nitrogen application would have given a profit. Increasing nitrogen to 48 and 72 pounds has increased yields (except in the case of sulphate of ammonia) but not enough to affect the additional cost of the fertilizers. Nitrate of soda has slightly outyielded dried blood and greatly outyielded sulphate of ammonia. It is considered that the low yields accompanying sulphate of ammonia are due to the acidity induced by this fertilizer. At \$1.50 a ton, a 6-ton application of manure on alternate years has given greater net returns

than any commercial fertilizer combination. Manure at \$1.87 a ton gives a net return equivalent to that for the phosphoric acid and potash plots. The 8- and 10-ton applications of manure have not given profitable returns. Burnt lime at 2 tons an acre once in 4 years and ground limestone at the same rate once in 2 years on plots receiving no commercial fertilizer or manure have each caused a slight increase in yield and in crop value. Burnt lime with 6 tons of manure has increased the yields over lime alone. Land plaster at the rate of 320 pounds an acre every 2 years has not appreciably increased yields. Computations are made showing the relative advantage of one treatment over another.—*C. R. Orton.*

3682. GEORGI, C. D. V. **Castor oil seeds. A note on oil content and extraction of oil.** *Malayan Agric. Jour.* 10: 191-192. 1922.—The amount of oil in locally grown seed is given and the constants found.—*I. H. Burkill.*

3683. HANSEN, ALBERT A. **The toll of weeds in Indiana.** *Proc. Indiana Acad. Sci.* 1921: 105-109. 1922.—The losses are estimated under such headings as, tillage loss, reduced yield, cutting roadside weeds, etc. The total weed loss in Indiana for 1920 is estimated at \$44,072,870 or \$14 per capita per year. Correctives are summed up under 10 suggestions, including use of pure viable seed, killing weeds before maturity, clean cultivation, and cooperation among farmers.—*F. C. Anderson.*

3684. HARDY, H. C. **Burning up the corn.** *Sci. Amer.* 126: 244. 1922.—The use of corn as a source of heat when coal is high in price is discussed.—*Chas. H. Otis.*

3685. HAYWOOD, A. H. **Dairying under North Coast conditions.** *Agric. Gaz. New South Wales* 34: 41-48. 1923.—Various methods are suggested for the production of dry and succulent fodder crops to be used during the winter season.—*L. R. Waldron.*

3686. HAYWOOD, A. H. **Sugar-cane as fodder.** *Agric. Gaz. New South Wales* 34: 100-102. 1923.—Notes are given on different varieties and suggestions are made as to methods of feeding.—*L. R. Waldron.*

3687. HERTEL, H. **Landbruget i 1922.** [Agriculture during 1922.] *Tidsskr. Landoekonomi* 1923¹: 1-40. 1923.—This survey includes damage due to insects, etc. Seed from America is reported as of poor quality, principally because of the lack of proper recleaning before shipping. Nevertheless, American clover, timothy, and other grass seed are considered better than much of the seed imported from Germany.—*Albert A. Hansen.*

3688. IVERSEN, KARSTEN. **Beretning fra Statens Forsøgsvirksomhed i Plantekultur.** [Report from the State Agricultural Experiment Station.] *Tidsskr. Planteavl* 28: 571-589. 1922.—The author reports on experiments from 1907 to 1910 in growing corn in Denmark for silage purposes. The preliminary work was not successful, but experiments will be continued.—*Albert A. Hansen.*

3689. KENNEDY, P. B. **Leguminous plants as organic fertilizers in California agriculture.** *California Agric. Exp. Sta. Circ.* 255. 8 p. 1922.—The author points out the advantages and desirability of growing leguminous plants as organic fertilizers in California.—*A. R. C. Haas.*

3690. KENNEDY, P. B. **The small-seeded horse bean.** *California Agric. Exp. Sta. Circ.* 257. 23 p., 1 pl., 14 fig. 1923.—The small-seeded horse bean is recommended as a valuable winter green manure crop, and to a less extent as a hay, silage, and seed crop for feeding livestock.—*A. R. C. Haas.*

3691. KOFAHL. **Zur Stickstoffdüngung der Schmetterlingsblütler.** [Fertilizing legumes with nitrates.] *Mitteil. Deutsch. Landw. Ges.* 38: 66. 1923.—Treating lucerne with nitrate

of soda and peas and lupines with ammonium chloride was without noticeable effect.—*A. J. Pieters.*

3692. LEIJNS, J. J. Onze rijstcultuur. [Our rice growing.] West Indië 4: 147-157. 1919.—A comparison is made of rice growing in the U. S. A. and in Surinam. Growing, harvesting, and thrashing are described.—*J. C. Th. Uphof.*

3693. LITTLE, L. G. Lucerne top-dressing experiments. Five years' trial at Glen Innes experiment farm. Agric. Gaz. New South Wales 34: 37-38. 1923.—Phosphoric acid and potash gave net positive results in all cases. The largest net gain was obtained from 200 pounds of superphosphate per acre.—*L. R. Waldron.*

3694. LITTLE, L. G. Wheat variety trials at Cowra. Agric. Gaz. New South Wales 34: 92. 1923.—The standard variety, Hard Federation, was outyielded by some of the newer and yet unnamed varieties.—*L. R. Waldron.*

3695. LONG, W. P. Hubam in British Columbia. Gleanings in Bee Culture 50: 88. Fig. 1-2. 1922.—Hubam clover on a trial plot at Vancouver seeded May 1. By July 17 it had made a growth of 4-5 feet and was beginning to bloom.—*J. H. Lovell.*

3696. LOWY, B. Conserving crops by fumigation. Sci. Amer. 127: 313. 1922.—The article concerns the use of carbon bisulfide and hydrocyanic acid gas for eliminating insects from rice and wheat in storage.—*Chas. H. Otis.*

3697. McDONALD, A. H. E. Wheat growing for profit. Agric. Gaz. New South Wales 34: 104. 1923.—Wheat growing is probably the most profitable type of farming in Australia.—*L. R. Waldron.*

3698. MAKIN, R. N., and E. S. CLAYTON. Farmers' experiment plots. Winter green fodder experiments, 1922. Agric. Gaz. New South Wales 34: 85-92. 2 fig. 1923.—Crops grown were wheat, oats, barley and rye and in some instances peas and vetches. The maximum yield of 17 tons was secured from Warden wheat and Golden vetches at Kyogle. Use of phosphates generally produced significantly increased yields.—*L. R. Waldron.*

3699. MARTIN, F. J., and R. E. MESSEY. Experiments on wheat growing in the Sudan. Wellcome Tropic. Res. Lab. Khartoum, Chem. Sec. Publ. 19. 24 p. 1921.—Over 30,000 acres of wheat are grown in the Sudan, mainly in the provinces of Dongola and Berber. Annual precipitation at Khartoum is 4.9 inches; about 6 irrigations of 4½ inches each are applied to the wheat crop. The soil at Khartoum, not considered heavy, contains over 40 per cent of clay. The native wheat is undesirable because of its long growing season, making it liable to attacks of stem rust (*Puccinia graminis*). Pure line selections were made of native wheats and varieties were imported from other countries. Only the earlier varieties, from Australia, India, and Egypt, have given good results. Even Egyptian varieties are rather late. The best yielding varieties were Firbank and Federation from Australia at about 35 bushels per acre; the native varieties yielded only 25 bushels. Full agronomic notes are given. The thrashed grain was hard and brittle, containing but 8-10 per cent of moisture and weighing up to 70 pounds per bushel. The milled flour was rather dark in all cases owing to primitive milling methods. Determinations were made of protein, dry and wet gluten, gliadin, glutenin, and diastatic capacity. Protein content varied from 9.8 to 10.9 per cent. Diastatic capacity was low. Baking results showed several of the wheats, including 2 native wheats, to produce loaves very nearly as large as those made from roller-milled Australian flour. The varieties Firbank, Federation, and Indian No. 40 are recommended. These varieties show less strength than the best American or Russian wheats. The Sudan climate shortens the growing period of wheats.—*L. R. Waldron.*

3700. MAY, R. G. Sudan grass in the Bathurst district. *Agric. Gaz. New South Wales* 34: 33. 1923.—Proper rate of seeding Sudan grass has been found to be 10 pounds per acre in rows 14 inches apart.—*L. R. Waldron.*

3701. MORTIFEE, A. Observations on Uba cane. *South African Sugar Jour.* 7: 34–45. 1923.—Certain factors make the Uba cane desirable for cultivation in Zululand. It is very hardy, resistant to drought in the higher lands and to floods on the Umfolozi flats, and has unusual ratooning qualities. A peculiarity of the variety is its production of “bull shoots,” extremely vigorous and rapid growing shoots which usually appear 8–9 months after cutting. An abnormal increase in moisture causes an increase in the number of these shoots. They contain less sucrose than the plant cane.—*C. Rumbold.*

3702. NOLTE, O. Beiträge zur Kenntnis der Ernährung der Schmetterlingsblütler. [Contribution to the knowledge of the nutrition of legumes.] *Mitteil. Deutsch. Landw. Ges.* 38: 78–80. 1923.—Varying quantities of nitrogenous fertilizer, mostly sulphate of ammonia, were applied to lupine, serradella, beans, peas, red clover and lucerne. No effect was noted on the 1st 3, but with the last 3 there were some increases. Increases were most pronounced with urea.—*A. J. Pieters.*

3703. O'KELLY, J. F., and ROWLAND COWART. Cotton experiments, 1922. *Mississippi Agric. Exp. Sta. Circ.* 45. 8 p. 1922.—Results are given of standard and new varieties grown on valley, hill, and wilt-infected soil. The average values of the increase for 2 years due to the application of 15 pounds available nitrogen per acre from different carriers are reported as \$12.82 for ammonium sulphate, \$12.67 for nitrate of soda, \$9.95 for calcium cyanamid, and \$1.60 for cottonseed meal.—*J. F. O'Kelly.*

3704. O'KELLY, J. F., and ROWLAND COWART. Corn experiments, 1922. *Mississippi Agric. Exp. Sta. Circ.* 47. 8 p. 1923.—Comparative yields of standard and new corn varieties on valley and hill soils and 3 years' results from the use of nitrates under corn are reported. The use of 15 and 30 pounds of available nitrogen per acre from ammonium sulphate, nitrate of soda, or calcium cyanamid was profitable only in seasons of ample rainfall.—*J. F. O'Kelly.*

3705. OPITZ. Versuche über Einwirkung starker Stickstoffdüngung auf den Anbauwert der Kartoffeln. [Investigations on the effect of heavy nitrogenous fertilizing on the propagating value of potatoes.] *Mitteil. Deutsch. Landw. Ges.* 38: 75–78. 1923.—Five varieties of potatoes were grown (1) on a reasonably fertile field, (2) with heavy excess of ammonium sulphate and nitrate of soda. In practically every case the seed stock from the field heavily fertilized gave smaller returns and showed more diseased hills.—*A. J. Pieters.*

3706. PATTERSON, T. H. The northern gum lands. *New Zealand Jour. Agric.* 25: 321–333. 3 fig. 1922.—Results to date indicate that these lands may be successfully and profitably farmed by proper methods. Drainage is often necessary and the land should then be lined. Deep cultivation must be practiced. The soil should not be too fine on top. Detailed data on the different experimental plots are given.—*N. J. Giddings.*

3707. PIPER, CHARLES V., and WILLIAM J. MORSE. The soybean. 339 p., 84 fig. McGraw-Hill Book Co., Inc.: New York & London, 1923.—The authors aim to present all facts now known about this important economic crop, and to emphasize its value as a human food. The soybean is discussed with relation to its commercial status, botanical history, agricultural history, culture, harvesting and storage, composition, utilization, varieties, structure of seed, oil content, soybean cake or meal, soybean products for human food, table dishes of soybeans and soybean products, and enemies. A bibliography of 600 titles is appended.—*Mary R. Burr.*

3708. REMH, TH. *Beobachtungen über Gaswasserdüngung*. [Observations on fertilizing with gaswater.] *Mitteil. Deutsch. Landw. Ges.* 38: 106-108. 1923.—Gaswater containing 1.1-2.21 per cent nitrogen as ammonia was applied as top dressing to meadows and broadcasted on land in preparation for mangels. Except where the gaswater was considerably diluted an initial injury to the grass was noted, but this injury was overcome and the plots fertilized yielded increases amounting to about 75 per cent of those on check plots treated with ammonium sulphate. Gaswater is recommended, but only in the immediate vicinity of factories as the value of the fertilizer does not warrant high transportation costs.—A. J. Pieters.

3709. SAMSON, HAROLD W. *United States grades for potatoes*. U. S. Dept. Agric. Circ. 238. 4 p. 1922.—Grading standards recommended by the Department of Agriculture and the U. S. Food Administration in 1917 with a few minor changes recommended in 1919 have proved so satisfactory that they are being generally adopted, and by many states as the official standard. Further slight revision is made by the adding of a U. S. No. 1 small grade. The 4 grades are fully described and included terms defined.—P. L. Ricker.

3710. SCHNEIDER. *Die Bewirtschaftung der Wiesen und Weiden unter Berücksichtigung der wirtschaftlichen Seite in Bezug auf Viehzucht und Viehhaltung*. [The management of meadows and pastures considered economically with respect to cattle breeding and cattle raising.] *Mitteil. Deutsch. Landw. Ges.* 38: 117-118. 1923.—The price of hay in Germany has increased 5,-7,000 fold since 1913, but prices of potatoes and sugar beets have risen only 4-500 fold. This shows Germany's dependence upon imported feeds. The remedy is in better crops resulting from a careful study of meadows and pastures.—A. J. Pieters.

3711. SHATTUCK, OBIL, and DOUGLAS W. RITCHIE. *Growing crops in Harney Valley*. Oregon Agric. Exp. Sta. Bull. 191. 24 p., 15 fig. 1922.—A discussion is given of methods of irrigation and crops adapted to this Oregon region. The different irrigation systems mentioned are: the "border system," "check system," "corrugation system," "furrow system," and "sub-irrigation."—Small cereals and forage crops such as alfalfa, field peas, clovers, and sunflowers do best. Potatoes and root crops can be grown but are not as reliable as cereals and forage crops.—C. E. Owens.

3712. SKUDERNA, A. W., and C. E. MICKEL. *The report of experimental work and field observations in investigating and factors affecting the sugar content and purity of sugar beets*. Season 1921. 119 p. [mimeographed], illus. American Beet Sugar Co.: Arkansas Valley, Colorado. 1922.—A résumé of the weather during 1921 is given and its effects on the crop. Effects are recorded of varying methods in cultivation especially fall plowing, rotation of crops, and thinning, on quality and yield of sugar beets. Analyses of soils, water and fertilizer experiments, sugar beet variety tests, experimental beet seed raising, and notes on treated seed follow. In 1921 there was a severe epidemic of leafspot (*Cercospora beticola*). The observations on this leafspot are connected with the different phases of the experimental work and form a commentary on the conditions which increased and diminished the virulence of the disease. There are observations on fungous diseases of minor importance, insect pests, and field losses prior to and after topping the beets and using different methods of ensiling the roots.—C. Rumbold.

3713. S[OUTH], F. W. *The eradication of sensitive plant, Mimosa pudica*. Malayan Agric. Jour. 10: 237. 1923.—It is shown that spraying with sodium arsenite kills that part of the plant which is above ground but does not kill the root, which sprouts again.—I. H. Burkill.

3714. STEPHENS, D. E., and G. R. HYSLOP. *Wheat growing after fallow in eastern Oregon*. Oregon Agric. Exp. Sta. Bull. 190. 35 p., 13 fig. 1922.—Best practices as to preparation of the soil, seed treatment, time, rate and depth of seeding, cultivation, and best varieties are discussed.—C. E. Owens.

3715. STILES, E. P. **The coast country and clover.** Beekeepers' Item 6: 45-46. 1922.—White clover (*Trifolium repens*) is spreading in the coast country of Texas, but it attracts very few honey bees. The soil of the upper Texas coast country is largely a heavy black clay and is often acid. If heavy liming would make it possible to grow white sweet clover (*Melilotus alba*), the value of the land would be greatly increased.—J. H. Lovell.

3716. STOA, THEODORE E. **Varietal trials with oats in North Dakota.** North Dakota Agric. Exp. Sta. Bull. 164. 46 p., 6 fig. 1922.—Varietal trials with oats are reported for North Dakota from 7 localities covering periods varying from 2 to 21 years. Mid-season varieties are generally better adapted than either early or late varieties. In the southern portion, early varieties frequently do as well or better than mid-season varieties. Late varieties do well only in northeastern North Dakota. Sixty-day and Kherson are the leading early varieties; Lincoln, Victory, and Siberian are leading mid-season varieties; and White Russian and White Tartarian are the best late varieties. Differences among varieties within any group are not important. While yield of straw is closely associated with height of plant, this yield varies greatly from year to year. Early varieties mature in 75-80 days from emergence. Mid-season varieties require about 10, late varieties 20 additional days for maturity. Early variety oats generally weigh least per bushel. Under normal conditions, oats grown in western North Dakota weigh more than those grown in the eastern portion of the state. Swedish Select, a mid-season variety commonly grown, does not yield well and is rather susceptible to stem rust.—L. R. Waldron.

3717. TESDORFF, A. **Oversigt. [Supervision.]** Tidsskr. Landokonomi 1922¹²: 567-577. 1922.—The report concerns the activities of the Danish agricultural Society from Oct., 1921, to Oct., 1922, particularly toward securing the enactment of agricultural legislation.—Albert A. Hansen.

3718. TICE, C. **Potato improvement work in B. C.** Agric. Jour. [British Columbia] 7: 272-273; 8: 11, 15. 1923.—The author deals chiefly with seed certification.—J. W. Eastham.

3719. WALDRON, L. R., T. E. STOA, and C. E. MANGELS. **Kota wheat.** North Dakota Agric. Exp. Sta. Circ. 19. 10 p., 4 fig. 1922.—Kota is a bearded, hard, red, spring wheat, resistant to stem rust. For periods of from 1 to 5 years at 7 points in North Dakota, Kota has outyielded Marquis 15.6 per cent. Comparative baking and milling data are given for Kota and Marquis wheats.—L. R. Waldron.

3720. WARD, F. E. **Cocksfoot seed production.** New Zealand Jour. Agric. 25: 18-19. 1 fig. 1922.—A successful trial of the Danish system at Ashburton Experimental Farm is reported.—N. J. Giddings.

3721. WENHOLZ, H. **Varieties of maize in New South Wales.** Agric. Gaz. New South Wales 34: 27-33. 4 fig. 1923.—The varieties Yellow Hogan, Manning Silvermine, Golden Superb, and Golden Glow are illustrated and the adaptation of the varieties is discussed with reference to different localities in New South Wales.—L. R. Waldron.

3722. WESTER, P. J. **Adlay, a new grain plant from the Orient.** Jour. Heredity 13: 221-227. 6 fig. 1922.—Adlay is the native Philippine name for Job's Tears (*Coix lachrymajobi* L.). While primitive tribes in the Philippines have long used the plant for grain, the author was surprised at the prolificacy of some strains. Seed was taken to Manila, where yields of 3,230 pounds to the acre were obtained. Milling tests in Manila and Washington, D. C., have proved that the grain is adapted for use with modern machinery, and when mixed with $\frac{1}{3}$ flour makes very acceptable bread. Since adlay yields fully as much as rice and does not require flooded paddies for culture, it is suggested that it may become an important tropical grain crop.—R. C. Cook.

3723. WHITTET, J. N. Kikuyu grass in bracken fern country. Agric. Gaz. New South Wales 34: 24-26. 2 fig. 1923.—When Kikuyu grass [*Pennisetum longistylum*] is planted at 3-foot intervals in drills plowed 3 feet apart in bracken fern areas, it quite smothers out the fern. The grass resists frosts and affords valuable pasture.—L. R. Waldron.

3724. WHITTET, J. N. Winter grasses in the Penrith district. Agric. Gaz. New South Wales 34: 103-104. 1 fig. 1923.—Three plats were sown with various grass mixtures and legumes. *Avena elatior* was eaten with most avidity and *Phalaris bulbosa* ranked 1st in growth and frost resistance.—L. R. Waldron.

3725. WINKLER, E. A. Hubam as a farm crop. Gleanings in Bee Culture 50: 762-763. Fig. 1-2. 1922.—The stalks and roots of the annual white sweet clover, or Hubam clover, are nearly as large as those of the biennial species. The roots of Hubam clover may exceed 6 feet in length. Sown broadcast this variety yields over 4 tons of dry matter per acre, which, if plowed under, is equal to nearly 80 tons of farm manure. It is said to save a year in crop rotation.—J. H. Lovell.

CHARLES A. WEATHERBY, *Assistant Editor*

(See also in this issue Entries 3669, 3707, 3807, 3808, 3813, 3949, 3965, 3970, 4045, 4051, 4056, 4098, 4184, 4231, 4373, 4494, 4619, 4627, 4647)

3726. ANONYMOUS. Agricultural research at Aberystwyth. Nature 109: 795-796. 1922.—The new buildings of the Welsh plant-breeding station of the Agricultural Department, University College of Wales, were formally opened May 20, 1922. In addition to a capital grant and annual grants-in-aid it receives an endowment from Sir Laurence Phillips of £10,000 and an annual donation of £1,000 for 10 years. The grounds include 142 acres pasture and arable land, 28 acres woodland, and 5 of garden. Work will be directed to clovers, grasses, and oats, not to barley, potatoes, or rootcrops.—O. A. Stevens.

3727. ANONYMOUS. List of serials currently received in the Library of the U. S. Department of Agriculture, exclusive of U. S. Government publications and publications of the State agricultural colleges and experiment stations, arranged by title, by subject, and by region. U. S. Dept. Agric. Dept. Circ. 187. 358 p. 1922.—The list of periodicals was prepared by MARGARET T. OLCOTT, and the list of other serials by EMMA B. HAWKS.—J. R. Schramm.

3728. BALTZ. "Quoddam forestum . . . positum in magetheida." Zeitschr. Forst- u. Jagdw. 53: 564-573. 1921.—Probable meaning and modern equivalents of old Latin terms, such as forestum, forestes, nemus, magetheida, etc., are discussed.—Two groves of distorted forest trees are described on the Island of Sylt, off the coast of Friesland, the remnants of an extensive forest in ancient times, which was gradually exterminated by exposure to the powerful winds from the North Sea. North of Kampen the sand dunes are covered with an extensive plantation of *Pinus montana* and *P. uncinata* which is serving its purpose of holding the sand. The plantation is several decades old, but the trees barely appear above the dunes. The stems are prostrate and buried, the erect branches appearing as individual trees.—J. Roesser.

3729. BASSERMANN-JORDAN, F. VON. Die Geschichte des Weinbaus. [The history of grape cultivation.] Ber. Senckenberg. Naturf. Ges. Frankfurt a. M. 51: 36. 1921.—An abstract is given of a lecture on the history of grape cultivation in Europe. Although prehistoric remains of grape vines have been found, the opinion is expressed that the cultivation of the grape for wine may have been introduced from Asia. In any case it had become established

in France prior to the Roman occupation. Grape cultivation in Europe reached its highest development in the 15th century.—*A. W. Evans.*

3730. BENNETT, F. [Rev. of: SARGEANT, JOHN. *The trees, shrubs, and plants of Virgil.* 149 p. B. H. Blackwell: Oxford, 1920 (see Bot. Absts. 9, Entry 1080).] Rept. Bot. Soc. and Exchange Club British Isles 6: 82-84. 1920 [1921].—[See also Bot. Absts. 11, Entry 2249.]

3731. BORZA, AL. *Bibliographia botanica Romaniaae.* [Botanical bibliography of Rumania.] Bul. Inform. Grăd. Bot. Muz. Bot. Univ. Cluj 1: 41-54, 87-91. 1921; 2: 62-64, 89-92. 1922.—This collection of all the botanical literature on Rumania, both domestic and foreign, published since 1914, includes both scientific and popular literature, and foreign publications which deal with the Rumanian flora.—*M. Tiesenhausen.*

3732. BOSCH, IMAN. G. J. VAN DEN. *In memoriam Salomon Koenen.* Cultura 35: 33-35. 1 pl. 1923.—S. Koenen, one of the principal agriculturists in the Netherlands, died Dec. 26, 1922. He studied in Wageningen, Netherlands, and afterward at the University of Jena. In 1906 he became professor at the College of Agriculture, Wageningen.—*J. C. Th. Uphof.*

3733. BOUGAULT, J. *Emile Bourquelot, 1851-1921.* Bull. Trimest. Soc. Mycol. France 38: 59-68. *Portrait.* 1922.—A short account is given of the life and works of the famous pharmacologist and student of the chemistry of the fungi. His investigations on the fungi were mostly biological and included: (1) nature of sugars, their transformation and distribution and (2) soluble hydrolyzing and oxidizing enzymes. A detailed biography is given in Jour. Pharm. et Chim., Dec. 1, 1921. A list of his mycological publications is given.—*D. S. Welch.*

3734. BOUGAULT, J. *Victor Harlay, (1872-1922).* Bull. Trimest. Soc. Mycol. France 38: 25-28. 1922.—This short biographical sketch is followed by a chronological list of 36 works.—*D. S. Welch.*

3735. BRITISH MUSEUM. *Catalogue of books, manuscripts, maps, and drawings in the British Museum (Natural History) Vol. VI, Supplement A-1.* 4 to, 512 p. With Addenda and Corrigenda Vols. I and II. A-Hooker. 48 p. Oxford University Press American Branch: New York, 1922. \$22.00.

3736. BROCKMAN-JEROSCH, [H.] *Die erste Nahrung des Menschen Geschlechts.* [The first food of the human race.] Ber. Senckenberg. Naturf. Ges. Frankfurt a. M. 50: 166. 1920.—A short discussion is given of the foods, especially vegetable, of the primitive Europeans. Most of the plants now cultivated are of recent introduction and the primitive races derived their vegetable food almost exclusively from wild indigenous plants. The most important of these was the oak, the acorn-meal of which is still used as food in the Mediterranean region and by the Indians.—*A. W. Evans.*

3737. BURNAT, EMILE. *Autobiographie publié avec une étude sur le botaniste et son oeuvre, des souvenirs et documents diverses par John Briquet . . . et François Cavillier.* [Autobiography published with a study of the botanist and his work, reminiscences and various documents by John Briquet and François Cavillier.] 185 p. Conservatoire botanique: Geneva, 1922.—Burnat was born at Vevey, Oct. 21, 1828. He was educated at Geneva and Paris as an engineer and engaged in industrial work at Mulhouse (Mulhausen), Alsace, 1851-1870. He then retired and settled at Nant, devoting himself to the study of the flora of the Maritime Alps until his death in 1920. August Gremli, J.-J. Vetter, M. A. Tonduz, L. Favrat, Emile Samuel Abrezol, Louise Jordan, François Cavillier, and John Briquet were associated with him in this enterprise. Some biographical information is given on each of the above. His herbarium was given to the city of Geneva.—The autobiography is followed by further biographical

data and reminiscences by JOHN BRIQUET and FRANÇOIS CAVILLIER. A bibliography of 184 titles of Burnat's publications, lists of species named in his honor, of collecting trips, of visitors and correspondents, a summary of collections in his herbarium, are followed by reprints of 3 of his speeches. Eulogies by P. BORNAUD, E. WILCZEK, C. DE LACROIX, KOPP, DANIEL MIEG, and a list of biographical notices, are appended.—*C. W. Dodge.*

3738. CARRIER, LYMAN. *The beginnings of agriculture in America.* xvii + 323 p., 30 fig. McGraw Hill Book Co. Inc.: New York & London, 1923.—The work touches briefly the theory of evolution, effect of environment on species, determination of plant history, origin of food plants, similarity of plants in the old and new worlds, primitive agriculture, plant culture as a start toward civilization, domestication of animals, early civilization in dry climates, accumulation of wealth and related topics. A chapter each is devoted to old world agriculture, American Indians, natural vegetation in America, Indian agriculture and a full discussion of Indian crops, Indian products and practices. The history of the exploration period and English Colonial settlements is told in detail, followed by the Pilgrim period and the story of the settlement of New York and New Jersey under the Dutch West India Co. Separate chapters give the history of Maryland, Delaware and Pennsylvania, Connecticut and Rhode Island, North and South Carolina and Georgia. French settlements and influence, colonial expansion, introduction of European crops, introduction of domestic animals, farm implements and the use of fertilizers, slavery, the effect of colonial commerce on agriculture, and the influence of the manufacture of alcoholic beverages on colonial agriculture. The closing chapter tells the history of relations with Great Britain. A valuable bibliography is appended.—*Mary R. Burr.*

3739. [DRUCE, G. C.] [Frederick Arnold Lees.] Rept. Bot. Soc. and Exchange Club British Isles 6: 358-361. 1921 [1922].

3740. DRUCE, G. C. *Obituaries.* Rept. Bot. Soc. and Exchange Club British Isles 6: 93-108. 1920 [1921].—Notices are included of John Gilbert Baker, 1834-1920; A. Montgomerie Bell, 1845-1920; Reginald Farrer, 1880-1920; and Wm. Moyle Rogers, 1835-1920.—*G. C. Druce.*

3741. DRUCE, G. C. [Thomas Carew Hunt and his herbarium.] Rept. Bot. Soc. and Exchange Club British Isles 6: 454-456. 1921 [1922].

3742. [DRUCE, G. C.] [William Whitwell.] Rept. Bot. Soc. and Exchange Club British Isles 6: 367-369. 1921 [1922].

3743. EAST, E. M. *Mendel and his contemporaries.* Sci. Monthly 16: 225-237. 1923.—Mendel developed a method, but the biologists of his day were not ready for such a change. When Weissmann's theory needed testing, Mendel's long-forgotten paper was brought to light, furnishing the necessary method, and genetics entered upon a new era.—*L. Pace.*

3744. EBERLE, E. G. *Frederick Belding Power.* Jour. Amer. Pharm. Assoc. 11: 403-405. *Portrait.* 1922.—In 1914 Frederick Belding Power resigned as Director of the Chemical Research Laboratories of the Burroughs Wellcome Co., London, to accept a position in the Phytochemical Laboratory, Bureau of Chemistry, Washington, D. C.—*Anton Høgstad, Jr.*

3745. FAIRCHILD, DAVID. *Alexander Graham Bell.* Jour. Heredity 13: 195-200. 1 fig. 1922.—This account of the life of Dr. Bell describes especially his studies in genetics and eugenics. He spent many years in developing a strain of twin-bearing, multiple-nippled sheep, and his efforts had been only partly successful at the time of his death. His principal eugenic studies related to the inheritance of deafness, and to the inheritance of longevity in the Hyde family.—*R. C. Cook.*

3746. FITTING, HANS. **Herman Vöchting.** Ber. Deutsch Bot. Ges. 37: (41)–(77). Pl. 1. 1919.—This article gives an extensive sketch of the life and work, together with a portrait and bibliography, of this German botanist (1847–1917).—*W. C. Muenscher.*

3747. FUNK, GEORG. **Zur Geschichte botanischer Forschung an der zoologischen Station zu Neapel 1872–1922.** [History of botanical research at the Zoological station at Naples, 1872–1922.] Ber. Deutsch. Bot. Ges. 40: 221–241. 1922.—This paper gives an extensive sketch of the history of the zoological station at Naples, especially of the botanical research work done there. The station was founded by Anton Dohrn in 1872. The author discusses the development of the laboratories, herbarium, equipment, etc. During the last 50 years botanists have worked at Naples upon general botanical problems as well as on marine algae. A bibliography of botanical work from this station is given.—*W. C. Muenscher.*

3748. GUFFROY, CH. **Léon Roussel.** Bull. Trimest. Soc. Mycol. France 38: 69–70. 1922.—This agricultural engineer, a student of the fungi, died March 11, 1916, from wounds received at Verdun. He was cited for exceptional bravery and received the Cross of the Legion of Honor. He was chiefly interested in agriculture and his work as director of an agricultural society took him to Spain in 1904. He published several popular works on edible and poisonous fungi.—*D. S. Welch.*

3749. HABERLANDT, G. **Zur Geschichte der physiologischen Pflanzenanatomie.** [History of physiological plant anatomy.] Ber. Deutsch. Bot. Ges. 40: 156–160. 1922.—This criticism was prompted by remarks appearing in the historical introduction to *Zelle und Cytoplasma* by H. Lundegarth, appearing in the first part of K. Linsbauer's *Handbuch der Pflanzenanatomie* in which Sachs, Schwendener, and Haberlandt are referred to as the founders of physiological plant anatomy. The author points out that physiological plant anatomy is as old as plant anatomy itself. In the 17th century Malpighi and Grew and their followers endeavored to explain, upon a functional basis, the anatomical structures which they discovered. During the first half of the 19th century Mohl, Unger, Schleiden and Nägeli were interested primarily in pure descriptive anatomy. Sachs also belonged to this school. In his earlier works Sachs did not mention function in his definition of tissues. The appearance in 1874 of Schwendener's *Das Mechanische Prinzip im Anatomischen Bau der Monokotylen*, is regarded as the rebirth of physiological plant anatomy. Lundegarth fails to mention or cite this work. After the appearance of this work, in 1877, Haberlandt went to Tübingen to study with Schwendener. Only after the appearance of Haberlandt's contributions of 1879 and 1881 did Sachs modify his views of tissues. A study of the literature cited does not justify placing the name of Sachs among the founders of physiological plant anatomy.—*W. C. Muenscher.*

3750. HARRIS, J. ARTHUR. **Galton and Mendel: their contribution to genetics and their influence on biology.** Sci. Monthly 16: 247–268. 1923.

3751. HASKELL, R. J. **The fourth annual summer field meeting of the American Phytopathological Society.** Phytopathology 13: 150–152. 1923.—A report is given of the meeting held Aug. 29 to Sep. 1, 1922, in the trucking districts of Delaware, New Jersey, and Pennsylvania.—*B. B. Higgins.*

3752. HENRY, A. **The Dublin Arboricultural Society.** Gardeners' Chron. 70: 196. 1921.—This society, probably founded in 1830, is the oldest society of its kind in the British Isles. It published its only volume, *Transactions Arboricultural Society*, in 1831. No further reference to the society has been found.—*C. W. Dodge.*

3753. HILL, T. G. **Index to the Annals of Botany.** Vols. XXI–XXX. (1907–1916). 8vo, 40 p. American Branch Oxford University Press: New York. 1922.

3754. HUSNOT, T. **Fernand Camus**. Rev. Bryologique 49: 67, 68. 1922.—Camus was born at Chodat, France, in 1852 and was educated as a physician, obtaining his degree in 1880. Soon afterwards, however, he became associated with the division of cryptogamic botany in the Natural History Museum at Paris and retained his position there until his death [in 1922]. He was particularly interested in the bryophytes and published numerous papers dealing with the mosses and hepatics of France.—A. W. Evans.

3755. [HUSNOT, T.] **George-Alfred Holt 1852-1921**. Rev. Bryologique 49: 16. 1922.—Holt was born at Douglas on the Isle of Man, England, and died at Sale, Cheshire. Although a chemist by profession he was a diligent student of bryology and discovered many rare species of mosses and hepatics in various parts of the British Isles.—A. W. Evans.

3756. J[ACKSON], B. D. **Early British botanists**. [Rev. of: GUNTHER, R. T. **Early British botanists and their gardens**, based on unpublished writings of Goodyer, Tradescant and others. viii + 417 p. University Press: Oxford, 1922.] Nature 109: 806-807. 1922.

3757. KAEMPFERT, WALDEMAR. **An Indian master-mind in science**. Asia 23: 173-176, 219. 4 fig. 1923.—A popular presentation of the work of J. C. Bose is given.—C. W. Dodge.

3758. KEARNEY, THOMAS H. **Louis Trabut, botanist and plant breeder**. Jour. Heredity 13: 153-160. 5 fig. 1922.—The author summarizes the work of Dr. Trabut, Government Botanist of Algeria, in plant introduction and plant breeding, with especial reference to his cooperation with U. S. Department of Agriculture in introducing numerous valuable plants of French North Africa into the U. S. A.—T. H. Kearney.

3759. KNIEP, HANS. **Ernst Stahl**. Ber. Deutsch. Bot. Ges. 37: (85)-(104). Pl. 1. 1919.—An extensive sketch is given of the life and work of this German botanist (1848-1919). A portrait and bibliography are included.—W. C. Muenscher.

3760. KNOBLAUCH, A. **Verzeichnis der Stifter**. [List of the founders.] Ber. Senckenberg. Naturf. Ges. Frankfurt a. M. 48: 35-64. 1918.—The present compilation gives biographical notices of the 32 founders of the Senckenberg natural history society of Frankfort on the Main. Of these the following 5 were interested in botany: Johannes Becker, Georg Wilhelm Freireiss, Louis Daniel Jassoy, Johann Friedrich Metzler, and Johann Kaspar Stein. Becker was born at Speyer in 1769 and died at Frankfort in 1833; he was a student of the local flora and played an active part in the establishment of the botanical garden and museum. Freireiss was born at Frankfort in 1789 and died at Leopoldina, Brazil, in 1825; in 1824 he published a description of that country in which he included an account of the vegetation. Jassoy was born at Hanau in 1768 and died at Frankfort in 1831; he established a botanical garden that won the warm admiration of Goethe. Metzler was born at Frankfort in 1749 and died at Offenbach in 1825; his garden, also, attracted the attention of Goethe. Stein was born at Gemmingen in Würtemberg in 1776 and died at Frankfort in 1834; he made a rich collection of plants in the vicinity of the city and incorporated it in the herbarium of the museum.—A. W. Evans.

3761. LARSEN, TH., og CARL MARIBOE. **Oversigt over fremmed Litteratur**. [Review of foreign literature.] Tidsskr. Planteavl 28: 615-642. 1922.—This is a systematic list of references to recent European and American literature on agricultural subjects with a section devoted to garden literature.—Albert A. Hansen.

3762. LEHMAN, FRANZ. **Alfred Koch**. Jour. Landw. 70: 217-220. 1922.—An obituary.—F. M. Schertz.

3763. LEIJIS, J. J. **Kolonisatie van Suriname door Nederlandsche Landbouwers**. [Colonization of Surinam by Dutch agriculturists.] West Indië 4: 47. 1919.—A history of the custom

methods of working, and present condition of colonization by Dutch agriculturists in Surinam is given.—*J. C. Th. Uphof.*

3764. LINNÉ, CARL VON. *Bref och skrivelser af och till Carl von Linne med understöd af Svenska Staten utgifna af Uppsala Universitet. Forsta afdelningen, Del 8: Bref till och fran Svenska Enskilda personer Kalm—Laxman. Utgifna och med upplysande noter forsedds af J. M. HULTH.* [Letters and correspondence of and to Carl von Linné published by the University of Uppsala with a grant from the Swedish state. 1st section, part 8: Letters to and from private persons in Sweden, Kalm and Laxman, edited with instructive historical notes by J. M. HULTH.] *v + 200 p.* A. B. Akademiska Bokhandeln: Uppsala, 1922. *6 kronor.*—This part contains a large amount of correspondence of Pehr Kalm (1716–1779) and also that of Johan Olof Kalmeter (1746–1776), Georg von Kjöörning (1743–1792), Johan Mauritz Klinckowström (1692–1768), Mårten Kähler (1728–1773), Magnus Lagerström (1691–1759), and Erik Laxman (1737–1796).—*C. W. Dodge.*

3765. MACOUN, JOHN. *Autobiography of John Macoun, M. A. [1831–1920.] Canadian explorer and naturalist, assistant director and naturalist to the Geological Survey of Canada. x + 305 p., 3 portraits, 5 pl.* Field-Naturalists' Club: Ottawa, 1922.—This memorial volume contains a brief introduction by ERNEST THOMPSON SETON. Macoun was born Apr. 17, 1831, in Maralin, County Down, Ireland. He emigrated with his family to Ontario, Canada, in 1850 where he worked as a farm hand and school teacher. After a brief normal training in Toronto he became professor of natural history at Albert College and in 1879 joined the staff of the Geological Survey of Canada. He spent many years on exploring parties in connection with the first Canadian transcontinental railway lines and later visited other parts of Canada. His autobiography ends abruptly in 1904 and the final chapter, written by his son, W. T. MACOUN, describes very briefly his declining years, which he spent in Sidney, British Columbia, where he died July 18, 1920. There follows a list of species named in his honor. The work is filled with interesting incidents of his botanical explorations but contains no index.—*C. W. Dodge.*

3766. MATISSE, G. *Le mouvement scientifique contemporain en France. 1. Les sciences naturelles.* [The contemporary scientific movement in France. 1. Natural sciences.] (Collection Payot 10.) *160 p.* Payot & Cie.: Paris, 1921. *4 francs.*—After a detailed discussion of the foundation of marine laboratories of experimental zoology, the development of animal embryology, and theories of the adaptation of the organism to its environment, the author briefly sketches the work of Gustave Chauveaud on the embryogeny of plants, of Marin Moliard on plant physiology, and of L. Matruchot on the cultivation of fungi.—*C. W. Dodge.*

3767. MÖBIUS, M. *Die Frankfurter Floristen. Zur Erinnerung an Martin Dürer.* [The floristic botanists of Frankfort. In commemoration of Martin Dürer.] *Ber. Senckenberg. Naturf. Ges. Frankfurt a. M.* 51: 154–166. 1921.—The author gives short biographical notices of numerous botanists, as a result of whose activities several local floras of Frankfort have been written, some of which are still in manuscript. The oldest to be published was the *Flora Moeno-Francofurtana* of J. J. Reichard, the 2 parts of which appeared in 1772 and 1778. Another important local flora was published in 1828 by J. Becker [see Bot. Absts. 12, Entry 3760] and bears the title, *Flora der Gegend um Frankfurt a. M.* A 3rd, by G. Fresenius, dated 1832, was the *Taschenbuch zum Gebrauch auf Botanischen Excursionen in der Umgegend von Frankfurt a. M.* These published floras, as well as those still unpublished, are fully described, and a list of more general works dealing incidentally with the region about Frankfort is appended. Martin Dürer, in whose commemoration the paper was prepared, was, in the opinion of the author, the botanist best fitted to prepare a new local flora, but unfortunately he failed to bring a work of this character to completion. He was born at Frankfort in 1842 and died there in 1921. Although an apothecary by profession he was greatly interested in plants and, after his retirement in 1879, devoted himself almost wholly to his botanical studies.—*A. W. Evans.*

3768. MOLLIARD, M. Discours prononcé aux obsèques de M. Gaston Bonnier. [Discourse presented at the funeral of M. Gaston Bonnier.] Rev. Gen. Bot. 35: 1-5. 1923.—The life of M. Gaston Bonnier is reviewed and tribute paid to his work and personality.—*J. C. Gilman.*

3769. M[U]R[E]T, E. Le centenaire d'Elias Landolt. [Centenary of Elias Landolt.] Jour. Forest. Suisse 72: 221-223. 1 pl. 1921.—The article is a résumé of the life work of Elias Landolt, the father of Swiss forestry, the creator of a Swiss practice of silviculture, the initiator of federal forest legislation, the teacher in forestry for 38 years under whom all Swiss foresters were trained.—*G. Kempff.*

3770. PABISCH, H. O. Tunmann. Ber. Deutsch. Bot. Ges. 37: (77)-(84). 1919.—A brief sketch of the life and work of this Austrian pharmacologist (1867-1919) is given together with a bibliography.—*W. C. Muenscher.*

3771. POPENOE, PAUL. Dr. Fenzi's contributions to American horticulture. Jour. Heredity 13: 215-220. 2 fig. 1922.—An account is presented of the life and work of E. O. Fenzi, born in Florence, Italy, 1843, who was awarded the third Meyer medal for distinguished service in plant introduction. He moved to California in 1893. Among the foreign plants brought by him to the U. S. A. are: *Lippia repens*, *Feijoa sellowiana*, *Vitis capensis*, *Buddleia madagascariensis*, *Lyonothamnus floribundus* var. *asplenifolius*, *Taxodium mucronatum*, *Asparagus scandens* var. *deflexus*, and *Acacia podalyriaefolia*. In 1913 he returned to Italy and has since been active in plant introduction work in Libya, Italy's North African colony.—*R. C. Cook.*

3772. PORTERFIELD, W. M., JR. References to the algae in the Chinese classics. Bull. Torrey Bot. Club 49: 297-300. Fig. 1. 1922.—The Chinese character for Algae is Tsao, which appeared in very early times. Judging from the references in ancient Chinese literature and from an "analysis of the ideograph, there is a possibility, if not a probability, that the knowledge of the algae as a distinct morphological unit in the plant kingdom dates back to very early times."—*P. A. Munz.*

3773. PRAIN, DAVID. Robert Allen Rolfe. Rept. Bot. Soc. and Exchange Club British Isles 6: 365-367. 1921 [1922].

3774. R., A. B. [William Carruthers.] Nature 109: 787-788. 1922.—William Carruthers was born in 1830 at Moffat, Dumfries, and died June 2, 1922. He was educated for the ministry at Edinburgh. Appointed in 1859 as assistant to J. J. Bennett, who recently had succeeded Robert Brown as Keeper of the Department of Botany at the British Museum, Carruthers succeeded Bennett in 1871 and his work there until 1894 showed great development [see Journal of Botany, 1895]. He was prominent in the Linnean, Royal, and other scientific societies. As consulting botanist to the Royal Agricultural Society from 1871 to 1910 he made many contributions to diseases of crops, pasture grasses, and to seed testing. His chief contributions to pure science were in paleobotany, notably his monograph on fossil Cycadean stems of the Secondary Rocks of Britain [Trans. Linn. Soc. 1870].—*O. A. Stevens.*

3775. REA, CARLETON. William Beriah Allen, (1875-1922). Trans. British Mycol. Soc. 8: 191-192. 1923.—William Beriah Allen of Benthall, Shropshire, was a potter by profession but he became at the same time an eminent mycologist and made several interesting discoveries and numerous additions to the British fungus flora.—*W. B. McDougall.*

3776. RÖMER, IULIUS. Schimbul meu de scrisori cu Florian Porcius. [My correspondence with Florian Porcius.] Bul. Inform. Grăd. Bot. Muz. Bot. Univ. Cluj 1: 57-63. 1921.—These reminiscences of the Transylvanian botanist give notes on interesting plants of Rumania.—*Al. Borza.*

3777. ROPER, IDA M. [Cedric Bucknall.] Rept. Bot. Soc. and Exchange Club British Isles 6: 355-356. 1921 [1922].

3778. SAVAGE, S. *A little known Bohemian herbal*. Library 2: 116-131. 4 fig., 2 portraits 1921.—The Bohemian edition of P. A. Mattioli, translated by Tradeáš Hájek z Hajku and printed at Prag in 1562 by Georgius Melantrichus ab Aventino, is the first in which the large woodcuts of the later editions were used. The collation and notes on the translator and printer are followed by a discussion of signatures of the engravers, which were effaced before the blocks were used for the German and Venice editions. Six of the woodcuts, 3 being of plants, are reproduced. The blocks were used repeatedly to illustrate herbals, being found in Duhamel du Monceau, *Traité des Arbres et Arbustes qui se Cultivent en France en Pleine Terre*, where it is stated that the original blocks were used.—C. W. Dodge.

3779. SCHONLAND, S. *South African botanical literature*. Bot. Surv. South Africa Mem. 4. 69-85. 1922.—This includes an enumeration of the principal works on systematic botany, economic botany, plant pathology, South African phytogeography, ecology of South African plants, and fossil plants.—E. M. Doidge.

3780. SHULL, GEORGE H. *A permanent memorial to Galton and Mendel*. Sci. Monthly 16: 263-268. 1923.—The plan proposes to use the income from a permanent fund to illustrate such research papers in Genetics as need colored plates.—L. Pace.

3781. SMITH, ERWIN F. *Pasteur, the man* (Dec. 27, 1822-Sept. 28, 1895). Sci. Monthly 16: 269-279. 1923.—Such facts of his ancestry and youth as present his characteristics and his broad field of work are given in this appreciation of Pasteur.—L. Pace.

3782. SMITH, W. G. *Botany in the twentieth century*. Pharm. Jour. 107: 473-476. 1922.—The address includes the following headings: Beginnings of plant chemistry and physiology; life in the soil; bacteroids; nitrification mycorrhiza; the relation of the plant to the soil; the plant-cell; metabolism; plant-breeding; selection and hybridization; diseases in plants; the treatment of plant diseases; immune varieties; recent botanical progress.—E. N. Gathercoal.

3783. STRAND, E. [Rev. of: BRYK, F. *Linnaeus im Auslande*. (Linnaeus abroad.) 33 p., 3 pl. Stockholm, 1921.] Arch. Naturgesch. Abt. 88: 167, 168. 1922.

3784. TUBEUF. [Rev. of: MORSTATT, H. *Bibliographie der Pflanzenschutzliteratur für 1914-1919*. (Bibliography of plant protection literature.) viii + 463 p. Biologische Reichsanstalt für Land- u. Forstwiss.: Berlin-Dahlem, 1921 (see Bot. Absts. 11, Entry 4543).] Forstwiss. Centralbl. 45: 38. 1923.—Four points are suggested for making such bibliographies more useful to German scientists: (1) the literature should be more carefully selected, and unimportant material omitted; (2) the important foreign literature should be covered by good abstracts; (3) for the easily accessible German material only the general scope should be noted and (4) the libraries in which the literature may be consulted should be indicated.—W. N. Sparhawk.

3785. TUCKER, ETHELYN M. *Incunabula in the library of the Arnold Arboretum*. Jour. Arnold Arboretum 4: 56-60. 1923.—The incunabula of the Arnold Arboretum library numbering 17, are briefly described; some of the works are very rare and no other copies are known in this country.—Alfred Rehder.

[Unnumbered Bull.] 106 p. 1923.—Suggestive material for the use of teachers in the elementary schools in California is presented. The material is grouped under 4 general topics: Human needs, interests and activities; plant life throughout the year; animal life throughout the year; natural phenomena and the inorganic world and soil studies.—A. R. C. Haas.

3800. MAHIN, EDWARD G., and RALPH H. CARR. Quantitative agricultural analysis. xiii + 329 p., 62 fig. McGraw-Hill Book Co., Inc.: New York. 1923.—International Chemical Series.—The book is prepared with the conviction of the authors that "one of the things most needed by scientific agriculture today is an increasing body of agricultural chemists who understand the importance of desiring to know *why* matters are thus and so," and that "the scientific development of fundamentals" must be included with instruction in "the mechanical notions and processes of chemistry." Part I, general analysis, includes: theory and general principles, general operations, quantitative determinations. Part II, special measurements, includes: density and specific gravity, heat of combustion (calorimetry), index of refraction, optical rotation (polarimetry), hydrogen-ion concentration. Part III, analysis of agricultural materials, includes: feeds, saponifiable oils, fats and waxes, dairy products, soils, fertilizers insecticides and fungicides, table of logarithms and antilogarithms, table of atomic weights.—C. S. Gager.

GENERAL, FACTORS, MEASUREMENTS

3814. ALLEN, W. E. *Studies on catches of marine phytoplankton made by aid of the Kofoid bucket in 1921.* *Ecology* 4: 74-80. 1923.—A general report is presented on work done by members of the staff of Scripps Institution. The studies, confined to diatoms and dinoflagellates (the diatoms being the most numerous) indicate a lack of knowledge of the relative fertility of different levels of the ocean depths. The same may be said with reference to the influence of temperature and other environmental factors. Maximum diatom production occurs near the summer solstice because of increase in light and temperature. The Kofoid bucket was found to be practical and accurate. It is believed that plans and methods have been found that are dependable and may be used in a permanent program of operations. T. J. Fitzpatrick.

3815. CANZ, E. Die Bedeutung des Wassers für das Pflanzenwachstum. [The significance of water for plant growth.] Jahresh. Ver. Vaterländ. Naturk. Württemberg 77: xxii-xxiii. 1921.—This report of a lecture emphasizes the importance of a liberal water supply for cultivated crops. The diversity of soils with respect to available water is mentioned, and that the amount necessary for vigorous plant development must exceed the wilting coefficient. It is shown that an increase in the harvest is dependent upon an increased water supply.—A. W. Evans.

3816. CHOUX, P. Revue des travaux de botanique tropicale et subtropicale. 1910-1919. Suite. [Review of work in tropical and subtropical botany 1910-1919. Continued.] Rev. Gén. Bot. 35: 34-41, 92-100, 141-148. 1923.

3817. ECOLOGICAL SOCIETY OF AMERICA COMMITTEE ON THE PRESERVATION OF NATURAL CONDITIONS. Preserves of natural conditions. 31 p., 15 fig. Ecological Society of America: 1921.

3818. GUILLAUME, ANDRÉ. Étude sur les limites de végétation dans le nord et l'est de la France. [On the limits of vegetation to the north and east in France.] Compt. Rend. Acad. Sci. Paris 175: 713-716. 1922.—Other authors have studied the limits of distribution of certain arbitrarily chosen species. It is preferable to choose a restricted region and study all of the plants. The area here studied is bounded southwest by Loiret, northwest by the Somme, northeast by Lorraine, and southeast by Haute-Saône. Of 1332 species found, 340 do not extend farther to the north and east. Influences which bring about these limits are discussed under climatic, geologic, physical, and palaeontological headings.—C. H. Farr.

3819. KOLKWITZ, R. Ueber die Standorte der Salzpflanzen. III. *Triglochin maritima*. [Stations for halophytes. III. *Triglochin maritima*.] Ber. Deutsch. Bot. Ges. 37: 343-347. 1919.—The author discusses the invasion and establishing of *Triglochin maritima* in certain areas in Germany recently flooded by salt water.—W. C. Muenscher.

3820. KOLKWITZ, R. Ueber die Standorte der Salzpflanzen. IV. *Erythraea linariifolia*. [Stations for halophytes. IV. *Erythraea linariifolia*.] Ber. Deutsch. Bot. Ges. 37: 420-426. 1919.—*Erythraea linariifolia*, a halophyte, is found in scattered localities in Germany in which the sodium chloride content of the water is very low. The water in these localities was found to contain large amounts of calcium sulphate.—W. C. Muenscher.

3821. LUTZ, FRANK E. Altitude in Colorado and geographical distribution. Bull. Amer. Mus. Nat. Hist. 46: 335-366. 1922.—This is a study based on plants, chiefly those listed in Rydberg's Flora of Colorado, from Portulacaceae to Fabaceae, inclusive. It applies the method of geographic average to the relations between altitudinal (in Colorado) and geographic distribution, and also derives an expression in terms of mid-latitude for Merriam's life zones in Colorado.—Frank E. Lutz.

3822. MARTELLI, ALESSANDRO. Forze naturali e fattori umani nella trasformazioni della montagna. [Natural forces and human factors in the metamorphoses of mountains.] Ann. R. Ist. Superiore Forest. Firenze 6: 3-21. 1920-1921.—This lecture was delivered at the Royal Superior National Forest Institute, Florence.—Ferdinand W. Haasis.

3823. MOREILLON, M. Évaporation de l'eau à l'air libre, à Montcherand (cant. de Vaud). [Free air evaporation of water at Montcherand (canton of Vaud).] Jour. Forest. Suisse 73: 52-56. 1922.—Observations of the free air evaporation on denuded and non-denuded soils were started by Bühler at Zürich and continued at Tübingen. A table compares the longer records obtained at Tübingen with those obtained at Montcherand, the latter having the higher free-air evaporation. A 2nd table gives values for soils denuded and covered with sod, for humus, limestone, sand and clay. Data obtained with a Wild evaporimeter and by

evaporation measurements of large bodies of water are nearly alike. A 3rd table covering the years 1911-1921, inclusive, shows the free-air evaporation measured with the Wild evaporimeter placed in the shade at Montcherand, 565 m. in altitude. During this period the Wild evaporimeter evaporated 60 per cent of the total precipitation received.—In answer to the question whether the evaporation rate is higher or lower in the mountains than on the plains, preliminary results with a Wild evaporimeter show a lower, and with a Livingston-Amberg evaporimeter a consistently higher rate for increases in altitude. Fog and mist condensations in the mountains have a negligible effect upon the evaporimeters. Slight free air evaporation takes place in temperatures below 0°C. throughout the day.—*G. Kempff.*

3824. NICHOLS, G. E. A working basis for the ecological classification of plant communities. *Ecology* 4: 11-23. 1923.—This paper is in the nature of a revision and amplification of an earlier one. Its aim is to present the essential facts and principles underlying the ecological classification of plant communities and to suggest a working plan for ecological surveys. The 1st part deals with the plant association as a vegetation-unit in its relation to the environment; the 2nd with the ecological classification of plant associations. Association is described as a group or community occupying a common habitat, the vegetation being similar throughout its extent in physiognomy, ecological structure, and floristic composition. Physiognomy includes the general outward appearance or external morphology of a plant community (ecological structure is to the plant community what morphological and physiological structures are to the plant) while floristic composition is concerned primarily with species which are constantly preponderant either numerically or in mass effect. Layer and group societies are plant communities of subordinate rank within the association. The association is regarded as an organic entity, plant societies bearing a relation to the association somewhat analogous to that borne by the various organs of an individual plant to the plant as a whole. The term association is recognized as applicable both to the abstract vegetation concept and to the concrete individual pieces of vegetation on which this concept is based. Habitat includes everything relating to the factors operative in a geographically definite locality, so far as these factors influence plants. A distinction is made between the general habitat relations of the association as a whole and the specific habitat relations of its constituent elements. Habitat factors are divided into climatic, physiographic, biotic, anthropic (human), and pyric (fire). The 1st is subdivided into regional and local climatic factors, rhythmical and progressive changes in climate, and other atmospheric influences. Physiographic factors are topographic and edaphic, rhythmical and progressive changes in physiography, and other physiographic influences. Biotic habitat factors are shade, root competition, humus, micro-organisms in the soil, plant and animal invasion, and other biotic influences. (To be concluded).—*J. E. Weaver.*

3825. OLSEN, CARSTEN. Studies on the hydrogen ion concentration of the soil and its significance to the vegetation, especially to the natural distribution of plants. *Compt. Rend. Trav. Lab. Carlsberg* (Copenhagen) 15¹: 1-166. 27 fig. 1923.—This is a detailed presentation of data upon which a preliminary report has been issued. The investigation, begun in 1916, comprises field observations and cultural experiments extending over 4 years.—Methods for colorimetric determination of H-ion concentration in soil extracts are described; the results of colorimetric and electrometric determinations are compared, generally with agreement within 0.2 pH; both methods have been used in this study. The homogeneity and constancy of the H-ion concentration of the soil were investigated and a comparison made of the acidity shown by the "soil liquid" (obtained by pressure) and the "soil extract" prepared with varying proportions of water. Considerable buffer action was observed in extracts in contact with soil, but very little in filtered extracts. No essential differences in reaction were found in soils taken at depths of 5-20 cm. The quantity of nitrate and ammonia present, as well as their rates of formation, were investigated in soils from the habitats studied, and account also was taken of differences in soil moisture content, level of water table, light intensity, and content of potassium, phosphorus and calcium. The distribution and density of vegetation were determined quantitatively using replicated quadrats 0.1 m. square, and expressing the frequency as

per cent of the number of individuals of the dominant species. The species frequencies are correlated with the H-ion concentration of the soil in 10 tables for each of the meadow and woodland formations, covering the range pH 3.5-8.0 in steps of 0.5 pH. From these tables summarizing tables are prepared showing the average frequency in each pH class of meadow plants from 78 localities and of woodland plants from nearly 200. The author concludes that the H-ion concentration of the soil has an important effect on the composition of plant associations; each species is in general found only within a certain range of H-ion concentration; within this range there is a narrower range in which the species has its greatest average frequency. For some species the wider range is only 3 pH classes; for others it may be 5-6 classes; the narrower range of maximum frequency is usually 1-2 classes. Comparatively few species are sufficiently precise indicators individually to afford a guide to the soil reaction, but when an association consisted of a number of species, the average pH class of their mean maximum frequencies, as determined from the tables, was found to include the H-ion concentration experimentally found.—The greater number of species are found in soils which approach neutrality; also habitats which are approximately neutral are richer in species than those decidedly acid or alkaline.—These conclusions were tested experimentally by growing plants appearing to have different optimal soil reactions in native soils with pH range 3.6-7.7; and in solution cultures in which the reaction was adjusted to a similar range, and maintained by constant drip or by aeration. Typical acid soil plants as *Deschampsia flexuosa* and *Senecio silvaticus* always showed the greatest growth in media of pH 4.5-5.0; they were chlorotic and severely stunted in neutral or alkaline media. Neutral or alkaline soil plants as *Poterium sanguisorba* and *Tussilago farfara* were most vigorous in media of pH 6.5-7.0. The fact that these plants did not become chlorotic in sub-neutral media shows that lack of available iron was not the cause of the poor growth of acid soil plants in similar media. Only aquatics, as *Helodea canadensis*, were found to thrive in alkaline solutions. It is held that in alkaline soils the water film in contact with plants roots must always be slightly acid due to liberation of CO_2 by the roots.—Experiments were conducted to determine the effect of ammonia as compared with nitrate as a source of nitrogen for acid and neutral soil plants. When their respective acid- and alkaline-producing natures were neutralized even the neutral soil plants grew well with ammonia as the sole source of nitrogen. Acid soils are typically high in NH_3 , but that plants characteristic of these habitats are more influenced by the H-ion concentration than the ammonia content of the soil was shown by their poor growth in highly acid media containing NH_4Cl , and their vigorous growth in less acid media containing equivalent amounts of NH_4NO_3 .—A tendency to vary in parallel manner was shown in the H-ion concentration of the cell sap and that of the medium in which the plant grew.—No ability on the part of the plants to alter the reaction of solution cultures toward a presumably optimum point was observed. Variations in reaction during growth were traceable to the source of nitrogen, the reaction becoming acid if nitrogen were furnished as ammonia, and alkaline if furnished as nitrate. In a "physiologically neutral" solution containing both ammonia and nitrate no change of reaction occurred. Critical values were reached in the acid direction first by neutral-soil plants and in the alkaline direction by acid-soil plants.—That the presence of aluminum in acid soils is not the sole cause of the avoidance of such soils by neutral-soil plants was shown by the vigorous growth of *Tussilago* in a solution containing Al provided the reaction were kept neutral. Al ions really are toxic to some plants, as barley, and may cause an effect independent of their acid-producing nature on hydrolysis by precipitating phosphoric acid.—F. Weiss.

3826. OLSEN, CARSTEN. The concentration of hydrogen ions in the soil. *Science* 54: 539-541. 1921.—This is a somewhat detailed abstract of the article noted in the preceding entry.—C. J. Lyon.

3827. PALMER, ERNEST J. The Red River forest at Fulton, Arkansas. *Jour. Arnold Arboretum* 4: 8-33. 1923.—The author presents a general account of the forest flora of the southwestern states and cites a number of localities where a remarkably large number of ligneous species occur. Especially Fulton, Arkansas, which is described in its phytogeographical aspects and of which the ligneous plants found within a radius of about 5 km. are listed,

comprising nearly 200 species and varieties of trees and shrubs. Two new supposed oak hybrids are mentioned, *Quercus nigra* \times *A. Shumardii* and *Q. Durandii* \times *Q. stellata*; and 1 new variety, *Forestiera acuminata* var. *vestita* is described.—ALFRED REHDER.

3828. WANGERIN, WALTHER. *Die Grundfragen der Pflanzensoziologie.* [The fundamental problems of plant sociology.] *Naturwissenschaften* 10: 574-582. 1922.

STRUCTURE, BEHAVIOR, SYMBIOSIS

3829. BEQUAERT, J. *Ants in their diverse relations to the plant world.* *Bull. Amer. Mus. Nat. Hist.* 45: 333-583. *Pl.* 26-29, *fig.* 77-100. 1922.—The author summarizes what is known of these varied and often intricate relations as follows: Economic importance of ants; ants as agents in the pollination of flowers; ants and extrafloral nectaries; dispersal of seed by ants; harvesting ants; ants and epiphytes; gall-inhabiting ants; fungus-growing ants; fungus parasites of ants (*Cordyceps*, *Isaria*, *Stilbum*, *Rickia*, and *Laboulbenia*); intracellular bacteria of ants; a review of African myrmecophytes (*Schotia*, *Macaranga*, *Cola*, *Scaphopetalum*, *Barteria*, *Epitaberna*, *Vitex*, *Uncaria*, *Sarcocephalus*, *Randia*, *Plectronia*, and *Cuviera*); synopsis of the literature of recorded myrmecophytes of the world; bibliography of the relations between plants and ants.—Frank E. Lutz.

3830. BOUGET, JOSEPH. *Observations sur l'optimum d'altitude pour la coloration des fleurs.* [Observations on the optimum altitude for the coloration of flowers.] *Compt. Rend. Acad. Sci. Paris* 174: 1723-1724. 1922.—A study is made of *Hepatica triloba* in the Pyrenees. Plants with white flowers lose their leaves, while those with red or blue flowers retain them all winter. The most brilliant colors occur between 700 and 1000 m. on the north slopes in the shade. At the highest altitudes for this species (up to 2000 m.) the flowers are all white. If planted at 2,850 m. all plants become white. If planted at 500-600 m. the flowers are nearly white. *Ramondia pyrenaica* and *Horminum pyrenaicum* give similar results.—C. H. Farr.

3831. CATALANO, GUISEPPE. *Determinazione razionale della xerofilia.* [Rational determination of xerophily.] *Bull. R. Orto Bot. Palermo* 2: 171-221. 1921.—Xerophily is defined as the faculty, present in all autotrophic plants, of living and reacting to a dry habitat by means of physiological adaptation in the time (xerophilous tendency) and adaptation in form and matter in the physical space occupied by the plant structure (xerophilous organization).—Edith K. Cash.

3832. COCKERELL, T. D. A. *Bees of the genus Panurginus obtained by the American Museum Rocky Mountain expeditions.* *Amer. Mus. Novitates* 36. 10 p. 1922.—This paper and those cited in the following 6 entries are chiefly entomological, but they also contain scattered records of flower visits by bees.—Frank E. Lutz.

3833. COCKERELL, T. D. A. *Bees of the genus perdita from the western states.* *Amer. Mus. Novitates* 33. 15 p. 1922.

3338. COCKERELL, T. D. A. Western bees obtained by the American Museum expeditions. Amer. Mus. Novitates 24. 15 p. 1921.—Largely entomological but contains scattered records of flower-visits by bees.—*Frank E. Lutz.*

3339. FRISON, THEODORE H. Report on the Bremidae collected by the Crocker Land Expedition, 1913-1917. Bull. Amer. Mus. Nat. Hist. 41: 451-459. Pl. 24. 1919.—This paper is largely entomological but contains a short section on the anthophilous habits of Arctic bumblebees.—*Frank E. Lutz.*

3340. GATES, F. C. Influence of moonlight on movements of leguminous leaflets. Ecology 4: 37-39. 1923.—Observations were made at night upon the behavior of the leaves of a number of leguminous plants found in the Philippines, where the temperature was never low enough to counteract any influence moonlight might exert. When the nights were clear and not too humid, the strong moonlight effected the partial resumption of the day position of the leaflets, and also caused the opening of the stomata in at least a few instances. The effects were most pronounced on plants having rather large leaflets, but even then were never carried to completion as they are during the change from night to day.—*John W. Crist.*

3341. LARBAUD, MARGUERITE. Anatomie des fleurs d'une même espèce à diverses altitudes. [Anatomy of flowers of the same species at different altitudes.] Compt. Rend. Acad. Sci. Paris 174: 1562-1564. 1922.—*Silene inflata* is particularly studied. At low and high altitudes the flowers are of the same size though fewer in number, but the vegetative part of the plant is proportionately reduced in the mountains. The differences in the morphology and histology of the flower parts at high and low altitudes are described. In general the cells are smaller, about $\frac{1}{5}$ — $\frac{3}{4}$, and the tissue of the flowers more compact. The opening of the anthers is more precocious in the mountains, and the pollen grains are a little smaller.—*C. H. Farr.*

3342. LEBOUR, MARIE V. The food of plankton organisms. Jour. Marine Biol. Assoc. United Kingdom 12: 644-677. 1922.—The marine plankton organisms in the Plymouth region the food of which consists chiefly of diatoms, include most of the common copepods, decapod larvae (excluding the larval lobster and crab megalopae), echinoderm larvae, mollusk larvae, most of the common forms of annelid larvae, *Cyphonautes* (of the Polyzoa), *Tomopteris helgolandicus* (of the Annelida), and *Tornaria* larvae (of the Enteropneusta). Organisms feeding largely on Peridineae include *Actinotrocha* (of the Phoronidea) and the Tintinnids (of the Protozoa).—*Marshall A. Howe.*

3343. LUTZ, FRANK E., and T. D. A. COCKERELL. Notes on the distribution and bibliography of North American bees of the Families Apidae, Meliponidae, Bombidae, Euglossidae, and Anthophoridae. Bull. Amer. Mus. Nat. Hist. 42: 491-641. 1920.—This paper cites numerous records of flower-visits by bees.—*Frank E. Lutz.*

3344. TROLL, KARL. Die Entfaltungsbewegungen der Blütenstiele und ihre biologische Bedeutung. [The biological significance of the movements of the flowerstalk.] Flora 115: 293-392. Pl. 4-10, 3 fig. 1922.—Comparative studies, supported by experiment, of pre- and postfloral movements in many species covering a wide range of families, give little support for the theory that such movements are adaptive responses of significance in the struggle for existence. In many cases they are conditioned by the organization of the inflorescence, e. g., in species of such families as the Commelinaceae, Droseraceae, Oxalidaceae, and Boraginaceae in which the inflorescence is a dichasium or a derived type. Such movements are effected by geotropism and epinasty. The similarity of movement in species of *Oxalis* of various habits, habitats, and climates presents many difficulties for the theory of adaptive responses. On the other hand, there is often more or less convergence in type of movement in unrelated forms which live under similar conditions (*Limnanthemum nymphaeoides* and *Hydrocleis*, *Vallisneria* and *Nymphaea candida*, *Oxalis acetosella* and *Viola septentrionalis*). Similarity of organization enables them to live under similar conditions although other types are possible; it is not a question of necessity but of possibility.—*A. G. Stoekey.*

3845. WÜST. Die erste und letzte Tracht im Jahre. [The first and last blossoms of the year.] Bienenpflege 44: 12-13. 1922.—Descriptions are given of the first and last blossoms of the year which attract bees. *Helianthus* is a late bloomer which is frequently visited by bees.—M. G. Dadant.

VEGETATION

3846. ARRHENIUS, O. Statistical investigations in the constitution of plant associations Ecology 4: 68-73. 1923.—It has been noticed that on areas increasing in size from y to y_1 the number of species found increases from x to x_1 according to the empirical formula $\frac{x}{x_1} = \left(\frac{y}{y_1}\right)^n$ where n is a constant. Within certain limits this approximation formula holds well for plant communities. Some associations increase their number of species very slowly, others very rapidly, and n has high and low numerical values accordingly; in other words rich types of association have a low n value and the poor ones a high one. The n -values for different associations are given and range from 1.8 to 12.5, the majority being between 2 and 3, with an average for the whole of 3.7. When the area increases very much the calculated value is higher than the observed one. It has been found that the distribution of species over an area follows the laws of probability; or, mathematically stated, if n individuals of a species are found n times on the area $\frac{Y}{n}$ the probability, a , of finding it on a smaller area y is $aY = y$ or $aY = Y + y$ or $a = 1 - (1 - \frac{y}{Y})$. The total of a values equals the probable number of species on the area y . Where Y is very large and n and y small, it has been observed that when the area increases geometrically the number of species likewise increases up to a certain limit, but when n and y are comparatively large the limit is soon reached. The formula has been found to hold very well for associations and agglomerations of communities in Sweden, Finland, Switzerland and Java.—T. J. Fitzpatrick.

3847. BATES, C. G. The transect of a mountain valley. Ecology 4: 54-62. 3 fig. 1923.—From a former extensive investigation in Colorado the conclusion was reached that the zonal distribution of the important forest trees of opposing slopes at the same elevation is due mainly to differences in insolation and its effects upon the soil surface. Since no measurements of light intensity were made, and other data were somewhat unsatisfactory, the present effort was aimed to test this conclusion. A valley was chosen with an axis lying east and west and bounded on either side by ridges only 700 feet apart. On a transect line normal to the contours on both slopes, 14 stations 50 feet apart were established and data gathered, beginning in July, on evaporation, soil temperature at the surface and at 1-foot depth, and soil moisture. The south exposure bears a stand of western yellow pine beginning to be invaded from the top by Douglas fir. The author ascribes this condition to the habit of prompt germination and immediate deep rooting of yellow pine, thus enabling it to succeed on a slope where the striking feature is the rapidity with which the surface moisture may drop below the wilting point. Douglas fir equals yellow pine in these respects but not in its ability to withstand the higher surface temperatures prevailing farther down the slope. The north slope has a cover of Engelmann spruce at its base and a forest of Douglas fir extending to the top. The lack of fir and the presence of spruce in the base area is thought to be due to (a) invasion by spruce when denuded, or (b) factors such as coldness of the site, lack of sunlight, etc., inimical to the more heat-demanding fir, or (c) soil quality unfavorable for fir.—John W. Crist.

3848. BOETTGER, CAESAR R. Meine Exkursion zur spanischen Kolonie Rio de Oro in Westafrika. [My excursion to the Spanish colony of Rio de Oro in West Africa.] Ber. Senckenberg. Naturf. Ges. Frankfurt a. M. 51: 18-31, 72-84, 167-173. 1 map. 1921.—In this popular account of Rio de Oro the author includes a few observations on the vegetation, calling attention to the great abundance of the Chenopodiaceae and designating the cactus-like Euphorbiae as the most striking plants of the region.—A. W. Evans.

3849. CAMPBELL, ELMER GRANT. Some aspects of Stone Mountain, Georgia, and its vegetation. *Proc. Indiana Acad. Sci.* 1921: 91-100. 11 photo. 1922.—Only lichens are found on the north slope, which is a vertical unbroken wall, but a dense forest of broad-leaved trees and herbaceous plants is found on the narrow rich talus. On the steep south slope grow conifers and flowering herbs, and on the broad south talus an almost pure stand of pine which merges into deciduous trees. The east and west slopes seem to have floras blending between those on the north and south.—*F. C. Anderson.*

3850. CHRISTENSEN, CARL. Om Vegetationen paa Høvblege. [Vegetation of Høvblege.] *Bot. Tidsskr.* 37: 421-432. 1922.—“Høvblege” is defined as the part of a cliff or hill which is devoid of trees and lies to the southwest part of the woody cliffs. Ostenfeld, in an article in *Naturens Verden* first called attention to the special vegetation of these areas, or island cliffs. The particular type of vegetation was that of Central Europe in that there were 4 distinct associations dominated by *Linum austriacum*, *Onobrychis sativa*, *Poterium polygnum*, and *Reseda lutea*, respectively. These island areas have been known for a long time for their orchids, but no specific study had been made. In 1922, Christensen, with K. Wünnstedt, made a physiographic ecological study of the various species and their distribution, employing the Raunkiaer statistical method.—*A. L. Bakke.*

3851. DICE, L. R. Notes on the communities of the vertebrates of Riley County, Kansas, with especial reference to amphibians, reptiles, and mammals. *Ecology* 4: 40-53. 1923.—Much of this article deals with vegetation. The names of many of the animal communities mentioned are suggestive of this, as: willow-poplar, valley forest, hillside forest, thicket, sumac, meadow, prairie, cultivated-field, orchard, ruderal, etc. In practically all the communities the vegetation is given, the dominant species listed, and important observations on the structure of the plant communities included.—*T. J. Fitzpatrick.*

3852. LARSEN, J. A. Association of trees, shrubs, and other vegetation in the northern Idaho forests. *Ecology* 4: 63-67. 1923.—The most common herbs, shrubs, and trees in the forests of northern Idaho are listed to afford a better insight into the quality and general characteristics of the habitat. The forest types show differences with increasing altitude, passing from nearly pure yellow pine, bordering the Columbia River Plateau, through western larch, Douglas fir with some yellow pine at higher elevations, and white pine, western hemlock, western red cedar, and lowland white fir on still higher and rougher ground. Above these altitudinally are the sub-alpine forests of mountain hemlock, alpine fir, Engelmann spruce, and lodge-pole pine. These belts often overlap broadly. The mean annual precipitation varies 18-20 inches in the yellow pine association to 27-35 inches in the western white pine community, prolonged drought occurring in the summer. The mean growing season (May to September) has a temperature of 60-65°F. in the yellow pine and 54-60°F. in the white pine community. Plant lists give the most frequent and typical species only.—*J. E. Weaver.*

3853. LAUTERBACH, L. Die Salzflora von Nauheim und Wisselsheim. [The saline flora of Nauheim and Wisselsheim.] *Ber. Senckenberg. Naturf. Ges. Frankfurt a. M.* 50: 143-152. 13 fig. 1920.—In the vicinity of the saline springs at Nauheim and Wisselsheim, Germany, a number of characteristic seashore plants occur and stand in sharp contrast to the usual vegetation of the district. The author illustrates and gives non-technical descriptions of the following saline species: *Atriplex patulum* var. *salinum*, *Erythraea pulchella*, *Festuca distans*, *Glauz maritima*, *Hordeum secalinum*, *Juncus gerardi*, *Plantago maritima*, *Salicornia herbacea*, *Scirpus maritimus*, *S. tabernaemontanus*, *Spergularia salina*, *Triglochin maritima*, and *Zannichellia palustris*. He calls attention also to the danger of extinction to which such plants are exposed in a highly developed agricultural region and lists several saline species that have already disappeared.—*A. W. Evans.*

3854. NEEDHAM, J. G., C. JUDAY, E. MOORE, C. K. SIBLEY, and J. W. TITCOMB. A biological survey of Lake George, N. Y. 78 p. 27 fig. State of New York Conservation Commission: 1922.—A comprehensive biological study was made with special reference to fish production.

Needham describes the hydrography and environment, and the vegetation and its turnovers into fish food. He discusses fish protection and propagation and offers recommendations to improve the fishing.—Juday records limnological observations on the temperature of the lake waters, transparency, dissolved gases, and plankton. Quantitative studies show the total yield of plankton forms and bottom fauna at the time of observation with every indication that an abundance of food materials is developed. The relative importance of certain organisms from the standpoint of fish food is pointed out.—Moore considers the primary sources of food of a number of important fishes of the lake, giving illustrations of food staples and food chains. Plant and animal associations, and limiting factors are discussed.—Sibley gives an annotated list of the fishes of the lake and a food census of the adults.—Titcomb gives the purpose of the investigation, makes several fish cultural observations and offers general recommendations from the standpoint of the fish culturist.—*E. Moore.*

3855. SEWARD, A. C. *A summer in Greenland*. 100 p., 47 fig. University Press: Cambridge, 1922.—A popular account of the geography, geology, people, and customs is given, with chapters on flora and fossil plants. Greenland has over 400 species of flowering plants, mostly circumpolar, only 1 endemic. The only trees are willows and birches, reaching a height of 18 feet with stems 1 inch in diameter at age of 100 years. The soil is thawed in summer to a depth of 2-6 feet. All roots are wide spread and superficial. Greenland is a rich field for fossil plants and glacial deposits. Marine drift from great distances may be mixed in glacial deposits with indigenous remains.—*Forrest Shreve.*

3856. THONE, FRANK. *Ecological factors in region of Starved Rock, Illinois*. Bot. Gaz. 74: 345-368. Fig. 1-5. 1922.—The region studied is one showing diverse habitats carrying diverse vegetation complexes derived from "the glacial relicts left behind by the northern retreat of the first post-Pleistocene flora, outliers from the mesophytic southeastern forests, forerunners of the western and southwestern plains, and desert types." The author's summary follows: This paper is a study of the ecological factors at 7 representative topographical points during the growing season of 1921. The factors studied were soil moisture, evaporating power of the air, evaporating power of solar radiation and temperature of air and soil. Observations were taken with special reference to their influence on seedling growth, because of the importance of the latter as a factor in succession. Soil moisture was found to vary (a) seasonally, falling off after the close of the spring rains and reaching a point below the minimum necessary for plant growth during a considerable portion of the summer, and rising again with the beginning of the fall rains; (b) according to the mechanical composition (and therefore retentivity) of the soil; (c) to a minor extent according to topography; and (d) according to the density of the foliage canopy. The evaporating power of the air was found to vary (a) seasonally, increasing until midsummer and falling off afterward; (b) according to the state of tree foliation, declining after the forest had become completely clothed; and (c) topographically, being greatest for the same period in exposed stations and least in sheltered ones. The evaporating power of solar radiation was found to vary in the same manner as the evaporating power of the air, complementing and emphasizing the data under the latter head. Maximum temperatures were found to vary in much the same manner as the evaporating power of the air. Minimum temperatures of the air were found to be affected by topography in a mode inverse to that of the maxima, being highest at the low lying stations and lowest at the higher lying ones. Certain vegetational phenomena showed a general correlation with the instrumental observations: (a) the density of ground cover, number of tree seedlings, and proportion of annuals in the total vegetation of any given association bore an inverse relation to the relative xerophytism; (b) in all but one of the stations conditions were favorable for the development of seedlings only in spring and fall; (c) in the climax forest for the region (upland oak woods) the water-supplying power of the soil consistently fell nearly or quite to zero during the summer drought period; (d) the location of "subclimax" and "superclimax" associations showed closer correlation with water relations than with temperature.—*B. W. Wells.*

APPLIED ECOLOGY

3857. ALFONSUS, ALOIS. Ueber die Errichtung von Pflanzgarten. [The establishment of the gardens.] Deutsche Imker 36: 36. 1923.—Varieties of bee plants are given adapted to the small garden.—*M. G. Dadant.*

3858. BALDWIN, E. G. The honey regions of Florida. Amer. Bee Jour. 62: 150-153. Fig. 1-5. 1922.—The most important honey plants in Florida are *Nyssa aquatica*, *N. biflora*, orange, *Cassia chamaecrista*, *Castanea pumila*, *Sabal megacarpa*, *S. Palmetto*, *Avicennia nitida*, *Ilex glabra*, *Hippomane Mancinella*, *Satureja rigida*, and *Mesophaerum spicatum*. Because of the great extension southward of peninsular Florida the honey flora and conditions of bee culture differ widely in the northern and southern portions of the state.—*J. H. Lovell.*

3859. BUCHEGGER, JOSEF. Die Goldrute und ihr Anbau. [The goldenrod and its cultivation.] Tiroler Bienenzeitg. 9: 12. 1922.—The writer describes the best conditions for growing *Solidago canadensis*. It is a desirable addition to the honey flora.—*M. G. Dadant.*

3860. CAMPBELL, S. M. Nectar secretion at high altitudes. Gleanings in Bee Culture 50: 792. 1922.—At high altitudes in the San Francisco Mountains in Arizona more honey is gathered than in the plains.—*J. H. Lovell.*

3862. COLEMAN, GEO. A. Beekeeping in our California national forests No. II. Honey flora. Western Honey Bee 11: 23-25. 1922.—*Salvia Columbaria* blooms Apr.-May and yields an excellent white honey. *S. mellifera* is the most important honey plant in its range (Mt. Diablo southward to San Diego County), blooms Apr. -July 15, and yields a water-white honey of excellent flavor. *S. apiana* blooms March-May and yields white honey of fine flavor. *S. sonomensis* blooms May-June and yields a honey similar to that of white sage. *Koellia californica* and *Monardella villosa* are minor honey plants in the Coast Ranges. *Artemisia californica* is valuable for its abundant pollen. *Solidago californica*, common on dry plains, is a valuable honey plant Sept.-Dec. *Baccharis pilularis* is common in the Coast Ranges and furnishes a large amount of honey.—*J. H. Lovell.*

3863. DAVIDSON, JOHN. Factors affecting nectar secretion in flowers. Amer. Bee Jour. 62: 153-154. 1922.

3864. ENGLE, M. C. Beekeeping in Cuba. Beekeepers' Rev. 36: 9. 1922.—Beekeeping at Herradura is briefly described.—*J. H. Lovell.*

3865. HOLMES, T. E. Beekeeping in the Idaho Panhandle. York's Bees and Honey 31^o: 6. 1922.—Notes are given on the honey plants of northern Idaho. The main sources of honey are fireweed and clover.—*J. H. Lovell.*

3866. HOLST, AXEL. Beekeeping in the Virgin Islands. Amer. Bee Jour. 62: 57-58. 1922.—Ninety per cent of the honey is gathered from trees and is mostly dark in color. There are 2 heavy honey flows, 1 in spring and 1 in fall. A list of the more important honey plants is given.—*J. H. Lovell.*

3867. HOLST, AXEL. Nectar secretion in the tropics. Amer. Bee Jour. 62: 265. 1922.

3868. LUND, JOHN. Alfalfa yields in the East. Gleanings in Bee Culture 50: 642. 1922.—At Landenburg, Pennsylvania, bloom of the 2nd crop of *Medicago sativa* yielded a surplus of honey, some colonies storing 40 pounds. Alfalfa allowed to stand produced a big crop of seed.—*J. H. Lovell.*

3869. MOORE, B. An interesting example of applied ecology. [Rev. of: JARDINE, J. T., and C. L. FORSLING. [Range and cattle management during drought. U. S. Dept. Agric. Bull. 1031. 1922.] Ecology 4: 82-84. 1922.

3870. PARKS, H. B. Agarita, guajillo and mesquite. Amer. Bee Jour. 62: 412-413. Fig. 1-4. 1922.—Agarita (*Berberis trifoliata*), abundant on the limestone hills of the Edwards Escarpment, Texas, blooms in early spring and is said to yield a light amber honey of good flavor. Guajillo (*Acacia Berlandieri*), common on the dry stony ridges of southern Texas, secretes a large amount of nectar. The honey, which is a very light amber color or milky white, with a mild, excellent flavor, granulates quickly. Mesquite (*Prosopis glandulosa*), yielding a light amber honey of fair quality, is common in southern Texas but not reliable every year.—J. H. Lovell.

3871. PARKS, H. B. Phacelia. Amer. Bee Jour. 62: 213. 1922.—*Phacelia integrifolia* is abundant along the Edwards Escarpment, Texas, and is very attractive to bees.—J. H. Lovell.

3872. PARKS, H. B. The blue bonnets as an aid to the bees. Beekeepers' Item 6: 137-138. Fig. 1. 1922.—*Lupinus subcarnosus* is most common in Texas between the Trinity and Sulphur Rivers and the high plain area and is adapted to limestone soil. Lupines are all nectarless, though this species is often erroneously reported by Texas beekeepers to yield small amounts of nectar. It is a valuable pollen flower, large quantities of orange-red pollen being gathered by bees. It is recommended as an ornamental.—J. H. Lovell.

3873. PELLETT, F. C. Beekeeping in Manitoba. Amer. Bee Jour. 62: 497-500. Fig. 1-6. 1922.—An account is given of conditions on the prairie and in the bush in the country about Winnipeg. South and west is level prairie, while north and east the land is covered with small poplars and other quick-growing trees. Immense crops of wheat, oats, and barley are grown. Large crops of honey are secured from *Cirsium arvense*, *Grindelia squarrosa*, *Melilotus alba*, *Tilia americana*, *Taraxacum officinale*, *Medicago sativa*, *Symphoricarpos racemosus*, asters, and goldenrods. An average of 150 pounds per colony is usual in well-cared-for apiaries.—J. H. Lovell.

3874. RAGGATT, H. W. Beekeeping in Australia. Gleanings in Bee Culture 50: 773. 1922.—Eucalyptus yields 95 per cent of Australian honey, most apiaries being located in forests. Out of every 5 years, 2 are good, 2 poor to medium, and 1 very poor. Lack of pollen often causes loss of many colonies.—J. H. Lovell.

3875. RICHTER, M. C. Migratory beekeeping. Gleanings in Bee Culture 50: 436-438. Fig. 1-2. 1922.—Brief mention is made of the more important sources of honey in California.—J. H. Lovell.

3876. RICHTER, M. C. Regional differences in California. Amer. Bee Jour. 62: 358-360. Fig. 1-6. 1922.—Five climatic regions are recognized in California: (1) Northern coast region, not adapted to beekeeping as there are few honey plants, and the summer is cool and damp. The spring bloom includes *Arctostaphylos manzanita*, *Ceanothus cuneatus*, *Erodium cicutarium*, and *Medicago hispida*. Later blooming honey plants are white clover, white sweet clover and alfalfa. (2) Central coast region near Sacramento, depending for its surplus honey on fruit bloom, wild mustard, cultivated asparagus and onions, sweet clover, and alfalfa. Large amounts of honeydew are also gathered. South in this region the honey flora includes *Salvia mellifera*, *Lotus glabra*, *Eriogonum fasciculatum*, and manzanita. (3) Southern coast region, which has yielded most of the large crops of California honey. The honey plants are *Salvia mellifera*, *S. apiana*, *S. leucophylla*, orange, Eucalyptus, lima bean, *Lotus glabra*, *Eriogonum fasciculatum*, *Rhus diversiloba*, *Hemizonia fasciculata*, *Trichostema lanceolatum*, and others. (4) Interior valley region, including Great Central Valley and Imperial Valley. Irrigated alfalfa is the principal honey plant. Other sources are fruit bloom, white sweet clover, Euca-

lyptus, melons, *Wislizenia refracta*, *Hemizonia fasciculata*, and *Trichostema lanceolatum*. In the Imperial Valley cotton yields a large amount of honey. (5) The mountain-plateau region, which has been little explored. Alfalfa is the chief honey plant, and sweet clover and *Eriogonum fasciculatum* are important in the fall. *Chrysothamnus nauseosus* yields a dark, ill-flavored honey. The Owens Valley in Inyo County is an excellent location.—*J. H. Lovell*.

3877. RICHTER, M. C. **The California orange flow.** *Gleanings in Bee Culture* 50: 76-78. *Fig. 1-8.* 1922.—Comparatively cool nights followed by warm days, the temperature rising to 85-95°F., results in very rapid nectar secretion; 15-20 pounds of honey may be stored daily. The orange flow may last only 10 days or extend over a month.—*J. H. Lovell*.

3878. S., G. L. **Honey plants of Oregon.** *Western Honey Bee* 10: 313-314. 1922.—Several species of *Vaccinium* are abundant in Oregon, but their relative value as honey plants is unknown. *V. parvifolium* yields a light amber honey of mild peculiar flavor, very thick and waxy, and difficult to extract.—*J. H. Lovell*.

3879. SKLENAR, GUIDO. **Götterbaum.** [Tree of heaven.] *Leipziger Bienenzeitg.* 37: 49. 1922.—The conditions governing the production of honey by the flowers of this tree are explained. It has been highly praised as desirable in Germany for both shade and nectar.—*M. G. Dadant*.

3880. SLATTERY, J. J. **Sourwood an uncertain yielder.** *Gleanings in Bee Culture* 50: 440. 1922.—At Hendersonville, North Carolina, 100 strong colonies stored 1,100 pounds of honey from *Oxydendrum arboreum*. Every few years this tree yields an enormous amount of honey, but the flow never lasts more than 5 weeks.—*J. H. Lovell*.

3881. SOUTHARD, A. E. **Palestine honey production.** *Beekeepers' Rev.* 36: 8-9. 1922.—There are only 4-5 weeks annually for honey-gathering in Palestine; the dry season lasts from April to October, and the rainy season from November to March. Orange, lavender, mint, wild thyme, Acacia, and cactus flowers are the chief sources of nectar.—*J. H. Lovell*.

3882. SUTER, R., and E. MOORE. **Stream pollution studies.** 84 p., 7 pl., 37 fig. New York State Conservation Commission: 1922. [Also in: State of New York Conservation Commission, eleventh annual report, for the year 1921. Legislative Document No. 29.]—Certain common and easily recognized plants and animals of streams are recommended for practical use as indicators of intensity of pollution. A stream polluted by organic wastes is conveniently divided into 3 zones: zone of recent pollution, septic zone, and zone of recovery, all occurring if the volume of waste is excessive.—Typical indicators of these zones are listed. In the zone of recent pollution may be found *Thiotrix* sp., *Saprolegnia* sp., *Leptomitilus lacteus* Agardh, *Sphaerotilus natans* Kütz., and tubifex worms (*Tubifex tubifex*). Green plants disappear as the lower limit of the zone is reached.—The septic zone, in which the oxygen supply is practically nil, is characterized by *Eristalis tenax* (L.), *Psychoda alternata* Say, *Erioptera* sp. Green plants reappear and reoxygenate the water at the lower limits of this zone. The zone of recovery is characterized by the presence of sludge in which bloodworms multiply excessively, a common form being *Chironomus decorus* Johann. The following fish regarded as tolerant forms frequent this zone, growing fat on the bloodworms: *Catostomus commersonii* Lace., *Ameiurus nebulosus* Les., *Semotilus atromaculatus* Mitch., *Campostoma anomalum* Raf. Other tolerant animals are: *Arctocorixa*, *Pisidium abditum* Hald, *Simulium venustum* Say, *Asellus communis* Say, *Cambarus immunitis* Hagen, and such plants as *Potamogeton pectinatus* L. and *P. americanus* C. & S.—Typical plants of the clean waters are markedly green, including green algae, as *Hydrodictyon reticulatum* (L.) Lagerh., and water mosses, as *Hypnum riparium*. Game fishes appearing in these waters are: *Micropterus dolomieu* Lace., *Salvelinus fontinalis* Mitch., *Salmo salar sebago* Gir, *Micropterus salmoides*.—A brief general discussion is given of the energy and food relations of plants and animals followed by a consideration of their requirements in the different zones of pollution.—The limits of tolerance of fish to trade wastes are compiled in a table. Authorities are cited.—*E. Moore*.

3883. WEIPPLE, THEODOR. Unter welchem Bedingungen empfiehlt sich die Einbürgerung der Goldrute? [What conditions are necessary for the introduction of the golden rod?] Illus. Monatsbl. Bienenzucht. 23: 25-26. 1923.—Further particulars are given as to methods of growing goldenrod in America with notes on the possibilities of its introduction into Continental Europe.—*M. G. Dadant.*

3884. WILDER, J. J. Chinaberry. Dixie Beekeeper 31^o: 24. 1922.—*Sapindus Drummondii* blooms in southeastern Georgia late in March but yields no surplus as the nectar is used as soon as gathered in stimulating brood-rearing.—*J. H. Lovell.*

3885. WILDER, J. J. Mexican clover. Dixie Beekeeper 44: 10. 1922.—*Richardia scabra* in southeastern Georgia furnished a heavy honey flow during June and July of 1922. The bloom yields heavily only in the morning, from dawn until 10 o'clock; during the heat of the day nectar secretion nearly ceases. The honey has a pleasant flavor and a large surplus is obtained.—*J. H. Lovell.*

3886. WILDER, J. J. Partridge pea. Dixie Beekeeper 44: 20-21. 1922.—The flowers of *Cassia chamaecrista* are nectarless, but extra-floral nectararies on the petioles secrete nectar freely. An average per colony of about 40 pounds of comb honey and 50 pounds of extracted honey is often obtained.—*J. H. Lovell.*

3887. WILLSON, H. B., J. C. DICKMAN, and W. C. BARNARD. Nectar from velvet bean. Gleanings in Bee Culture 50: 774. 1922.—In Mississippi *Mucuna utilis* is reported to secrete nectar freely, but bees do not gather it because of its repulsive taste. In southern Georgia a small surplus is gathered from this source; the honey has a peculiar acid flavor. *Richardia scabra* is a most valuable summer and fall honey plant in Georgia.—*J. H. Lovell.*

3888. WOODS, D. C. The honey industry of Haiti. The Beekeepers' Rev. 37: 7. 1922.—Beekeeping in Haiti is favored by abundant nectariferous plants. Honey from *Haematoxylon campechianum* is nearly white and has a delicate flavor. It may become cloudy in 2-3 months and granulate.—*J. H. Lovell.*

3889. ZEISS. Die einjährige Riesenhonig—(Hubam)—Klee. [The great annual honey plant—Hubam clover.] Bienenpflege 44: 6. 1922.—The discovery of annual white sweet clover and its value to the beekeeper and agriculturist are briefly recounted. The high price of seed has prevented testing in other countries than that in which it was discovered (U. S. A.).—*M. G. Dadant.*

FOREST BOTANY AND FORESTRY

J. S. ILLICK, *Editor*

(See also in this issue Entries 3728, 3822, 3823, 3847, 3852, 3873, 4031, 4130, 4290, 4370, 4392, 4484, 4618, 4631, 4670, 4673, 4679, 4702)

3890. ANONYMOUS. A drill for the tree-dentist. Sci. Amer. 126: 259. 1 fig. 1923.—A motor driven tree-drill, with a burr made up of 11 tool-steel circle-saw blades is described.—*Chas. H. Otis.*

3891. ANONYMOUS. Baling trees. Sci. Amer. 127: 340. 1 fig. 1922.—A mechanical packer or baler, as employed by the U. S. Forest Service, is described. It is used preliminary to transporting seedlings from the seed bed to the place of planting.—*Chas. H. Otis.*

3892. ANONYMOUS. Brennstoffmangel und Forstwirtschaft. [Fuel shortage and forestry.] Deutsch. Forstzeitg. 37: 730. 1922.—The fuel shortage has led to heavy cutting of fire wood and use for fuel of timber needed for constructon, etc. The entire timber cut in Germany

would supply only a small fraction of the needed fuel. To save the forests and the wood-using industries, cities and industrial plants must be provided with coal.—*W. N. Sparhawk.*

3893. ANONYMOUS. Determining the penetration of wood preservatives. *Sci. Amer.* 127: 11. 1922.—The tests used by the U. S. Forest Products Laboratory for determining the depth to which wood preservatives penetrate are given.—*Chas. H. Otis.*

3894. ANONYMOUS. Giant trees in the olden days. *Sci. Amer.* 126: 379. 1922.

3895. ANONYMOUS. Introduction of exotics into jarrah forests. *Australian Forest. Jour.* 5: 281-282. 1922.—The propagation of certain valuable exotics in mixture with indigenous species has been successful. Wattles (*Acacia pycnantha*, *A. decurrens*, and *A. dealbata*), *Pinus pinaster*, and *P. halepensis* are noted.—*C. F. Korstian.*

3896. ANONYMOUS. New tanning material. *Australian Forest. Jour.* 5: 219-223. 1922.—The manufacture of mixed tanning extracts, suitably blended, is advocated to relieve the world shortage of vegetable tanning materials. Average tannin content and particulars of distribution are given for several species of *Acacia* and *Eucalyptus* and *Callistris calcarata*. Some are not sufficiently plentiful to be a regular source of tanning extracts but considered collectively they may yield appreciably, incidental to the regular logging operation.—*C. F. Korstian.*

3897. ANONYMOUS. Paper from Australian timber. *Agric. Gaz. New South Wales* 34: 57. 1923.—A good quality of paper has been made from pulp, 60 per cent of which was made from *Eucalyptus regnans*, *E. sieberiana*, and *E. delegatensis*, and 40 per cent being imported sulphite pulp.—*L. R. Waldron.*

3898. ANONYMOUS. Spraying trees from the air. *Sci. Amer.* 126: 333. 1 fig. 1922.—A grove of 500 caterpillar infested catalpa trees was successfully dusted with lead arsenate from an airplane.—*Chas. H. Otis.*

3899. ANONYMOUS. The baobab or bottle-tree. *Australian Forest. Jour.* 5: 279-281. 1922.—*Adansonia Gregorii* is described as one of the characteristic yet unique trees of the savannah, attaining a height of 30-40 feet and a thick barrel- or bottle-shaped trunk 10-18 feet high and 6-20 feet in diameter.—*C. F. Korstian.*

3900. ANONYMOUS. The West Australian red gum. *Australian Forest. Jour.* 5: 203-206. 1922.—*Eucalyptus calophylla*, containing a high percentage of tannins, is suggested as a new tanning material to supplement the waning supply of tan-bark of the 2 wattles, *Acacia pycnantha* and *A. decurrens*.—*C. F. Korstian.*

3901. ANONYMOUS. Timbers of the north Kimberleys. *Australian Forest. Jour.* 5: 130-132. 1922.—Brief descriptions are given for some of the trees occurring as scattered specimens in the "savannah forest."—*C. F. Korstian.*

3902. BADOUX, H. Dégâts par le charançon du sapin. [Depredations of the fir weevil.] *Jour. Forest. Suisse* 73: 68-69. 1922.—The author describes the characteristics and habits of *Pissodes piceae* Ill., which appeared during 1921 in white fir stands. It is not of economic importance unless followed by *Sirex gigas*, a trunk borer. Where this combination is feared, all branches infested with the weevil should be removed and barked, or burned.—*G. Kempff.*

3903. BARBEY, A. Le charançon des aiguilles du sapin. (*Polydrosus pilosus* Gredl). [The fir needle weevil.] *Jour. Forest. Suisse* 72: 186-189. 1 pl. 1921.—The insect and its activities in partially defoliating white fir during the spring of 1921, representing its first serious invasion into Swiss forests, are described. All damage is caused by the adult, mainly during the first 3 weeks in June. The result is a loss of volume increment.—*G. Kempff.*

3904. BAUST. *Durchforstung (Läuterung) von Fichtenschonungen.* [Thinning of young spruce stands.] *Deutsch. Forstzeitg.* 37: 580-582. 1922.—Volunteer pine frequently invades spruce plantations; the former, growing more rapidly and having spreading crowns, may injure the spruce. Such pines should be removed while small; if delayed, too sudden removal may subject the spruce to injury from wind, sun-scald, and snow-breakage.—*W. N. Sparhawk.*

3905. BINDER. *Die Benutzung des Pfluges zur Begründung von Kiefernkulturen auf schlechten Sandböden.* [The use of the plow in establishing pine plantations on poor, sandy soils.] *Forstwiss. Centralbl.* 44: 249-252. 1922.—Contrary to the assertion of Möller, great value is claimed for plowing in establishing pine (or spruce) on poor sandy soils, especially where heather is liable to menace the young trees. Results obtained from plowing and from hacking the soil by hand are compared.—*W. N. Sparhawk.*

3906. DIEDERICH, EUGEN. *Die niederländische Forstwirtschaft.* [Forestry in the Netherlands.] *Forstwiss. Centralbl.* 44: 420-424. 1922.—The forests originally covering most of the Netherlands were early destroyed; by the 13th century it was necessary to import timber from Danzig. In 1833 the forest area was only 169,026 hectares; it gradually increased to 260,923 hectares in 1911, and since then has again decreased, being 247,785 hectares in 1920, or 7.59 per cent of the total land area. The areas of forest are given for individual provinces and by kinds of forest. Conifer high forest covers 134,222 hectares, broadleaf high forest 20,412 hectares, and coppice and willow-holts the remainder. Large areas have been planted since 1889, principally to *Pinus silvestris*, with occasional hardwoods, and along the coasts to the more resistant *P. laricio* vars. *austriaca* and *corsica*.—*W. N. Sparhawk.*

3907. EBERHARD, J. *Neue und alte Betriebsformen.* [New and old cutting systems.] *Forstwiss. Centralbl.* 44: 326-342. 1922.—Characteristics of the various methods of cutting are discussed, with especial reference to the "wedge shelterwood" system (Schirmkeilschlag) developed by Eberhard at Langenbrand. The writer emphasizes the fact that no system can be applied schematically, and that silvicultural methods must be adapted to the multitude of varying conditions met in any forest.—*W. N. Sparhawk.*

3908. FUNKE, G.-L. *Sur les pousses supplémentaires estivales.* [On the supplementary shoots of trees in summer.] *Compt. Rend. Acad. Sci. Paris* 175: 901-904. 1922.—A study was made in the forest of Fontainebleau on the following species: *Carpinus betulus*, *Quercus robur*, *Celtis australis*, *Wistaria sinensis*, *Ligustrum vulgare*, and *Evonymus europæus*. It is concluded that in determining the age of trees by the number of annual rings, the "aught shoots" have not usually constituted a source of error.—*C. H. Farr.*

3909. GILL, WALTER. *Annual progress report upon state forest administration in South Australia for the year 1921-22.* *Ann. Prog. Rept. Woods and Forests Dept. South Australia.* 13 p. Adelaide, 1922.—This routine administrative report discusses general conditions and progress. The area of Forest Reserves is reported as 190,474 acres; 748,033 trees were planted, with a survival of 91 per cent. The revenue for the year amounted to £11,234.—*C. F. Korstian.*

3910. HASTINGS, A. B. *Fighting the forest-fire menace.* *Virginia Geol. Comm. Office of State Forester Bull.* 20. 16 p. 1920.—This popular bulletin is designed to aid in the organized campaign against the fire menace.—*C. F. Korstian.*

3911. HASTINGS, A. B. *Forest wardens' manual.* *Virginia Geol. Comm. Office of State Forester Bull.* 22. 31 p. 1921.—The manual is a handbook of instructions and information for the forest wardens of Virginia.—*C. F. Korstian.*

3912. HECK. *Beiträge zur forstlichen Zuwachskunde.* [Notes on the study of forest increment.] *Forstwiss. Centralbl.* 44: 290-326. 6 fig. 1922.—The author discusses some of

the results of his 24 years of measurements on permanent sample plots of beech, spruce, ash, and fir. The measurements, taken carefully each year, show the very great annual variations in rates of growth which are obscured in periodic (5-year) measurements. It is also shown that trees with straight, clear stems grow at a more rapid rate than others,—a fact of considerable importance in making thinnings. Data are presented showing growth by months during several years. In general, diameters measured in the east-west direction are somewhat greater than in a north-south direction.—*W. N. Sparhawk.*

3913. HELMS, A. **Introducing exotic conifers into New South Wales.** Australian Forest Jour. 5: 27-30, 176-179. 1922.—The climate and forest conditions of the Pacific Northwest (U. S. A.) are discussed with particular reference to *Pseudotsuga taxifolia*. Its yields in the Cascade Mountains of Washington and Oregon are compared with those in Prussia and Denmark. The conclusion is reached that Douglas fir is one of the world's most rapid-growing conifers, producing timber with a wide range of uses. If present experiments result in the successful introduction of this tree into New South Wales it is believed that it will become one of the most important exotics.—*C. F. Korstian.*

3914. HERRMANN. **Bericht über die Waldsamenernte für 1922.** [The 1922 forest-seed crop.] Deutsch. Forstzeitg. 37: 813-816. 1922.—This report discusses the crops of forest tree seeds of the principal species in different parts of Germany.—*W. N. Sparhawk.*

3915. HERRMANN. **Bericht über die Waldsamenernte für 1922.** [Yield of forest seed in 1922.] Deutsch. Forstzeitg. 37: 655-656. 1922.—The prospects of a seed crop of the most important species in different parts of Germany are discussed.—*W. N. Sparhawk.*

3916. HOFMANN, J. V. **Furred forest planters.** Sci. Monthly 16: 280-283. 1923.—The work of rodents is discussed. They may become plentiful enough to prevent seeding, but are usually an important factor in the regeneration of forests.—*L. Pace.*

3917. HOHENADL, W. **Neue Grundlagen der Holzmessung.** [New principles of forest mensuration.] Forstwiss. Centralbl. 44: 55-68, 109-117, 150-159, 184-194, 233-240, 388-399. 1922.—The author discusses the use of higher mathematics in measuring the growth and volume of trees and stands.—*W. N. Sparhawk.*

3918. HOLMES, J. S. **Forest fires in North Carolina during 1918, 1919 and 1920 and forest protection in North Carolina.** North Carolina Geol. and Econ. Surv. Econ. Paper 51. 82 p. 1921.—This bulletin contains information concerning the amount and extent of damage caused by forest fires in North Carolina. The need for greater care in handling fire in and near woods is stressed.—*C. F. Korstian.*

3919. JONES, RICHARD CHAPIN. **The administrative report of the Virginia State Forester for the calendar years 1920-1921.** Virginia Geol. Comm. Office State Forester Bull. 24. 63 p. 1922.—Recommendations for certain additions to present forestry laws and necessary extensions of the work are included.—*C. F. Korstian.*

3920. JONES, RICHARD CHAPIN. **The forest resources of Virginia.** Virginia Geol. Comm. Office State Forester Bull. 19. 11 p. 1919.—The author presents a short account of the character, amount, value, and condition of the forest resources of the state, with a warning that under present destructive practices they are being depleted, and that the industries dependent on them are threatened.—*C. F. Korstian.*

3921. K., S. **Sächsische Wald- und Holzwirtschaft.** [Saxon forest regulation.] Deutsch. Forstzeitg. 37: 538-539. 1922.—The annual cut in Saxon state forests has just been reduced from 800,000 to 500,000 cubic m. This was necessary in spite of the pressing demand for wood because the forests were being overcut and the forest capital reduced. The paper mills of Saxony alone require 1,250,000 cubic m. annually.—*W. N. Sparhawk.*

3922. LEMMEL. Das Problem der volkswirtschaftlichen Produktivität und seine Stellung in der Staatsforstwirtschaft. [The problem of economic productivity and its position in government forest management.] *Zeitschr. Forst.- u. Jagdw.* 54: 129-160. 1922.—This academic discussion covers (1) the problem; (2) the conception of political economy, past, present, and personal; (3) the essence of productiveness; (4) the qualifications of economic productiveness including the determination of the aims of domestic economy as limited by social usage; and the technic.—It is fundamentally unimportant whether the science of politico-economic productiveness is based upon the theory of use or that of cost.—*J. Roesser.*

3923. LEWIS, C. M. Ashes and sawdust the basis of a new industry. *Sci. Amer.* 126: 396. 3 fig. 1922.—Ashes and sawdust are the main ingredients of a cheap composition used as a substitute for cardboard and wood in the manufacture of boxes.—*Chas. H. Otis.*

3924. MATTHÄI. Die waldbauliche Bedeutung der Samenprovenienz bei der Eiche. [Silvicultural importance of origin of seed of oak.] *Forstwiss. Centralbl.* 44: 405-419, 463-484. 2 fig. 1922.—While broadleaf species originally predominated in the forests of Germany, they generally gave way to conifers as the better soils were cleared for agriculture and large clear-cut areas were planted to conifers, which were easier to plant and grew more rapidly than oak, beech, and other hardwoods. As a result of the general impoverishment of the forest soils, foresters realized the need of increasing the proportion of beech and favoring natural reproduction where practicable. As beech and oak together utilize the soil better than either alone, the cultivation of oak was stimulated also. The source of seed for establishing oak stands is therefore of great importance.—The significance of origin of seed is discussed in relation to modern theories of genetics. Those forms of a given species will do best on a given site which have developed on the same or a similar site, as shown for pine, spruce, and larch by Schott, Cieslar, Engler, and others.—On the basis of phenology, 6 zones can be distinguished within the range of the European white oak (sessile and pedunculate oaks): (1) a very early zone with insular climate, where the foliage develops before Apr. 24 and the growing period is over 200 days; (2) an early zone with warm climate, foliage appearing Apr. 24-May 2, and 180-190 days growing season; (3) an early zone with moderately warm climate, leaves appearing May 3-5, with 163-173 days growing season; (4) a late zone with cool climate, vegetation starting May 6-10 and growth lasting 158-162 days; (5) a late zone with cold climate, foliage starting May 11-18 and growth lasting 154-157 days; (6) a very late zone with cold climate, growth starting after May 19 and lasting 145 days or less. The geographical and altitudinal location of these zones is given in some detail. The average growth rates of the oaks developed in the different zones decrease as climatic conditions become less favorable, and growth and yield data must be worked up separately for the several climatic "races." Within each zone the outward forms of the trees have certain distinguishing characteristics; similarly the associated species of trees and smaller vegetation are different.—While Kienitz, Arndt, Hauch, and others have studied the effects of source of seed, much more comprehensive investigations should be undertaken; meanwhile the extreme importance should be recognized of using seed adapted to the site.—*W. N. Sparhawk.*

3925. MELL, C. D. The peer of decorative hardwoods. *Sci. Amer.* 126: 254. 3 fig. 1922.—Rosewood, its source of supply, and former and present uses are described. The largest amount is used in professional and scientific instruments; smaller amounts are used for fixtures, musical instruments, railroad cars, sporting and athletic goods, handles, furniture, etc.—*Chas. H. Otis.*

3926. MÜLLER, H. Die Verjüngung litauischer Kiefern-Fichten-mischbestände. Ein Schwanengesang. [The regeneration of Lithuanian pine-spruce mixed stands. A swan-song.] *Zeitschr. Forst.- u. Jagdw.* 54: 161-170. Fig. 1-2. 1922.—The author discusses clear-cutting versus natural regeneration and sees in the "continuous management" idea a method of conversion from clear-cutting systems to natural regeneration systems. When the author took over the forest district Uszballen in 1913, clear-cutting and artificial regenera-

tion were practiced in the pine-spruce stands on all but 1 compartment. Storm and nun-moth damage in 1913 necessitated a change in the silvicultural system, which led to the selection systems with natural reproduction to fit the needs of individual stands. The problem is discussed, also various technical features concerning the careful cutting of the understory during spruce regeneration—fellings and artificial methods to aid the securing of spruce regeneration.—*J. Roeser*.

3927. O'BYRNE, J. W. The forests of Russell County, Virginia. Virginia Geol. Comm. Office of State Forester Bull. 21. 23 p., 10 pl. 1922.—This bulletin is a continuation of the series of reports on the forest resources of the state, by counties. It describes the forest conditions of Russell County and stresses the necessity of more conservative cutting to prevent depletion of the timber supply.—*C. F. Korstian*.

3928. OELKERS. Kohlensäure und Jahrring. [Carbon dioxide and annual rings.] Zeitschr. Forst.- u. Jagdw. 54: 170-174. 1922.—The author analyzes the desirability of the continuous selection systems. He states that the rate and quantity of wood production depends upon the available CO₂, which is derived mainly through the decomposition of litter and other organic matter on the ground. To increase both CO₂ and wood production, soil culture and protection are necessary. This is accomplished in the continuous selection systems by well executed thinnings which regulate the amount of precipitation and sunshine reaching the soil, the accumulation of a satisfactory quantity and kind of litter on the ground, and the proper distribution of humus.—*J. Roeser*.

3929. PACK, CHARLES LATHROP. Trees as good citizens. 257 p., illus. (partly col.). American Tree Assoc.: Washington, D. C., 1922.

3930. PAESSLER. Über den Gerbstoffgehalt der Douglasienrinde. [The tannin content of Douglas fir bark.] Forstwiss. Centralbl. 44: 245-249. 1922.—Tests on bark from young trees (35-40 years) grown in Bavaria showed 10-18 per cent tannin, with a high sugar content. The tannin content was highest for bark free from the thick corky layer found on older trees. Sheep and goat leather tanned with this material indicated that it has properties intermediate between those of spruce and oak barks. It is suggested that extension of the area planted to Douglas fir may eventually result in a valuable source of raw material for the leather industry.—*W. N. Sparhawk*.

3931. PETRI, L. Ricerche sperimentali sul trattamento elettrico del legno. [Experimental studies on the electrical treatment of wood.] Ann. R. Ist. Superiore Forest. Firenze 6: 23-141. Pl. 1 (col.), fig. 1-20. 1920-1921.—This article treats of the use of the electric current in securing rapid penetration of preservative solutions. Laboratory methods and results are discussed.—*Ferdinand W. Haasis*.

3932. PLANKE. Samenerzeugung geharzter Föhren. [Seed production of pines tapped for resin.] Forstwiss. Centralbl. 44: 172-175. 1922.—Cones of untapped trees (*Pinus silvestris*) averaged 50 per cent heavier and contained 44 per cent more seed; also, seed from untapped trees weighed 30 per cent more than those from tapped trees, and had a percentage germination of 82.5 as compared with 64.5 for seed from tapped trees. The cones, seed, and seedlings from tapped and untapped trees differ in appearance.—*W. N. Sparhawk*.

3933. PRATT, JOSEPH HYDE. Biennial report of the state geologist 1919-1920. Bienn. Rept. North Carolina Geol. and Econ. Surv. 1919/20: 15-27. 1922.—The forestry activities are handled by the Forestry Division, the report of which is summarized under the following captions: demand for timber, present condition, forest fire statistics, protection of watersheds, wood-using industries, study of southern pines, chestnut bark disease, North Carolina Forestry Association, work of the U. S. Forest Service in North Carolina during 1919-1920, and suggested forestry legislation.—*C. F. Korstian*.

3934. PRELLER. *Kiefernkultur und anderes aus der Kassubei*. [Pine culture.] Deutsch. Forstzeitg. 37: 913-917. 1922.—The author describes methods of establishing pine stands on waste lands. Where scattered seed trees were present and the vegetation cover not too dense, satisfactory results were obtained by harrowing strips among and near them. Broadcast seeding on plowed and harrowed land was successful, as were spot-sowing in furrows and planting of cones in furrows. Broadcast seeding immediately following burning off of the brush cover was not successful. Planting on shifting sands is also described, and it is stated that *Pinus banksiana* did not do as well as the native *P. silvestris*.—W. N. Sparhawk.

3935. PUCHNER, H. *Die verzögerte Keimung von Baumsämereien*. [Delayed germination of tree seeds.] Forstwiss. Centralbl. 44: 445-455. 1922.—Germination tests of 100 *Fraxinus excelsior pendula* seed picked from the tree and freed from the husks, and of 100 similar seed dried at 35°C. for 6 weeks, yielded practically identical results. The first seed germinated in 5 months, while germination continued for 6 years, at the end of which 34 undried and 36 dried seed had sprouted. In similar tests of unopened fruits, 7 and 6 per cent, respectively, germinated within 7 years. The 1st undried fruit sprouted in 20 months, the 1st dried one in 2 years. Free seed of *Tilia europea parvifolia* began to germinate in 15 months, and the last one germinated near the end of the 7th year; 14 per cent germinated altogether. Of 100 whole fruits of linden, all decayed without germinating, and of 100 fruits in which a small groove was cut only 1 germinated, after 5 years. These tests indicate the desirability of removing the seed from the fruit in sowing ash, and the futility of sowing whole fruits of linden in any case.—W. N. Sparhawk.

3936. RIEMENSCHNEIDER. *Die Folgen der Trockenheit von 1921*. [Results of the 1921 drought.] Deutsch. Forstzeitg. 37: 606. 1922.—Oak, hornbeam, pine, larch, silver fir, and Douglas fir showed little ill effects. Beech and spruce were seriously injured, putting out but little foliage in 1922 and many trees dying.—W. N. Sparhawk.

3937. SCH. *Die Nonnenkalamität*. [The nun-moth calamity.] Deutsch. Forstzeitg. 37: 752. 1922.—Beginning in 1919, Central European spruce forests have suffered greatly. In Czechoslovakia 7,000 hectares of spruce have been killed, on 10,800 hectares over 50 per cent of the trees were killed, on 20,000 hectares 25-50 per cent, and on 45,000 hectares less than 25 per cent. The infestation has spread into Bavaria, Saxony, and Silesia, and is still advancing.—W. N. Sparhawk.

3938. SCH. *Ungarns Forstpolitik*. [Forest policy of Hungary.] Deutsch. Forstzeitg. 37: 991. 1922.—The Hungarian government has submitted 6 forestry laws to the National Assembly: (1) creating a special fund to promote forestry, afforestation, and technical literature; (2) empowering certain credit institutions to lend money on forest properties; (3) creating a forestry bureau; (4) organizing the forest administration under the department of agriculture; (5) promoting increased production and afforestation; (6) encouraging associations of forest workers.—W. N. Sparhawk.

3939. SCH. *Verstaatlichung des grossen Privatwaldbesitzes in der Tschechoslowakei*. [State expropriation of private forests in Czechoslovakia.] Deutsch. Forstzeitg. 37: 606. 1922.—The Czechoslovakian government takes over, on Jan. 1, 1923, the approximately 300,000 hectares of private forests in the mountain districts near the boundaries, paying the owners pre-war values. This measure is adopted to put an end to trade between Germany and the German forest owners in Czechoslovakia, to increase the state resources, and to give the state control of a zone along its borders.—W. N. Sparhawk.

3940. SCHMIDT, ANDR. *Die Seekiefer (Sternkiefer, Igelföhre)*. [The maritime pine.] Forstwiss. Centralbl. 44: 265-269. 1922.—After the failure of attempts to grow *P. maritima* or *P. pinaster* in the Palatinate some 65 years ago, foresters generally agreed that the species was not suited to that part of Germany because of its susceptibility to frost. Many surviving

plantations indicate that not only was this idea wrong, but that maritime pine on very poor soils is far superior to the native *Pinus silvestris*. Results of stem analyses of average trees of the 2 species grown in mixture show a volume per tree of from 4 to 17 times as great in the maritime pine. It is suggested that a frost-hardy strain may be developed by careful selection.—*W. N. Sparhawk*.

3941. SCHMIEDEBACH, O. *Die Tachymetrie in Walde*. [Tachometry in the forest.] Zeitschr. Forst.- u. Jagdw. 54: 110-111. 1922.—The 3 principal tachometric methods and their applicability are briefly discussed. The most suitable instrument will consist of a small, light theodolite, with a stadia telescope for measuring distance, a gradient circle, and an attachable compass.—*J. Roesser*.

3942. SCHNIDER. *Die Bodenbonitierung und Klassenbildung für die bayerische Grundsteuer und deren geschichtliche Entwicklung*. [Soil valuation and classification for purposes of the Bavarian land tax.] Forstwiss. Centralbl. 44: 175-184; 224-232. 1922.—In theory, land of all classes was to be taxed on the basis of its average net yield, reduced to common terms of money value. Because of the wide variation in costs, and the absence of reliable data on yields and costs over a period of years, such classification was not possible. Instead, assessments were based on relative gross yields, reduced to terms of $\frac{1}{2}$ bushels of rye. This method was applied to pasture and forest lands as well as to cultivated land.—*W. N. Sparhawk*.

3943. SCHUBERT. *Über die Schattenfestigkeit der Holzarten*. [Concerning the shade tolerance of trees.] Forstwiss. Centralbl. 44: 285-290. 1922.—Starting with Wagner's theory that differences in tolerance of trees are due to differences in ability to absorb and utilize light of the shorter wave lengths, and pointing out that the most tolerant species, beech and fir, occur on limestone soils, Schubert advances the theory that it is the fluorescence of calcium salts which increases the tolerance of trees on soils containing lime. The rays from the red part of the spectrum are most favorable to assimilation and plant growth, while the ultra-violet rays either do not favor growth or actually retard it. Crystals of several calcium compounds, such as calcite, dolomite, aragonite, apatite, and wollastonite, show red fluorescence, converting ultra-violet rays into red rays. If it is true, as suspected, that calcium oxalate crystals, which are abundant in the foliage and bark of trees, also have red fluorescence, this will explain the greater tolerance of trees on limestone soils, and also the more thrifty growth of trees as well as of other vegetation on such soils. Moreover, Stoklasa has shown that calcium is one of the constituents of chlorophyll. Schubert suggests the desirability investigating whether calcium oxalate exhibits red fluorescence, as calcium carbonates and phosphates are known to do.—*W. N. Sparhawk*.

3944. SCHÜPFER. *Wuchsleistungen von Pseudotsuga Douglasii*. [Growth of Douglas fir.] Forstwiss. Centralbl. 44: 205-214. 2 fig. 1922.—Results of measurements on permanent sample plots in Bavaria are given in detail; 36-year-old stands showed an enormous increment during the last 5-year period, amounting to 35.96 cubic m. per hectare per annum, single trees having a volume of over 1 cubic m. It is not known how satisfactory the wood will prove for general construction, as only small trees have been cut. Douglas fir is less wind-firm than native species. Its culture is recommended on limited areas protected from wind.—*W. N. Sparhawk*.

3945. SCHWAPPACH. *Das bayerische Gesetz über die Aufforstung landwirtschaftlichen Grundstücke, vom 22 December, 1921*. [Bavarian law of December 22, 1921, regarding afforestation of agricultural land.] Deutsch. Forstzeitg. 37: 532-533. 1922.—Land used for agriculture may be devoted to timber growing only with permission of local officials. An owner may afforest small adjoining tracts without a permit, but must notify the proper authorities. Permits are granted only in cases where soil, climate, or location make the land better suited for forests than for agricultural crops, or if the forest is needed for a bird refuge or for protection of slopes or watercourses.—*W. N. Sparhawk*.

3946. SIEBER, PH. *Die Birke (Betula verrucosa)*. [The birch.] Forstwiss. Centralbl. 45: 12-18. 1923.—A plea is made for the greater appreciation of the birch as it reproduces abundantly, grows rapidly, and is useful in all sizes. It is especially well adapted to restock bare areas as a forerunner of more valuable species.—W. N. Sparhawk.

3947. STOATE, T. N. *Sylvicultural notes: Pinus insignis*. Australian Forest. Jour. 5: 102-104, 125-126. 1922.—Insect pests of the nursery and plantations, and utilization are discussed.—C. F. Korstian.

3948. VAILE, E. EARLE. *Some experiments in afforestation on the Waiotapu-taupo-plains*. New Zealand Jour. Agric. 25: 359-363. 1922.—More than 40 species have been planted. For timber purposes *Pinus insignis*, *Eucalyptus Macarthurii*, *E. viminalis*, *E. Gunnii*, *E. acervula*, and *Pseudotsuga Douglasii* are recommended. Natural afforestation is taking place wherever there is opportunity. Forest fires are a serious menace.—N. J. Giddings.

3949. WEISS, L. *Heinrich Zschokkes Einfluss auf die französischen Ödlandaufforstungen*. [Zschokke's influence on the reforestation of waste lands in France.] Forstwiss. Centralbl. 44: 455-462. 1922.—The early history of the reclamation is discussed briefly. The methods and species (maritime pine) finally used were those recommended by Zschokke.—W. N. Sparhawk.

3950. WHITE, C. T. *Botanical notes on Queensland forests*. Australian Forest. Jour. 5: 147-149. 1922.—A note is presented on the forest conditions of the Russell River and Bellenden-Ker Ranges, northeastern Queensland, together with a list of the important trees grouped by families.—C. F. Korstian.

3951. WILSON, ROBERT, and F. E. COFF. *Development of cooperative shelter-belt demonstrations on the northern great plains*. U. S. Dept. Agric. Bull. 1113. 27 p., 15 fig. 1923.—Objects of this cooperation are to stimulate interest in the improvement of farm homes by planting belts of trees about farm buildings in the northern Great Plains region, and to demonstrate by actual trial the species of trees best adapted to the different sections of this region. Results are based on 1,234 cooperation demonstrations (nearly 1½ million trees) over a 5-year period, of which 716 plantings are still growing. Box-elder, green ash, white elm, and caragana were most extensively tested and seem best adapted to the climatic conditions generally prevailing. Northwest poplar, chokecherry, buffalo berry, Russian olive, Black Hills spruce, white spruce, blue spruce, Scotch pine, and jack pine, less extensively tested, give promise of being suitable for general planting. Norway poplar, Carolina poplar, Russian golden willow, and laural leaf willow are not adapted to general planting. Methods of planting, cultivating, pruning, and precautions against animal and insect damage are discussed. A standard spacing distance has not yet been determined. Box-elder, green ash, and white elm were much more hardy when stock was raised from seed gathered from native trees than the more southern and eastern strains. Evidence is conclusive that it is possible to start successfully a planting of trees on the average upland farm site in this region, and future results will show whether or not these plantings will maintain themselves after attaining their maximum growth.—J. T. Buchholz.

3952. WIMMER. *Der Bestandsbegriff in seiner Bedeutung für Theorie und Praxis des Waldbaues*. [Significance of the "stand" concept in silvicultural theory and practice.] Forstwiss. Centralbl. 44: 371-380. 1922.—This is largely a discussion of the characteristics of various silvicultural systems. The writer concludes that theory and practice of silviculture and also of forest regulation must be based, not on the individual tree or the whole forest, but on the stand.—W. N. Sparhawk.

3953. ANONYMOUS. [German rev. of: WALDRON, L. R. The inheritance of rust resistance in a family derived from a cross between durum and common wheat. North Dakota Agric. Exp. Sta. Bull. 147. 24 p., 2 fig. 1921 (see Bot. Absts. 9, Entry 279).] Zeitschr. Pflanzenzücht. 8: 443-444. 1922.

3954. ANONYMOUS. [German rev. of: WITTE, H. Einige Beobachtungen über die Samenfarben des Rotklee und ihre Erbllichkeit. (Observations on the seed colors of red clovers and their inheritance.) Sveriges Utsädesför. Tidskr. 30: 257-265. 1920.] Zeitschr. Pflanzenzücht. 8: 444. 1922.

3955. ANONYMOUS. [German rev. of: WITTE, H. Luzernförädling. (Alfalfa investigations.) Sveriges Utsädesför. Tidskr. 31: 165-200. 1921.] Zeitschr. Pflanzenzücht. 8: 445. 1922.

3956. ALLEN, C. L. Effect of the age of sire and dam on the quality of offspring in dairy cows. Jour. Heredity 13: 167-176. 6 fig. 1922.—This study of the production records of Holstein-Friesian cows shows that there is no significant difference between the average age of the parentage of groups of high producing and comparatively low producing cows respectively; in fact, the dams of the high producers are on the average the younger. Some of the very highest producers were born from very immature parents.—Bulls as a rule are kept less than 4 years, and if they produce better daughters when aged, it is usually due to the fact that they are bred to better cows. This does not detract from the fact that the proven sire is much more desirable than the untried one.—The young from very immature or very old parents are as valuable as any. A 1st calf or a calf born in waning years is as valuable as a calf born in the prime of life.—Cows were found to reach their highest productive capacity on the average at about 6 years of age.—R. C. Cook.

3957. ALLEN, W. H. Selection of breeders without the trap nest. New Jersey Agric. Exp. Sta. Hints to Poultrymen 11: 1-4. 1922.—October is considered the best time to select breeding hens without the use of trap nests. Selection may be based largely on physical characteristics such as weight, body capacity, health, and quality. The past production of the hen may be judged largely by the pigmentation of the vent, ear lobes, beak, and shanks. The time of molting is also considered and late molting is a very desirable trait. The progeny test is recommended as a basis for selecting breeding males. Pedigreed males may be purchased from other breeders to be used in flocks not trap nested.—F. A. Hays.

3958. ALVERDES, F. [German rev. of: PLATE, L. Allgemeine Zoologie und Abstammungslehre. [General zoology and genetics.] vi + 629 p., 557 fig. Gustav Fischer: Jena, 1922.] Zeitschr. Indukt. Abstamm.- u. Vererb. 30: 138-139. 1922.

3959. ARISZ, W. H. Selectie van Hevea. [Selection in Hevea.] Arch. Rubbercult. 5: 475-485. 1921.—The author considers it unnecessary to isolate pure lines of *Hevea brasiliensis* and advocates the use of F₁ hybrids. Vegetative reproduction as a means of improvement is discussed.—C. D. LaRue.

3960. BEMMELN, J. F., VAN. Wing-design of mimetic butterflies. Proc. Roy. Acad. Amsterdam 23: 877-886. 1922.—Mimetic resemblances do not come under one general law; each must be explained individually. Real mimicry is rare and of chance origin. Excluding from consideration possible usefulness of mimetic forms and studying them from a purely morphological standpoint, mimetic patterns do not differ essentially from non-mimetic. The

author tries "to reconstruct the original common genus or family type" by comparative studies, judging by the markings of both mimetic and non-mimetic members of the group. "All the elements which enter into the composition of the pattern of mimetic forms can be traced back to those of their non-mimetic congeners," and are characteristic of the group as a whole.—The aberrant slender wings of mimetic Dismorphias, though unlike the common type in butterflies, are probably primitive, cf. Sphingids, Hepialids, as well as Trichoptera, Neuroptera, Odonata. Mimic and model simply retain the ancient form. Their spotted pattern likewise may be more primitive than the white or yellow self colors of common Pierids.—Analysis of the case of *Papilio dardanus* shows that its several different mimetic females are more primitive in coloration and form of wings than the male type. Wing tails and suffusion of the wing with yellow, characteristic of the male, are relatively recent acquisitions. Taillessness and extension of black markings, characteristic of the mimetic females, are primitive. Several "non-mimetic" female varieties resemble these females more than they do the male.—Since every detail in the pattern of mimetic forms is one of the hereditary features of the group (genus, family, or order), "there is no reason left for ascribing the total effect of the combination of all these details to the influence of protective mimicry" through natural selection. "Polymorphic females may profit by their accidental likeness to unpalatable forms, * * but this profit can merely be a consequence of a casual similarity, never its cause.—J. H. Gerould.

3961. BLARINGHEM, L. Sur l'hérédité du sexe chez la *Lychnide dioïque* (*Lychnis vespertina* Sibthorp). [The inheritance of sex in dioecious *Lychnids*.] *Compt. Rend. Acad. Sci. Paris* 174: 1429-1431. 1922.—*Lychnis vespertina* crossed by *L. sylvestre*, *L. rubrum*, and *L. vespertina* gave 99, 96, and 95 per cent pistillate plants respectively. Rose colored and white flowered plants of the 1st cross, back-crossed by the same plants used as seed parent, gave a total of 423 pistillate and 472 staminate plants. The progenies of individual plants varied from 31 to 66 per cent of pistillate plants with no relation between flower color and sex.—D. F. Jones.

3962. BLUHM, AGNES. [German rev. of: HARRISON, J. W. H. A preliminary study of the effects of administering ethyl alcohol to the lepidopterous insect *Selinia bilunaria* with particular reference to the offspring. *Jour. Genetics* 9: 39-52. 1919.] *Arch. Rass.- u. Ges. Biol.* 14: 356-357. 1922.

3963. CLARK, A. H. Animal evolution. *Proc. Nation. Acad. Sci. [U. S. A.]* 8: 219-225. 1922.—The radially symmetrical colonial coelenterates represent the highest degree of purely biological perfection, and all other animals (except the sponges) are derived from them through the appearance of various defects which had the anomalous result of leading to increased bodily efficiency.—D. F. Jones.

3964. CLAUSEN, ROY E. Inheritance in *Drosophila hydei*. I. White and vermilion eye-colors. *Amer. Nat.* 57: 52-58. 1923.—Two sex linked mutants—white and vermilion—have been isolated in *Drosophila hydei* which appear to be parallel with the similar mutants in *D. melanogaster* and in *D. obscura*. The percentage of crossing over between them is 9.3 as compared with 30.5 in *D. melanogaster* and 8.0 in *D. obscura*. With the mutants described by Hyde, 2 of the 6 linkage groups expected, because of the 6 pairs of chromosomes in *D. hydei*, are thus known. Non-disjunction appeared in the case of 1 male, which was completely sterile. It was probably an XO male, which is sterile in *D. melanogaster*.—H. H. Plough

3965. COLE, LEON J. Chanticler poultry. *Jour. Heredity* 13: 147-152. 3 fig. 1922.—At the Institute Agricole d'Oka, Province of Quebec, Canada, the poultry husbandman, Brother Wilfred, a Trappist monk, undertook the "creation" of a purely Canadian breed of poultry. "Fancy" characters were to be eliminated and the breed was to be a general purpose one. The color decided on was white, and the plumage was to be heavy enough to offer maximum protection during the Canadian winter, and the comb and wattles were to be

reduced to a minimum to reduce the chances of freezing. In making his new breed he used the obvious method of mixing together the available ingredients and "sifting out the desired ones with the sieve of selection." He made his first crosses in 1908, a dark Cornish being bred to white Leghorn hens and a Rhode Island red to white Wyandottes. In succeeding years various crosses were made, with selection toward the desired type. By 1920 the uniformity of the breed had become such that it was recognized by the American Poultry Association and admitted to a place in the "standard of Perfection."—*R. C. Cook.*

3966. CZUBER, E. Zur Frage der Anwendbarkeit der Wahrscheinlichkeitsrechnung auf landwirtschaftliche Versuche. [The question of the application of the theory of probabilities to agricultural investigations.] Zeitschr. Pflanzenzücht. 8: 331-339. 1922.—The author discusses the application of simple biometric methods, the arithmetical mean, standard deviation, standard deviation of mean, and standard deviation of the difference of means, in agricultural data. He criticizes the use of certain more complex methods of analysis.—*Sewall Wright.*

3967. DANIEL, LUCIEN. Hyperbioses de Soleil et de Topinambour. [Hyperbiose grafts of *Helianthus annuus* on *Helianthus tuberosus*.] Compt. Rend. Acad. Sci. Paris 175: 984-985. 1922.—A scion of sunflower is grafted upon a stock of *Helianthus tuberosus*. Later a scion of *H. tuberosus* is grafted upon this scion of sunflower. *H. tuberosus* is referred to as the hypobiont and the hyperbiont and sunflower is the mesobiont. The hyperbionts differ in vigor and branching, and resist very unequally the environmental conditions. Tuberization of the hypobiont is more intense than in ordinary grafts, i.e., olobiosis of *H. annuus* on *H. tuberosus*, but the crop is not so large. It did not exceed 400 gm., whereas in olobiosis it is 700 gm., in olohyperbiosis 2,050 gm., and in hemihyperbiosis 800-975 gm. A study is also made of the distribution of inulin in these grafts. None is found in the *H. annuus* as a mesobiont.—*C. H. Farr.*

3968. DAVIS, B. M. An attempt to improve through selection the style length and fertility of *Oenothera brevistylis*. Genetics 7: 590-596. 1922.—For 5 generations of *Oenothera brevistylis*, a short-styled mutation of *O. Lamarckiana*, selection toward increased length of style was practised, those plants being chosen as parents which produced the highest percentage of flowers with increased style length, except when sterility (a high degree of which is correlated with the short style of *O. brevistylis*) prevented such procedure. Selection failed to hold the gains made by individual plants; though the short style is inherited, the variations back toward normal style length are apparently not due to inherited factors.—*Frieda Cobb Blanchard.*

3969. DUBLIN, LOUIS I. The higher education of women and race betterment. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. p. 374-385. Williams & Wilkins Co.: Baltimore, 1923.—The higher education of women should be a powerful influence for race betterment; practically, it has not worked that way. It is a common criticism of women's colleges that they educate students away from normal home interests and, in place of these, develop other interests which are, in a sense, antagonistic. A relatively small proportion of college women marry and, when married, bear but few children. For this disgenic tendency the kind of education women receive is largely responsible. It is pointed out also that college women are very often unprepared to assume their obligations in the community effort for social betterment. They are not always aware of the importance of the social movements which promise so much in the solution of community problems. To meet this situation the writer recommends a change in the curriculum of women's colleges. He has emphasized a programme of scientific construction covering the entire 4-year period, of which the central theme is the biological sciences, with especial reference to personal and community hygiene. The courses follow one another beginning with those in physics and chemistry and general biology, through physiology and hygiene, community hygiene, as included under such headings as, bacteriology, sanitation, vital statistics, and the administration of

public health departments. It is one of the advantages of this plan that it has unity; that it covers a field of study that has the greatest possible bearing on the immediate needs of the students themselves; that it gives added opportunities for cooperation to most of the departments of the college; that it makes all departments conscious of the part they are to play in a larger programme; and that it ties up the college activities to those in the community along lines considered of the greatest importance in modern life. The author has had in mind, throughout, the development of such interest on the part of the students as will attract them to the activities of home life as a personal ideal. It will develop a confidence to participate in the constructive community activities. Special emphasis is placed upon such work as public health, especially as it affects schools, care of mothers and children, and the Americanization of the foreign born. It is assumed that the young college woman who has had the advantages of such courses as are outlined will be ready to serve these movements with technical direction and, in any case, with sympathy and understanding.—*Louis I. Dublin.*

3970. EAST, E. M. As genetics comes of age. *Jour. Heredity* 13: 207-214. 1922.—The author reviews what has been done in genetics since the rediscovery of Mendel's data in 1901. This is compared with the beliefs prevailing since ancient times regarding the inheritance of characters. The article presents no new facts but summarizes the work that has been done in genetics since that science began.—*R. C. Cook.*

3971. EAST, E. M. Population in relation to agriculture. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. p. 215-232. Williams & Wilkins Co.: Baltimore, 1923.—The author discusses phases of the problem of assuring an adequate future food supply for the growing population of the world, presenting estimates of the world population, rate of increase, total land area, arable land area, and area now being farmed, and discussing the possibility of increase in production per acre, the possibility of discovering new foods, the problems of soil fertility, and problems of an agricultural policy. But even with solution for all these difficult problems, "no matter how great the heights of human genius in providing for future generations the present rate of population increase cannot continue indefinitely."—*Sylvia L. Parker.*

3972. ENRIQUES, PAOLO. Hologynic heredity. *Genetics* 7: 583-589. 2 fig. 1922.—The name diagnic heredity is proposed for the typical sex-linkage of the XX-XY type and diandric heredity for the WZ-ZZ type. Hologynic heredity is proposed for a new type of inheritance where transmission is direct from mother to daughter, the sons not being affected. Pedigrees showing the hologynic inheritance of hemophilia and cataract of the eye are given. A case of holoandric heredity is cited, transmission being from father to son, the daughters not being affected. An explanation is offered which makes use of selective fertilization.—*J. L. Collins.*

3973. FETSCHER, R. Ein Stammbaum mit Spalthand. [A "cleft-hand" pedigree.] *Arch. Rass.- u. Ges.-Biol.* 14: 176-177. 1922.—A mentally normal boy with bilateral "cleft-hand" has 1 epileptic and 3 normal sibs; parents, uncles, and aunts are all normal. The paternal grandfather, however, showed evidence of mental aberration and 1 of his nephews has "cleft-hand." The author is inclined to ascribe these physical and mental anomalies to the same cause, possibly a recessive Mendelian factor.—*C. H. Danforth.*

3974. FETSCHER, R. Über die Erbllichkeit des angeborenen Klumpfusses. [On the heredity of congenital club foot.] *Arch. Rass.- u. Ges. Biol.* 14: 140-158. 1922.—Club foot is hereditary in $\frac{1}{2}$ - $\frac{3}{4}$ of all cases and depends primarily on nervous causes. Families in which the trait appears show a somewhat increased number of bodily defects and a greatly increased frequency of mental disturbances; infant mortality is high.—*C. H. Danforth.*

3975. GOODALE, H. D., and RUBY SANBORN. Changes in egg production in the Station flock. *Massachusetts Agric. Exp. Sta. Bull.* 211. 99-125. 16 fig. 1922.—Results of 8 years'

work in breeding Rhode Island Red poultry for egg production are reported. The working hypothesis assumes that 5 main characteristics are concerned in annual egg production. These characteristics are called maturity, rate, broodiness, persistency, and winter pause. The age at 1st egg has been reduced to an average of below 200 days. Some families have been developed that are practically free from broodiness. Progress has also been made in eliminating the winter pause and also in increasing the percentage of birds showing high rate. Special attention has not been given to persistency. Standards for selection became more rigid as the work progressed. Particular attention was paid to the size of the family in selecting both male and female breeders. The average winter egg production has advanced from 36.70 to 67.3 eggs; the average annual egg yield, from 145.41 to 200.98 eggs at the close of 1921.—*F. A. Hays.*

3976. GOWEN, MARIE S., and JOHN W. GOWEN. Complete linkage in *Drosophila melanogaster*. *Amer. Nat.* 56: 286-288. 1922.—In 1917 a stock appeared which showed no crossing over in the sex chromosome. This has been continued to date, and shows complete linkage, i.e., absence of crossing over in the 2nd and 3rd chromosomes as well. The condition is stated to be genetic, and the gene is believed to be recessive, located in the dichaete-hairless region of the 3rd chromosome. The females in this stock thus show the same complete linkage which is the rule for males.—*H. H. Plough.*

3977. GRIFFEE, F. Breeding oats resistant to stem rust. *Jour. Heredity* 13: 187-190. 3 fig. 1922.—The method used for differentiating heterozygous and homozygous F_2 plants in breeding for rust resistance, when resistance is a dominant character, is to grow in the greenhouse F_3 seedling families from each resistant F_2 plant. These seedlings are inoculated with rust and from their reaction the F_2 plants which are homozygous for resistance are determined. In breeding oats resistant to stem rust, 192 of the 567 F_3 seedling families tested bred true for resistance.—*Fred Griffie.*

3978. HEINRICHER, E. Kreuzungsversuche zwischen *Viscum album* L. und *V. cruciatum* Sieb. [Crossing experiments between *Viscum album* and *V. cruciatum*.] *Ber. Deutsch. Bot. Ges.* 40: 174-177. 1922.—*Viscum cruciatum* pollinated with *V. album* did not set fruit while the reciprocal cross yielded some fruits, which resembled those of *V. album* but which the author suggests may be the result of close pollination by pollen from staminate plants of *V. album* in the same vicinity. Von Tubeuf's statement that these 2 species of *Viscum* hybridize could not be verified. The results of the author's experiments with mistletoes lead him to conclude that anemophily is more general than entomophily.—*W. C. Muenscher.*

3979. HERIBERT-NILSSON, N. Experimentelle Studien über Variabilität, Spaltung, Artbildung und Evolution in der Gattung *Salix*. [Experimental studies in variability, splitting, species formation, and evolution in the genus *Salix*.] *Lunds. Univ. Arsskr.* 14: 145 p., 65 fig. 1918.—The author approached the problem of splitting in hybrids in the genus *Salix* because Wichura's results were not clear. He grew a large 2nd generation of hybrid *S. viminalis* × *S. caprea*. General habit of growth showed variations in height, mechanical structure and branching; some plants were intermediate, some like one parent, and some like the other. Some leaves were noticeably larger and some smaller than those of the parents and F_1 ; the shape was intermediate in various degrees. All degrees of intermediacy were shown in regard to color, glossiness, and hairiness, and a greater range of variability than appeared in the parents. Of 150 specimens, 70 per cent were apparently like F_1 . The remainder belonged in 1 of 3 types: (1) resembling one species in some respects and the other in others; (2) resembling one of the parents decidedly; (3) differing decidedly from both parents. Mendelian splitting occurs in connection with leaf form, involving not more than 4 hereditary factors. Length of leaf and width split independently. More individuals are like *S. caprea* in leaf width than like *S. viminalis*, indicating more factors for width than for length. *S. caprea* has 2 polymere (polymere) factors for leaf width, *S. viminalis*, 1 for leaf length. These factors also influence

leaf color, height of shrub, and periodicity. This is considered proof that the most fundamental species-characters Mendelize. Back-cross (*S. viminalis* \times *S. caprea*) \times *S. viminalis* confirmed the author's assumption of the factorial constitution of the species. Hairiness splits in a more complicated way than fundamental habit characters. Pubescence of stamens, form of catkin and time of blossoming, resistance to *Melampsora* and winter killing are characters governed by other factors. *S. viminalis* \times *S. daphnoides* shows splitting and segregation of the most fundamental physiological and morphological characters. The species difference is genotypically simpler than between *S. viminalis* and *S. caprea*. Numerous back-crosses confirm the assumption made in accordance with the Mendelian theory that range of variability of a back-cross can lie only between the F_1 and the back-cross parent, that the majority are intermediate and thus phenotypically resemble the parent. Primary hybrids were obtained where the number of individuals was not too small. Crosses between the hybrid and the 3rd species result variously, depending on the factorial constitution; all are variable. (*S. cinerea* \times *S. purpurea*) \times *S. caprea* and *S. aurita* \times (*S. repens* \times *S. viminalis*) showed less variability than F_2 . (*S. viminalis* \times *S. caprea*) \times *S. cinerea*, and (*S. viminalis* \times *S. caprea*) \times *S. aurita* showed as much variability as F_2 . Crosses between 2 hybrids show greater variability than F_1 cross and if 1 parent is common to both hybrids, it will reappear in the progeny of the hybrid cross. Crosses between complicated hybrid combinations show the greatest resemblance to the species last used in the combination. The author secured 2 combinations in which there were 6 species; Wichura had 1 in which there were 7. Sterility does not increase with degree of complication. The usual 1:1 ratio of sexes was greatly modified in some crosses. Mosaic forms were found at times. Many cases were encountered in which great phenotypic variability in hybrid progeny could be traced back to an unexpectedly simple factorial system. Difference between species and variety characters is morphological, not genotypical, hence reduced to a question of nomenclature. What seem like new species are often but the expression of a new combination of factors. Genotype formation through crossing is the cause of variability. Varieties of species must be as old as species, not developed from them, as Darwin thought. Species of systematists arise in distinct morphological entities resulting from combinations of splitting factors of 2 species. Formation of new genes has not been established experimentally. Loss of genes is questionable; an evolutionary theory built on the idea of mutants arising through loss of genes would be untenable.—*Helen D. Hill.*

3980. HILDÉN, KAARLO. Über die Form des Ohrläppchens beim Menschen und ihre Abhängigkeit von Erbanlagen. [On the form of the ear lobes in man and their relation to heredity.] *Hereditas* 3: 351-357. 1922.—Except for the aged, the ill, and the newborn, all the inhabitants of Runo, an isolated island, were examined as to the form of ear lobes. Two categories are recognized, the free and the adherent. Of the former, there were 168 cases; of the latter, 89. While there was occasional difficulty in diagnosis, the author, unlike Carrier, found no exception to the rule that the free type of ear lobe behaves as a simple dominant trait, the adherent form being recessive.—*C. H. Danforth.*

3981. HOFFMAN, F. L. Race amalgamation in Hawaii. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. p. 90-108. Williams & Wilkins Co.: Baltimore, 1923.—A study is reported of 22,388 death certificates of decedents in the Territory of Hawaii, 1910-1915, with especial reference to the correlation of father's birthplace and mother's birthplace with birthplace of the subject. Racial affinities of parents were inferred from their place of birth. The summarized data are given from which the following may be emphasized: (1) Of 20,631 mothers, 7,442 were born in Hawaii, 7,269 in Japan, 1,597 in Portugal, 1,358 in China; and the remaining 14.4 per cent in the Philippines, Porto Rico, Spain, U. S. A., Korea, Germany, and elsewhere, in the order named. (2) The percentage of subjects of whose parents both were born in same country was Chinese 78.3, English 48.6, Hawaiians 98.2, Japanese 99, Filipinos 97.5, Portuguese 85.8, Americans 66.8. It is concluded that "racial intermixture in the Hawaiian Islands is much more restricted than is generally assumed;" that the greatest amount of intermixture is between native Hawaiian women and foreign men, chiefly Chinese,

English, and German. The Japanese, although the second largest racial element in the data, were involved in practically none of the mixed marriages.—*L. C. Dunn.*

3982. HOFFMAN, F. L. The problem of negro-white intermixture and intermarriage. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. *p.* 175-188. Williams & Wilkins Co.: Baltimore, 1923.—Race intermixture between blacks and whites in the U. S. A. is found to be on the increase. The ratio of mulattoes to the total colored population increased from 11.2 per cent in 1890 to 20.9 per cent in 1910. The ratio and rate of increase of mixed bloods is greatest in the west, least in the south. Data on 8 cases of mixed marriages in St. Paul and Minneapolis are given from which it is concluded that "the whitewomen who have married blacks are of the weaker class either mentally, morally or physically; while conversely the negro men represent the better class in most respects, at least physically and mentally." After some discussion the author condemns all such mixed marriages as disgenic and anti-social.—*L. C. Dunn.*

3983. HOOTON, E. A. Observations and queries as to the effect of race mixture on certain physical characteristics. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. *p.* 64-74. Williams & Wilkins Co.: Baltimore, 1923.—This paper presents a physical anthropologist's impressions concerning the use of non-mensurable morphological details as criteria of race or mixture, with remarks on the possibility of analyzing modern races by the study of racial hybrids. Among the specific details considered are: (1) the peculiarly compact bony texture and yellow brown patina characteristic of negroid skulls which appears in the skulls of hybrids between negroids and races lacking this peculiarity; (2) the complex coronal suture of European races which appears to be dominant in crosses with races characterized by simpler sutures; (3) the low broad nasal bridge of negroids and mongloids which considerable evidence indicates is recessive to the leptorrhine (European) type; (4) head form. Mesocephalic races are interpreted generally as hybrid types often showing disharmonic dolicho and brachy features, suggesting separate inheritance of the cranial parts. Conclusions are given from unpublished data on the inheritance of hair form and color, skin pigmentation, etc., in negro-white crosses illustrating the author's thesis that the physical results of racial crosses may be interpreted as due to the inheritance of numerous small units, presumably Mendelian, from each parent race.—*L. C. Dunn.*

3984. IZQUIERDO, J. JOAQUIN. Breve resena genealogica de la familia Izquierdo. [The genealogy of the Izquierdo family.] 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. *p.* 348-373. Williams & Wilkins Co.: Baltimore, 1923.

3985. JACK, H. W. Brothers in Rugby football. Jour. Heredity 13: 161-162. 1922.—This paper affords additional evidence of the hereditary nature of athletic traits in families. Twenty-three sets of 2 or more brothers are considered from the point of view of their ability to play the British game, as judged by expert selection committees; that brothers inherit similar qualities is clearly evident.—*H. W. Jack.*

3986. JENKIN, T. J. Notes on vivipary in *Festuca ovina*. Rept. Bot. Soc. and Exchange Club British Isles 6: 418-431. 1 *pl.* 1921 [1922].—Vivipary is shown to be to some extent hereditary and by such seeds as the plant is able to produce.—*G. C. Druce.*

3987. JONES, E. E. The genetic significance of intra-uterine sex ratios and degenerating fetuses in the cat. Jour. Heredity 13: 237-239. 1922.—To test Doncaster's hypothesis that occurrence of tortoise shell males in cats and their usual sterility might be due to hormone action as in free-martins in cattle, uteri of pregnant cats were examined. No trace of anastomosis of circulatory systems supplying fetuses was found. Intra-uterine sex ratio in cats was found to be 122.10 ± 8.30 . White coat color in cats was thought to have similar action to that found by Little in mice; the hypothesis was tested by comparison of litter size. Mean litter size of white females was 4.08 ± 0.13 , that of non-whites 4.48 ± 0.07 , the difference being

0.39 ± 0.15 , which is 2.71 times the probable error. Records of degenerating embryos show that out of 102 fetuses of white cats, 11, or 10.78 ± 2.07 per cent were degenerating. In non-white females out of 551 fetuses, 25, or 4.54 ± 0.60 per cent were degenerating. The difference is 6.25 ± 2.16 , which is 2.89 times the probable error. Recalculation of non-white figures excluding 1 litter considered pathological, shows 21 degenerating out of 547 fetuses, a percentage of 3.84 ± 0.58 . The difference between white and non-white then becomes 6.845 ± 2.149 , which is 3.2 times the probable error. The author believes that the conclusion is probably warranted that a significantly greater number of degenerating fetuses is found in white than in non-white cats; also that in some white cats, at least, a lethal action of some sort is operative when the factor for white is present even in a simplex condition.—E. E. Jones.

3988. KAHN, EUGEN. [German rev. of: ENTRES, JOSEPH LOTHAR. *Zur Klinik und Vererbung der Huntingtonschen Chorea*. (On the clinics and heredity of Huntington's chorea.) 149 p. Julius Springer: Berlin, 1921.] *Zeitschr. Indukt. Abstamm.- u. Vererb.* 29: 219. 1922.

Investigations of the constitution problem and temperament.) 2nd ed., 195 p., 32 fig. Julius Springer: Berlin, 1922.] *Zeitschr. Indukt. Abstamm.- u. Vererb.* 30: 139-144. 1922.

3991. KEY, WILHELMINE E. *Heritable factors in human fitness and their social control*. 1. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, Genetics, and the Family. p. 405-412. Williams & Wilkins Co.: Baltimore, 1923.—Since many refinements of method in education and philanthropy tend to encourage the survival of the inherently unfit, the question of a nation's continuing integrity resolves into a nice balance between certain genetic and social forces inherent in the blood lines of its people. Intensive study of family networks shows widely different potentiality of their various lines. Slight differences in planfulness and perseverance in 2 brothers, for example, have been found to initiate a divergence which in a few generations served to place the 2 branches founded by these brothers at opposite extremes of the social scale. Studies of the quantitative variation in such traits and of the ability with number, point to a segregation of factors to produce on the one hand accentuation and on the other progressive degeneration with regard to these traits, according to the types of mating made. The degenerating lines show frequently a very high birthrate; this, together with their tendency to draw to themselves the defective members of other mixed strains, results in centers of degeneracy and defect. This situation emphasizes as one of the chief duties of institutions, a detailed study of the families from which their charges come, with a view of allowing their genetic potentialities due weight in deciding the fate of their cases, and calling for additional state aid in the treatment of the centers of degeneracy and defect as fast as they are uncovered. The abilities known as the aptitudes have also been found to follow blood lines. The personalites, that have led in industry, science, art, and political organization have arisen by a fortunate crossing of able lines. Hitherto this process, at least under the social conditions pertaining in the U.S.A., has seemed to take care of itself. There are however grave indications of change. The dying out of many highly gifted lines, the low fecundity of others are among the signs of this change. The salient social and economic factors involved in the situation are gradually being evaluated. In addition to the means already touched on for correcting the anti-eugenic influences are the following: (1) a return to saner

and simpler standards of living which would make possible the rearing of larger families in middle classes; (2) a campaign of education calculated to foster "the eugenic conscience" among all classes; (3) the encouragement on the part of the numerous foundations, not of celibacy and comparative sterility in their members, but of marrying and rearing families; (4) the concept of service in contrast to that of personal aggrandizement; (5) early and more adequate economic adjustment to render possible early marriage and parenthood; (6) psychological tests supplemented by family history studies to determine the trend of mental and emotional development. These are especially indicated where the child shows delinquent tendencies or bids fair to become unusually brilliant.—*Wilhelmine E. Key.*

3992. LADEBECK, ERNST. *Die Farben einiger Hühnerrassen.* [The pigmentation of races of poultry.] *Zeitschr. Indukt. Abstamm.- u. Vererb.* 30: 1-62. 38 fig. 1922.—A study of color in the following races of poultry is reported: *Gallus bankiva*, Partridge-feathered Italian, Red Sussex, Rhode Island Red, Speckled Sussex, Crollivitz, Barred Rock, and Minorca. The report is divided into 3 sections: (1) morphology of feathers and feather pigment; (2) chemical properties of feather pigments; (3) coloration of comb, earlobes, and shanks. Feather color is found to depend upon color and shape of pigment granules and their distribution. The chemical properties of the pigments are rather extensively reported upon. Yellow pigment of the shanks is classed as a lipochrome. An extensive list of references is given.—*F. A. Hays.*

3993. LANCEFIELD, REBECCA C., and CHARLES W. METZ. *The sex-linked group of mutant characters in Drosophila willistoni.* *Amer. Nat.* 56: 211-241. 1922.—Twenty-eight recessive sex-linked mutant characters are described, and the genetic behavior of this species is shown to be similar to that of *D. melanogaster*. At least 2 of these mutants—yellow and scute—are believed to be parallel mutations, while forked and stubby probably are also. When the genes of the sex chromosome of *D. willistoni* are plotted in a map on the basis of the percentages of crossing over, it appears that yellow and scute are near the middle, while forked and stubby are at one end at 12 and 42 units respectively. The map in *D. melanogaster* shows yellow and scute at one end of the chromosome, with singed and forked 21 and 56.5 units off. Since the X chromosome of *D. melanogaster* is rod-like and that of *D. willistoni* is V-shaped, these facts suggest the interesting conclusion that the X chromosome of the former corresponds to one end only of the same chromosome in the latter.—*H. Plough.*

3994. LA RUE, CARL D. *Correlation in structure between mother and daughter trees of Hevea.* *Arch. Rubbercult.* 5: 567-573. 1921.—Bark thickness and the number of rings of latex vessels were investigated in 1½-year old seedlings of which the female parents only were known. The thickness of bark in the seedlings varied from 0.5 to 3.0 mm., with an average of 1.28 mm. The coefficient of correlation between mother and daughter trees for bark thickness is 0.366 ± 0.106 . The number of latex-vessel rings in the seedlings varied from 2 to 11, with an average of 5.9. The table showing the correlation between mother and daughter trees for number of latex-vessel rings indicates that the coefficient of correlation is insignificant. Since the number of latex-vessel rings is one of the most important factors in yield, there is an indication that yield, also, may be little inherited from the mother tree where seed are produced by open pollination. Seed of which both parents are high producers are to be preferred for selection in spite of their increased cost.—*C. D. La Rue.*

3995. LÉCAILLON, A. *Sur les caractères d'un hybride issu de l'union d'un Canard musqué mâle (Cairina moschata Flem.) et d'une Oie d'Egypte femelle (Chenalopes aegypticus Eyt.).* [The characters of a hybrid resulting from the mating of a Canard Muscovy male duck (*Cairina moschata*) and an Egyptian female goose (*Chenalopes aegypticus* Eyt.)] *Compt. Rend. Acad. Sci. Paris* 174: 68-69. 1922.—The hybrid resulting from the accidental mating possessed upon hatching the yellow color and characteristic odor of the duck. The hybrid was a male and when adult was of large size and carried the body in the upright manner of a goose. It was mute as is the duck. Mating with a female goose which continued for 3 years

proved infertile. In its extended mating habit and its aggressiveness the hybrid was like a goose. The plumage color, in general, resembled dorsally, the duck, and ventrally, the goose; the white feathers of both species were lacking. The red skin and erectile feathers present on the head of the muscovy duck were absent, as were the brown feathers on the face, neck, and breast of the goose. This hybrid had taken characters from both parent species, but it cannot be considered a mosaic.—*H. W. Feldman*.

3996. LENZ-MUNCHEN. [German rev. of: FRETZ, G. P. *Heredity of headform in man*. 193 p., 16 pl., 9 fig. Martinus Nijhoff: The Hague, 1921.] *Zeitschr. Indukt. Abstamm.-u. Vererb.* 29: 214. 1922.

3997. LOTKA, ALFRED J. *The stability of the normal age distribution*. *Proc. Nation. Acad. Sci. [U. S. A.]* 8: 339-345. 2 fig. 1922.—Earlier papers by the author have established the fact of a unique age distribution which, in certain circumstances, has the property of perpetuating itself when once set up in a population. This paper offers proof that this age distribution is stable; that is, that a population will spontaneously revert to it after displacement therefrom or will converge to it from an arbitrary initial age distribution.—*Sylvia L. Parker*.

3998. LOTSY, J. P. *La botanique appliquée et l'hybridisme*. [Applied botany and hybridism.] *Rev. Bot. Appl.* 2: 313-325. 1922.—The principles of the chromosome theory of heredity are reviewed with mention of the difficulties in analyses caused by heterogamy and linkage. Hybrids are divided into 2 groups, those in which crossing-over occurs and those in which it does not occur. The behavior in *Drosophila* hybrids is given as typical of the first class. In the 2nd group there are 7 divisions as follows: duplex hybrids, Mendelian hybrids, nuclear chimeras, pseudohybrids, semi-duplex hybrids, pseudo-duplex hybrids, and triplex hybrids. This classification is based upon the behavior of the paternal and maternal haploid chromosomes. A species exemplifying each class is given. The cytological work of Täckholm on *Rosa* and of Belling on *Canna* is considered as evidence for the theory of the origin of species by the hybridization of existing species differing in specific chromosome number.—*J. L. Collins*.

3999. MACDOWELL, E. C. *The influence of alcohol on the fertility of white rats*. *Genetics* 7: 117-141. 7 fig. 1922.—The fertility of treated animals has been tested by comparisons with full brother-and-sister controls. The results indicate that heavy as well as light doses of alcohol tend to reduce the sizes of litters from treated rats and their descendants. Heavy doses reduce the number of litters produced by the treated rats and increase the number produced by their descendants. The 1st result is interpreted as due to a modification of the germ-plasm; while the 2nd is believed to support the hypothesis that the alcohol has raised the numbers of litters in the 2nd generation through the elimination of the litters in the first generation that bore the less fertile germinal material.—*Herman L. Ibsen*.

4000. MALLOCH, WALTER SCOTT. *An F₁ species cross between Hordeum vulgare and Hordeum murinum*. *Amer. Nat.* 55: 281-285. 1921.—This cross between common cultivated barley and *Hordeum murinum*, a wild barley, had a sheath with a greater circumference than the blade, thus fitting loosely around it. The blade of the 1st leaf was narrow, linear, and spirally twisted with slightly roughened edges. The blade was about $1\frac{1}{2}$ inch in width and the plant grew to a height of 4 inches; at this stage the plant died. There was no evidence of nodes. The 2 species differ in a large number of morphological characters. Probably the reaction systems of the 2 species fail to harmonize. There are all degrees of incompatibility of reaction systems in species crosses.—*Walter Scott Malloch*.

4001. MOHR, OTTO L. Ö. Winge's paper on "The interaction between two closely linked lethals in *Drosophila* as the cause of the apparent constancy of the mutant 'spread.'" A necessary rectification. *Genetics* 4: 457-461. 1922.—The stock which Winge assumed to be spread

and which he obtained from the author was not spread but dichæte. Spread differs from dichæte both morphologically and genetically. The genetic behavior of dichæte has been described by previous *Drosophila* workers, with whose accounts Winge's is in agreement. The lethal which Winge designates as vit was known to the author, in whose stock of dichæte it arose by mutation. A note by Winge explains how the mistake came to be made. [See Bot. Absts. 12, Entry 4024.]—*Alexander Weinstein.*

4002. MORGAN, T. H. On the mechanism of heredity. (Croonian lecture.) Proc. Roy. Soc. London, B 94: 162-197. 2 pl., 35 fig. 1922.—This paper constitutes a general survey of the *Drosophila* work showing the genes to be localized in the chromosomes. After reviewing the parallelism between chromosome behavior and the distribution of the genes according to Mendel's 1st and 2nd laws, the author cites Bridges' cases of non-disjunction of the 4th and of the sex chromosomes and Lillian V. Morgan's case of union of the 2 X chromosomes (resulting in 100 per cent non-disjunction) to show that specific characters have, even in abnormal cases, been found identical in distribution with specific chromosomes. He next reviews the parallelism between the cytologically determined constellation of chromosomes and the genetic "maps" of linkage-groups, as found by various workers, first in *Drosophila melanogaster*, and later in *D. simulans*, *D. willistoni*, *D. virilis*, *D. obscura*, the edible pea, and *Clarkia*. The idea of crossing over in its relation to distance along the chromosome is explained, and the evidence from interference concerning the manner of crossing over. It is shown that the cytological evidence for crossing over is inconclusive and that it is not likely that this process occurs at the "strepsinema" stage, as usually figured. The author finally cites the estimates which have been made of the probable maximum diameter that can be assigned to a gene. Dividing sperm head size or chromatin volume by the probable minimum number of genes—as calculated from the relative frequency with which mutations occur in previously known loci (Muller)—the maximum possible gene size turns out to be between 60 and 77 μ . But some of the shorter known "map" distances between genes, if proportionated to the size of the chromosomes which the maps represent, would stand for a real distance of only 20 μ (cf. the haemoglobin molecule of 2 $\frac{1}{2}$ μ).—*H. J. Muller.*

4003. MOTTET, SERAPHIM. La degenerescence de la pomme de terre. [Degeneration of the potato.] Jour. Soc. Nat. Hort. France 23: 263-268. 1922.—Degeneration of potatoes is attributed to (1) influence of diseases; (2) imperfect adaptation of varieties to soil and climate; (3) depletion of nutritive elements in the soil and the formation of toxins; (4) deterioration of the varieties on account of long continued asexual propagation. The main discussion concerns the last cause. The writer admits that the question is debatable but maintains the affirmative that there is an actual degeneration due to senility; the passing out of culture of many varieties is cited as evidence. The influence of degenerative diseases is acknowledged but is not considered the only cause. The suggestion is made that there may be a relation between smooth, regularly shaped tubers with shallow eyes and degeneration.—*C. H. Myers.*

4004. MULLER, H. J. A simple formula giving the number of individuals required for obtaining one of a given frequency. Amer. Nat. 57: 66-73. 1923.—The author presents approximate formula, $\log_e P = -\frac{n}{P - \frac{1}{2}}$, for estimating the chance (P) that a given expected frequency of occurrence (1 in P) may still be correct when no individuals of the minority type have appeared among n individuals. Conversely, the formula can be used for calculating the number of individuals (n) which must be obtained in an experiment to be reasonably sure (chance 1- P) that at least one individual of the minority type may appear where the expected frequency is 1 in P .—*Sewall Wright.*

4005. MÜLLER, K. [German rev. of: PUTTICK, G. P. The reaction of the F_2 generation of a cross between a common and a durum wheat to two biologic forms of *Puccinia graminis*. Phytopath. 11: 205-213. 1921 (see Bot. Absts. 11, Entry 298).] Zeitschr. Pflanzenzücht. 8: 436-437. 1922.

4006. NELLE, WILHELM. Die Beschaffenheit des Gebisses bei kongenitalem Myxödem. [The character of the teeth in congenital myxodema.] p. 50-57. Diss. Bonn Univ.: Jena, 1922.

4007. PEARL, RAYMOND. Some eugenic aspects of the problem of population. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. p. 212-214. Williams & Wilkins Co.: Baltimore, 1923.—This paper is an abstract of the writer's studies of the population problem, which he states "is a problem only because the globe on which we live is strictly limited in size." It has been found that the population growth of every country so far tried, and also experimental population of fruit flies in a pint milk bottle, follow a smooth and regular curve, of which the mathematical equation has been written. The main characteristics of the curve are that the rate of growth is at first slow, increases to a maximum, and then decreases, the universe finally reaching a saturation point. If this saturation point is to be reached in a few centuries it becomes an important question what kind of people will comprise this population. "Here enters the eugenic phase of the problem * * * Birth control offers the most hopeful outlook but it is beset by many difficulties."—*Sylvia L. Parker.*

4008. PEARL, RAYMOND, and T. J. LEBLANC. A further note on the age index of a population. Proc. Nation. Acad. Sci. [U. S. A.] 8: 300-303. 1 fig. 1922.—This paper reports the result of testing the author's age index, proposed in 1920, by computing the indices of a number of communities with 2 different age groupings, one having 6 age groups the other only 3. The communities used were the 99 counties of Iowa in 1915. The correlation coefficient was found to be $+0.84 \pm 0.02$, indicating that the index may be used with considerable confidence, even where the original statistics furnish only 3 broad age classes for the entire life span.—*Sylvia L. Parker.*

4009. RENNER, O. Das Rotnervenmerkmal der Önotheren. [Red veins in Oenotheras.] Ber. Deutsch. Bot. Ges. 39: 264-270. 1921.—This paper deals with a discussion of Heribert Nilsson's view on this subject. The author thinks that the homozygous dominant combination of factors for red veins is zygotic lethal. This opinion is supported by the fact that a large number of aborted seed was observed in the crosses where such a genetic combination was expected. The author suggests that the excess of plants with red veins over the expectancy is due to the faster tube growth of those pollen grains which carry the dominant factor for red veins.—*M. Demerec.*

4010. RENNER, OTTO, und WALTER KUPPER. Artkreuzungen in der Gattung Epilobium. [Species hybridization in the genus Epilobium.] Ber. Deutsch. Bot. Ges. 39: 201-206. 1921.—The results in this preliminary report differ from the conclusions reached by Lehmann. Experiments showed that the reciprocal crosses between species of *Epilobium* are different. Lehmann explains this difference on the assumption that the diploid chromosome set in the parental species consisted of 2 different haploid sets. He parallels the appearance of different reciprocal crosses in *Epilobium* with the similar appearance in the crosses between heterogamous Oenotheras. The authors think that the difference in reciprocal crosses is due to the influence of the cytoplasm which is brought into the cross by one parent only.—*M. Demerec.*

4011. REUTER, M. Zur Frage des Hermaphroditismus beim Wilde. [The question of hermaphroditism in game.] Zeitschr. Forst.- u. Jagdw. 54: 107-110. 1922.—An hermaphroditic deer is described and the common appearance of hermaphroditism among female hyenas is discussed.—*J. Roeser.*

4012. SCHLUMBERGER, OTTO. Pflanzenschutz und Kartoffelzüchtung. [Plant disease control and potato breeding.] Fühlings Landw. Zeitg. 71: 183-191. 1922.—The importance of potato breeding as a means of plant disease control is pointed out. Promising results

obtained by this method in England and the U. S. A. are mentioned. As the breeding for disease resistance is considered the only means of finally solving the problem, Germany is urged to do much more work along this line.—*P. Kvakán*.

4013. SEASHORE, CARL E. Individual and racial inheritance of musical traits. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics, and the family. p. 231-238. Williams & Wilkins Co.: Baltimore, 1923. The gift of music may be enhanced in children from generation to generation by scientific forethought in mating. To this end, the concept of musical talent must be clarified, recognizing that it is not one but a group of hierarchies of talent, each more or less independent of the others; the tonal talents, for example, are as independent of the rhythmic talents as the color of the eyes is independent of stature. Knowledge of the laws of the inheritance of musical talent must be based upon accurate scientific measurements and statistics on the same biological principles as are employed in the study of inheritance in plants and animals. Such factors as the sense of pitch, the sense of rhythm, musical imagination, musical memory, musical intellect, creative imagination, quality of voice, range of voice, and volume of voice, may be isolated and measured or rated in a given individual and the findings may be compared for successive generations. Such of these factors as should be found to be heritable may then be predicted as stature is now predicted with various degrees of certainty on the basis of family history of stature. Such knowledge will be used in the future not primarily in formal eugenic guidance, which is quite within the range of possibility, but rather through the situation that scientific facts of this kind will become a part of the store of common knowledge and will enrich and improve common sense knowledge and natural reactions in courtship and mating. As the rare rose is more beautiful to the botanist and the floriculturist than to the ignorant peasant, so organized knowledge of the laws of musical inheritance will give direction and warmth to nature's spell of love in mating a rare talent with a rare talent.—*Carl E. Seashore*.

4014. SINNOTT, E. W., and GEORGE B. DURHAM. Inheritance in the summer squash. Jour. Heredity 13: 177-186. 2 fig. 1922.—Self-fertile strains in *Cucurbita Pepo* were discovered and a number of pure lines established. Inheritance of various plant characters were studied. White body color in fruit is dominant over yellow and yellow over green. Plain (solid or self) color of fruit is dominant over striping in some cases but appears to be recessive in others. Wartiness of fruit is dominant over smoothness and may be caused by at least 2 independent factors, cumulative in their effect. "Disc" fruit shape is dominant over "sphere," the main difference being due to a single factor although 1 or more additional factors may produce minor effects. White flesh is usually dominant over cream and single blossom-end scar over double, although the latter character is readily modified in its expression by the environment. Many other characters were found to be definitely inherited, but the manner of their inheritance is not as yet clearly established.—*E. W. Sinnott*.

4015. SPRINGER, MARY G. The effect upon developing eggs of extracts of embryos of the same species. Biol. Bull. 43: 75-96. 1922.—Cultures of sea-urchin and starfish were treated with "egg extract," i.e., suspensions of crushed eggs in sea water, distilled water, acidified water, ether and water, acetone and water, or alcohol and water. In general, experiments upon *Asterias* eggs by extracts of the same species in sea water solution showed a slight retardation, a higher degree of cytolysis, and a greater tendency to stop either at the blastula or gastrula stage. Extracts of *Arbacia* larvae, when present in sufficient concentration with any of the solvents mentioned, definitely retarded the development of eggs of the same species, causing cytolysis, arrests of growth, and a very noticeable failure of eggs to develop beyond the early, non-motile blastula stage. If formative substances do exist in the early embryological stages, they are unable, under the conditions tried, to be effective.—*Caroline M. Perkins*.

4016. STAFFE, ADOLF. Untersuchungen über die Augen- und Haarfarbe der Schulkinder des Kuhländchens. [Investigations on the eye and hair color of the school children of Kuhländchen.] Arch. Rass.-u. Ges. Biol. 14: 305-314. 1922.—Blue eyes and blonde hair are Nordic characteristics the inheritance of which has been extensively studied; their frequency afford a good index of the amount of Nordic blood in a population. In this study of 3,058 boys and 3,014 girls, 6-14 years of age, the frequency of blue eyes was found to be 46 per cent and of blonde hair 59 per cent as compared with 47 and 75 per cent, respectively, for Swedish recruits. This tends to confirm the ethnological evidence that the people of Kuhländchen, the region of Mendel's nativity, are of prevailing Nordic origin. It must be borne in mind however that children tend to become darker with age, a phenomenon which the author attributes to heterozygosis with early incomplete dominance. In this material blue eyes and light hair were not closely associated. The frequency of blue eyes among girls was found to be slightly greater than among boys. The author believes with Lanz that the supposed dominant sex-linked 2nd factor for eye pigmentation is peculiar to Mongolian strains and their hybrid descendants. Red hair (1.38 per cent) was found to be twice as common among boys as among girls, suggesting a sex-linked epistatic factor. Freckling is strongly associated with light and especially red hair. The same is possibly true of birthmarks and naevi.—C. H. Danforth.

4017. SYERDRUP, ASLAUG. Postaxial polydactylism in six generations of a Norwegian family. Jour. Genetics 12: 217-240. 6 pl., 1 fig. 1922.—Two types of postaxial polydactylism are recognized. Type A, the more pronounced form, is characterized by the strong and equal development of the 5th and 6th digits, generally associated with a more or less defective additional metacarpal or metatarsal. The trait may manifest itself in any or all extremities, but the right hand shows a more variable tendency than the left. Type B is characterized by small supernumerary fingers without bony connection with the rest of the hand. The feet of individuals with type B hands may show as extreme a development of polydactylism as those belonging to type A. Polydactylism of both types is transmitted regularly by affected parents to part of their offspring. However, in one line the number of affected individuals is in excess of 50 per cent (17: 8) and here most of the cases are of type A, while in another line the number of polydactylous individuals is less than would be expected (8: 14) and all are type B. Similar observations have been reported by others, from which the author is led to suggest that type A is the product of cumulative factors while type B is due to only 1 factor. It seems probable that the latter may sometimes be suppressed by an inhibiting factor. Associated with type A is a clearly demonstrable shortening of the 5th metacarpal bone but it has not been determined whether this is a secondary manifestation or is due to a separate gene linked with one of those for polydactylism.—C. H. Danforth.

4018. SWINGLE, W. W. Is there a transformation of sex in frogs? Amer. Nat. 56: 193-210. 1922.—The author replies to E. Witschi [Amer. Nat. 55: 641.] who is said to be convinced that the problem of sex development and differentiation in frogs has been settled. The author feels that the time has come for a revision of the entire question of sex development in Anurans. Evidence is adduced to show that Bidder's organ is homologous to the pro-testis of frogs, and is not a rudimentary ovary, except in females. He does not agree with Witschi on parallelism in behavior of Müllerian ducts and the gonads. Hermaphroditism in frogs is considered.—R. K. Nabours.

4019. SWINGLE, W. W. Spontaneous metamorphosis of the American axolotl. Amer. Nat. 56: 560-567. 1922.—Autoplastic and homoplastic thyroid transplantation appeared to have no effect on the metamorphoses of the American axolotl; whereas heteroplastic, using the glandular tissue of *Necturus*, and thyroid feeding, using desiccated thyroid tissue with 0.21 per cent iodine, both had perceptible influence in hastening metamorphosis. Heteroplastic pituitary transplantation gave indefinite results. Thyroidectomy performed before the onset of metamorphosis effectively prevented the latter, while thyroidectomy after the onset of metamorphosis had no effect. These animals were not entirely satisfactory material. There is discussion of other matters concerning axolotls, and the influence of their thyroids on metamorphoses in other Amphibia.—R. K. Nabours.

4020. TJEBBES, K., en H. N. KOOIMAN. Erfelijkheidsonderzoekingen bij boonen. VII. Bloemkleur en zaadhuidkleur. [Genetic investigations on beans. Flower color and seed coat color.] VIII. Over de erfelijkheid van de eigenschap dorschbaarheid van de pene. [Concerning the inheritance of threshability of the pod.] *Genetica* 4: 447-456. 1922.—From various crosses with beans the authors are led to conclude that: (1) there is an intensifying factor for color, *F*, which when acting with 1 or more of the factor complexes *AB*, *AC*, or *AD* produces lilac flower color; (2) there is a different factor, which, although it has no definitely clear influence on the colors of the seed coat, can nevertheless cause the flowers to be colored, as is shown by the brown beans with colored and white flowers; (3) in connection with the reports of Shaw and Morton it must be assumed that the factor *F* may be disturbed in its action by the factor producing the "eyed" condition. Crosses between threshable and non-threshable varieties of beans reveal 1 main factor difference, the threshable condition being dominant. The results in F_2 do not constitute a very close fit (174:38) but the F_3 generation gives a ratio more nearly in accordance with expectation (1572:572).—A. R. Saunders.

4021. VOGT, A., und R. KLAINGUTI. Weitere Untersuchungen über die Entstehung der Rotgrünblindheit beim Weibe. [Further investigations on the origin of red-green blindness in women.] *Arch. Rass.- u. Ges. Biol.* 14: 129-140. 1922.—An examination of 2238 Basel school girls 11-16 years old revealed 8 cases of colorblindness. This is about the frequency of colorblindness among women of Central Europe generally (0.4 per cent). The affected subjects and as many of their relatives as could be reached were subjected to careful study to test the theory that colorblindness is a typical sex-linked trait. The evidence is all in accord with this hypothesis. It is noteworthy that 2 colorblind parents produced only colorblind children, 1 son and 2 daughters; and that the marriage of a colorblind man with a (presumably) heterozygous woman resulted in all 4 of the possible types of offspring. The authors are inclined to doubt the genetic separateness of the different forms of colorblindness, although this question is left open.—C. H. Danforth.

4022. WELLENSIEK, S. J. De erfelijkheid van het al of niet bezit van "draad" bij rassen van *Phaseolus vulgaris* L. [Heredity of stringiness of *Phaseolus vulgaris* varieties.] *Genetica* 4: 443-446. 1922.—The writer crossed 3 pure lines of stringless beans with a variety, "Wagenaar," having a high degree of stringiness. In the F_1 generation the stringless condition was dominant, with monohybrid segregation in F_2 . The actual ratios agree well with the expected results and apparently there exists a monofactorial difference between the variety "Wagenaar" and the stringless pure lines.—A. R. Saunders.

4023. WINGE, Ö. A peculiar mode of inheritance and its cytological explanation. *Jour. Genetics* 12: 137-144. 1 pl., 8 fig. 1922.—Inheritance of black-spotted versus non-spotted dorsal fin in the fish *Lebistes reticulatus* had been found by J. Schmidt [see Bot. Absts. 10, Entry 1748] to follow the distribution which a Y chromosome would have. In cytological examination Winge finds 23 pairs of chromosomes, all 46 very much alike, at maturation in the male; 46 were also counted in female somatic cells and indicated in oogenesis. Though no sex chromosomes were identified, he assumes the male to have had XY, the female XX, as required by the genetic results. He proposes the term "one-sided masculine inheritance" for Schmidt's case, and states that sex-linked inheritance of the *Drosophila* type has also been found in *Lebistes*.—H. J. Muller.

4024. WINGE, Ö. The interaction between two closely linked lethals in *Drosophila* as the cause of the apparent constancy of the mutant "spread." *Genetica* 4: 321-338. 1922.—A stock of *Drosophila melanogaster* characterized by holding the wings outstretched was found to differ from the wild type in 2 factors: (1) a gene responsible for the morphological peculiarity, acting as a 3rd chromosome dominant with a recessive lethal effect; (2) a lethal in the opposite chromosome, crossing over with the 1st gene in about 1 per cent of cases and thus causing the stock to breed almost true. The author supposed that the stock was identical with spread

and concluded that the published accounts of spread as a recessive are incorrect; but in a note added to the reprints he explains that the stock he worked with is not spread but dichæte and agrees with dichæte in its behavior [see Bot. Absts. 12, Entry 4001.]-*Alexander Weinstein.*

4025. WOLFE, A. B. *Eugenics and social attitudes.* 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. p. 413-418. Williams & Wilkins Co.: Baltimore, 1923.—The unmanageableness of society results from a maladjustment between the need of rational cooperative control and the conflict instincts inherited from the biological past, and the hold-over of political and economic individualism from the 18th century. The deficiency is one of proper attitudes more than of intellectual capacity. The task of eugenics is therefore not only selections for capacity but the development in the population at large, through every available means, of attitudes suitable to social requirements. Unless this is done selective eugenics stands little chance of adoption by democratic societies. Such a broadening of aim is in accord with Galton's definition of eugenics. The most dangerous dysgenic element is not necessarily in the "lower" classes, but, as concerns attitudes, may be found in the middle classes. The most pressing tasks are: (1) to develop all the intellectual capacity; (2) to free knowledge from censorship of any kind; (3) to acquire in the general population a scientific attitude; (4) to develop mutual tolerance and understanding; (5) to acquire a morality of self-respect; (6) to substitute workmanship for acquisitiveness, and cooperation for conflict. Human attitudes and their modification should be the prime interest of all the eugenisists except technically trained genetists.—*A. B. Wolfe.*

4026. YOUNG, C. C. *Practical tests in Karakul breeding.* Jour. Heredity 13: 229-236. 1922.—It has been found that the sheep thrive in a variety of climates but seem to do best under desert conditions. By properly selecting long-wool ewes it has been found possible to obtain high grade Karakul pelts by crossing with the imported rams, as the black, tightly curled wool of the Karakul seems to be entirely dominant. It is emphasized that the Karakul is a mixed breed, as the natives of the Kara-Kum region have no conception of scientific breeding and cross their fur sheep with all other native strains.—*R. C. Cook.*

4027. ZELENY, CHARLES. The temperature coefficient of a heterozygote with an expression for the value of a germinal difference in terms of an environmental one. Biol. Bull. 44: 105-112. 3 fig. 1923.—The heterozygote between normal full eye and ultra-bar eye in *Drosophila* shows an increased number of ommatidia as the temperature at which the larvae are reared decreases, at a rate similar to that characteristic of ultra-bar and not of full eye. Although a single ultra-bar factor is not sufficient to bring about a complete effect in reducing ommatidia number as produced by 2 ultra-bar factors, it is sufficient to produce the complete change to a physiological system of the ultra-bar type. The gene ultra-bar has the same type of reaction as a temperature difference. On the logarithmic scale of ommatidia number it is possible to express the relation between the germinal factor and the environmental factor as a constant.—*D. F. Jones.*

FRUITS AND GENERAL HORTICULTURE

4028. ANONYMOUS. Pollination in orchards. New Zealand Jour. Agric. 25: 148-150. 1 chart. 1922.—Some recent investigations are reviewed.—*N. J. Giddings.*

4029. ANONYMOUS. Tree surgery as applied to citrus. Florida Grower 27³: 6. 6 fig. 1923.—Tree surgery proved successful. The treatment of wounds and application of materials were essentially the same as with other kinds of trees.—*J. C. Th. Uphof.*

4030. ANONYMOUS. Varieties of fruit recommended for planting in British Columbia. British Columbia Dept. Agric. Circ. New Hort. Ser. 64. 4 p. 1922.

4031. ANONYMOUS. Verslag over het jaar 1920 van het Department van den Landbouw in Suriname. [Report for the year 1920, Department of Agriculture, Surinam.] 129 p. Paramaribo, 1920.—Short reports are given of the culture, harvest, and condition of the following: coffee, cocoa, coconuts, cotton, rice, malachra. The management of government forests is also reported.—*J. C. Th. Uphof*.

4032. ALLEN, W. J. Some experiments in the storage of lemons. Agric. Gaz. New South Wales 34: 127. 1923.—Treatment of lemons with slaked lime dust to prevent decay showed slight advantage over no treatment and more marked advantage than dusting with sulphur or coating with vaseline.—*L. R. Waldron*.

4033. ANTHONY, R. D., and J. H. WARING. Methods of interpreting yield records in apple fertilization experiments. Pennsylvania Agric. Exp. Sta. Bull. 173. 42 p. 1922.—The author discusses methods used in conducting and reporting orchard field trials based on data taken from 5 orchards in Pennsylvania beginning in 1907 and 1908. The general plan of each test is described, with notes on types of soil and special conditions present in each orchard. The yield records on the various plots are interpreted through the comparative use of Bessel's and "Student's" formulae for determining the probable error. Attention is called to the necessity of reducing the common factors of variability such as topography, soil, and unknown stocks as well as the need of increasing the number of trees under treatment. Certain results for the orchardist are derived; "apple trees standing in a non-legume sod must receive nitrogenous fertilizers. Commercial carriers of nitrogen have proved as valuable as manure. Trees under cultivation have not shown a profitable return from the addition of fertilizers when a good cover crop was grown. Where a cover crop was not grown in the cultivated plots the trees did not maintain their vigor."—*C. R. Orton*.

4034. ARENS, P. Het planten met marcotten. [Planting with "marcotts."] Arch. Rubber cult. 5: 382-387. 1921.—An account is given of a number of plantings with "marcotts." Most of these were successful, and the trees could be tapped sooner than when stumps were planted. This method is not considered objectionable if good roots are developed before planting.—*C. D. La Rue*.

4035. BARSS, A. F. Small fruit survey. British Columbia Dept. Agric. Circ. 39. 15 p. 1922.—A report is made on the cost of growing strawberries and red raspberries in certain coast sections of British Columbia during 1921.—*J. W. Eastham*.

4036. BECKWITH, CHARLES S. Report of the cranberry substation. Proc. Amer. Cranberry Growers Ann. Meeting 53: [Unpaged.] 1923.—On savannah land where vine growth was not excessive a complete fertilizer gave in 4 successive years an increase of 20, 68, 73, and 107 per cent, respectively, over the unfertilized plot, which yielded 35 barrels per acre, which is twice the average for New Jersey. Recent tests show that nitrate of soda is more efficient than dried blood. On muck soils no fertilizer is known that can be safely used year after year.—Treatments of from 1,000 to 12,000 pounds of lime per acre have not yet given results.—Three spray applications were effective in keeping the berries sound until Aug. 1, by which time those on unsprayed plots had rotted; by Aug. 25 all had rotted. Summer flooding destroys part, if not all, of the cranberry girdlers but may cause rot.—Data are being collected relative to frost prediction.—*J. K. Shaw*.

4037. BEVAN, W. The Sultana vine in Cyprus. Cyprus Agric. Jour. 18: 9-10. 1923.—In 1913, cuttings of this seedless grape were imported from Crete and distributed to vine growers. While good yields have been secured they do not equal those obtained in Crete. It is thought that more intelligent pruning may increase the yield.—*W. Stuart*.

4038. BOBILIOFF, W., en C. A. GEHLSSEN. Over het uitdunnen volgens bastonderzoek op de gouvernementsrubberonderneming "Vada." [The use of bark investigation as a guide in thinning on the government estate "Vada."] Arch. Rubbercult. 5: 406-412. 1921.—The study of the bark is compared with production as a means of thinning on the government estate "Vada." Eight hectares were thinned, 4 by each method. In 3 cases out of 4 the bark investigations gave better results than yield data.—*C. D. LaRue.*

4039. CHEVALIER, A. L'olivier Arbéquina. [The Arbequina olive.] Rev. Bot. Appl. 2: 26-27. 1922.—This olive variety is cultivated in the province of Lerida, Spain, where it represents 92 per cent of all varieties planted. It is more resistant to cold than any of the other varieties there grown and is reported to be a heavy bearer. Every 2 years, in some cases more often, the trees are severely pruned to expedite gathering the fruits.—*Paul Russell.*

4040. CRAWFORD, R. P. World crops for America. Sci. Amer. 126: 226-227. 5 fig. 1922. A brief popular description is given of the ways in which plants are sought abroad and brought to American experiment stations for testing.—*Chas. H. Otis.*

4041. DAVIS, KARY C. Horticulture. A text book for high school and normals. vi + 416 p., 287 fig. J. B. Lippincott Co.: Philadelphia, 1922.—This volume is designed to give to students a course in gardening, orcharding and small fruits that will cover the horticultural field, omitting unessentials. Six chapters are devoted to preliminary studies and plant propagation; 6 to vegetable gardening; 6 to various phases of orcharding; 4 to small fruits, nuts, etc.; 1 to the home wood lot and forestry; and 1 each to soil improvement, the home and school grounds, weeds, and birds; also an appendix with data of value to the student and grower.—*J. H. Gourley.*

4042. DONKERSLOOT, F. W. De vegetatieve vermenigvuldiging van Hevea als kebonpraktijk. [Vegetative reproduction of Hevea as an estate practice.] Arch. Rubbercult. 5: 510-540. 1921.—This is a full account of the methods of vegetative reproduction of *Hevea brasiliensis* developed on the estates of the Holland-American Plantation Co. under the direction of the botanist. Cost accounts, etc., are given.—*C. D. La Rue.*

4043. ESBJERG, NIELS. Forsøg med Sorter af Stikkelsbaer 1910-1920. [Experiments with gooseberries, 1910-1920.] Tidsskr. Planteavl. 28: 596-614. 1922.—This report on the work of the state agricultural experiment station on methods of raising gooseberries for the market includes a discussion of diseases and other factors. The gooseberry is relatively a much more important crop in Denmark than it is in America.—*Albert A. Hansen.*

4044. FLETCHER, F. J. Market nursery work: A series of six books on the cultivation of crops for market. Vol. VI. Decorative plants, trees and shrubs. vi + 68 p., 23 fig. Benn Bros.: London, 1922.—This reference book is designed to assist nurserymen.—*J. H. Gourley.*

4045. GALLOWAY, B. T. An historic orange tree. Jour. Heredity 13: 163-166. 2 fig. 1922.—The introduction of the original Washington naval orange tree from Bahia, Brazil, is recounted. Twelve trees were sent to William Saunders, Plant Propagator in the U. S. Department of Agriculture. From these he budded other trees which he sent to Miss Elizabeth Tibbetts, Riverside, California. Of these original budded trees 1 is still living at Riverside and 1 in the citrus greenhouse at Washington. From these trees has developed the entire navel orange industry of California.—*Robert C. Cook.*

4046. GALLOWAY, B. T. Improved method of propagating the Litchi. Jour. Heredity 13: 201-206. 5 fig. 1922.—The Litchi is one of the principal fruits of South China, but is practically unknown in the Western Hemisphere. This is in part due to the fact that the seed perish if not planted immediately and to the great difficulties of propagation. Inarching is the method used by the Chinese, but it is slow and produces misshapen plants. The Office

of Foreign Seed and Plant Introduction, U. S. Department of Agriculture, has developed a steam-heated propagating case in which the cuttings are placed. This insures uniform temperature, light, and humidity, and with proper soil ($\frac{2}{3}$ peat and $\frac{1}{3}$ sand) very satisfactory results are reported.—*R. C. Cook.*

4047. GANDRUP, JOHANNES. Over den invloed van teer op Heveaschors. [The influence of tar on Hevea bark.] Arch. Rubbercult. 5: 549-559. 1921.—Tar has no effect on the renewal of bark which has been scraped away, as in the treatment of disease. Where the scraping extends nearly to the cambium the tar kills it and increases the size of the wound.—*Carl D. LaRue.*

4048. GEHLSSEN, C. A. De waarde van het bastonderzoek voor de plantsoensveredeling. [The value of bark examination in thinning.] Arch. Rubbercult. 5: 453-463. 1921.—The author finds no difference in reliability between bark examination and yield as criteria for thinning rubber plantations; and as bark examination is cheaper it is preferable.—*C. D. LaRue.*

4049. GRANTHAM, J. Over het Uitdunnen volgens bastonderzoek op de gouvernement's rubberonderneming "Vada." [Thinning by means of bark examination on the government rubber estate "Vada."] Arch. Rubbercult. 5: 541-542. 1921.—The author criticizes Bobilioff and Gehlsen [see Bot. Absts. 12, Entry 4038], claiming that their data are not sufficiently reliable to permit of definite conclusions.—*C. D. LaRue.*

4050. HENDRICKSON, A. H. Further experiments in plum pollination. California Agric. Exp. Sta. Bull. 352. 247-266. 1922.—Results are reported from 3 years' work in 2 California counties on additional varieties, many of which have recently become prominent. The value of honey bees in orchards of shipping plums is emphasized. In addition to varieties previously reported the following Japanese plums proved self-sterile: Apex, Duarte, El Dorado, Formosa, Gaviota, Prize, and Upright. In 3 years' experiments, Formosa and Gaviota were shown to be inter-sterile. Beauty, Methley, and Santa Rosa seemed to be self-fertile, at least to a limited degree. Apex, El Dorado, Formosa, Gaviota, and Kelsey were generally scanty pollen producers and therefore of questionable value as pollinators of other Japanese varieties. Beauty, Burbank, Duarte, Santa Rosa, and Wickson seemed to be the most effective pollinators for the Japanese varieties. Among the European varieties, Imperial and Tragedy were again shown to be self-sterile. Likewise President, Quackenboss, Standard, and Washington failed to set fruit with their own pollen. Diamond set well with its own pollen 1 year, but failed to do so the other 2; for practical purposes it must be considered self-sterile. Pond (Hungarian or Gros prune) when pollinated with its own pollen set no fruit in 1920, but set a light crop in 1922; it is probably partially self-fertile. California Blue, Giant, and Yellow Egg proved self-fertile. Grand Duke, contrary to results obtained at Davis, California, where it was found to be self-sterile under certain conditions, set a small percentage of fruit with its own pollen. All European plums blossoming in midseason or later appeared to be able to cross-pollinate effectively. Tragedy was able to pollinate the Japanese varieties but was not pollinated by them. The presence of honey bees materially aided in setting heavy crops on the following combinations of varieties: Formosa and Wickson; Beauty and Santa Rosa; Diamond and Grand Duke. Observations showed that many other combinations were benefitted by bees. Inter-pollination of Formosa and Gaviota by bees failed; interplanting of these varieties for cross-pollination purposes cannot be recommended. The results showed that whenever a particular cross had been made for 2 or 3 successive years the percentage of set was usually lowest in 1922, a fact probably due to the prolonged period of cold rainy weather during the blossoming season of that year.—*A. R. C. Haas.*

4051. HILLENMEYER, H. F. Synoptic history of the American grape. Nation. Nurseryman 314: 97-99. 1923.—An historic statement is given of grape culture in American and particularly in Kentucky, together with critical observations.—*J. H. Gourley.*

4052. LA RUE, CARL D. Structure and yield in *Hevea brasiliensis*. Arch. Rubbercult. 5: 574-588. 1921.—The correlation between the number of rows of latex-vessels in the outer bark and those in the inner bark is 0.094 ± 0.059 in the case of 126 seedlings 2½ years old, while for mature trees it is no higher. It therefore appears that trees do not produce latex-vessel rings at a uniform rate and that the number of vessels in a seedling cannot be taken as a criterion of the number the mature tree will possess. The correlation between yield of dry rubber and number of rings of latex vessels is 0.513 ± 0.016 , between yield of dry rubber per year per cm. of width of tapping surface and number of latex-vessel rings, 0.0457 ± 0.017 . The bark types as based on distribution of stone-cell layers described by Bobilioff (Arch. Rubbercult. 2: 1918) could not be distinguished in this investigation. The structure of the bark of a given tree may change under certain conditions. The following correlations are given: between yield of rubber and circumference of tree, 0.299 ± 0.019 ; circumference of tree and thickness of bark, 0.26 ± 0.02 ; number of latex-vessel rings and circumference of tree, 0.162 ± 0.021 ; thickness of bark and number of rings of latex-vessels, 0.15 ± 0.02 ; increase in girth and yield of rubber, 0.375 ± 0.038 . These indicate the importance of rapid growth of the trees during the whole period of production. Approximately 1000 trees were used in computing the correlations.—C. D. LaRue.

4053. LESOURD, F. Rajeunissement des pêcheurs en plein vent. [Rejuvenation of peach trees out of doors.] Rev. Hort. 91: 432. 1921.

4054. MAAS, J. G. J. A. Uitdunnen volgens bastonderzoek. [Thinning by bark examination.] Arch. Rubbercult. 5: 543-548. 1921.—The author criticizes Bobilioff and Gehlsen [see Bot. Absts. 12, Entry 4038], showing the unreliability of their data.—C. D. LaRue.

4055. McCORMICK, A. C. Blight resistance in pear stocks. Nation. Nurseryman 314: 112, 114. 1923.

4056. MASON, S. C. The Saidy date of Egypt: a variety of the first rank adapted to commercial culture in the United States. U. S. Dept. Agric. Bull. 1125. 35 p., 8 pl., 4 fig. 1923.—Of hundreds of varieties of the date palm few have attained commercial importance in Europe or America and the discovery of the adaptation to southern California of the Egyptian Saidy (Sayd or Saydeh) variety "marks a new era in date production in the United States." Much space is devoted to such topics as: character and early history of the Libyan oases (the home of the Saidy date), early Egyptian knowledge of the date palm, accounts of oasis dates by modern teachers, the proof of the identity of "Wahi," "Sewi," and Saidy dates, and its standing as a commercial variety. A study of the temperature requirements for the Saidy date shows that conditions at Mecca, California, are very nearly identical with those of the Egyptian oases. At Temple, Arizona, there is a deficiency in the mean minimum temperature curve of 7-8°F. between flowering time and midsummer, a condition which may account for the fact that these dates fail to mature at the Temple gardens. Saidy dates also have greater resistance to atmospheric humidity than such varieties as Deglet Noor, rendering them more immune to the smut fungus *Graphiola phoenixia*, and suitable for culture to a vast area of the Imperial Valley of California and the lower Colorado Valley of both California and Arizona.—J. T. Buchholz.

4057. MIDDLETON, W. A. Yields, grades, prices and returns for apple varieties in the Okanagan Valley. British Columbia Dept. Agric. Bull. 90. 13 p. 1922. —A comparison is made of 25 commercial varieties.—J. W. Eastham.

4058. PECK, H. H. An object lesson to citrus growers. Agric. Gaz. New South Wales 34: 70. 1923.

4059. PRICE, J. C. C. The grape. Alabama Agric. Exp. Sta. Bull. 211. 33-50. 14 fig. 1920.—This is a report of tests of 48 varieties of bunch grapes and 6 of muscadine grapes.

Technical descriptions of the several varieties of fruit and photographs of typical clusters are furnished. Judged by the productiveness, hardness, and vigor over a period of 6 years under similar conditions and treatment on the Experiment Station Farm at Auburn, Alabama, the following bunch grapes are considered best suited to Alabama conditions: Brighton, Catawba, Concord, Delaware, Diamond, Ives, Isabella, Moore, Niagara, Warden, and Winchell. The results with muscadines are not as clear cut, though Scuppernong and Thomas grapes seem to be the best of those tested.—*W. A. Gardner.*

4060. PROSCHOWSKY, A. R. *Butia capitata* (Becc.) var. *deliciosa*. Rev. Hort. 94: 39. 1922.—The fruits are entirely without fiber, easily freed from the stone, and of agreeable, sub-acid flavor. The tree withstands drought and relatively low temperatures without injury.—*E. J. Kraus.*

4061. ROBERTSON, W. H. The growth of the small-fruit industry [in British Columbia.] Agric. Jour. [British Columbia] 7: 270-271. 1923.

4062. SCHUSTER, C. E. Filberts. Oregon Agric. Exp. Sta. Circ. 28. [Unpaged.] 1922.—The author discusses suitable soils, propagation, planting, cultivation, pruning, harvesting, varieties, and cross-pollination.—*C. E. Owens.*

4063. SCHUSTER, C. E. Pollination of the sweet cherry. Oregon Agric. Exp. Sta. Circ. 27. [Unpaged.] 1922.—Self-sterility, inter-sterility, pollinizers and cross-pollination, number of pollinizer trees, varieties suitable for pollinizers, and part played by bees are discussed.—*C. E. Owens.*

4064. SCHUSTER, WILH. Das liebliche Blümchen Borretsch. [The lovely borage blossoms.] Die Biene 61: 23. 1923.—Borage (*Borago officinalis*) was formerly used extensively in salads as well as recognized as a desirable honey plant.—*M. G. Dadant.*

4065. SIMPSON, R. Government nurseries at Oliver, B. C. Agric. Jour. [British Columbia] 7: 222-223. 1922.

4066. STAHEL, GEROLD. Eukele praktische wenken voor het oculeeren van cacao. [Some practical hints in budding cacao.] Dept. Landb. Suriname Mededeel. 17. 2 p. 1919.—Seed for stocks must be selected from very strong trees. The seedlings with 2-3 leaves are transplanted in well shaded nursery rows; when 1½-2 years old they are usually 2½-3 feet high and suitable for budding, which is done by the Forkert method preferably in the first weeks of the rainy season. Within 2-3 weeks the top of the plant is bent over and tied to a neighboring one so that the budded part is at the uppersurface. When the bud has produced a shoot 1½ feet long (4-6 months) the bended portion of the stem is cut off directly above the budding place. Budding wood may be used only when the bark has a dark brown color.—*J. C. Th. Uphof.*

4067. STEINMANN, A. Over den invloed van teer op de regeneratie van den bast bij *Hevea brasiliensis*. [The influence of tar on the renewing bark of *Hevea brasiliensis*.] Arch. Rubbercult. 5: 495-503. 1921.—An increased thickness of bark may be secured by the use of coal tar, due to increased activity of the cork cambium. Since no increase takes place in the latex-bearing part of the bark the application of tar is not advised.—*C. D. LaRue.*

4068. STEVENS, NEIL E. The possible relation of spring temperatures to the keeping quality of the cranberry crop. Proc. Amer. Cranberry Grower's Ann. Meeting 53: [Unpaged.] 1923.—Supranormal temperatures during the shipping season and excessive precipitation during the harvest period are unfavorable for good keeping qualities of cranberries. It is shown that accumulated excess temperatures during May and June are usually correlated with poor keeping quality of the crop for that season. Data for the years 1912-1922 show only 1 year in which this general relationship does not hold; it is thought that this season was too

cool for favorable development of the cranberry crop. It is thought that a knowledge of the temperatures for May and June will be of value to sales agents in handling the crop for the season.—*J. K. Shaw.*

4069. STOKLEY, C. L. **Succeeding with the Cavendish banana.** Florida Grower 27¹⁰: 8-9. 1923.—Conditions in parts of Florida are suitable for commercial banana growing. Pure muck soils on which water does not stand are best although higher land answers if well supplied with humus and irrigated. Fertilizer is necessary for high yields. Plants set out in March or April produce fruit the following autumn, 1 acre yielding as much as 400 bunches.—*J. C. Th. Uphof.*

4070. STUBENRAUCH, A. V., MILO N. WOOD, and CHARLES J. BOOTH. **Horticulture for schools.** *xxiii + 325 p., 8 pl., 135 fig.* Macmillan Co.: New York. 1922.—“This book is intended as a text-book of horticulture for high-schools and for other schools requiring a text for pupils of high-school grade, and also for use in homes and reading courses.” The major portion of the material in this volume was brought together by the senior author but after his death it was completed by the junior authors.—The material is elementary in nature and the number of subjects treated is extensive for the size of the book.—Five chapters treat of the plant and its propagation; 4 of vegetable culture; 4 of deciduous fruits and orchard management; 1 of semi-tropical fruits; 1 of small fruits and the grape; 2 of marketing; 1 of incidental products; and 1 of the use of ornamental plants.—*J. H. Gourley.*

4071. TUFTS, WARREN P. **Thinning deciduous fruits.** California Agric. Exp. Sta. Circ. 258. 13 p., 5 fig. 1923.—Specific recommendations are given.—*A. R. C. Haas.*

4072. VINKEN, E. J. **De papaja.** [The papaya.] West Indië 5: 32-35. 1920.—This contains a description of papaya growing. Two instances are cited of a male tree producing fruit. Attempts to change a staminate into a pistillate tree by incisions failed.—*J. C. Th. Uphof.*

4073. VISCHER, W. **Over samengestelde kurkhuidvorming en natuurlijke bastvernieuwing bij Hevea brasiliensis.** [Cork formation and bark renewal in Hevea brasiliensis.] Arch. Rubbercult. 5: 486-492. 1921.—Successive layers of cork cambium are formed one inside the other. Since the outer layers die and are shed, bark affected with brown bast disease may ultimately be thrown off. It was found that the application of tar greatly increases the local activity of the cork cambium.—*C. D. La Rue.*

4074. WALLE, PAUL. **La culture du caféier dans l'état de São-Paulo.** [Culture of coffee in the State of São Paulo.] Rev. Bot. Appl. 2: 5-11. 1922.—The present status of the coffee industry is considered, with brief historical notes, and attention is called to its amazing growth during the past 100 years. The writer then takes up the area occupied by the coffee plantations, method of cultivation, diseases, yield, preparation for the market, principal varieties grown, commercial aspect of the industry, and the future of coffee growing in the state of São Paulo, which he regards as promising.—*Paul Russell.*

4075. WHITE, ELIZABETH C. **Report of progress in blueberry culture.** Proc. Amer. Cranberry Growers' Ann. Meeting 53: [Unpaged.] 1923.—A 16-acre plantation more or less in bearing yielded about 1,000 bushels. Nearly all the plants were seedlings and showed much individuality in frost injury. Seedlings on lower ground but from frost-resistant parents showed no damage. Certain named varieties were frost resistant.—*J. K. Shaw.*

4076. WOLK, P. C. VAN DER. **Opkomst en nieuwe wegen der cocos-cultuur.** [Rise and new methods of cocos growing.] West Indië 4: 116-130. 1919.—In transplanting cocos seedlings care should be taken to protect the roots from injury. The vertical method results in germination within 4 months rather than 9, and the seedlings can be planted deeper. Artificial irrigation is desirable.—*J. C. Th. Uphof.*

4077. WRIGHT, WALTER PAGE. **Practical gardening for pleasure and profit.** 6 vol. 367, 365, 367, 359, 370, and 376 p., illus. Educational Book Co.: London, 1922.—These volumes give a comprehensive treatise of gardening in all its phases. Several other writers have contributed, which has resulted in a cyclopedia of information. The volumes treat respectively of: (1) gardening practice and plant life; (2) vegetables and their cultivation; (3) practical fruit growing; (4) glass houses and pot plants; (5-6) the flower garden.—*J. H. Gourley.*

4078. WYMAN, RICHARD M. **Cultural notes.** Amer. Nurseryman 374: 91. 1923.—This article tells how to handle and transplant nursery stock, especially of evergreens and deciduous shade trees, from the seed bed to the field.—*J. H. Gourley.*

FLORICULTURE AND ORNAMENTAL HORTICULTURE

4079. ANONYMOUS. **Killing weeds on paths and lawns.** New Zealand Jour. Agric. 24: 304. 1922.

4080. ANONYMOUS. **Sterilization of soil in glass houses.** New Zealand Jour., Agric. 25: 42-46. 5 fig. 1922.—Apparatus and methods for rapid and effective steam sterilization are discussed. Such sterilization is of doubtful value for eelworm control as thorough treatment is not likely to extend to a depth greater than 9 inches while eelworms may be found at 18 inches.—*N. J. Giddings.*

4081. ALDERWERELT VAN ROSENBURGH, C. R. W. K. VAN. **Index Pteridophytorum quae anno 1919 in Horto Botanico Bogoriensi coluntur.** [Index of pteridophytes cultivated in 1919 in the Botanic Garden at Buitenzorg.] Bull. Jard. Bot. Buitenzorg III, 1: 358-351. 1919.

4082. COSTANTIN ET MAGROU. **Applications industrielles d'une grande découverte française.** [Practical applications of a great French discovery.] Ann. Sci. Nat. Bot. 4: i-xxxiii. Fig. 1-32. 1922.—A discussion is given of commercial attempts in growing orchids from seed by inoculation with certain endophytic fungi.—*Paul Weatherwax.*

4083. DAVIDSON, H. C. **The culture of pot plants: in rooms, greenhouses, and frames.** vii + 154 p. C. Lockwood & Son: London, 1922.—In this practical treatise on the handling of ornamental plants in the house and under glass, chapters are devoted to handling house plants; annuals; herbaceous perennials; hardy and tender shrubs; scented and bulbous plants; and pot plants.—*J. H. Gourley.*

4084. FINDEISEN, THEODOR. **Einiges über Azaleentreiberei.** [About azalea forcing.] Möllers Deutsch. Gärt. Zeitg. 38: 6-7. 1923.—In forcing *Azalea indica* proper light is of as much importance as heat. Detailed cultural directions are given.—*J. C. Th. Uphof.*

4085. LAPLACE, F. **Culture des Nymphaea bleus comme plantes annuelles.** [The culture of blue Nymphaeas as annuals.] Rev. Hort. 94: 10-12. Fig. 3. 1922.—Plants from seed started in the greenhouse from November to March, when planted in the open near the end of May, flower from July until freezing weather. A number of species and varieties are listed.—*E. J. Kraus.*

4086. LESOURD, F. **Trois variétés de dahlias simples.** [Three varieties of single dahlias.] Rev. Hort. 94: 34. 1 pl. (colored.) 1922.

4087. MACSELF, A. J. **Hardy perennials.** 219 p., color photographs, water-color drawings, line drawings. T. Butterworth, Ltd.: London, 1922.—This is a general treatise on the culture of hardy perennials together with a description of a number of "those that are worth growing." Planting, propagating hardy plants, care of plants in the garden, and plants worth growing are discussed in separate chapters.—*J. H. Gourley.*

4088. MOTTET, S. *Eucryphia pinnatifolia* Spach. Rev. Hort. 94: 32-34. Fig. 8-9. 1922.

4089. PRESCOTT, EDWARD E. *The Dahlia in Australia*. 122 p. Whitcombe & Tombs, Ltd.: Melbourne. 1920.—This volume deals with the evolution of this popular flower, its introduction, a description of types, and with Dahlia species, together with much cultural information.—J. H. Gourley.

4090. PURPUS, A. *Winterharte Selaginellen*. [Hardy Selaginellas.] Möllers Deutsch. Gärt. Zeitg. 38: 17-18, 29-30, 41-42. 4 fig. 1923.—The following species of *Selaginella* are mentioned as resistant to the winters in Germany: *S. helvetica* Lk., *S. denticulata* Link. (not *S. denticulata* Hort.), *S. Douglasi* Spring., *S. mongolica* Rub., *S. Mariesii* Baker, *S. apus* Spring., *S. Ludiwiciana* A. Br., *S. nipponica* Franch et Sav., *S. Savatieri* Baker., *S. borealis* Spring., *S. selaginoides* Link., and *S. rupestris* Spring.—J. C. Th. Uphof.

4091. PYLE, ROBERT. *How to grow roses*. 14th ed., 189 p., 15 color pl., half-tones, line drawings. Conrad & Jones Co.: West Grove, Pennsylvania, 1923.—In this attractive treatise on the culture of the rose, an appeal is made to interest all in rose growing and explicit information is given on choice of varieties and garden operations. The amateur and rose fancier will find the groupings of roses for special purposes a convenient feature of the work. The following chapter headings indicate the nature of the contents: Comradeship of the rose; where on my place can I grow roses; how to choose the choicest; universal favorites and special purpose varieties; laying the foundation; planting; rose-time; protecting the roses; pruning for abundance; the best roses for America; selections by experts for special sections; extending the dominion of the rose; hybridizing; own-root and budded or grafted roses; how to preserve rose fragrance; roses for forcing or indoor bloom. In the appendix are given: Rose-lovers' calendar of operations; rose synonyms; analysis of species; and bibliography.—J. H. Gourley.

4092. ROUX, J. *Echinopsis Eyriesii et multiplex*. Rev. Hort. 94: 29-30. 1922.—This is a spontaneous hybrid intermediate between the parents in several characters.—E. J. Kraus.

4093. SANDERS, THOMAS WILLIAM. *Rock gardens and alpine plants*. 3rd ed., 205 p., illus. (colored pl. and half tones). W. H. & L. Collingridge: London, 1922.—This is a complete guide to the construction of large and small rockeries, the cultivation of alpine plants, and use of water gardens.—J. H. Gourley.

4094. STEIDEL, HEINR. *Clematis durch Stecklinge vermehrt*. [Clematis propagated from cuttings.] Möllers Deutsch. Gärt. Zeitg. 38: 42-43. 1 fig. 1923.—Clematis is usually propagated by grafting but several forms of the *lanuginosa*, *florida*, *patens*, *Jackmanni*, and *coccinae* classes can be propagated successfully from cuttings taken in July. After removing $\frac{2}{3}$ of the leaves of the cuttings the latter are put in a mixture of peat dust and sand, covered by a layer of washed sand and placed in a medium warm frame in a shaded and moist environment.—J. C. Th. Uphof.

4095. STURM, H. *Helleborus als winterblühende Blütenstaude*. [Helleborus as flowering herbaceous plants in winter.] Möllers Deutsch. Gärt. Zeitg. 38: 18-19, 42. 1923.—The following forms are suitable for forcing: *Helleborus abchasicus*, Mme. Tourtado, *H. colchicus*, *H. corsicus*, *H. guttatus*, *H. giganteus*, *H. Kochi*, and *H. lividis*. Three- to 4-year old plants should be transplanted with soil adhering to the roots and placed under glass in October. Flowers appear within a few weeks.—J. C. Th. Uphof.

4096. TOOLE, WILLIAM, SR. *Native plants of Wisconsin suitable for cultivation*. 54 p., frontispiece. Wisconsin State Horticultural Society: 1922.—This booklet includes an introduction by FREDERIC CRANFIELD and 5 separate papers by the author, as follows: Domesticating our native flowers; native shrubs; our native trees; cultivating our native ferns; and our native climbing vines.—J. H. Gourley.

4097. VALETON, TH. *Index Zingiberacearum quae anno 1919 in Horto Botanico Bogoriensi coluntur.* [Index of Zingiberaceae cultivated in 1919 in the Botanic Garden at Buitenzorg.] Bull. Jard. Bot. Buitenzorg III, 1: 321-326. 1919.

4098. WEBSTER, ANGUS DUNCAN, *London trees.* xii + 218 p., 32 fig. Swarthmore Press: London, 1922.—An account is presented of the trees that succeed in London, with descriptive notes and historical incidents. A spirit has grown up in the city to plant and preserve beautiful trees and special provision is made to protect them.—*J. H. Gourley.*

4099. WUST. *Schönblühende Stauden für den Imkergarten, Siedlungen und Vorgarten.* [Beautiful blooming shrubs for the bee garden, settlement, and flower garden.] Markische Bienenzeitg. 13: 43. 1923.—Descriptions are given of shrubs of varying heights especially suited to home planting.—*M. G. Dadant.*

VEGETABLE CULTURE

4100. BECKEL. *Sortenanbauversuch mit Rotkohl im Jahre 1922.* [Variety test of red cabbage in 1922.] Mitteil. Deutsch. Landw. Ges. 38: 100-101. 1923.—Tests were conducted with 5 varieties on 5 fields. In taste and odor all scored alike but in color Zittauer giant scored highest and Holland blood red lowest. As a result of the trials the author ranks Westfalia first, Danish stonehead second, and Zittauer giant last, with Holland blood red and Othello near the end of the list.—*A. J. Pieters.*

4101. BECKEL. *Sortenanbauversuche mit Tomaten im Jahre 1922.* [Variety tests with tomatoes in 1922.] Mitteil. Deutsch. Landw. Ges. 38: 123-124. 1923.—In this test with 4 varieties on 5 experimental fields the variety Danish Export produced the best fruit.—*A. J. Pieters.*

4102. DAVIDSON, H. C. *Vegetable culture: A practical manual.* viii + 144 p. C. Lockwood & Son: London, 1922.—This book is an attempt to answer many questions that have come to the author in his correspondence. He outlines his own practices and gives his reasons for them. Special mention is made of trenching and manuring; use of the hoe to destroy weeds and keep the soil in good tilth; use of lime to correct acidity and also for the control of club root of Cruciferae. The volume contains good practical directions throughout.—*J. H. Gourley.*

4103. HOLT, P. *Cantaloupes in Imperial Valley.* Amer. Bee Jour. 62: 379. 1922.

4104. ISBELL, C. L., and W. D. KIMBROUGH. *Use of wooden constructed fire heated hot beds for production of sweet potato plants.* Alabama Agric. Exp. Sta. Bull. 217. 6 p., 2 fig. 1922.—The authors give directions for construction of trench and broad types of hot beds and recommendations for their operation.—*W. A. Gardner.*

4105. LEIJS, J. J. *Zoete pataten.* [Sweet potatoes.] West Indië 4: 136-141. 1919.—A description of sweet potato culture in Surinam is given. The variety Blauwkop (Bluehead), which originated from the White Bermuda is of good quality, but does not yield well. Smitranken is also of good quality and is now being tested for productivity.—*J. C. Th. Uphof.*

4106. WEIRUP. *Anbauversuche mit Bohnen im Jahre 1922.* [Tests of beans in 1922.] Mitteil. Deutsch. Landw. Ges. 38: 63-66. 1923.—This report covers the performance of 3 varieties of green pole, 2 of wax pole, and 4 of wax bush beans. The pole wax variety Goldkrone yielded heaviest, all pole varieties outyielding the bush varieties.—*A. J. Pieters.*

4107. WEIRUP. *Anbauversuche mit Erbsen im Jahre 1922.* [Variety tests of peas in 1922.] Mitteil. Deutsch. Landw. Ges. 38: 80-82. 1923.—A detailed report is given of the performance of 4 varieties of garden peas on 5 experimental fields, the variety Moringia receiving the highest score.—*A. J. Pieters.*

4108. WEIRUP. *Sortenwahl beim Gemüsebau*. [Selecting varieties for vegetable culture. *Mittel. Deutsch. Landw. Ges.* 37: 763-764. 1922.—The author gives a list of desirable varieties of peas, beans, carrots, cabbage, and onions.—A. J. Pieters.

4109. ZIMMERLEY, H. H. *Cabbage strain tests*. *Virginia Truck Exp. Sta. Bull.* 37-38. 211-220. 1922.—Strains of Early Jersey Wakefield in 1920 and 1921 yielded 6.13-9.9 and 6.66-9.87 tons per acre respectively. Early cuttings in 1920 ranged from 0.13 to 4.53 and in 1921 from 0.9 to 5.63 tons per acre. Results show a big variation in total yield and production of early maturing heads from seed obtained from different sources. Strains of Charleston Wakefield in 1920 yielded 7.16-11.9 tons per acre, and in 1921, 10.6-14.22. Early cuttings in 1920 varied from 0.0 to 1.93 tons and in 1921 from 0.4 to 3.50 tons per acre. In 1921 premature seed stalk production in fall-planted Early Jersey Wakefield varied in different strains from 4.7 to 25.3 per cent and in the Charleston Wakefield from 14 to 28 per cent. "In the four earliest lots of Early Jersey Wakefield an average of 10.9 per cent of the plants went to seed as compared with 21.7 per cent in the four latest headings lots. . . . The plants which form a small compact head early in the season are less likely to seed prematurely than those which are somewhat open headed and leafy."—H. A. Jones.

HORTICULTURE PRODUCTS

4110. ANONYMOUS. *Over het gebruik van koffiepulp*. [Concerning the use of coffee pulp.] *West Indië* 6: 24-27. 1921.—Use of coffee pulp as (1) manure, (2) fuel, and (3) in the manufacture of alcohol is advised.—J. C. Th. Uphof.

4111. ALLEN, W. J., and S. A. HOGG. *The drying of prunes, currants, sultanas, and raisins*. *Agric. Gaz. New South Wales* 34: 135-138. 1923.

4112. AZOULAY, LÉON. *Le commerce et l'industrie des champignons secs en France et à l'étranger*.—Mesures à prendre pour prévenir les empoisonnements qu'ils peuvent causer. [The dried mushroom trade in France and elsewhere.—Precautions necessary to prevent poisoning.] *Bull. Trimest. Soc. Mycol. France* 38: 117-122. 1922.—The report of a committee regarding the preparation and sale of dried mushrooms is given.—D. S. Welch.

4113. AZOULAY, LÉON. *Proposition de loi ayant pour objet de prévenir les empoisonnements dus aux champignons mis en vente et à ceux cueillis par les particuliers*. [Legislation for the prevention of poisoning by mushrooms placed on sale or collected for individual use.] *Bull. Trimest. Soc. Mycol. France* 38: 109-116. 1922.—Information is included as to the extent and seriousness of mushroom poisoning, methods of prevention by public advertising, inspection, sales regulation, licences, and other means of protecting the public. The text of the proposed law is given.—D. S. Welch.

4114. GEORGI, C. D. V. *Oil from Aleurites species*. *Malayan Agric. Jour.* 10: 202-205. 1923.—The very hard nut of *Aleurites moluccana* may be most conveniently cracked by heating at 130-140°C. for 1 hour and then soaking in cold water. The yield of oil is given, also its constants.—I. H. Burkill.

4115. GEORGI, C. D. V. *Some Malayan oils and fats of minor importance*. *Malayan Agric. Jour.* 10: 222-227. 1923.—This gives the amount of oil and its constants in seed of *Bertholletia excelsa*, *Calophyllum inophyllum*, *Croton tiglium*, *Nephelium mutabile*, and *N. lappaceum*, locally produced.—I. H. Burkill.

4116. POWER, FREDERICK B., and VICTOR K. CHESNUT. *Examination of authentic grape juice for methyl anthranilate*. *Jour. Agric. Res.* 23: 47-53. 1923.—This ester is found in all varieties examined which are of *labrusca* origin and also in hybrid varieties in which this species predominates. Juices from varieties of *Vitis rotundifolia* from southern U. S. A., from *V. vinifera* from California, and from 1 sample of juice of *V. bourquiniana* did not have the ester.—D. Reddick.

4117. THOMMEN, GUSTAVE. Notes on the fern leaf industry. Amer. Fern Jour. 12: 122-125. 1922.—Fern leaves are collected in the fall and stored in cold frames or refrigerating places at a temperature of 31-32°F. Before they reach the market there is often a loss of 50-75 per cent, the cause of which is not understood.—*F. C. Anderson.*

MORPHOLOGY, ANATOMY AND HISTOLOGY OF VASCULAR PLANTS

E. W. SINNOTT, *Editor*

(See also in this issue Entries 3749, 3766, 3816, 3829, 3841, 3908, 3931, 3967, 4073, 4255, 4342, 4349, 4352, 4397, 4402, 4511, 4568, 4571, 4575, 4584, 4603, 4666, 4715)

4118. ALBEGGIANI, ELISABETTA. Misure ed osservazioni comparative sullo sviluppo in superficie degli organi fogliari e radicali. [Comparative measurements and observations on development of leaf and root systems.] Bull. R. Orto Bot. Palermo 2:157-170. 1921.—The extent of leaf and root surfaces was estimated for a number of plants of different species (*Urtica dioica*, *Tropaeolum majus*, *Helianthus annuus*, *Chenopodium album*, *Ricinus communis*, *Portulaca oleracea*, *Phaseolus vulgaris*, *Mercurialis annua*, etc.). Results indicated that the leaf surface is usually greater than that of the roots, and sometimes twice as great. The two tend to be equal when plants are young, but with maturity the leaf surface increases more rapidly than that of the roots.—*Edith K. Cash.*

4119. BAILEY, IRVING W. The anatomy of certain plants from the Belgian Congo, with special reference to myrmecophytism. Bull. Amer. Mus. Nat. Hist. 45: 585-621. Pl. 30-45. 1922.—Studies were made of *Vitex Staudii*, *Curiera* sp., *Platonia Laurentii*, *P.* sp., *Barteria fistulosa*, *B. dewevrei*, and *Sarcocephalus* sp.—The food of twig-inhabiting ants is described. Theories of myrmecophily and myrmecophytism are discussed, with the following conclusion: "Certain plants tend—for reasons which are at present obscure—to form extrafloral nectaries, food-bodies, prostomata, saccate leaves, fistulose branches, and other pseudodomatia, etc. In many cases, but by no means in all, these structural modifications of plants are taken advantage of by ants in their search for food and domatia. The myrmecophytic relationship which results is purely a case of parasitism in which all the advantage lies with the ants."—The origin of pseudo-gall forming habit is discussed.—*Frank E. Lutz.*

4120. BAURE, RAPHAEL. Entwicklungsgeschichtliche Untersuchungen an Polygonaceenblüten. [Development of the flower in the Polygonaceae.] Flora 115: 273-292. Pl. 2-8. 1922.—The floral plan of the Polygonaceae is 5-merous, not 3-merous. It is doubtful whether the Eriogoneae should be classed with the Polygonaceae.—*A. G. Stokey.*

4121. BECQUEREL, PAUL. La théorie de meriphyte devant les phénomènes de l'ontogénie vasculaire. [The theory of the meriphyte in the light of the phenomena of vascular ontogeny.] Compt. Rend. Acad. Sci. Paris 175: 233-235. 1922.—The author discusses the validity of Chauveaud's theory of vascular evolution. He supports the conclusions of Chauveaud as based on many species of the higher plants, and criticizes Bugnon for confining his studies to a single species.—*C. H. Farr.*

4122. BÖNING, KARL. Ueber den inneren Bau horizontaler und geneigter Sprosse und seine Ursachen. [The inner structure of horizontal and bent shoots and its causes.] Ber. Deutsch. Bot. Ges. 40: 279-282. 1922.—This is a report of observations upon anatomical differences in the tissues produced in eccentric radial growth of horizontal shoots of many herbaceous and woody plants. The author suggests that the unequal growth on the upper and lower side of shoots is due to mechanical stretching on the upper side, and pressure on the lower side. Any difference on the 2 sides of the shoot is usually due to differences in the xylem elements, which have slightly lignified and much thickened walls on the upper side, and the reverse on the lower side. Eccentric radial growth was found most commonly in trees and least commonly in herbs.—*W. C. Muenscher.*

4123. BOUVRAIN, GEORGES. Sur l'évolution vasculaire dans la *Mercuriale*. [On the vascular development of *Mercurialis*.] *Compt. Rend. Acad. Sci. Paris* 175: 380-382. 1922.—The author defends the interpretation of Chauveaud, as opposed to that presented by Bugnon [see Bot. Absts. 12, Entries 4125, 4126, 4127, 4129].—C. H. Farr.

4124. BRUYNE, C. DE. Idioblastes et diaphragmes des *Nymphéacées*. [Idioblasts and diaphragms of the *Nymphaeaceae*.] *Compt. Rend. Acad. Sci. Paris* 175: 452-455. 1922.—*Nuphar luteum*, *Nymphaea alba*, *N. lotus*, and *Victoria regia* were studied. Contrary to the report of certain authors, all of the *Nymphaeaceae* are provided with partitions in the aeriferous canals, either in all parts or only in the root. The idioblasts are branching sclerenchymatous cells.—C. H. Farr.

4125. BUGNON, P. L'organisation liberoligneuse chez la *Mercuriale* reproduit-elle une disposition ancestrale? [Is the fibro-vascular organization of *Mercurialis* an ancestral arrangement?] *Compt. Rend. Acad. Sci. Paris* 174: 1484-1486. *Fig. 1 (i-iv)*. 1922.—A continuation of a previous study [Ibid. 174: 1194. 1922]. A study is made of the fundamental difference between the vascular organization at the base of the cotyledon and at the base of the vegetative leaves. It is found in opposition to Chauveaud, that the 2 regions are identical in their principal characteristics; differences are of secondary importance.—C. H. Farr.

4126. BUGNON, P. Sur l'accélération basifuge dans l'hypocotyle. [The basifugal acceleration of the hypocoty.] *Compt. Rend. Acad. Sci. Paris* 175: 43-45. 1922.—Chauveaud's interpretation [see Bot. Absts. 12, Entry 4129] of the anatomy of the hypocotyl of *Mercurialis* as opposed to the author's interpretation is discussed [see preceding entry]. It is concluded that the basifugal acceleration theory is based on the postulate of the initial continuity of the embryonic conductive apparatus. It does not explain the character common to the centripetal and centrifugal protoxylem. Certain vessels in the hypocotyl region are destroyed, in the course of germination, by the intercalary growth of the region. [See also Bot. Absts. 12, Entry 4123].—C. H. Farr.

4127. BUGNON, P. Sur la différenciation vasculaire basipète pour toutes les traces foliaires chez la *Mercuriale*. [On the basipetal vascular differentiation of all the foliar traces in *Mercurialis*.] *Compt. Rend. Acad. Sci. Paris* 175: 897-899. 7 *fig.* 1922.—Figures and descriptions are given of the leaf traces at 6 levels. The author regards Chauveaud's theory [see Bot. Absts. 12, Entry 4129] of basifugal acceleration as unnecessary to explain the basipetal vascular differentiation of the hypocotyl of *Mercurialis*. [See also Bot. Absts. 12, Entry 4123].—C. H. Farr.

4128. BUGNON, P. Sur la position systématique des *Euphorbiacées*. [On the systematic position of the *Euphorbiaceae*.] *Compt. Rend. Acad. Sci. Paris* 175: 629-632. *Fig. 1-2*. 1922.—This family is placed by some in the *Apetalae* next to the *Urticales*, and by others in the *Dialypetalae* next to the *Malvales*. Wettstein considers it transitional between the *Apetalae* and the *Dialypetalae*. In embryological characters, especially the venation of the cotyledons, the *Euphorbiaceae* seem to be closely related to the *Sterculiaceae*, a family of the *Malvales*.—C. H. Farr.

4129. CHAUVEAUD, GUSTAVE. Les principales variations du développement vasculaire dans les premières phyllorhizes des phanérogames ne sont pas déterminées par l'accroissement intercalaire. [The principal variations in the vascular development of the primary phyllorhiza of phanerogams are not determined by intercalary growth.] *Compt. Rend. Acad. Sci. Paris* 174: 1487-1489. 1922.—A study was made of the vascular variations in parts of the seedlings of *Ricinus* and *Mercurialis*. In *Ricinus* the basifugal accelerations are more marked than in *Mercurialis*.—C. H. Farr.

4130. COSTANTIN, J. Sur les croix de Malte présentées par les bois soumis à des traumatismes. [The Maltese cross seen in wood after wounding.] *Compt. Rend. Acad. Sci. Paris*

174: 1313-1316. 1922.—This phenomenon is most evident in chestnut, but also in certain species of *Acer*, *Staphylea*, black alder, dogwood, oak, ash, and service-tree. Advantage is taken of it in treating wood preparatory to making canes, pen holders, and similar articles. A large number of superficial cicatrices of the cortex are made Mar. 15-Apr. 15. The pattern of the section varies with the manner of making the cuts and the kind of wood.—C. H. Farr.

4131. DENHAM, H. J. The structure of the cotton hair and its botanical aspects. British Cotton Indust. Res. Assoc. Shirley Inst. Mem. 1: 87-100. 1922. [See Bot. Absts. 12, Entry 537.]

4132. FISCHER, HUGO. *Anemone alpina* L. mit monstrosen Blütenhüllblatt. [*Anemone alpina* L. with an abnormal perianth lobe.] Ber. Deutsch. Bot. Ges. 37: 476-478. Fig. 1. 1919.—An abnormal perianth lobe of *Anemone alpina* is described. The possible origin of perianth lobes from green leaves is discussed.—W. C. Muenscher.

4133. GANDRUP, JOHANNES. Over den steencellenring in de schors van Hevea. [The stone-cell ring in the cortex of Hevea.] Arch. Rubbercult. 5: 465-471. 1921.—The stone-cell ring develops from, and replaces, a ring of bast fibers.—C. D. La Rue.

4134. GANDRUP, JOHANNES. Over der kurklaag van Hevea schors. [The cork layer of Hevea bark.] Arch. Rubbercult. 5: 389-396. 1921.—The method of formation of cork is discussed. Tissues of the bark affected with brown bast disease will not be cut off by cork formation.—C. D. La Rue.

4135. GATIN, C. L. Première contribution à l'étude de l'embryon et de la germination des Aracées. [Embryo and germination in the Araceae.] Ann. Sci. Nat. Bot. X, 3: 145-169. Pl. 1-10. 1921.—Ten genera of the family are considered. The embryo is an undifferentiated proembryonal mass in *Caladium*, but more or less differentiation is shown in other genera. The endosperm is lacking in the mature seed in some genera. The vascular tissue is described as showing much variation in form. The primary root of the seedling often fails to develop, its place being taken by secondary roots, which may be formed before the maturity of the seed. Polyembryony, or at least the production of more than 1 embryonal axis in a single seed, is noted in *Aglanema* and *Dieffenbachia*.—Paul Weatherwax.

4136. GEISENHEYNER, L. Ueber eine monströse *Linaria vulgaris*. [A monstrosity in *Linaria vulgaris*.] Ber. Deutsch. Bot. Ges. 37: 479-484. Fig. 1-2. 1919.—The flower and inflorescence is described. [See also Bot. Absts. 12, Entry 4138.]-W. C. Muenscher.

4137. GERTZ, OTTO. Ueber septierte Stomazellen. [Septate guard cells.] Ber. Deutsch. Bot. Ges. 37: 329-334. Fig. 1-16. 1919.—Stomata with more than 2 guard cells and other stomatal abnormalities are described and illustrated for a number of plants.—W. C. Muenscher.

4138. GRAF, JACOB. Eine abnorme Blütenbildung bei *Linaria vulgaris*. [An abnormal flower structure in *Linaria vulgaris*.] Ber. Deutsch. Bot. Ges. 37: 485-489. Pl. 7. 1919.—A study of the structure of the abnormal flowers of *Linaria vulgaris* described by Geisenheyner [see Bot. Absts. 12, Entry 4136] is reported.—W. C. Muenscher.

4139. GYORFFY, I. Keimlinge der Weissstanne mit Doppelblättern. [Seedlings of white fir with double leaves.] Ber. Deutsch. Bot. Ges. 39: 123-125. Fig. 1. 1921.—Four seedlings of *Abies alba* with double or forked cotyledons are described and pictured.—W. C. Muenscher.

4140. HASTINGS, G. T. Rudimentary sporangia on the royal fern. Torrey 23: 10. 1923. In May, 1922, many plants of *Osmunda regalis* showed a tendency for all fronds to be fertile, over $\frac{1}{2}$ of the plants bearing rudimentary sporangia on the upper pinnae of the sterile fronds. These were about $\frac{1}{3}$ the size of normal sporangia, and were in all stages of development. Later in the season no sporangia were observed.—J. C. Nelson.

4141. HEIMLICH, LOUIS F. *Peloria* in *Linaria* and other plants. *Proc. Indiana Acad. Sci.* 1921: 111-116. *Fig. 1-12.* 1922.—On more than a dozen plants of *Linaria vulgaris* Hill all flowers had 5 spurs instead of 1. Others noted were *Delphinium belladonna*, with 1 sepal divided and leaflike; *Calendula officinalis* L., with some of the small flowers changed into small heads on long pedicels; *Picea excelsa* L., which produced from a terminal bud a cone containing small loose scales with large microsporangia at the base and a middle zone of sterile scales resembling megasporophylls.—*F. C. Anderson.*

4142. HEINRICHER, E. Ueber die Blüten und die Bestäubung bei *Viscum cruciatum* Sieb. [The flowers and pollination of *Viscum cruciatum*.] *Ber. Deutsch. Bot. Ges.* 40: 168-173. *Fig. 1-2.* 1922.—The general structure of the small and inconspicuous flowers, the failure to find nectar, and the echinate but not sticky pollen in *Viscum cruciatum*, all suggest wind pollination rather than insect pollination.—*W. C. Muenscher.*

4143. HERZFELD, STEPHANIE. *Ephedra campylopoda* Mey. *Morphologie der weiblichen Blüte und Befruchtungsvorgang.* [Ephedra campylopoda Mey. Morphology of the female flower and fertilization.] *Denkschr. Akad. Wiss. Wien Math.-Nat. Kl.* 98: 243-268. *Pl. 1-2.* 1922.—This species has 2 kinds of female flowers—those borne upon strictly female plants and having only ovules, and those in which the ovulate flowers have some stamens below the ovule. In both, a ring of tissue develops at the base of the nucellus, but subsequently an integument which is prolonged into the long micropyle characteristic of Gnetales develops in the normal flower, while in the modified female flower the development of the integument is more or less abortive or distorted. The ring of tissue below the integument is neither sporophyll, integument, nor perianth, but an organ "sui generis" and homologous with the actinomorphic fertile scales (Fruchtschuppen) of the Taxaceae.—The development of the female gametophyte is normal. All the cells of the upper layer are potential archegonium initials, but the usual numbers developing are 3-5 with 1-6 as the limits. No wall is formed between the ventral canal nucleus and the egg, not even spindle fibers being distinguishable.—The pollen grain at the shedding stage contains 1 prothallial cell, 2 "wall cells," a tube cell, and an "antheridial" cell which, later, gives rise to 2 male cells. One of the male nuclei fuses with the ventral canal nucleus, and the other unites with the egg nucleus. This is described as double fertilization. The author believes that such fusions, described by several students of gymnosperms as occasional occurrences, belong to the same category and constitute a step toward true double fertilization. She found no embryo developing as a result of the fertilization of the ventral canal nucleus.—The reduced condition of the female gametophyte of *Ephedra*, when compared with that of other Gnetales, indicates the way to the origin of the embryo-sac of angiosperms.—The chromosome number of the gametophyte is 6 and that of the sporophyte, 12—just 1/2 the number which is almost universal in gymnosperms.—*Charles J. Chamberlain.*

4144. KOSTYTSCHEW, S. Der Bau und das Dickenwachstum der Dikotylenstämme. [The structure and growth in thickness of the stem of dicotyledons.] *Ber. Deutsch. Bot. Ges.* 40: 297-305. *Fig. 1-10.* 1922.—The arrangement of the procambium determines the shape of the stem in dicotyledons. A continuous ring of procambium develops into a solid cylinder of wood and phloem; isolated groups of procambium develop into distinct vascular bundles. Only the earliest formed cambium ring develops wood and phloem; the interfascicular cambium developed in a few plants produces only parenchyma, which is not identical with the medullary ray tissue formed in a continuous woody ring. The leaf traces in a young cylinder are easily distinguished from the true vascular bundles. These leaf traces are independent morphological units, being purely the result of a correlation between leaf and stem development. The strips of procambium between each leaf trace are often mistaken for interfascicular cambium, giving rise to serious errors.—*C. L. Wilson.*

4145. LA ROSA, ANGELINA. Il periderma picciolare di alcune specie di *Ficus*. [The petiolar periderm of some species of *Ficus*.] *Bull. R. Orto Bot. Palermo* 2: 149-156. 1921.—The species studied, growing in the Palermo Botanical Garden, are as follows: *Ficus saus-*

sureana, *F. leucontathoma*, *F. quercifolia*, *F. glomerata*, *F. polioarpa*, *F. Sycomorus*, *F. Vagneri*, *F. Neumannii*, *F. gigantea*, *F. salicifolia*, *F. laurifolia*, *F. capensis* and *F. vasta*. The periderm of the leaf petioles in every case was found to develop from the layer of cells immediately beneath the epidermis, the brown, withered walls of the epidermal cells persisting on the surface. The periderm of the branches is formed at the same time or slightly later than that of the petioles, and likewise originates from the subepidermal tissue, but continues to increase in thickness after the leaves have fallen. The early formation of periderm in the leaf petioles of exotic species of *Ficus* serves to limit transpiration and aid in protecting the leaf tissues from drying.—*Edith K. Cash*.

4146. LAVIALLE, P., et J. DELACROIX. *Laparoï du pistil et du fruit dans le genre Euphorbia*. [The wall of the pistil and the fruit of the genus *Euphorbia*.] *Compt. Rend. Acad. Sci. Paris* 175: 179–181. 1922.—Detailed descriptions of these organs are given. In the structure of the ovary and fruit, the *Euphorbiaceae* are believed to show a relationship to the *Malvaceae*, especially to the tribe *Bombaceae*. In like manner they seem to be related to the *Rutaceae*.—*C. H. Farr*.

4147. MIRANDE, MARCEL. *Sur l'origine morphologique du liber interne des Nolanacées et la position systématique de cette famille*. [The morphological origin of the internal wood of the *Nolanaceae* and the systematic position of this family.] *Compt. Rend. Acad. Sci. Paris* 175: 375–376. 1922.—The vascular structure of 3 species of *Nolana* is described. In the characters here studied this family is more like the *Solanaceae* than the *Convolvulaceae*, and it is suggested that the family be placed between the *Boraginaceae* and the *Solanaceae*.—*C. H. Farr*.

4148. NEGER, F. W. *Beiträge zur Kenntnis des Baues und der Wirkung der Lentizellen II*. [Structure and function of lenticels II.] *Ber. Deutsch. Bot. Ges.* 40: 306–313. *Fig. 1–2*. 1922.—In this 2nd paper [see *Bot. Absts.* 9, Entry 872] the author describes the lenticels on the aerial roots of *Philodendron* and discusses the literature. Lenticel-like intumescences on the lower surface of the phyllodia of species of *Acacia* are interpreted as adaptations which function as stomata in the exchange of gases under greenhouse conditions.—Infections were produced through lenticels on twigs of *Acer* and *Aesculus* which had been inoculated with pure cultures of conidia of *Nectria cinnabarina*.—*W. C. Muenscher*.

4149. NICOLAS, G. *Contribution à l'étude des synanthies*. [Contribution to the study of synanthly.] *Rev. Gén. Bot.* 35: 49–56. 1923.—Synanthly as found in *Narcissus Tazetta* was studied morphologically and anatomically. The author is of the opinion that synanthly may be caused by deficient nutrition.—*J. C. Gilman*.

4150. RIMBACH, A. *Lebensweise von Chloraea membranacea*. [Seasonal growth of *Chloraea membranacea*.] *Ber. Deutsch. Bot. Ges.* 40: 322–326. *Fig. 1–6*. 1922.—The author describes the growth of this orchid from seed sown in flower pots. Under natural conditions in Uruguay, the leaves appear in March on the rhizome which has remained dormant during the warm, dry January and February. In August the leaves begin to die and by October the inflorescence appears from among the dying leaves. Blossoming begins in November and lasts about 3 weeks. After the fruit matures and the seed are disseminated, in December, the fruit stalk drops off and the plant remains dormant, without aerial organs, through the summer.—*W. C. Muenscher*.

4151. SCHÜRHOFF, P. N. *Zur Phylogenie des angiospermen Embryosacs*. [Phylogeny of the embryo-sac in angiosperms.] *Ber. Deutsch. Bot. Ges.* 37: 161–169. 1919.—Various views regarding the significance of the contents of the mature embryo-sac of angiosperms are discussed, but none offer any explanation of the derivation of this organ from the female haploid generation of gymnosperms. According to the author the egg corresponds to the egg of gymnosperms. One synergid is the homologue of the ventral canal cell; the other is a later delimited cell of the many-nucleate prothallium. The polar nuclei are the remains of the many-nucleated, cellular, undifferentiated prothallium. The antipodals correspond to the cellular prothallium of gymnosperms.—*W. C. Muenscher*.

4152. SCHÜRHOFF, P. N. Zur Polyembryonie von *Allium odorum*. [Polyembryony in *Allium odorum*.] Ber. Deutsch. Bot. Ges. 40: 374-381. 1923.—A large number of embryos occur in the antipodal end of many embryo sacs of *Allium odorum* which possess the diploid number of chromosomes, in contrast with the haploid condition present in the normal embryo-sac nuclei. These antipodal embryos are adventitious embryos originating from the vegetative budding of the outer layers of the inner integument of the nucellus.—M. E. Stratton.

4153. SOUÈGES, RENÉ. Embryogénie des Caryophyllacées. Les premiers stades du développement de l'embryon chez le *Sagina procumbens* L. [Embryogeny of the Caryophyllaceae. The early stages in the development of the embryo of *Sagina procumbens*.] Compt. Rend. Acad. Sci. Paris 175: 709-711. Fig. 1-18. 1922.—A figure of each successive cell-division is given accompanied by a careful description of each stage. [See also following entry.]—C. H. Farr.

4154. SOUÈGES, RENÉ. Embryogénie des Caryophyllacées. Les derniers stades du développement de l'embryon chez le *Sagina procumbens* L. [Embryogeny of the Caryophyllaceae. The later stages in the development of the embryo of *Sagina procumbens*.] Compt. Rend. Acad. Sci. Paris 175: 894-896. Fig. 19-34. 1922.—This continuation [see preceding entry] carries the embryo to the final stage, as it is found in the seed.—C. H. Farr.

4155. SOUÈGES, RENÉ. Embryogénie des Malvacées. Développement de l'embryon chez le *Malva rotundifolia* L. [Embryogeny of the Malvaceae. Development of the embryo of *Malva rotundifolia*.] Compt. Rend. Acad. Sci. Paris 175: 1435-1436. Fig. 1-14. 1922.—The author describes and figures the development of the embryo of this species. This is found to be absolutely identical with that of *Senecio vulgaris* and *Urtica pilulifera*.—C. H. Farr.

4156. SOUÈGES, RENÉ. Recherches embryogéniques sur l'*Hippuris vulgaris* L. [Embryological researches on *Hippuris vulgaris*.] Compt. Rend. Acad. Sci. Paris 175: 529-532. Fig. 1-17. 1922.—The development of the embryo of this plant is much like that of *Veronica arvensis*.—C. H. Farr.

4157. SPESSARD, EARL AUGUSTUS. Prothallia of *Lycopodium* in America II. *L. lucidulum* and *L. obscurum* var. *dendroideum*. Bot. Gaz. 74: 392-413. Pl. 16-18. 1922.—Prothallia of *L. lucidulum* were found in quantity at certain stations in Michigan. They occur in small patches from 1 of which 153 individuals were taken. The habitat is drier than that occupied by the adult sporophytes. The sporophytes migrate to moister conditions through gemmae originating from occasional survivals of egg-initiated sporophytes in wet years. Histological studies of the prothallia are presented. The prothallia are monoecious, the sex organs appearing in acropetal succession.—The prothallia of *L. obscurum* var. *dendroideum* are much rarer, only 37 being found here. They occur in soils very diverse with regard to humus content, but soils which the author believes to be slightly drier than those carrying the sporophytes. The antheridia, and to a less extent the archegonia, occur in unusually large masses, the excess size of which may be related to the influence of the symbiotic fungus which was noted to invade this region. In *L. lucidulum* spore-like bodies of an endophytic fungus are present in half of the cells, the other half carrying the mycelium. This condition does not obtain in *L. obscurum*, where all the cells bear mycelial material. The taxonomic position of the fungi is still in doubt but the writer regards them as Ascomycetes rather than Oomycetes, as others have heretofore done.—B. W. Wells.

4158. STOMPS, THEO. J. Blattbecher, Sprossbecher und Stengelbecher. [Leaf-pitchers, shoot-pitchers and stem-pitchers.] Ber. Deutsch. Bot. Ges. 40: 264-268. 1922.—A brief discussion is given of what appear to be misinterpretations of some of the author's views regarding the nature and origin of certain pitcher-like modifications of some plant organs.—W. C. Muenscher.

4159. VUILLEMIN, PAUL. *La petalosteme*. [The petalostem.] Compt. Rend. Acad. Sci. Paris 175: 553-531. 1922.—The portion of the flower which the petals and stamens comprise is termed the petalostem. It is considered to originate from the frond, rather than from the leaf, as do the sepals and floral bracts. Petals and stamens may intergrade, but their metamorphoses into sepals is regarded as illusory. An evolutionary series of floral types is given which sets forth the transformations of the petalostem.—C. H. Farr.

MORPHOLOGY AND TAXONOMY OF ALGAE

E. N. TRANSEAU, *Editor*

L. H. TIFFANY, *Assistant Editor*

(See also in this issue Entries 3747, 3772, 3779, 3814, 4187, 4232, 4234, 4471, 4488, 4510, 4566, 4585, 4629, 4634, 4683, 4705, 4713)

4160. HAMEL, G. *Sur quelques particularités de la flore algologique de Saint-Malo*. [On certain particulars in the algal flora of Saint-Malo.] Compt. Rend. Acad. Sci. Paris 175: 1091-1093. 1922.—*Codium Bursa*, *Cladophora prolifera*, and *Solieria chordalis* are reported for this locality and their distribution is discussed. Certain other species are reported from this vicinity as their northern limit, such as *Gelidium sesquipedale*, *Gigartina Teedii*, *Polysiphonia subulifera*, and *Zanardinia collaris*.—C. H. Farr.

4161. NICOLAS, G. *Un nouvel hôte du Phyllosiphon Kühn*. [A new host for Phyllosiphon.] Compt. Rend. Acad. Sci. Paris 175: 46-47. 1922.—This siphonaceous alga is a parasite on the leaves of certain aroids. *Phyllosiphon Arisari* has been known to occur on 2 species of *Arisarum* and on *Arum maculatum*. It is now found in Algeria on *Arum italicum*. A description of the appearance of the parasite and the host is given.—C. H. Farr.

4162. PUYMALY, A. DE. *Adaptation à la vie aérienne d'une Conjuguée filamenteuse (Zygnema peliosporum Witttr.)*. [The adaptation to aerial life of a filamentous conjugate, *Zygnema peliosporum*.] Compt. Rend. Acad. Sci. Paris 175: 1229-1231. 1922.—This alga, resembling *Zygnema Ericetorum* var. *terrestre*, grows on the ground forming a webby structure. The filaments secrete a gelatin which agglutinates the threads together and effectively resists desiccation. Reproduction is by akinetes; zygospores are rare.—C. H. Farr.

4163. TAYLOR, WM. RANDOLPH. *Recent studies of Phaeophyceae and their bearing on classification*. Bot. Gaz. 74: 431-441. 1922.—After a review of recent work on the life histories of Phaeophyceae by Sauvageau, Drew, Killian, Williams, Kylin, Kuckuck, Pascher, and Ikari, the author proposes a classification of the group based on the newer morphological findings. The orders Phaeosporales and Cyclosporaes are retained. The former is divided into 3 suborders, (1) Ectocarpineae (8 families), with morphological alternation of similar generations shown or inferred to be present; (2) Dictyosiphonineae (1 family), with morphological alternation of dissimilar generations present or inferred, the sporophyte exceeding the gametophyte in size; (3) Cutlerineae (1 family), with morphological alternation of similar or dissimilar generations present, gametophyte, when different, larger than the sporophyte, growth trichothallic. The order Cyclosporaes is divided into 3 suborders each with one family: (1) Dictyotineae, with morphological alternation of similar generations; (2) Laminarineae, with morphological alternation of dissimilar generations, gametophyte smaller than the sporophyte; (3) Fucineae, with only cytological alternation of generations.—I. F. Lewis.

MORPHOLOGY AND TAXONOMY OF BRYOPHYTES

ALEXANDER W. EVANS, *Editor*

(See also in this issue Entries 3754, 3755, 3779, 4246, 4629, 4634, 4683)

4164. AMANN, J. *Fissidens Mnevidis* Amann, sp. nova. Rev. Bryologique 49: 51. 1922.—The new species described under the above name was based on material collected by P. Jaccard in the valley of the Nile, Egypt. It is assigned to the section *Bryoideum* C.M.—A.W. Evans.

4165. AMANN, J. *Le Cinclidotus danubicus* en Suisse. [*Cinclidotus danubicus* in Switzerland.] Rev. Bryologique 49: 49, 50. 1922.—The discovery of *Cinclidotus danubicus* Schiffner & Baumgartner, a species new to Switzerland, is announced on the basis of specimens collected by E. Seiger at Basel. The species is briefly characterized, and the cellular indices of the various European species of *Cinclidotus* are tabulated.—A. W. Evans.

4166. ANDREWS, A. LEROY. Additions to the bryophyte flora of Iceland. Bryologist 26: 4. 1923.—The author reports 1 hepatic and 2 mosses as additions to the list given by Hesselbo in the Bryophyta of Iceland [see Bot. Absts. 1, Entries 470, 1040].—E. B. Chamberlain.

4167. ANDREWS, A. LEROY. The status of *Gyroweis* in North America. Bryologist 25: 97-100. 1922.—*Gyroweis* as a generic name has no valid status as it is antedated by *Weisiodon* Schimp. *Gyroweis tenuis* Schimp. does not occur in North America, reports of it being due to errors in determination. *G. Barbula* (Schwaegr.) Par., *G. brevicaulis* (Hpe.) Broth., *G. obtusifolia* (Hpe.) Broth., and *G. barbulacea* (C. M.) Broth., all species of tropical America, do not belong in the genus, and their exact status is at present uncertain. If *Weisiodon* is extended beyond its original application, it should probably include *Dactylhymenium Pringlei* (E. G. Britton) Card. of Mexico, *Gyroweis boliviana* R. S. W. of the Andes, and *Didymodon topheus* (Brid.) Jur. of western North America.—E. B. Chamberlain.

4168. ANDREWS, A. LEROY. Two additions to the Bermuda flora. Bryologist 26: 6. 1923.—The author reports *Octoblepharum albidum* (L.) Hedw. and *Bryum murale* Wils. as additions to the flora of Bermuda and notes new localities for 2 other mosses and for 2 hepatics.—E. B. Chamberlain.

4169. BRITTON, ELIZABETH G. Notes on *Fissidens*, II. Bryologist 26: 1. 1923.—*Fissidens palmatus* (Sw.) Hedw. is apparently endemic in Jamaica and known only from the original collection. Material from St. Thomas and Cuba reported under the above name belongs to *Fissidens Kegelianus* C. M., a common species of subtropical and tropical America. The synonymy and distribution of the latter species are outlined.—E. B. Chamberlain.

4170. CONKLIN, GEO. HALL. Report of the Curator of the Hepatic Herbarium. Bryologist 26: 10-11. 1923.—In recapitulating the additions to the herbarium of the Sullivant Moss Society, the author mentions localities for a few uncommon hepatics.—E. B. Chamberlain.

4171. DISMIER, G. Note sur le *Zygodon conoideus* (Dicks.) Hook. et Tayl., d'après le travail M. N. Malta. [Note on *Zygodon conoideus*, based on the work of Mr. N. Malta.] Rev. Bryologique 49: 61-64. 1922.—The author reviews a recent paper by Malta on the distribution of *Zygodon conoideus* [see Bot. Absts. 11, Entry 2671] and cites the species from several additional localities in France, 7 different departments being represented. He calls particular attention to the propagula of *Zygodon*, as described by Malta, and emphasizes the importance of these organs in distinguishing closely related species.—A. W. Evans.

4172. Локтуровский, В. С. [DOCTUROWSKY, W. S.] Мхи торфяных болотъ Полѣсья Минской и Волынской губ. [The mosses of the peat bogs of Polesia in the Provinces Minsk and Wolyn.] Вѣстникъ торфяного Лѣла [Reports on Peat] 3/4. 1916. [With French summary.]—In this paper 111 species of mosses are listed, 23 belonging to the genus *Sphagnum*, and their distribution in various associations is described. The determinations were made by V. F. Brotherus and H. Lindberg.—W. S. Docturowsky.

4173. GARDET, G. Sur l'extension vers l'Est, d'une bryacée d'allure méridionale: *Conomitrium Julianum* Montagne. [On an extension toward the East of a bryophyte having a southern appearance: *Conomitrium Julianum*.] Rev. Bryologique 49: 65, 66. 1922.—The author records the discovery of the aquatic *Conomitrium Julianum* at Jussey (Haute-Saône) and at Voisy (Haute-Marne), these stations extending the known range of the species into the eastern part of France.—A. W. Evans.

4174. LOESKE, L. Haplolepideen und Diplolepideen in bryo-systematischer Beziehung. [Haplolepideae and Diplolepideae from the standpoint of moss taxonomy.] Bot. Archiv 4: 110-112. 1923.—The distinctions between the Haplolepideae and the Diplolepideae are based on differences in the peristome and were first pointed out by Philibert in 1884. In the typical Haplolepideae the peristome is single and each tooth is derived from 1 external row of cells and 2 internal rows; in the typical Diplolepideae the peristome is double and each tooth of the outer peristome is derived from 2 external rows and 1 internal row. In the author's opinion these distinctions have been much overrated by taxonomists, and peristomes of identical structure may sometimes be found in genera that would not be considered closely related, if their gametophytic characters were taken into consideration. Similarity in the structure of the peristome may therefore represent a convergence-phenomenon and have but little phylogenetic significance.—A. W. Evans.

4175. LORENZ, ANNIE. Some Hepaticae from Grand Manan N. B. Bryologist 26: 5. 1923.—A list of 25 species from the island of Grand Manan, New Brunswick, is given, the local distribution of each species being indicated. The report is based on a collection made in 1922 by W. R. Taylor and the only rarity included is *Diplophyllum albicans* (L.) Dum.—E. B. Chamberlain.

4176. NICHOLSON, W. EDW. Mosses and hepatics near Aviemore, East Inverness. Rev. Bryologique 49: 54-58. 1922.—The region reported upon was explored by the author and H. H. Knight during July, 1921. It is situated about midway between the east and west coasts of Scotland and is too dry to yield a full representation of the so-called Atlantic species, only 3 of which were collected. The mosses enumerated number 34 and the hepatics 58. Each species is accompanied by data regarding stations, and occasional critical remarks are interpolated.—A. W. Evans.

4177. PEARSON, WM. HY. Swiss hepatics. Rev. Bryologique 49: 59-61. 1922.—A small collection of Hepaticae made in July, 1922, by P. G. M. Rhodes in the St. Bernard region of Switzerland is reported upon. The species listed number 15 and are accompanied by full data regarding localities and occasionally by critical remarks. Under *Lophozia Lyoni* (Tayl.) Steph. the new variety *subaequiloba* Meylan is described.—A. W. Evans.

4178. TRABUT, L. Deux Funariacées nouvelles. [Two new Funariaceae.] Rev. Bryologique 49: 64, 65. 2 fig. 1922.—The author describes and figures 2 new Algerian mosses under the names *Funaria deserticola* and *Physcomitrium longicollum*, comparing the *Funaria* with *F. attenuata* and the *Physcomitrium* with *P. acuminatum*.—A. W. Evans.

4179. WILLIAMS, R. S. *Brachymenium condensatum*, sp. nov. Bryologist 26: 2-3. Pl. 1. 1922.—A new moss from Mexico is described and figured under the above name. The species was based on material collected by C. G. Pringle at Patzcuaro (No. 762) and is allied to *B. imbricatifolium* C. M.—E. B. Chamberlain.

4180. YUNCKER, T. G. Additions and corrections to the list of Indiana mosses. Proc. Indiana Acad. Sci. 1921: 155, 156. 1922.—The author's list of Indiana mosses has already been abstracted [see Bot. Absts. 10, Entry 997]. In the present paper 7 additional species and varieties for Indiana and 18 for Monroe County are enumerated, and 6 records in the earlier list are corrected. The additions are taken from a paper published by F. L. Pickett in 1915.—F. C. Anderson.

MORPHOLOGY AND TAXONOMY OF FUNGI, LICHENS, BACTERIA, AND MYXOMYCETES

H. M. FITZPATRICK, *Editor*

D. S. WELCH, *Assistant Editor*

(See also in this issue Entries 3733, 3748, 3766, 3797, 3829, 4112, 4113, 4157, 4260, 4261, 4265, 4270, 4282, 4284, 4289, 4295, 4302, 4303, 4310, 4314, 4315, 4316, 4324, 4335, 4341, 4346, 4351, 4409, 4444, 4445, 4448, 4505, 4560, 4565, 4579, 4629, 4634, 4683, 4713)

FUNGI

4181. BALLINGS, MADELEINE. *Le Vermicularia herbarum*, parasite des Oeillets. [*Vermicularia herbarum* a parasite of carnation.] Bull. Soc. Path. Vég. France 9: 288-289. 2 pl. 1922.—*Vermicularia* killed leaves of *Dianthus caryophyllus* and formed conidia, pseudosclerotia, and a sterile stroma; the similarity of this stroma to that of *Microsticta* is emphasized.—J. Dufrénoy.

4182. BATAILLE, F. Flore analytique et descriptive des Tuberoidees de l'Europe et de l'Afrique du Nord. [Analytical and descriptive flora of the Tuberoideae of Europe and North Africa.] Bull. Soc. Mycol. France 37: 155-207. 1921.—The author presents descriptive keys and bibliographical notes regarding the Tuberoideae of Europe and North Africa. No new names are introduced.—C. W. Dodge.

4183. BEZSSONOFF, N. Über die Züchtung von Pilzen auf hochkonzentrierten rohrzuckerhaltigen Nährböden und über die Chondriomfrage. [The growth of fungi on media containing a high concentration of cane sugar and a consideration of the chondriome question.] Ber. Deutsch. Bot. Ges. 37: 136-148. Pl. 1. 1919.—The development of the sexual stage in molds is stimulated by the presence of large quantities of cane sugar in the substratum. Under such conditions the chondriome material becomes more or less dispersed throughout the cytoplasm of the cell. The chondriome bodies disappear and the cytoplasm stains darker with nuclear stains.—D. S. Welch.

4184. BISBY, G. R. The literature on the classification of the Hysteriales. Trans. British Mycol. Soc. 8: 176-189. 1923.—There has always been a great deal of confusion in the classification and naming of the Hysteriales, the indication being that they form a transitional group between the Pyrenomycetes and Discomycetes. Attention is called to the need for further comparative and synthetic study in this group. The review of the literature is followed by a bibliography of 78 titles.—W. B. McDougall.

4185. BLUMER, SAMUEL. Beiträge zur Specialization der Erysiphe horridula Lév. auf Boraginaceen. [Specialization of *Erysiphe horridula* on Boraginaceae.] Jahrb. Phil. Fakultät II. Univ. Bern 2: 28-34. 1922. [See Bot. Absts. 12, Entry 588.]

4186. BROOKS, F. T., and C. G. HANSFORD. Mould growths upon cold store meat. Trans. British Mycol. Soc. 8: 113-142. Fig. 1-10. 1923.—Twelve distinct species of fungi, representing 7 genera, were found growing upon cold store meat. Two of these, *Sporotrichum carnis* and *Torula botryoides*, are described as new, and 1, *Wardomyces anomala*, is described as the type species of a new genus. Numerous species of *Cladosporium* are believed to be strains of *C. herbarum*, the fungus which causes the common "black spot" of meat. Some strains of *C. herbarum* develop from spores and make a considerable growth at -6°C . Some of the other molds develop slightly at this temperature and all grow readily at 0°C . or just above. It is further shown that the spores and young mycelia of some of these molds may retain vitality for more than 2 years at -6°C . The growth of all of these fungi is superficial, the mycelium penetrating not more than 4 mm. at most and the meat is not rendered unfit for food. Growth may be prevented "by controlling the temperature and humidity conditions in cold stores and by avoiding unduly prolonged storage."—W. B. McDougall.

4187. BURNHAM, STEWART H., and ROY A. LATHAM. The flora of the Town of Southold, Long Island, and Gardiner's Island, New York. (Third supplementary list.) *Torrey* 23: 3-9. 1923.—The list includes 3 species of gall-producing insects, 3 of Myxomycetes, 9 of Euphyceae, 1 of Phycomycetes, 17 of Pyrenomycetes, 8 of other Ascomycetes, 3 of Melanconiales, 17 of Sphaeropsidales, 1 of Ustilaginaceae, 8 of Pucciniaceae, 1 of Tremellaceae, 1 of Dacromycetaceae, 2 of Thelephoraceae, and 1 of Hydnaceae, with notes on habitat and distribution.—J. C. Nelson.

4188. CHAPMAN, A. C. The use of the microscope in the brewing industry. *Jour. Roy. Microsc. Soc. London* 1922: 261-263. 1922.—The microscope may be used in the study of types of yeast, in preparing pure line cultures, and in ascertaining freedom from bacterial infections.—Wm. Randolph Taylor.

4189. CHENANTAIS, J. E. Notice taxonomique sur le groupe *Melanomma*. [Taxonomic note on the group *Melanomma*.] *Bull. Trimest. Soc. Mycol. France* 38: 88-92. 1922.—In classifying the species of this group external or anatomical characters are of little value as are also biological characters. It is suggested that the only method applicable to such a group is, as already suggested by the author for the classification of *Lophiotrema*, the selection of a few important and well recognized forms, the arrangement of these in a series according to spore measurements, and the interpolation of all other forms into this series, considering the latter as synonyms.—D. S. Welch.

4190. COLLEY, REGINALD H., and MINNIE W. TAYLOR. Studies on the aecial stage of *Cronartium ribicola* and *Cronartium occidentale*. [Abstract.] *Phytopathology* 13: 46-47. 1923.

4191. CORBIÈRE, L. Note sur le *Boletus sphaerocephalus* Barla. [On *Boletus sphaerocephalus*.] *Bull. Trimest. Soc. Mycol. France* 38: 71-77. *Pl. 1 (col.)*. 1922.—The author has collected a fungus near Cherbourg which corresponds very closely to the description of the rare species *B. sphaerocephalus* Barla, never reported since its description in 1859. The fungus is redescribed.—D. S. Welch.

4192. CUNNINGHAM, G. H. Occurrence of apothecia of brown rot in New Zealand. *New Zealand Jour. Agric.* 25: 177. 1922.—The finding of apothecia of *Sclerotinia cinerea* is recorded.—N. J. Giddings.

4193. DAVIS, W. H. Germination of the spores of timothy smut (*Ustilago striaeformis* (Westd.) Niessel). [Abstract.] *Phytopathology* 13: 38-39. 1923.

4194. DICKSON, F., and W. R. FISHER. A method of photographing spore discharge from apothecia. *Phytopathology* 13: 30-32. *Fig. 1-2*. 1923.—A detailed description is given of the method used in securing an excellent photograph of spore discharge from the apothecia of *Sclerotinia libertiana* Fekl.—B. B. Higgins.

4195. DODGE, B. O. The distribution of the orange rust of *Rubus*. *Phytopathology* 13: 61-74. 1923.—Collections of the orange leaf rust on species of *Rubus* were made throughout the Eastern U. S. A. from North Carolina to Maine. The rust in each collection was determined by germinating the aeciospores. Both *Kunkelia nitens* (Schw.) Arthur and *Gymnoconia interstitialis* (Schl.) Lagh. were found on blackberries and dewberries throughout the territory covered. Only *Gymnoconia* was found on the black raspberry (*Rubus occidentalis*).—B. B. Higgins.

4196. DOSDOLL, LOUISE, and J. J. CHRISTENSEN. Variations in the length of spores of *Helminthosporium sativum* P. K. & B. under different conditions of growth. [Abstract.] *Phytopathology* 13: 50. 1923.

4197. ELLIOTT, JOHN A. The ascigerous stage of the sweet potato black-rot fungus. [Abstract.] *Phytopathology* 13: 56. 1923.—On the basis of morphological characters the fungus known as *Sphaeronema fimbriatum* (E. & H.) Sacc. is transferred to the Ascomycetes under the name *Ceratostomella fimbriata* comb. nov.—B. B. Higgins.

4198. FITZPATRICK, H. M. A survey of the evidence indicating that *Phytophthora* should be merged with *Pythium*. [Abstract.] *Phytopathology* 13: 34. 1923.

4199. FITZPATRICK, HARRY MORTON. Monograph of the Nitschkieae. *Mycologia* 15: 23-67. Pl. 1-7. 1923.—A revision of the species of *Nitschkia* and of several other genera hitherto not regarded as closely related to it or to each other has resulted in the tentative erection in the Sphaeriales of a new subfamily, **Nitschkieae**. The genera included, *Nitschkia*, *Calyculosphaeria* nom. nov. (*Winterella* Berl.), *Tympanopsis*, *Thaxteria* and *Acanthonitschkea*, agree strikingly in the external aspect of the perithecium, which is turbinate collapsing to cupulate. Superficial, brown, thick-walled hyphae characterized by a striking metallic iridescence are usually prominent. A stroma is absent in some forms and present in others. Of the 32 species previously included in *Nitschkia* (*Coelosphaeria*) only 3 are retained, a new species, *N. floridana*, being described. Thirteen species are definitely excluded from the whole subfamily, 9 are transferred to the related genera here treated, and 7 remain as doubtful due to unavailability of authentic material. The new name *Calyculosphaeria* is used to replace *Winterella* Berl. and *Winterina* Sacc., both of which are preoccupied. The species *Nitschkia calyculus*, *N. collapsa*, *N. pezizoidea*, *N. tristis*, and *N. Winteriana* are included in *Calyculosphaeria* on the basis of their uniseptate spores, and *C. macrospora* is described as new. The writer follows Starbäck in recognizing *Tympanopsis* for *Nitschkia euomphala*, and describes *Tympanopsis uniseriata* as new. The spores of *Thaxteria* are shown to be brown and transversely tri-septate. The species *T. didyma* and *T. leptosporoides* (Wint.) comb. nov. are included, the latter being the same as *Nitschkia rugulosa* and *Coelosphaeria leptosporoides*. In *Acanthonitschkea*, *A. macrobarbata* is described as new.—H. M. Fitzpatrick.

4200. GASSNER, GUSTAV. Ueber einen eigenartigen Uromyces auf *Passiflora foetida* L. [A peculiar Uromyces on *Passiflora foetida*.] *Ber. Deutsch. Bot. Ges.* 40: 64-69. Fig. 1-3. 1922.—*Uromyces Appelianus* n. sp. is described, and reported as forming galls on *Passiflora foetida* in Uruguay and Brazil.—W. C. Muenscher.

4201. GÄUMANN, ERNST. Ein kleiner Beitrag zur Pilzflora des Krakatau. [A small contribution to the fungus flora of Krakatau.] *Bull. Jard. Bot. Buitenzorg* III, 2: 8-9. Pl. 1. 1920.—Two new fungi are described and figured: *Macrophoma Arundinae* on *Arundina speciosa* Bl., and *Phyllosticta Tinisporae* on *Tinispora crispa* Diels.—Alfred Rehder.

4202. GÄUMANN, ERNST. Ueber *Coelographium aurantiacum*, n. g., n. sp. [On *Coelographium aurantiacum*.] *Bull. Jard. Bot. Buitenzorg* III, 2: 10-14. Pl. 2, 3. 1920.—Saccardo's section *Coelographium* of *Graphium* is elevated to generic rank with 2 species, *C. caviceps* (Oudem.) and *C. aurantiacum*.—Alfred Rehder.

4203. HÖHNEL F. VON. Fünfte vorläufige Mitteilung mycologischer Ergebnisse (Nr. 399-500). [Fifth preliminary report on mycological investigations.] *Ber. Deutsch. Bot. Ges.* 37: 153-161. 1919.—The list includes many genera and species with changes and corrections. The names of the following genera appear: *Hymenula*, *Psilonia*, *Leptothyrium*, *Actinopelte*, *Sirodochiella*, *Anomomyces*, *Sphaeria*, *Epictinium*, *Fusoma*, *Entylomella*, *Tubercina*, *Phacostilbella*, *Graphium*, *Sporocybe*, *Stromatostysanus*, *Stysanus*, *Phyllosticta*, *Napicladium*, *Fusicladium*, *Clasterosporium*, *Brachydesmium*, *Halotrichum*, *Coniothecium*, *Stigmopsis*, *Helminthosporium*, *Brachysporium*, *Oidium*, *Penicillium*, *Monilia*, *Amblyosporium*, *Acrothecium*, *Pleurothecium*, *Scolicotrichum*, *Passalora*, *Carlia*, *Azosma*, *Macrosporium*, *Heterosporium*, *Cordana*, *Cladosporium*, *Phragmitis*, *Pucciniopsis*, *Cyclogonium*, *Cladotrichum*, *Sarcinella*, *Cercospora*, *Ramularia*, *Physospora*, *Coniophora*, *Triposporium*, *Stigmatea*, *Venturia*, *Cerato-*

sporella, *Fusicladiella*, *Cercosporidium*, *Didymothamnium*, *Hormocladium*, *Stictochorella*, *Xyloma*, *Ascospora*, *Dothidea*, *Cheirpodium*, *Clasterisporium*, *Meliola*, *Bactrodesmium*, *Hy-menopodium*, *Phanerocoryneum*, *Apotemnium*, *Pestalozzina*, *Mastigosporium*, *Monothecium*, *Columnothyrium*, *Actinothyrium*, *Melampsora*, *Melanobasidium*, *Epochnium*, *Sporidermium*, *Phanerocorynella*, *Coccodinium*, *Sporidesmium*, *Thyrostroma*, *Thyrostromella*, *Stigmina*, *Puccinia*, *Stictochorella*, *Hemileia*, *Pseudopuccinia*, *Circinotrichum*, *Helicotrichum*, *Gyothrix*, *Campsotrichum*, *Tricholeconium*, *Sarcopodium*, *Conoplea*, *Botryotrichum*, *Ceratocladium*, *Ellisiella*, *Colletotrichum*, *Vermicularia*, *Steirochaete*, *Pestalozzia*, *Bartalinea* *Sphaeropsis*, *Strasseria*, *Phoma*, *Phomopsis*, *Diaporthe*, *Cytospora*, *Dilophospora*, *Robillarda*, *Marsonia*, *Kabatia*, *Neottiospora*, *Hysteropezizella*, *Hysterostegiella*, *Tiarosporella*, *Ciliochora*, *Plagiorhabdus*, *Sirosperma*, *Aposphaeria*, *Pyrenochaeta*, *Trichocicinnus*, *Chaetophoma*, *Desmopatella*, *Heterosphaeria*, *Dacryomyces*, *Ephelis*, *Balansia*, *Rhabdospora*, *Zythia*, *Pyrenopeziza*, *Scleroderris*, *Sclerochaetella*, *Septoria*, *Darluka*, *Botryella*, *Diplodothiella*, *Ceuthospora*, *Pestalozziella*, *Chaetospermum*, *Amphiciliella*, *Dendrodochium*, *Calostilbella*, *Calostilbe*, *Microcera*, *Corallomyces*, *Haplographium*, *Trematosphaeria*, *Odontotrema*, *Phragmonaevia*, *Naeviella*, *Pragmopara*, *Gelatinosporium*, *Cladsterigma*, *Micropera*.—D. S. Welch.

4204. HÖHNEL, F. VON. **Ueber Bau, Stellung und Nebenfrüchte von Lasiobotrys.** [Morphology, systematic position, and imperfect stages of Lasiobotrys.] Ber. Deutsch. Bot. Ges. 37: 103–107. 1919.—The genus *Lasiobotrys* Kunze is placed near *Trabutia* under the Dothideales. The genus is described and its morphology and relationship discussed. *Lasiobotrys Lonicerae* Kunze is provisionally broken up as follows (conidial stages in brackets): 1. *Lasiobotrys Lonicerae* Kunze [*Colletotrichella Xylostei* (Faut.) n. comb., syn. *Labrella Xylostei* Faut.]; 2. *L. Periclymeni* n. sp. [*Colletotrichella Periclymeni* (D.) v. H.]; 3. *L. latemarensis* n. sp. [*Kabatia Lonicerae* (Harkness) v. H., syn. *K. latemarensis* Bub.]; 4. *L. mirabilis* n. sp. [*Kabatia mirabilis* B.].—A more complete description of these species is not possible until mature ascospores are found.—W. C. Muenscher.

4205. JOHANN, HELEN. **Influence of temperature on the morphology of Fusarium spores.** [Abstract.] Phytopathology 13: 51. 1923.

4206. JORGENSEN, C. A. **Heleococcum aurantiacum n. gen. et n. spec.** Bot. Tidsskr. 37: 417–420. Fig. 1–2. 1922.—The author gives a taxonomic description of the fungus to substantiate his conclusion that it represents a new genus as well as a new species.—A. L. Bakke.

4207. KILLERMANN, S. **Neuer Fund einer Vibrissea in Deutschland.** [A Vibrissea new to Germany.] Ber. Deutsch. Bot. Ges. 39: 345–347. Fig. 1. 1921.—*Vibrissea turbinata* Phill. is reported from Germany apparently for the 1st time.—W. C. Muenscher.

4208. KIRBY, R. S. **Heterothallism in Ophiobolus cariceti.** [Abstract.] Phytopathology 13: 35. 1923.

4209. KLEBAHN, H. **Wirtswechsel und Spezialisierung des Stachelbeerrostes.** [Specialization and change of host in Ribes rusts.] Ber. Deutsch. Bot. Ges. 40: 104–111. 1922.—Infection experiments, with teleutospores of *Puccinia Carici* produced on *Carex* spp. with aeciospores from *Ribes grossularia*, resulted in abundant infections on *Ribes* but not a single infection on *Urtica dioica*. The author maintains that the 2 rusts forming aecia upon *Ribes* and *Urtica* respectively, are biologically distinct and that Eriksson has not removed the possibility of a mixture of these 2 forms when he secured infections on both *Ribes* and *Urtica* from teleutospores collected on *Carex* growing in the vicinity of both *Ribes* and *Urtica* plants. Experiments indicate that both rusts are specialized on certain sections of the genus *Carex*. The *Ribes* rust has become more or less specialized upon *R. grossularia* and *R. nigrum*.—W. C. Muenscher.

4210. LAIBACH, F. **Zur Kenntnis der Gattung Septoria.** [Concerning the genus Septoria.] Ber. Deutsch. Bot. Ges. 37: 245–249. 1919.—The author discusses the relationship between

Septoria and *Mycosphaerella*, and shows that some species of the latter may have an imperfect stage which is more like *Cercospora*. Biological specialization appears to exist in the genus *Septoria*.—D. S. Welch.

4211. MAINS, E. B. Observations concerning *Puccinia Pattersoniana* and *Puccinia Moreniana*. Proc. Indiana Acad. Sci. 1921: 133-135. Pl. 1, fig. A-B. 1922.—The pedicels of the teliospores of both species stain dark blue with chloral hydrate and iodine. It is thought that *Puccinia Pattersoniana* has its aecial stage on *Brodiaea*.—F. C. Anderson.

4212. MAINS, E. B., and H. S. JACKSON. Aecial stages of the leaf rust of barley, *Puccinia simplex*, and rye, *P. dispersa*, in the United States. [Abstract.] Phytopathology 13: 49-50. 1923.

4213. MAINS, E. B., and H. S. JACKSON. Strains of the leaf rust of wheat, *Puccinia tritici*, in the United States. [Abstract.] Phytopathology 13: 36. 1923.

4214. MAIRE, RENÉ, et E. CHEMIN. Un nouveau Pyrénomycète marin. [A new marine pyrenomycete.] Compt. Rend. Acad. Sci. Paris 175: 319-321. Fig. 1-4. 1922.—This parasite on the red alga *Dilsea edulis* is described and given the name *Mycaureola Dilseae*.—C. H. Farr.

4215. MAUBLANC, A. Les champignons comestibles et vénéneux. [Edible and poisonous fungi.] Encyclopedie Pratique du Naturaliste Vol. VIII. 110 p., 96 col. pl., 140 fig. P. Lechevalier: Paris, 1921.—This is a handbook to the more common mushrooms of France. Part I, general information: characteristics of fungi, geographical distribution and influence of climate and soil upon fungous flora; the natural habitat of fungi and the time of their appearance. Part II, classification of fungi: a brief characterization of Myxomycetes and Phycomycetes is followed by a more detailed account of the morphology and taxonomy of the Basidiomycetes and a somewhat less thorough treatment of the Ascomycetes. Keys to the important families and genera are given. Part III, edible and poisonous mushrooms: general characteristics of poisonous forms, a list of the deadly and more dangerous species, symptoms of poisoning and treatment; edible forms in general, nutritive values, sale, and preparation for food; culture and preserving of mushrooms. These introductory pages are followed by 96 full page colored plates, each accompanied by a description of the characters, habit, variations, properties, and distinguishing features of each species.—D. S. Welch.

4216. MELIN, ELIAS. Boletus-Arten als Mykorrhizenpilze der Waldbäume. [Boletus mycorrhizas of forest trees.] Ber. Deutsch. Bot. Ges. 40: 94-97. 1922.—The author previously isolated 3 mycorrhizal fungi from *Pinus sylvestris* and *Picea Abies*. Since these fungi did not fruit in pure culture he compared their hyphae with those of *Boletus* species which produce mycorrhizas in these trees; they did not prove to be the same. In infection experiments the author was able to produce synthetic mycorrhizas of *Boletus elegans* on *Larix europaea* and *Boletus luteus* on *Pinus sylvestris* and *Picea Abies*.—W. C. Muenscher.

4217. MILBRAITH, D. G. Alternaria from California. Bot. Gaz. 74: 320-324. Fig. 1-2. 1922.—A new species, *A. oleracea*, is described. It occurs on cabbage, on the leaves of which it causes dark spots lacking the profuse growth of conidia and the zonation characterizing the lesions produced by *A. Brassicae* (Berk.) Sacc. Morphological differences also distinguish the 2 species.—B. W. Wells.

4218. MURRILL, WILLIAM A. Dark-spored agarics—V. *Psilocybe*. Mycologia 15: 1-22. 1923.—The genus *Psilocybe* is briefly characterized, a key to 34 species is given, and each species is described. The following new species are presented: *P. caespitosa*, *P. latispora*, *P. vialis*, *P. Cokeri*, *P. panaeoliformis*, *P. castaneifolia*, *P. castaneicolor*, and *P. caeruleascens*.—H. R. Rosen.

4219. PATOUILARD, N. Quelques espèces nouvelles de champignons. [New species of fungi.] Bull. Trimest. Soc. Mycol. France 38: 83-87. 1922.—The following species are described as new: *Neopectia Thaxteri*, *Calonectria Jimenezii*, *Platyglaea fibrosa*, *Tremella granuliformis*, *Heterochaete ochroleuca*, *Phaeolus iobaphus*, *Phellinus chaetoloma*, *Cladoderris imbricata*, *Rhodophyllus (Entoloma) caeruleatus*. A new genus *Erispora* is described in the Nectriaceae with *E. parasitica* as the type species.—D. S. Welch.

4220. PLANTEFOL, M. Sexualité expérimentale des Basidiomycètes. [Sex in Basidiomycetes.] Ann. Sci. Nat. Bot. 3: xxxii-xli. Fig. 1, 2. 1921.—A review is given of the work of Mlle. Bensaude on certain Agaricaceae. A parallelism is shown to exist between the binucleate condition of certain cells here and that known in the Uredinales. It is pointed out that this probably indicates a kind of sexuality.—Paul Weatherwax.

4221. PILLAY, T. PADMANABHA. Zur Entwicklungsgeschichte von *Sphaerobolus stellatus* Tode. [The development of *Sphaerobolus stellatus* Tode.] Diss. Jahrb. Phil. Fakultät II Univ. Bern. 3: 197-219. Fig. 1-4. 1923.—The reduction division takes place in the basidium and the germ tube from the spore immediately begins to form clamp-connections so that the plant is diploid from the start. There is no primary haploid mycelium since the diploid stage begins with the spore, in which paired nuclei are found. It is not shown how this dikaryon originates but the possibilities are discussed. Information regarding *Gastromycetes* other than *Hypochnus terrestris* is meager. The haploid phase is more developed in *Cyathus* than in *Sphaerobolus*, which was early placed in the *Gastromycetes*. According to the present investigations it probably is to be included in the *Plectobasidiaceae* as established by Fischer. It is suggested that together with *Scleroderma*, *Leucogaster*, and *Melanogaster*, it might be considered intermediate between the *Plectobasidiaceae* and the *Hymenobasidiaceae*.—D. S. Welch.

4222. TIEGS, E., Beiträge zur Oekologie der Wasserpilze. [Contributions to the ecology of water moulds.] Ber. Deutsch. Bot. Ges. 37: 496-501. 1919.—*Leptonitis* is found in water containing large amounts of organic nitrogen. *Sphaerotilus natans* grows commonly in larger streams containing smaller amounts of organic nitrogen. Both of these forms thrive best in alkaline or neutral waters. In contrast, *Penicillium fluitans* n. sp. is found in waters containing acid waste from munition factories.—D. S. Welch.

4223. VAN HOOK, J. M. Indiana fungi. VI. Proc. Indiana Acad. Sci. 1921: 143-148. 1922.—A list of 34 species with place and date of collection is given. In many cases the descriptions are rewritten or amplified.—F. C. Anderson.

4224. WEESE, J. Beitrag zur Morphologie und Systematik einiger Auriculariineengattungen. [The morphology and systematic relationships of certain genera of the Auriculariales.] Ber. Deutsch. Bot. Ges. 37: 512-519. 1919.—The following genera of the family *Phleogenaceae* are discussed: *Stilbum*, *Pilacrella*, *Hoehnelomyces*, and *Phleogena*, with a key for their separation.—D. S. Welch.

4225. WEESE, J. Mykologische und phytopathologische Mitteilungen. [Mycological and phytopathological contributions.] Ber. Deutsch. Bot. Ges. 37: 520-527. 1919.—I. Canker of fruit and shade trees. A review is given of the literature with special reference to those pathogens belonging to the genus *Nectria*. The author previously showed that *N. ditissima* (Tul.) Fr. (= *N. coccinea* (Pers.) Fr.) is not the organism causing the common canker of fruit trees, which is caused by *N. galligena* Bres., a form often incorrectly determined.—II. A disease of orchids. *Nectria bulbicola*, described by P. Hennings and said by him to cause severe injury to orchids, is found to be *N. ochroleuca* (Schw.) Berk., a form which is to the tropics what *N. cinnabarina* is to Central Europe. *N. Orchidearum* Theissen also falls into this species. To control the disease all affected bulbs and roots should be removed.—D. S. Welch.

4226. WESTON, WILLIAM H., JR. Production and dispersal of conidia in the Philippine *Sclerosporas* of maize. Jour. Agric. Res. 23: 239-278. Pl. 1-10. 1923.—In their conidial phases *Sclerospora philippinensis* Weston and *S. spontanea* Weston are injurious parasites of maize in the Philippine Islands. Production of conidia on infected plants is preceded by the establishing on leaves and sheaths of characteristically discolored areas. Conidiophores develop only from the stomata, at night, and when the surface is covered with dew or other moisture. Several are formed at each stoma during the course of the night. Evidence is presented that the conidia are liberated by active ejection from the sterigmata, rather than by passive disjunction, although the writer considers that further investigation is necessary to establish this point. Nocturnal development of conidiophores in the usual amount of dew follows a relatively regular cycle, which, however, may be altered by rain or by drying winds. Conidia are produced in vast numbers and production may be repeated on successive nights when conditions are favorable over a period covering as much as 75 per cent of the total life of the host plant. Dispersal of conidia takes place necessarily at night and is accomplished chiefly by the wind. Splashing, acting either separately or with the wind, and, to a less degree, such agents as surface water, insects, and moist soil laden with conidia are other factors in dispersal. Dissemination of the 2 downy mildews on maize is accomplished in the Philippine Islands by means of the conidia. With reference to the possible entry into the U. S. A. or other countries, the author points out that mycelium in the case of maize itself plays no part in distribution. However, as mycelium in cuttings of other hosts, such as sugar cane and related grasses, these diseases could be carried long distances. The oospore stage is not found on maize in the Philippines. Whether the oogonial *Sclerosporas* occurring on sugar cane and 2 wild grasses in the Islands are related to maize is not known. This stage must be responsible for at least some of the local and distant spread of these fungi and may possibly be involved also in the dissemination of the conidial phases on maize.—*L. M. Massey.*

4227. WESTON, WILLIAM H., JR. The production of conidia at night in species of *Sclerospora*. [Abstract.] Phytopathology 13: 34. 1923.

4228. WINELAND, GRACE O. The production in culture of the ascigerous stage of *Fusarium moniliforme*. [Abstract.] Phytopathology 13: 51. 1923.

LICHENS

4229. BIORET, GEORGE. Les Graphidées corticoles. [The bark-inhabiting Graphidaceae. Ann. Sci. Nat. Bot. 4: 1-68. Pl. 1-11. 1922.—An anatomical and biological description is given of the crustaceous, bark-inhabiting lichens of the Graphidaceae. Much variation in the structure of the thallus is shown in different genera and in different species of the same genus. The development of the thallus is much influenced by the nature of the substratum. Many varieties and some species that have been described are shown to be merely variations due to the state of maturity of the thallus or to the nature of the substratum. No new names are proposed.—*Paul Weatherwax.*

4230. GIARDINI, GIOVANNI I. A preliminary report on the lichens of western Pennsylvania. Bryologist 25: 100-108. 1922.—A list is given of 82 species and varieties of lichens. There is no descriptive matter, but each species listed is accompanied by full notes on locality and habitat, with indication of relative abundance.—*E. B. Chamberlain.*

4231. LYNGE, BERNT. Index specierum et varietatum lichenum quae collectionibus "Lichenes Exsiccati" distributae sunt. [Index of species and varieties of lichens which have been distributed as "Lichenes Exsiccati."] Nyt Mag. (Appendix) 53-60: (in 2 parts, each with separate paging) Part I. pp. 1-559; Part II. pp. 1-316. 1915-1922.—The 1st part contains complete details as to bibliography and contents of 119 different issues of exsiccati containing lichens.—In the 2nd part alphabetical lists are given of every species, variety, and named form in all the issues with citations of serial numbers and issues. Identifications of the different species are not made and synonymies are not given.—*K. Münster Ström.*

4232. MOREAU, FERNAND. *Recherches sur les lichens de la famille Stictacées.* [Lichens of the family Stictaceae.] Ann. Sci. Nat. Bot. 3: 297-376. Pl. 1-4, fig. 1-20. 1921.—The Stictaceae are here treated in the same manner as were the Peltigeraceae in a previous article by the same author in collaboration with Mme. Moreau [see Bot. Absts. 4, Entry 1130]. The problems investigated are: the development of the apothecium, a comparison of the elements of the lichen with corresponding algae and fungi, and the phenomenon of biomorphogenesis. The great uniformity noted in the 11 species studied would justify inclusion in 1 large genus. The algae concerned have the character of Chlorophyceae or of Nostocaceae. The formation of the apothecium and the soredium is described. Fecundation was not observed in any instance. Many apothecia are aborted in primordial stages, this doubtless explaining the sterility of many Stictaceae. A theoretical discussion is given of the relation of the parts of a lichen and the significance of the symbiotic condition.—Paul Weatherwax.

4233. TOBLER, FRIEDERICH. *Biologische Flechtenstudien I.* [Biological studies of lichens. I.] Ber. Deutsch. Bot. Ges. 37: 364-368. Fig. 1-8. 1919.—The soredia of *Cetraria glauca* L. "germinate" on twigs of *Fagus* and *Pinus Picea*, producing distinct thalli which soon fuse into larger matted thalli with irregular margins.—W. C. Muenscher.

BACTERIA

4234. CHOLODNYJ, N. *Ueber Eisenbakterien und ihre Beziehungen zu den Algen.* [Iron bacteria and their relation to algae.] Ber. Deutsch. Bot. Ges. 40: 326-346. Fig. 1-6. 1922.—Algal filaments especially of *Conferva*, growing in water containing iron often possess tubercles, "Psichohormium-Bildungen." These gelatinous masses are incrustated with iron but do not represent enlargements of cell membranes. The tubercles are caused by *Sideromonas Confervarum* n. g., n. sp., a short cocco-bacillus, the cells of which tend to form chains. The presence of many of these chains explains the characteristic spongy structure of the tubercles. The tubercles often produce a hypertrophy of the chlorophyll apparatus in the enclosed cells, which have a dark green color and store quantities of reserve food. These "modified cells" apparently represent a resting stage of the alga. The formation of these modified cells suggests a symbiotic relationship between *Sideromonas* and *Conferva*, in which the iron bacteria probably obtain oxygen from the assimilating algal cells.—W. C. Muenscher.

4235. KITCHEN, J. *A key for the identification of bacteria.* Jour. Roy. Microsc. Soc. London 1921: 378-380. 1921.—An index number system is given, suggested as more easily memorized than that used by the Society of American Bacteriologists.—Wm. Randolph Taylor.

4236. LISK, HENRIETTA. *Gas production by an aerobic spore bearing bacillus.* Jour. Amer. Water Works Assoc. 10: 139-144. 1923.—The writer has found an organism in milk which shows morphological and physiological characteristics corresponding to those described for *B. asterosporus*. The conclusion is reached that all aerobic, spore bearing, gas producing bacilli so far described are probably this species.—D. S. Welch.

4237. Mutch, N. *The isolation of the single bacterial cell.* Jour. Roy. Microsc. Soc. London 1919: 221-224. Fig. a. 1919.—Hanging drops of a suspension of the organisms are examined in a moist slide provided with a ring of filter paper wet with salt solution. These drops are prepared by a series of dilutions. When a drop with but 1 organism has been obtained additional sterile nutrient is added and the slide set aside to allow the organism to increase enough to permit bulk transfers.—Wm. Randolph Taylor.

4238. NORTON, JOHN F., and GORDON E. DAVIS. *Bacteriostatic action of dyes on Streptococcus viridans and pneumococci.* Jour. Infect. Diseases 32: 220-222. 1923.—No difference was noted between the action of dyes on the *Streptococcus viridans* and on the pneumococcus groups. The bacteriostatic action was marked only where the dyes contained 3 benzol rings and 2 or more amino groups containing alkyl radicals.—R. L. Starkey.

4239. POTTHOFF, HEINZ. Zur Frage nach dem Vorkommen von Befruchtungsvorgängen bei Bakterien. [On the occurrence of fertilization processes in bacteria.] *Naturwissenschaften* 10: 441-446. Fig. 1-12. 1922.

4240. TRUFFAUT, GEORGES, et N. BEZSSONOFF. Un nouveau bacille fixateur d'azote. [A new nitrogen-fixing bacterium.] *Compt. Rend. Acad. Sci. Paris* 175: 544-546. 1922.—The organism, which is described as *Bacillus Truffauti*, resembles *Bacillus vulgaris* in structure. It fixes as much as 7 mgm. of nitrogen per gm. of levulose consumed, and develops rapidly under anaerobic conditions.—C. H. Farr.

4241. WALKER, JOHN E. Variations in *Streptococcus hemolyticus* on animal passage. *Jour. Infect. Diseases* 32: 287-296. 1923.—The appearance of colonies and the virulence of the "moist" type of *Streptococcus epidemicus* altered with age and acquired the characteristics of *S. hemolyticus*. With animal passage, *S. hemolyticus* showed the reverse tendencies.—R. L. Starkey.

PALEOBOTANY AND EVOLUTIONARY HISTORY

EDWARD. W. BERRY, *Editor*

(See also in this issue Entries 3774, 3779, 3818, 3855)

4242. BERTRAND, PAUL. Sur les flores houillères de la Sarre. [On the coal flora of the Sarre region.] *Compt. Rend. Acad. Sci. Paris* 175: 770-773. 1922.—The flora is given of 4 or 5 zones, which are named after the characteristic species, as follows: Zone of *Pecopteris lamurensis*, zone of *Mixoneura ovata*, zone of *Pecopteridium Defrancei*, zone of *Neuropteris tenuifolia*. The last-named is said to correspond to the zone of *Neuropteris tenuifolia* and *Linopteris sub-Brongiarti* of northern France, where the 3rd zone given above is not represented. The 2nd zone corresponds exactly to that of *Mixoneura flexuosa* of the Gard region. The 1st zone, which constitutes the lower beds of the Ottweiler, represents the series of Rive-de-Gier in the lower series of the Molières of the Gard region.—C. H. Farr.

4243. BOOTH, A. L. The microstructure of coal from an industrial standpoint. *Jour. Roy. Microsc. Soc. London* 1922: 151-160. Pl. 6, 7. 1922.

4244. CARPENTIER, A. Revue des travaux de paléontologie végétale publiés dans le cours des années 1910-1919. Premier partie: Paléozoïque. Suite. [Review of the work in plant paleontology published in the course of the years 1910-1919. First part: Paleozoic. Continued.] *Rev. Gén. Bot.* 35: 42-47, 101-112, 149-160. 1923.

4245. DEPAPE, GEORGES. Recherches sur la flore pliocène de la vallée du Rhône.—Flôres de Saint-Marcel (Ardèche) et des environs de Théziers (Gard). [Pliocene flora of the valley of the Rhone.] *Ann. Sci. Nat. Bot.* 4: 73-265. Pl. 1-15, Fig. 1-45. 1922.—This is a monographic account of the Pliocene floras from Saint Marcel, Théziers, Bagnols and Eure in the western valley of the Rhone, of upper Plaisancian age, and of Vacquières of lower Astian age. There is a good bibliography, the Pliocene geology is discussed, and the species are elaborately described and illustrated. The total flora numbers 72 for the most part well known species, only 1, *Polygonatum pliocenicum*, being described as new. The following genera are represented: *Woodwardia*, *Osmunda*, *Ginkgo*, *Torreya*, *Glyptostrobus*, *Sequoia*, *Cupressus*, *Pinus*, *Phragmites*, *Sabal*, *Smilax*, *Salix*, *Populus*, *Alnus*, *Carpinus*, *Fagus*, *Quercus*, *Castanea*, *Juglans*, *Pterocarya*, *Carya*, *Myrica*, *Ulmus*, *Zelkova*, *Buxus*, *Liriodendron*, *Laurus*, *Persea*, *Oreodaphne*, *Sassafras*, *Cinnamomum*, *Buettneria*, *Zanthoxylon*, *Pirus*, *Robinia*, *Acer*, *Sapindus*, *Celastrus*, *Ilex*, *Berchemia*, *Cornus*, *Liquidambar*, *Platanus*, *Trapa*, *Diospyros*, *Viburnum*, *Notelea*, *Fraxinus*, *Phillyrea*, *Nerium*, and *Coriaria*. The most varied genera are *Quercus*, *Populus*, *Acer*, and *Viburnum*. Thirty-one are identical with, or close to, still living species, 11 have decided North American affinities, 11 are Oriental, 5 are related to forms still living in

the Canary Islands, 28 are Mediterranean, 4 are Caucasian, and 16 are European cool temperate. The ecological bearing is carefully analyzed and the flora is considered to represent elements of the littoral, stream valleys, hills, and uplands of 1000 m. or more. The precipitation is considered to have been variable for these different zones, though ample. The mean annual temperature is considered to have been about 20°C. The fossils are carefully compared with both recent and fossil floras.—E. W. Berry.

4246. DOUIN, R. Les mousses et les hépatiques fossiles des tufs du Lautaret (Hautes Alpes). [The fossil mosses and liverworts of the tufa of the Lautaret (High-Alps).] Rev. Gén. Bot. 35: 113-126. Pl. 1-2. 1923.—The earlier work on the fossil liverworts and mosses is briefly reviewed. The age and origin of the tufa of Lautaret is discussed and the flora of this region briefly mentioned. The author determined 5 mosses of the family Hypnaceae and 5 liverworts, all, apparently, belonging to the acrogynous Jungermanniaceae. The mosses were *Amblystegium riparium* Br., *Hypnum commutatum* Hedw., *H. irrigatum* Zett., *H. falcatum* Brid., *Eurynchium circinnatum* B. E., var., *deflexifolium* Boulay. The liverworts described are: *Lophozia Hornschuchiana* Nees, *Jamesoniella Carringtoni* (Balf.) Schiffner var. *alpina* R. Douin, *Pedinophyllum interruptum* (Nees) Schiffner, *Plagiochila asplenoides* L., and *Aplozia riparia* (Tayl.) Dum.—J. C. Gilman.

4247. FLORIN, R. Zur Alttertiären Flora der südlichen Mandschurei. [The Older Tertiary Flora of Southern Manchuria] Palaeont. Sinica A1: 1-52. Pl. 8, fig. 3. 1922.—The author describes a considerable flora from the coal measures of Fu-Shun in southern Manchuria the age of which is considered upper Eocene or lower Oligocene. The following genera represented by previously described species are discussed: *Lygodium*, *Osmunda*, *Sequoia*, *Dryophyllum*, *Fagus*, *Zelkova* (?), *Panax* (?), *Viburnum*, *Phyllites*, *Glyptostrobus*, *Corylus* (?), *Carpinus*, *Alnus*, *Populus*.—E. W. Berry.

4248. KNOWLTON, F. H. Fossil plants from the Tertiary Lake beds of south-central Colorado. U. S. Geol. Surv. Professional Paper 131: 183-197. Pl. 41-44. 1923.—The author describes the fossil plants from lake beds in the volcanic series of south-central Colorado which are considered to be upper Miocene in age. The following species are recorded: *Pinus crossii* n. sp., *P. similis* n. sp., *P. coloradensis* n. sp., *P. florissanti* Lesq., *Abies rigida* n. sp., *A. longirostris* n. sp., *Sabina linguifolia* (Lesq.) Ckl., *Populus lesquereuxi* Ckl., *Alnus larseni* n. sp., *Planera myricaefolia* (Lesq.) Ckl., *Rubus inquirendus* n. sp., *Ribes protomelaenum* Ckl., *Vitis florissantella* Ckl., *Odostemon marginata* (Lesq.) Knowlton, *O. hakeaefolia* (Lesq.) Knowlton, *Sterculia aceroides* n. sp., *Phyllites potentilloides* n. sp., and 2 species of *Phyllites*.—E. W. Berry.

4249. KNOWLTON, F. H. Revision of the flora of the Green River formation with descriptions of new species. U. S. Geol. Surv. Professional Paper 131: 133-182. Pl. 36-40. 1923.—This is a revision of this middle Eocene flora. Thirty-six species in the literature are dropped as worthless or from other horizons. *Alnites* and *Alnus* become *Planera*; *Ampelopsis* becomes *Parthenocissus*; *Ceanothus* becomes *Zizyphus*; *Myrica* becomes *Rhus*; and *Pecopteris* becomes *Osmunda*. The recognized Green River flora now consists of 81 species and comprises 3 fungi, 5 ferns, 8 equisetums, 9 monocotyledons including 3 palms, and among the dicotyledons the genera *Salix*, *Myrica*, *Comptonia*, *Juglans*, *Quercus*, *Planera*, *Ficus*, *Lomatia*, *Oreodaphne*, *Pimelia*, *Brasenia*, *Sedum*, *Ailanthus*, *Amygdalus*, *Dalbergia*, *Leguminosites*, *Sophora*, *Mimosites*, *Sapindus*, *Rhus*, *Euonymus*, *Acer*, *Ilex*, *Zizyphus*, *Cissus*, *Parthenocissus*, *Eucalyptus*, *Aralia*, *Andromeda*, *Sambucus*, *Achaenites*, *Antholithes*, *Carpolithus*, *Carpites*, *Phyllites*, and *Nordenskioldia*.—The following are described as new: *Caenomyces eucalyptae*, *C. sapindicola*, *Danaea coloradensis*, *Pontederites hesperia*, *Salix linearis*, *S. longiacuminata*, *Myrica minuta*, *M. praedrymeja*, *Comptonia* (?) *anomala*, *Juglans winchesteri*, *Oreodaphne viridiflumensis*, *Pimelia spatulata*, *Sedum hesperium*, *Dalbergia viridiflumensis*, *D. retusa*, *Sophora coloradensis*, *Mimosites coloradensis*, *Sapindus winchesteri*, *Rhus myricoides*, *Sambucus winchesteri*, *Achaenites cichoroides*, *Carpolithus caryophylloides*, *Carpites newberryana*, *C. inquirenda*, *Phyllites winchesteri*, *C. coloradensis*.—E. W. Berry.

4250. KRAUSEL, R. Ist *Taxodium distichum* oder *Sequoia sempervirens* Charakterbaum der deutschen Braunkohle? [Is *Taxodium distichum* or *Sequoia sempervirens* the characteristic tree of the German lignite?] Ber. Deutsch. Bot. Ges. 39: 258-263. Fig. 1-3. 1921.—Sections of wood from the lignite deposits of Germany showed numerous resin canals, especially in the wound tissue, which have not been found in *Taxodium distichum* or *T. mexicanum*. The author therefore concludes that the common tree in these lignite deposits is *Taxodioxydon sequoianum* (the Tertiary form of *Sequoia sempervirens*) and not *Taxodioxydon taxodii* (the Tertiary form of *Taxodium distichum* including *T. mexicanum*.) [See also following entry.]—W. C. Muenscher.

4251. KUBART, B. Ist *Taxodium distichum* oder *Sequoia sempervirens* Charakterbaum der deutschen Braunkohle? [Is *Taxodium distichum* or *Sequoia sempervirens* the characteristic tree of the German lignite?] Ber. Deutsch. Bot. Ges. 39: 26-30. Fig. 1-2. 1921.—According to some investigators brown coals or lignites found in Germany are composed largely of the Tertiary form of *Taxodium distichum*. Other investigators state that the plant concerned here is the Tertiary form of *Sequoia sempervirens*. Woods with wood parenchyma cells with thickened and pitted cross walls have been referred to *Taxodioxydon taxodii* (the Tertiary form of *Taxodium distichum*). Woods with thin, non-pitted cross walls in the wood parenchyma cells were referred to *Taxodioxydon sequoianum* (the Tertiary form of *Sequoia sempervirens*). The author points out that the wood in these lignite deposits cannot be referred with certainty to either *Sequoia* or *Taxodium* since *Taxodium mexicanum* has cross walls in the wood parenchyma cells that are more or less similar to those in *Sequoia sempervirens*. [See also preceding entry.]—W. C. Muenscher.

4252. LUNDQVIST, G. Fossile Pflanzen der Glossopteris Flora aus Brasilien. [Fossil plants of the Glossopteris flora in Brazil.] K. Svenska Vetens.-Akad. Handl. 60³: 1-36. pl. 1-2. 1919.—The author describes the following Permian plants from Paraná and Rio Grande do Sul: *Marchantites*, *Schizoneura* sp., *S. gondwanensis* Feist. (?), *Sigillaria brardi* Brongn., *S.* sp., *Knorria* sp., spores, *Cardiocarpon* sp., *Glossopteris browniana* Brongn. (?), *G. indica* Schimp., *G.* sp., *Gangamopteris obovata* (Carr.) White, *G.* sp., *Neuropteridium plantianum* (Carr.) White, *Noeggerathiopsis hislopi* (Bunb.) Feist., *Arberia* (?) *brasiliensis* n. sp., *Voltzia heterophylla* Brongn. (?), *Annularia australis* Feist., *Sphenophyllum oblongifolium* Unger, *Pecopteris* sp., *Brachyphyllum* (?) *australe* Feist.—E. W. Berry.

4253. MAIDEN, J. H. A critical revision of the genus *Eucalyptus*. Vol. VI, Part 5. p. 219-254, pl. 224-227. John Spence: Sydney, 1922.—This part continues the discussion of the topic "Fossil plants attributed to *Eucalyptus*" and deals particularly with those fossil forms found in countries outside of Australasia. The following species, although previously published, redescribed, and illustrated: *Eucalyptus oceanica* Unger, *E. Haeringiana* Ettingshausen, *E. aegea* Unger, *E. sibirica* Heer, *E.* (?) *americana* Lesq., *E. borealis* Heer, *E. angusta* Velenovsky, *E. dubia* Ettingshausen, *E. dakotensis* Lesq., *E. Gouldii* Ward, *E. proto-Geinitzi* Saporta, *D. Choffati* Saporta, *E.* (?) *attenuata* Newberry, *E.* (?) *angustifolia* Newberry, *E.* (?) *nervosa* Newberry, *E.* (?) *parvifolia* Newberry, *E. latifolia* Hollick, *E. Wardiana* Berry, *Myrcia havanensis* Berry, *Myrtophyllum* (*Eucalyptus*?) *Geinitzi* Heer, and *M.* (*Eucalyptus*?) *Schubleri* Heer. A chapter is also added on the "Exudates" of *Eucalyptus*.—J. M. Greenman.

4254. PILGER, R. Die Stämme des Pflanzenreichs. [The lineage of the plant kingdom.] 2nd ed., 119 p., 23 fig. Vereinigung Wissenschaftliche Verleger: Berlin and Leipzig, 1921.

4255. RUDOLPH, KARL. Zur Kenntnis des Baues der Medullosen. [The structure of the Medullosa.] Beih. Bot. Centralbl. II Abt., 39: 196-222. Pl. 3-4. 1922.—The stem of *Medullosa stellata*, *M. porosa*, and *M. Leuckarti* is a solenostele (amphiphloic siphonostele). The primary wood of this stem consists of parenchyma with more or less numerous tracheids similar to *Heterangium*.—The outer wood has gaps the arrangement of which has not been determined.—While the tracheids of the stem extend lengthwise as a rule, a cross section of

the primary xylem shows constantly: (1) an inner layer with tracheids extending lengthwise; (2) a middle layer with tangential horizontal tracheids; (3) a small outer layer with tracheids extending lengthwise.—The condition of the middle layer with its horizontal tracheids is compared with the girdle bundles in the cydales. It is suggested that the problem of the horizontal tracheids may be an ecological one.—*L. Pace.*

4256. SAHNI, B. **The present position of Indian palaeobotany.** Proc. Asiatic Soc. Bengal 174: clix-clxxv. 1921 [1922].—A historical and stratigraphic account is given of the present status of the study of the fossil floras of India from the Cambrian to the post-Tertiary. It is especially important in connection with the more abundant floras of the Gondwana series, giving lists of species with their horizons for the Carboniferous, Permian, Triassic, Jurassic, and Cretaceous, with a bibliography.—*E. W. Berry.*

4257. WALKOM, A. B. **Paleozoic floras of Queensland. Part 1. The flora of the Lower and Upper Bowen Series.** Queensland Geol. Surv. Publ. 270. 64 p., 9 pl. 1922.—A monographic account is given of 23 different plants, members of the *Glossopteris* flora, that comprise the flora of the Bowen series. *Glossopteris jonesi* and *Samaropsis etheridgei* are described as new, and the following are recorded from Queensland for the 1st time: *Phyllothea robusta*, *Glossopteris tortuosa*, *Gangamopteris cyclopteroides*, *G. angustifolia*, and *Dictyopteridium sporiferum*. Scale fronds of *G. lossopteris* are described and seed associated with this genus and described as *Nummulospermum bowenense* are considered as its probable fruits. The Bowen series is of Permian, or Permo-Carboniferous, age.—*E. W. Berry.*

DISEASES CAUSED BY FUNGI

4258. ANONYMOUS. **Kaalbrok.** [Clubroot.] Tidsskr. Planteavl. 28: 563-566. 1922.—This is a discussion of the effects of clubroot (*Plasmodiophora Brassicae*) on the roots of crucifers.—*Albert A. Hansen.*

4259. ALCOCK, M. L. **A die-back in Sussex.** Trans. British Mycol. Soc. 8: 190. 1923.—*Diplodia Griffoni* Sacc. & Trav. was found to be the cause of a bark disease of apple trees in Sussex.—*W. B. McDougall.*

4260. ALLEN, RUTH F. **A cytological study of infection of Baart and Kanred wheats by *Puccinia graminis tritici*.** Jour. Agric. Res. 23: 131-151. pl. 1-6. 1923.—The variety Baart is susceptible to the strain (I) of the fungus used while Kanred is immune. Germination of urediniospores and the formation of substomatal vesicles is the same on both hosts. In Kanred, however, the number of entrances is small, apparently due in part to the smallness of the stomatal opening. In Baart, a slender hypha issuing from the vesicle proceeds until it comes in direct contact with a cell. It then swells at the tip, its pair of nuclei divide, a septum is formed and the terminal cell which is closely applied to the host cell becomes the haustorium mother cell. From the mother cell, penetration of the cell wall of the host is effected through an invisible pore. The plasma membrane of the host cell is invaginated by the enlarging haustorium. A new growing point arises from the pe-

ultimate cell of the hypha and other haustorial mother cells may be produced in the substomatal vesicle or in intercellular spaces. The process is the same in Kanred until a haustorium is formed. Penetration of the host cell is actually accomplished but the haustorium soon shrinks and dies and the effect is communicated to the mother cell or even farther. The host cell likewise dies but diffusion of material from the dead host cells to healthy ones seems to be prevented by the formation of thickened contact walls. The fungus may produce several infecting hyphae before it is completely exhausted.—The osmotic concentration of the attacked host cell is changed. Various theories of immunity are discussed but the chemical theory seems to correspond best with the facts observed.—*D. Reddick.*

4261. BARSALI, E. *Il seccume dei Platani.* [Leaf blight of *Platanus*.] *Processi Verbali Soc. Toscana Sci. Nat.* 28: 6-8. 1919.—The 3 forms of *Gloeosporium* found on leaves and branches of *Platanus* affected with sycamore leaf blight or anthracnose (*Gloeosporium nervisequum* (Fekl.) Sacc., *G. nervisequum* var. *valsoideum* Saac., and *G. Platani* (Mont.) Oud. have been determined to be the same fungus, all 3 being conidial forms of *Gnomonia veneta* (Sacc. & Speg.) Kleb. The slight variations in spore measurements may be attributed to differences in substratum, as verified by artificial cultures.—The disease has spread rapidly in Italy and is particularly prevalent in cold, wet springs. Cultivation of resistant varieties of sycamore is considered the most effective means of control.—*Edith K. Cash.*

4262. BARSS, H. P. Copper carbonate for wheat smut control. *Oregon Agric. Exp. Sta. Circ.* 30. 3 p. 1922.—This article discusses preliminary tests and gives directions for using this dust treatment.—*C. E. Owens.*

4263. BERGER. *Ist der Hallimasch Parasit oder Saprophyt?* [Is the "honey fungus" [*Armillaria mellea*] a parasite or a saprophyte?] *Forstwiss. Centralbl.* 44: 424-431. 1922.—Since Hartig's experiments in 1872 it has generally been considered that the fungus is both saprophytic and parasitic, although some have asserted that it attacks only diseased plants. Berger cites observations indicating that the fungus is saprophytic only. In all cases investigated the affected trees were also attacked by bark-beetles, injured by lightning, or otherwise weakened; in no case did the author observe an otherwise healthy tree attacked by *Armillaria mellea*. His theory is that infection must be preceded by fermentation or decomposition of the sap, such as occurs on freshly cut stumps and in trees attacked by bark-beetles or otherwise injured.—*W. N. Sparhawk.*

4264. BIRMINGHAM, W. A. Diseases of *Pinus insignis*. *Australian Forest. Jour.* 5: 181-182. 1 fig. 1922.—*Thelephora terrestris*, responsible for what is commonly known as "smothering disease," is very briefly discussed.—*C. F. Korstian.*

4265. BLANCHARD, M., et G. LEFROU. Présence dans une lésion humaine d'un saccharomycète pathogène pour le cobaye. [Presence in a human lesion of a saccharomycete pathogenic to guinea pigs.] *Bull. Soc. Path. Exotique* 15: 915-918. 1922.—A saccharomycete was present "to the exclusion of all other germs" in a deep abscess of the scapulo-vertebral region of a European at Brazzaville, French West Africa. Attempts to culture this yeast on several media failed. Pus injected into guinea pigs produced swellings and ulcers in which this yeast was the only organism demonstrable.—*Philip Brierley.*

4266. BRANSTETTER, B. B. Fungi internal to Missouri seed corn of 1921. *Jour. Amer. Soc. Agron.* 14: 354-357. 1922.—A disease survey shows that 1921 Missouri corn was heavily infected with *Fusarium moniliforme*, *Cephalosporium Sacchari*, and *Diplodia Zeae* in the order named, that kernels of many ears were infected with 2 of the above fungi, and that with care comparatively disease-free ears can be selected, thus eliminating the necessity of using the germinator as a means of detecting heavy infection.—*F. M. Schertz.*

4267. BRENTZEL, W. E. A disease of flax not previously reported in the United States. [Abstract.] *Phytopathology* 13: 53-54. 1923.—This disease is probably the same as that produced by *Phlyctaena linicola* Speg. in South America.—B. B. Higgins.

4268. BRENTZEL, W. E. Disease of flax caused by a species of *Rhizoctonia*. [Abstract.] *Phytopathology* 13: 53. 1923.

4269. BRITON-JONES, H. R. The smuts of millet (*Andropogon Sorghum* Brot.). Ministry Agric. Egypt Tech. and Sci. Serv. (Bot. Sec.) Bull. 18. 6 p., 3 pl. 1922.—The following smuts of millet occurring in Egypt are briefly discussed, including occurrence, descriptions of the disease and causal fungus, and methods of treatment: long smut (*Tolyposporium filiferum* Busse), head smut (*Ustilago reiliana* Kuehn), and grain smut (*Sphacelotheca Sorghi* (Lk.) Clinton).—Frederick V. Rand.

4270. BRUIJN, HELENA L. G. DE. The saprophytic life of *Phytophthora* in the soil. Mededeel. Landbouwhoogeschool Wageningen 24: 1-38. 2 pl. 1922.—Researches into the nature of *Phytophthora Syringae* Klebs brought the author to the same conclusions as reached by Klebahn (1904), who was of the opinion that the fungus persists in the soil. Experiments were also conducted with *P. erythroseptica* Peth. and with *P. infestans* DeBy., bog soil, leaf mold, and other types of soil being used. The soils were put into test tubes just as received from nature, and sterilized. Portions of pure cultures with some of the medium were then transferred to the soil tubes. Soon the mycelium started growth in the surrounding soil, and the latter, containing the fungus, was again transferred to other soil tubes to make sure that the fungi could live on soil alone. All 3 species were found to persist in soil, but the external behavior differed among them. *P. Syringae* forms white aerial mycelium on the top of the soil if the humidity is favorable; if too moist, however, the fungus, though alive, may not be visible. *P. erythroseptica* forms more aerial mycelium, and behaves differently on different types of soil, developing well on clay. *P. infestans* is not easily cultivated, and the growth of the fungus is rather slow. A piece of medium containing the fungus was transferred to a tube with sterilized bog soil whereupon the mycelium soon spread over the surrounding soil. After 4 weeks the transferred piece of agar was taken out of the tube, leaving the mycelium on the soil alone, and later the bog soil with the fungus was transferred to all the other types of soil under test, and in each case it grew successfully. Its aerial mycelium grows toward the lower parts of the test-tubes, while the other 2 species form their aerial mycelium at the top of the soil. *P. infestans* grows best on clay, less well on leaf mold, and rather poorly on sand. The genus *Phytophthora* is not such an obligate parasite as was formerly supposed.—J. C. Th. Uphof.

4271. BURGER, O. F. Melanose and stem-end rot of citrus fruits. [Abstract.] *Phytopathology* 13: 45. 1923.—Both diseases are caused by *Phomopsis Citri* Faw.—B. B. Higgins.

4272. COLLINS, J. FRANKLIN. A noteworthy case of resistance to the chestnut bark disease. [Abstract.] *Phytopathology* 13: 47. 1923.

4273. COONS, G. H. Control of stinking smut of wheat (*Tilletia levis*) with dust treatments. [Abstract.] *Phytopathology* 13: 37. 1923.

4274. COONS, G. H., and RAY NELSON. Yellows-resistant celery: 3rd progress report. [Abstract.] *Phytopathology* 13: 56. 1923.—The disease is due to *Fusarium* sp.—F. V. Rand.

4275. CRÉPIN, C. Une maladie grave de la pomme de terre dans le Forez. [A serious disease of Irish potato in the Forez.] Bull. Soc. Path. Vég. France 9: 237-243. Fig. 1-2. 1922.—Some seriously diseased potato plants had rolled leaves, but this trouble differed from true leaf-roll in that the parenchyma was soft. The cause of the disease is *Vermicularia varians* Duc.—J. Dufrenoy.

4276. CUNNINGHAM, G. H. Apple and pear black spot: their appearance, cause, and control. New Zealand Jour. Agric. 25: 20-31. Fig. 1-12. 1922.—The apple scab, *Venturia inequalis*, is described in detail, and pear scab, *Venturia pirina*, is briefly discussed. Destruction of fallen leaves is recommended and a detailed spray schedule is given.—N. J. Giddings.

4277. CUNNINGHAM, G. H. Brown rot, *Sclerotinia cinerea* Schroet. Its appearance, cause and control. New Zealand Jour. Agric. 25: 83-93. Fig. 1-8. 1922.—Brown rot was not particularly destructive in New Zealand until 1915, but since that time has been one of the most serious diseases of stone fruits. The disease is described in detail and control measures are fully discussed. A recommended spray schedule for leaf curl and brown rot is given.—N. J. Giddings.

4278. CUNNINGHAM, G. H. Coral spot, *Nectria cinnabarina* (Tode) Fries. A wound parasite of fruit-trees. New Zealand Jour. Agric. 25: 354-359. Fig. 1-7. 1922.—This disease is quite prevalent and causes greater injury than is usually believed. The appearance of infected tissues is described. The life history of *Nectria cinnabarina* is given. General sanitation regarding woody tissues is recommended for control.—N. J. Giddings.

4279. CUNNINGHAM, G. H. Leaf curl, bladder plum and cherry curl. Their appearance, cause, and control. New Zealand Jour. Agric. 26: 85-97. Fig. 1-10. 1923.—Leaf curl, *Taphrina deformans* (Fcl.) Tulasne, is quite prevalent in New Zealand. It occurs on peaches, nectarines, almonds, and apricots. Hobbs Royal, Charlotte, Hale's Early, and Saunders are listed as somewhat resistant varieties.—Bladder plum, *Taphrina Pruni* (Fcl.) Tulasne, occurs on both English and Japanese varieties of plums but is most serious on the latter. Cherry curl, *Taphrina minor* Sadeb., occurs in only 2 localities in New Zealand and shows no evidence of spreading.—The 3 diseases are described in some detail and control measures suggested.—N. J. Giddings.

4280. CUNNINGHAM, G. H. Leaf rust, *Puccinia Pruni-spinosae* Pers. Its appearance, cause, and control. New Zealand Jour. Agric. 25: 271-277. Fig. 1-9. 1922.—Leaf rust is common on stone fruits in New Zealand, causing serious defoliation and injuries to the fruit. Appearance of the disease and life history of the organism are discussed. The alternate host, anemone, is not common and it is believed that the disease also overwinters in the uredo stage. Plowing under of all infected leaves and spraying with lime-sulphur are recommended as control measures.—N. J. Giddings.

4281. CUNNINGHAM, G. H. Silver blight, *Stereum purpureum* Pers. New Zealand Jour. Agric. 24: 276-283. Fig. 1-8. 1922.—Silver blight or silver leaf is common in New Zealand on almonds, apples, apricots, cherries, currants, gooseberries, nectarines, peaches, pears, plums, quinces, and many ornamental trees and shrubs. It causes losses of 1-10 per cent and is most injurious to stone fruits. Symptoms, pathological histology, life history, and preventive treatment are discussed.—N. J. Giddings.

4282. CUNNINGHAM, G. H. The significances of apothecia in the control of brown rot of stone fruits. New Zealand Jour. Agric. 25: 225-230. Fig. 1. 1922.—Large numbers of apothecia of *Sclerotinia cinerea* have been found growing from peach and plum mummies; detailed studies have been made and will be reported elsewhere. Cultivation is believed to be a very important factor in control as apothecia were found only where the mummies were on, or in, closely compacted soil. An apothecium was formed from a mummy buried at a depth of 3 inches.—N. J. Giddings.

4283. DICKSON, JAMES G. The influence of soil temperature and moisture on the development of seedling blight of wheat and corn caused by *Gibberella Saubinetii* (Mont.) Sacc. [Abstract.] Phytopathology 13: 50. 1923.

4284. DRECHSLER, CHARLES. A new blossom-end decay of watermelons caused by an undescribed species of *Pythium*. [Abstract.] *Phytopathology* 13: 57. 1923.

4285. DRECHSLER, CHARLES. The occurrence of zonate eye-spot [*Helminthosporium giganteum* H. & W.] on various grasses and its mode of extension. [Abstract.] *Phytopathology* 13: 59-60. 1923.

4286. DUCOMET, V. Observations sur le developpement du *Rhizoctone* de la luzerne. [The spread of *Rhizoctonia* on Medicago.] *Bull. Soc. Path. Vég. France* 9: 312-316. 1922.—*Rhizoctonia* infects those lucerne plants suffering from drought. The only way to combat the disease seems to lie in caring for the proper nutrition of the plant.—*J. Dufrénoy*.

4287. DUFRÉNOY, J. Biologie de l'*Armillaria mellea*. [Biology of *Armillaria mellea*.] *Bull. Soc. Path. Vég. France* 9: 277-281. *Fig. 1-2*. 1922.—*A. mellea* proves a dangerous pathogen for trees, chiefly chestnut and walnut, when planted too deeply. Destruction of plum, cherry, and walnut orchards is recorded. Grafting of *Juglans regia* on *J. Hindsii* is advocated.—*J. Dufrénoy*.

4288. ECKERSON, S. H., and JAMES G. DICKSON. The influence of soil temperature and moisture on the chemical composition of wheat and corn and their predisposition to seedling blight. [*Gibberella Saubinetii* (Mont.) Sacc.] [Abstract.] *Phytopathology* 13: 50-51. 1923.

4289. EDSON, H. A., and M. SHAPOVALOV. Parasitism of *Sclerotium Rolfsii* on Irish potatoes. *Jour. Agric. Res.* 23: 41-46. *Pl. 1-3*. 1923.—Potatoes infected with this organism may show any of the following symptoms: seed-piece rot, damping-off, stemrot, wilt or blight. When tubers are affected, a progressive soft, white rot with profuse extrusion of liquid results. Destruction of host tissue is accomplished without hyphal penetration.—Varietal strains of the fungus, both physiological and morphological, are shown to exist.—*D. Reddick*.

4290. FILLEY, W. O., and H. W. HICOCK. Control of the white pine blister rust in Connecticut 1909-1921. *Connecticut Agric. Exp. Sta. Bull.* 237. 305-326. *Pl. 23-26*. 1922.—The white pine blister rust was found in the State in 1909. White pine has been said to be essential to the practice of forestry in the State; therefore it commands much care and study. A history of the causative organism, *Cronartium ribicola*, together with its life cycle on 2 hosts is given. Measures for control instituted by the Federal Government and by the State are given. Scouting for and removal of infected *Ribes* has been carried on since 1917. Infected pines may also be destroyed. Future observation is necessary to check up the effectiveness of the removal of the 2 species infected. The possible area of serious infection is limited to about 500 square miles in the northwestern part of the State where wild *Ribes* plants are abundant. It has been found that infection takes place through the stomata of the leaves; also, that 2 and 3-needled pines may be infected as readily as the 5-needled pines. A survey has shown the State to contain 20,000 acres of pure pine over 25 years of age and 20,000 acres under 25 years of age. There are 150,000 acres of pine-hardwoods with more than 40 per cent of other species. The forest area of the State is 1,483,300 acres and there is a stand of pine totaling 150,000,000 board feet.—*Henry Dorsey*.

4291. FOËX, E. La dartrose de la pomme de terre en 1922. [The dartrose disease of the Irish potato.] *Bull. Soc. Path. Vég. France* 9: 244-250. 1922.—*Vermicularia varians* Duc. developed as a pathogen on potato plants in most parts of France. A relation between geographical distribution of the disease and ecological factors is indicated. To control the disease, seed from infected plants should be avoided. Seed disinfection is also advocated.—*J. Dufrénoy*.

4292. FUNK, GEORG. Zur Kenntnis der Keimlingserkrankungen bei Koniferen. [Diseases of conifer seedlings.] *Forstwiss. Centralbl.* 44: 381-388. 1922.—The "damping-off" of

coniferous seedlings has been attributed by various writers to a fungus (*Fusoma parasiticum* Tubeuf), the effect of excessive heating of the surface of the soil, stagnant moist atmosphere and excessive soil moisture, or combinations of these causes. Funk has found that *Fusoma* is ordinarily saprophytic, but it becomes parasitic on seedlings which are in a weakened condition. This is also the case with several other fungi of the genera *Fusoma*, *Fusarium*, and *Botrytis*, which destroy conifer seedlings. Many diseased seedlings are found to have their roots covered with minute mites, probably species of *Tyrophypus*. It seems probable that the roots wounded by these mites are made susceptible to attack by the fungi.—W. N. Sparhawk.

4293. GARBOWSKI, L. La lutte contre le blanc de groseillier (*Sphaerotheca Mors-uvae* Berk. et Curt.). [Control of gooseberry mildew.] Bull. Trimest. Soc. Mycol. Franc 38: 98-99. 1922.—Experiments indicate that treatment with arsenite of soda in solutions of 0.01-0.02 per cent is more effective than the customary methods of applying polysulphides or powdered sulphur.—D. S. Welch.

4294. GARDNER, MAX W., and H. S. JACKSON. New aspects of apple blotch control. [Abstract.] Phytopathology 13: 44. 1923.

4295. GODFREY, GEORGE H. A *Phytophthora* footrot of rhubarb. Jour. Agric. Res. 23: 1-26. Pl. 1-12, 3 fig. 1923.—*Rheum rhaponticum* in many parts of eastern U. S. A. is affected. A sudden wilting of outer leaves in midsummer is the first indication. The leaf stalk is girdled at the base, decays very rapidly, and secondary invaders soon appear. The root soon becomes affected and the plant dies. The prevalence of the disease is correlated with wet, cloudy weather. The disease is caused by *Phytophthora parasitica* var. *rhei* n. var. The fungus is described and compared with all other species of the genus as to cultural characters, host range, morphology, etc.—Spraying with Bordeaux mixture appears to reduce infection and this material may be used with impunity since the disease appears after the rhubarb harvest. The disease is easily carried to new places in infected roots. Surface contamination of divided roots is easily prevented by wetting the roots thoroughly with formaldehyde (1-100) and covering them for several hours.—D. Reddick.

4296. GRAVES, ARTHUR H. The *Melanconis* disease of the butternut. [Abstract.] Phytopathology 13: 47. 1923.

4297. GREENWOOD, F. W. Collar rot in pea crops on the Wairau plain. Some causes and preventive measures. New Zealand Jour. Agric. 26: 35-37. 1 fig. 1923.—This disease, due to a species of *Fusarium*, has been very destructive to peas in certain sections, especially on sour or poorly drained soils. The use of lime is recommended. The disease does not appear to injure tares and these may be grown.—N. J. Giddings.

4298. HARRINGTON, J. B. Discussion of Hayes and Stakman's paper, "Wheat stem rust—from the standpoint of plant breeding." Proc. Western Canadian Soc. Agron. 2: 36-37 1921 [1922].—Suggestions are made as to important phases of the wheat stem rust problem needing further investigation, with special emphasis on the value of cooperation. [See following entry.]—Frederick V. Rand.

4299. HAYES, H. K., and E. C. STAKMAN. Wheat stem rust from the standpoint of plant breeding. Proc. Western Canadian Soc. Agron. 2: 22-35. Fig. 1-4. 1921 [1922].—The discovery of biologic forms of stem rust of wheat has given the breeding of rust-resistant varieties a definite scientific basis. Numerous tests of biologic forms in the urediniospore stage have furnished data showing the relative stability of the individual forms. Extensive tests with various biologic forms are suggested to determine whether or not genetic segregation occurs at the time of teleutospore formation. Forms which are heterogeneous and give the X type of reaction should be favorable material for such a study. Disease resistance in

plants is inheritable in the ordinary manner. After determining the number and prevalence of biologic forms of stem rust, these forms should be used in building up wheat varieties resistant to all forms of wheat stem rust. Definite cooperation between pathologists and breeders, and between different research institutions, is suggested. [See also preceding entry.] *Frederick V. Rand.*

4300. HENRY, A. W. Some fungi causing black point of wheat. [Abstract.] *Phytopathology* 13: 49. 1923.—In inoculation tests with several fungi black point was produced by *Helminthosporium sativum*, *H. sp.*, *Brachysporium*, and *Stemphylium*.—*B. B. Higgins.*

4301. HENRY A. W. The pathogenicity of *Fusarium moniliforme* Sheldon cereals. [Abstract.] *Phytopathology* 13: 52. 1923.

4302. HOPKINS, E. F. The *Sphaerulina* leaf spot of clover. *Phytopathology* 13: 117-126. Pl. 8-9, fig. 1-3. 1923.—A disease produced by *Sphaerulina trifolii* E. Rostr. on various species of *Trifolium* and not previously reported in America has been found rather generally distributed. The fungus was isolated and grown in cultures and successful inoculations with pure cultures were made on *Trifolium pretense* L. and on *T. repens* L. Gross inoculations were successful on these 2 species and also on *T. hybridum* L., *Medicago sativa* L., *M. maculata* Willd., *Melilotus alba* Lam., and *M. officinale* Willd. The disease is characterized by the appearance of very small black spots on the leaf blades, petioles, and stipules. These spots finally enlarge and become pale brown in color with dark brown margins. Perithecia develop abundantly in the old spots.—*B. B. Higgins.*

4313. MAINS, E. B. Evidence of the seed carriage of the *Euphorbia* rusts, *Uromyces proëminens* and *U. dictosperma*. *Proc. Indiana Acad. Sci.* 1921: 137-139. 1922.—Seed from plants of *Euphorbia dentata* heavily rusted with telia of *Uromyces proëminens* were planted. Seven plants out of 60 showed infection either with pycnia or aecia or with both. Aeciospores from these infected plants were sown on 5 uninfected plants and production of uredinia and telia of *U. proëminens* resulted upon capsules and leaves. The same kind of an experiment was carried out, using seed from plants of *Euphorbia arkansana* Eng. & Gr. heavily rusted with telia of *Uromyces dictosperma* Ellis & Ev. sent from Kansas. Eleven plants out of 42 showed infection. Uredinia and telia appeared later upon most of the plants. Aeciospores were sown on uninfected plants and uredinia and telia were produced. *U. dictosperma* is a full-cycled, autoecious species. It seems evident that both rusts are seed carried.—F. C. Anderson.

[Destruction of woodwork in the castle of Versailles by *Phellinus cryptarum*.] *Compt. Rend. Acad. Sci. Paris* 175: 389-394. *Fig. 1-4*. 1922.—In addition to this species there are found *Polyporus cryptarum* Fr., *Boletus cryptarum* Bull., *Polyporus undatus* Pers., *Coniophora membranacea*, and *Rhyncolus culinaris* Germ. The wood was chiefly of *Xestobium rufovillosum* Deg. and *Anobium domesticum* Geoffr. A microscopic study is made of the wood infested with *Phellinus cryptarum* Bull.—C. H. Farr.

4315. MARCLOUX, E. Mycose pulmonaire. [Pulmonary mycosis.] *Bull. Soc. Path. Exotique* 15: 919-920. 1922.—An abscess in the region of the right scapula of a Frenchman from French West Africa contained yeast cells and the pus from this abscess produced fatal tumors in guinea pigs. Attempts to culture the yeast failed. The author considered it suggestive of *Monilia*.—Philip Brierley.

4316. MEHTA, KARM CHAND. Observations and experiments on cereal rusts in the neighborhood of Cambridge, with special reference to their annual recurrence. *Trans. British Mycol. Soc.* 8: 142-176. 1923.—Field work was carried on for nearly 2 years to determine the relative importance of the various factors which go to explain the origin of rust outbreaks year after year. At the same time extensive culture work was carried on to throw light on the physiological differences between the yellow, brown, and black rusts of wheat. In black rust, *Puccinia graminis*, it was found that both uredospores and mycelium soon lose their vitality if exposed to winter weather and, also, that direct infection of wheat by sporidia is not possible. Hence it is concluded that annual outbreaks of this rust must be caused by fresh infection with aecidiospores from barberry. The uredospores of the brown and yellow rusts, *P. triticea* and *P. glumarum*, however, germinate well at any time during the winter and so may infect young wheat plants in spring. The culture work showed that in the case of black rust specialization is not so fixed as reported by some other workers but that the brown and yellow rusts are much more rigidly specialized.—W. B. McDougall.

4320. NEWTON, MARGARET. Biologic forms of wheat stem rust in Western Canada. *Proc. Western Canadian Soc. Agron.* 1: 34-35. 1920 [1921].—This constitutes a summary of a paper delivered by the author at Edmonton, Alberta, in 1920. By infection experiments she has shown that 11 distinct biological forms of wheat stem rust are present in Western Canada.—*Frederick V. Rand.*

4321. NOBÉCOURT, PIERRE. Sur le mécanisme de l'action parasitaire du *Penicillium glaucum* Link et du *Mucor stolonifer* Ehrb. [Mechanism of the parasitic action of *Penicillium glaucum* and *Mucor stolonifer*.] *Compt. Rend. Acad. Sci. Paris* 174: 1720-1722. 1922.—These fungi which are commonly saprophytes may affect various fruits and vegetables. Their destructive action is due to a substance secreted by the fungus diffusing through the flesh of the parasitized fruit. There are certain evidences that this substance is an enzyme as it is destroyed by a temperature above 60°C; its action ceases at 0°C, but recovers with a rise in temperature. Immunity to these fungi is not considered as due to resistance to this secretion.—*C. H. Farr.*

France* 9: 257-259. 1922.—Following the drought in 1921 and 1922 many potato plants wilted in the field as early as August. Wilted plants were infected by *Vermicularia varians* Duc.—*J. Dufrénoy.*

4324. P[ILICHOD]Y, A. Le "pourri" de la tige. (*Trametes Pini*.) (Ses manifestations dans les vieux peuplements de la vallée de Joux.) [The trunk "rot". Its manifestations in the old stands of the Joux River Valley.] *Jour. Forest. Suisse* 72: 223-226. 1921.—*Trametes Pini* is contrasted with *T. radiciperda*, the more prevalent of the 2. It is described in detail as to the host and the means of access, the characteristic decay, the spread radially and vertically, and the typical outward manifestations. In the old stands of the Joux River Valley the rot did not produce the typical sporophores, but the fruiting bodies were produced in the form of incrustations on the underside of dead branches, close to the trunk. The rot was, therefore, mistaken for either *Polyporus annosus* or a Fomes of the *F. roburineus* group. The rot was identified through microscopic examinations of the spores.—*G. Kempff.*

4325. S., G. N. Pine branch twist a fungus disease on pine (*Melampsora pinitorqua*). *Cyprus Agric. Jour.* 18: 19. 1923.—The author gives a description of the appearance of branches affected with the disease. Only 2 cases have been noted (in the Laphos forest in Cyprus, by the forest staff.—*W. Stuart.*

4326. SALMON, E. S., and H. WORMALD. A safe method of preventing "bunt" in wheat. *Jour. Ministry Agric. Great Britain* 29: 722-728. 1922.—Treating wheat with a solution of copper sulphate should be abandoned as a solution of the strength necessary to kill the spores of bunt seriously impairs the germination of the seed-wheat.—A better method consists of the use of a 1-480 aqueous solution of formalin. This is sprinkled slowly over the seed wheat at the rate of 1 gallon to 2 bushels of seed, the latter being stirred until the grains are all thoroughly wet. The seed is then placed in a heap, left covered for 4 hours with sacks wet with the formalin solution, and then spread out to dry in a thin layer on a clean floor. The treated seed when dry should be sown as soon as possible.—*M. B. McKay.*

4327. SCHOENE, W. J. The past, present and future of the cedar situation. *Proc. Virginia State Hort. Soc.* 1922: 42-46. 1923.—This is a discussion of the status of cedar eradication as a control measure for the cedar-rust disease of apples in Virginia.—*F. D. Fromme.*

4328. SHAPOVALOV, MICHAEL. Relation of potato skinspot to powdery scab. *Jour. Agric. Res.* 23: 285-294. *Pl.* 1-4. 1923.—Skinspot appears on the surface of potato tubers as "round,

raised, closed pustules frequently with a depressed border, single or in aggregates of varied configuration; dark-brown or bluish brown outside and olive brown to brown inside." The name "skinspot" has no right to existence except as a matter of convenience, for the lesions are essentially and primarily the closed or immature sori of *Spongospora subterranea*. The range of this disease coincides with that of *Spongospora* scab. Secondary invaders such as *Oospora pustulans* in England, *Phoma eupyrena* in Germany, *Phoma tuberosa* in Maine, or *Colletotrichum atrementarium* in Pennsylvania, etc., do not contribute to the production of the lesions.—D. Reddick.

4329. SHARPLES, A. A preliminary account of observations on the fungi causing "Brown root" disease. *Malayan Agric. Jour.* 10: 181-183. 1922.—There are 3 morphologically different fungi associated with "brown root" disease: those of the brown root disease of camphor and of the Ceylon brown root disease seem to be species of *Hymenochaete*; whereas the brown root disease of Malaya has a fungus which resembles a *Corticium*.—I. H. Burkill.

4331. SPIEKERMANN. Wie kann die weitere Verbreitung des Kartoffelkrebses in Deutschland verhindert werden? [How can the further spread of potato canker be prevented in Germany?] *Mitteil. Deutsch. Landw. Ges.* 38: 117. 1923.—The use of resistant varieties is said to be the only solution. The following are given as potato varieties partly or wholly immune: Parnassia, Pepo, Hindenburg, Arnika, Jubel, Preussen, Thieles, Earliest, Kuckuck, Magdeburger Blue, Paulsens July.—A. J. Pieters.

4332. STAHEL, GEROLD. Bijdrage tot de kennis der krullotenziekte. [Contribution to the knowledge of witches brooms.] *Dept. Landb. Suriname Bull.* 39: 34 p., 8 pl. 1919.—The disease is caused by *Marasmius perniciosus*. It was not possible to infect cocoa-buds by the mycelium taken from witches brooms. The basidiospores have to pass the cuticle or the stoma. A description is given of inoculation of the cocoa fruits. Most petrified fruits are found in May and June. In pure cultures it was never possible to obtain fruiting bodies. The mycelia form a dense mass on agar; white at first and later red, they become lemon-yellow in the full light. When placed out-of-doors in shaded pots, the mycelia become red within 2 to 3 days and produce fruiting bodies during rainy weather after 10 days. The hymenia produce but few spores in the morning, most of them being formed between 6 and 12 P.M. During the last 15-20 years the witches broom disease has caused much loss in Surinam to cocoa trees. The disease is at present eradicated by removing the witches brooms, petrified fruits, and diseased flowers every 3-4 weeks.—J. C. Th. Uphof.

4333. STAHEL, GEROLD. De Sclerotium-ziekte van de Liberiakoffie in Suriname veroorzaakt door *Sclerotium coffeicolum* nov. spec. [The Sclerotium disease of Liberia coffee in Surinam caused by *S. coffeicolum* n. sp.] *Dept. Landb. Suriname Bull.* 42. 34 p., 11 pl. 1921.—Previous to 1917 the Sclerotium disease caused no damage, but in that year it became dangerous in Upper Surinam. The fungus is found on the leaves and the berries of Liberia, canephora, excelsa, and Abeocuta coffees where it causes brown spots hardly 0.5 cm. in diameter, with conspicuous concentric rings. By artificial inoculation the disease was also induced on the Robusta, Uganda, Mocca, and Surinam coffee varieties, but it grows only poorly on the varieties not belonging to the Liberia group. The fungus cannot attack the berries until they are about three quarters grown. It develops only in the exocarp and mesocarp and does not enter the seed, the latter germinating normally. The sclerotia are orange to brown externally, white within, flat, and up to 0.5 cm. broad. Dead berries which have fallen to the ground are sometimes entirely covered with sclerotia. On the fruit they are flattened, but larger than those on the leaves. It was not found possible to germinate the sclerotia artificially. On the underside of the leaves small "spines" are formed which are easily scattered by the wind and are composed of bundles of hyphae 5 to 8 μ in diameter. These spines are

connected with each other by many anastomoses. No spore formation has ever been found on these spines but pure cultures were made from them. They grow readily in acid but not in alkaline media. It is characteristic that the fungus itself lives only in dead tissue, the only actively parasitic period in its life being that of its entry through the cuticle or stomata. The mycelium probably excretes oxalic acid which kills the cells in the vicinity of the advancing hyphae, the latter subsisting upon the resulting dead cells. *Sclerotium coffeicolum* n. sp. is apparently related to *S. Rolfsii*.—*J. C. Th. Uphof*.

4334. STAHEL, GEROLD. De Zuid-amerikaansche Hevea-bladziekte op de rubberplantage der "Lawa Caoutchouc Compagnie." [Hevea leaf-disease in Lawa.] *West Indie* 4: 63-64. 1919.—The South American Hevea leaf-disease, caused by *Melanopsammopsis Ulnei* makes Para rubber culture impossible. The "Compagnie des mines d'or" near Lawa, having a plantation of 120-130 hectares, was entirely ruined by it. This plantation was 120-150 m. above sea level. In 1918 the Hevea hills were often covered with heavy fogs, causing the disease to become epidemic within 6 months. One third of the trees were killed on account of the resulting loss of young leaves. The top of the eastern slope of hill subject to northeast winds was less liable to the disease than the western slope where fog and dew remain longer. The original host of the fungus seems to be *Hevea guyanensis*, which occurs in the forests of Surinam.—*J. C. Th. Uphof*.

4341. WEBER, GEORGE F. III. Septoria disease of rye, barley and certain grasses. *Phytopathology* 13: 1-23. *Fig. 1-9*. 1923.—In this paper Septoria leaf blotch of (1) rye, (2) barley, (3) quack grass, (4) brome grass, and (5) Kentucky blue grass are described; and a general summary and discussion of the results reported in the 3 papers is given. The disease on rye (*Secale cereale*) is caused by *Septoria Secalis* Prill. & Del. Only the leaves are attacked, producing irregular spots, in size ranging from small and almost circular to large areas often involving the entire leaf. This widely distributed disease is apparently limited to rye but does not seem to be of economic importance. The disease on barley (*Hordeum vulgare*) is caused by *Septoria Passerinii* Sacc., which attacks the leaf sheath and the leaf blade, producing indefinite yellowish areas which blend gradually into the normal green of the leaf. Inoculation tests indicate that the host range is limited to species and varieties of *Hordeum*. It has not proved of economic importance. The disease on quack grass (*Agropyron repens*) is caused by *Septoria Agropyri* E. & E. The infected leaves soon turn yellowish, die, and turn brown. In inoculation experiments infections were produced on plants of *Agropyron*

repens only. The disease on brome grass (*Bromus inermis*) is caused by *Septoria Bromi* Sacc. The infected leaves turn yellow, dry, and die prematurely. Infections were produced on *Bromus inermis* only, though other species of *Bromus* were not inoculated. A disease of Kentucky blue grass (*Poa pratensis*) produced by an unidentified species of *Septoria*, has been found at Madison, Wisconsin. Small, circular to oval spots are produced on the leaf blades. The disease is apparently different from that produced by *Septoria gramineum* Desm. Of the 8 species of *Septoria* studied, 6 are sharply specialized to the host on which they were found. The other 2, *S. Tritici* and *S. nodorum* are less specialized, since both attack wheat, rye, and *Poa pratensis*.—B. B. Higgins.

4342. WENIGER, WANDA. Pathological morphology of durum wheat grains affected with "black point." [Abstract.] *Phytopathology* 13: 48-49. 1923.—The disease is due to *Helminthosporium sativum* P. K. & B.—F. V. Rand.

4343. WHETZEL, H. H. The *Alternaria* blight of potatoes in Bermuda. *Phytopathology* 13: 100-103. Fig. 1. 1923.—A severe attack of early blight (*Alternaria Solani*) on potatoes (*Solanum tuberosum*), occurring in Bermuda in the early winter of 1921, is described. The unusual features noted were the suddenness and rapidity of development of the disease, the completeness of the destruction of the plants, the size of the lesions and their similarity to late blight lesions, and the occurrence of large water-soaked areas on the stems.—B. B. Higgins.

4344. WOOLMAN, H. M. Cytological studies on the infection of wheat seedlings by *Tilletia Tritici* (Bjerk.) Wint. [Abstract.] *Phytopathology* 13: 36-37. 1923.

DISEASES CAUSED BY BACTERIA

4345. ANDERSON, P. J. Controlling tobacco wildfire in the seed-bed. [Abstract.] *Phytopathology* 13: 59. 1923.

4346. BROWN, NELLIE A. Bacterial leafspot of geranium in the eastern United States. *Jour. Agric. Res.* 23: 361-372. Pl. 1-3. 1923.—A leafspot of cultivated geraniums (*Pelargonium* spp.) is widespread in greenhouses and occurs occasionally in the field. It is most commonly found on cuttings or on plants that are being forced.—The disease is caused by *Bacterium Pelargonii* n. sp. The organism is described in detail and is compared with *B. Erodii* Lewis which it resembles in many details. Infections were produced under warm, moist conditions and poor ventilation. The disease disappears when these growth conditions are corrected.—D. Reddick.

4347. BROWN, NELLIE A. Experiments with Paris daisy and rose to produce resistance to crown gall. *Phytopathology* 13: 87-99. Pl. 3-4, fig. 1-4. 1923.—Two attempts were made to develop resistance to *Bacterium tumefaciens* Sm. & Towne. in the Paris daisy by taking cuttings from galled plants through successive generations. The plants were inoculated through needle pricks. After galls were well developed, cuttings were made from the galled stems. After these cuttings had started growth and were developing rapidly they were likewise inoculated. No decided resistance was developed; in fact the plants were gradually devitalized. Those of 1 series died in the 5th and the other series in the 7th galled generation. With roses several crosses were made between commercial varieties. The plants were inoculated and the seed allowed to develop on galled stems. Of the resulting seedlings only 1 (Mrs. Charles Russell × Sunburst) showed evidence of resistance. By the end of 2 years this resistance had been lessened so that the plants from this cross also galled readily.—B. B. Higgins.

4348. CLINTON, GEORGE P., AND FLORENCE A. McCORMICK. Wildfire of tobacco in Connecticut. *Connecticut Agric. Exp. Sta. Bull.* 239. 365-423. Pl. 29-32. 1922.—A tobacco disease survey during the period 1920-1921 disclosed the presence of the bacterial leaf-spot disease, wildfire (*Bacterium tabacum*), in Hartford, Tolland and Litchfield Counties, with the

greatest center of infection north of Hartford in Hartford County. The possible methods of the introduction and further dispersal of the disease in the State are pointed out. The appearance of the diseased plants both in the seed bed and in the field is described at length. Control measures are suggested as follows: (1) sterilize beds, boards, and sash of the seed bed or use beds made on new uninfected land; (2) use seed from a field free of wild fire; (3) use as little water on plants as will give good growth, and air the beds day and night when feasible; (4) spray the plants with 4-4-50 Bordeaux mixture; (5) set out the fields with plants from uninfected beds; (6) a week after setting out remove diseased plants, repeating the process 7-10 days later; (7) badly infected fields should be plowed and reset with healthy plants; (8) with primed tobacco the infected and non-commercial leaves may be removed and destroyed.—A bibliography of 34 numbers is included.—*Henry Dorsey.*

4349. LEVINE, MICHAEL. Studies in plant cancers. V. Leafy crown galls on tobacco plants resulting from *Bacterium tumefaciens* inoculations. *Phytopathology* 13: 107-116. *Pl.* 5-7. 1923.—Tobacco plants were inoculated with *Bacterium tumefaciens* in the leaf axils, in the stem internodes, and in the midrib of the leaves. A trocar, 0.5 millimeter in diameter, was inserted and the tissue removed and replaced by a drop of the bacterial suspension. Leafy crown galls resulted from many of the inoculated leaf midribs and from inoculated stem internodes as well as from the inoculated leaf axils. These leafy crown galls were of 2 types. Those produced on the leaf midribs and on the stem internodes evidently resulted from differentiation in the crown gall tissue, while some of those in the leaf axils resulted from abnormal growth of the axillary bud. The latter type was larger, with a more distinct stem. Occasionally both types developed in a single leaf axil.—*B. B. Higgins.*

4350. QUANJER, H. M., EN J. HUDIG. De aardappelschurft met betrekking tot klimaat en bodem. [Potato scab in relation to climate and soil.] *Cultura* 35: 1-12. 2 pl., 1923.—Potatoes fertilized with superphosphate and sulphate of ammonia were smooth, but the addition of a small amount of marl resulted in a slight amount of scab. Slag, nitrate of soda, and marl gave very scabby tubers. The tubers become scabby on alkali land but healthier when the land is acid.—*J. C. Th. Uphof.*

4351. REDDY, CHARLES S., AND JAMES GODKIN. A bacterial disease of brome-grass. *Phytopathology* 13: 75-86. *Pl.* 1-2. 1923.—A new disease of brome grass (*Bromis inermis*) occurring in Wisconsin and North Dakota, has been under investigation during the past 3 years. On the leaves spots are produced which are at first light olive-green, circular to elliptical water-soaked areas with light brown centers. Later the color changes to a dark chocolate or purplish-brown. Old spots are usually linear but often coalesce and destroy the entire leaf. The disease is produced by a non-motile, rod-shaped *Bacterium* similar morphologically to *Bacterium coronafaciens* Elliott. It differs from this species in pathogenicity on certain hosts and in the character of the spots produced. It is therefore described as *Bacterium coronafaciens* Elliott var. *atropurpureum* n. var. The organism has also been found parasitizing quack grass (*Agropyron repens*), and by artificial inoculation has been caused to attack oats (*Avena sativa*) and various species of *Bromus*.—*B. B. Higgins.*

4353. RIKER, A. J. The location of the crown-gall organism in its host tissues. [Abstract.] *Phytopathology* 13: 43. 1923.

4354. SANFORD, G. B. The potato scab problem. *Proc. Western Canadian Soc. Agron.* 2: 71-81. 1921 [1922].—This discussion includes the history of the problem, description of the causal organism (*Actinomyces scabies*), its relation to temperature, the factors concerned in its distribution, methods of scab prevention, and disease resistant varieties.—The organism is present in all normal soils, especially those rich in organic material. The irregularity in

the results of control measures suggests other more important factors in controlling or favoring the disease; from experimentation and observation it is suspected that moisture is 1 of these.—*Frederick V. Rand.*

4355. TAYLOR, W. H. Tomato diseases. Black-stripe and its control. New Zealand Jour. Agric. 26: 101-103. 1923.—Black stripe disease (*Bacillus lathyri* Manns and Taub.) of tomatoes, causing serious losses to tomato growers, is largely influenced by the kind and amount of fertilizer used. Excess nitrogen or heavy manuring favor the disease, but it may be overcome by applications of sulphate of potash used at the rate of about $\frac{1}{4}$ ounce per plant.—*N. J. Giddings.*

4356. VALLEAU, W. D. An important period in the life history of two bacterial organisms causing leaf-spots on tobacco. Phytopathology 13: 140-144. Fig. 1. 1923.—Observations on seedbed infection of tobacco plants with angular leaf spot and wildfire led to the belief that the causal bacteria, when introduced on the seed or otherwise, multiply rapidly in the seedbed soil and attack the leaves which lie in contact with this infested soil. It seemed possible, therefore, that the addition of some toxic agent might prevent this multiplication of the bacteria in the soil. In an experiment in which sulphur was added to the soil at the rate of 500, 1000, and 2000 pounds per acre, no leaf spot appeared in any of the treated plats, while it developed abundantly in a control plat receiving no sulphur. Because of injury to the stand in the treated plats, the use of sulphur is not recommended.—*B. B. Higgins.*

4357. VRIEND, J. Stachytarpheta vatbaar voor Slijmziekte. [Stachytarpheta susceptible to slime sickness.] Deli-Proefsta. Medan. Vlugschrift 16. 4 p., 1 fig. 1922.—The author showed by infection experiments that the bacterial wilt disease of tobacco and tomato also attacks the common verbenaceous weed *Stachytarpheta indica* Vahl.—*A. J. Pieters.*

4358. WATERS, R. Fireblight. New Zealand Jour. Agric. 24: 350-357; 25: 209-214. Fig. 1-9. 1922.—A brief history of the disease, its distribution, hosts, methods of dissemination, character and results of inoculation experiments are given. A new insect carrier (*Sephesta cinerea*) is reported. The problem of fireblight control in New Zealand is seriously complicated by the great number of hawthorn hedges. Special legislation has been enacted giving the government authority to adopt such measures as may seem essential in orchard sections.—*N. J. Giddings.*

DISEASES CAUSED BY ANIMAL PARASITES (INSECTS, NEMAS, PROTOZOANS, ETC.)

4359. BAUNACKE, W. Untersuchungen zur Biologie und Bekämpfung des Rübenne-matoden *Heterodera schachtii* Schmidt. [Investigations of the biology and control of the rape nematode *Heterodera schachtii*.] Arbeit. Biol. Reichsanst. Land- u. Forstw. 12: 185-288. Pl. 1-5. 1922.—The nematode question in Germany is more than ever one of great agricultural importance. The wide occurrence of the rape malady, and the power of *Heterodera schachtii* for rapid adaptation, reproduction, and dissemination, endanger the culture of other important crops. Practical means for the extermination of the nematodes in diseased soil have not been known heretofore.—The brown resting cysts are the carriers of the disease. The content of these cysts in the soil and the depth of their occurrence indicate the degree of disease. The larvae escaping from the cysts at once seek the host plants. This larval behavior permits the use of bait both in examination of the soil for infestation and for control. With the aid of the larvae in the cysts, the parasitic inclinations of stocks of *Heterodera* upon cultivated plants can be ascertained.—The behavior of wandering larvae is influenced by thermal and chemical stimuli. Unfavorably high or low soil temperatures check their energy and cause them to become quiescent. Favorably warm temperatures increase their activity to a maximum, the latter being reached at 25°C. The concentration of water-soluble metabolic products of host plant roots, decreasing with distance, is perceived as a positive stimulus. The precision of larval movement from remote distances to the host plant, as well as the power to distinguish sharply unaccustomed or unsuitable food plants, finds its explanation in

this finely marked chemical sensitivity. Larvae remaining latent in the interior of cysts and embryos enclosed within eggs are also in a high degree sensitive to these thermal and chemical stimuli. The use of these chemical stimuli in a way corresponding to natural events makes it possible to bring newly formed 1-summer cysts to complete emptiness in a few weeks, where otherwise a year is required. The evacuation of the cysts takes place apart from the host plant, under the influence of root excretions alone.—A small number of highly specialized strains of *Heterodera* retain general powers of adaptation. They make possible the preservation of the species under altering conditions of existence, as well as the rapid adaptation to new host plants. The tenacious persistence of the nematodes in soil is explained by the extremely many-sided system of species preservation and distribution by which the parasites progress in development under favorable conditions but resist those that are adverse.—Control measures are directed against the resting cysts. The chief mass of these may be destroyed in autumn by sprinkling the ground just before the plow with a 1 per cent solution of ammonia (this may be concentrated to 2 per cent where water is scarce). In conjunction with this treatment, it is recommended that a stimulative crop (i.e., one that the nematodes especially prefer) be sown thickly as soon as the productive crop is cleared away. This stimulative crop, growing during the chief developmental period of the parasites, activates the deep-lying cysts, which are destroyed by the disinfection that follows. These control measures are to be repeated the next year, and until examination of the soil shows no infestation.—*W. S. Beach.*

4360. CORY, ERNEST N. Dusting for the pea aphid. Jour. Econ. Entomol. 16: 81-84. 1923.—Dusting is most promising for pea aphid control. The principal tests were to determine the most effective percentage of nicotine. A high nicotine content and not less than 30 pounds of dust per acre are preferable. The use of a trailer of canvas is advised. There should be at least 50 per cent of the vines infested when dusting is begun.—*Author's abstract.*

4361. DELONG, D. M. Results of spraying and dusting for the control of the red spider (*Paratetranychus pilosus*). Jour. Econ. Entomol. 16: 8-90. 1923.—A lime sulphur wash, 1-40, easily controls red spider, though it is too strong for prune foliage, which at times may be seriously injured by 1-75. The control by various sulphur dusts in combination with arsenate of lead or nicotine did not vary greatly, ranging from 50 to 60 per cent. Soap added to a lime-sulphur wash, increases its value by at least 5-10 per cent. A 1-per cent lime-sulphur with 6 pounds of sulphur paste for each 100 gallons and 1 pound of resin fish oil soap gave very satisfactory control.—*From Author's Abstract.*

4362. FRANCHINI, G. Action du latex d'Euphorbes sur différents trypanosomes. Culture de flagellés dans des latex divers. [Action of the latex of Euphorbias on different trypanosomes. Culture of flagellates in the latex of various plants.] Bull. Soc. Path. Exotique 16: 41-50. 1923.—Five species of *Trypanosoma* from blood of man or of animals lived longer in glass slide mounts in fresh Euphorbia latex than in physiological solution or citrate solution.—Three species of *Herpetomonas*, 2 of *Trypanosoma*, and 1 other flagellate were cultivated in autoclaved latex or latex plus bouillon. Growth was obtained in latex of 6 species of Euphorbiaceae, 4 of Apocynaceae, 2 of Asclepiadaceae, 2 of Urticaceae, 1 of Artocarpeae, and 2 of Sapotaceae. None of the organisms grew in latex of Menispermaceae (1 species) or Anacardiaceae (1 species) tried, and *Herpetomonas Ctenocephali* grew in none of the latex tried. *Trypanosoma Lewisi* changed to Crithidian and Herpetomonad forms more quickly in latex than in N. N. N. medium, and *T. Gambiense* soon formed leishmaniform parasites. Flagellates cultured in latex sometimes showed evident changes of form. *Herpetomonas pyrrocoridis* cultured in latex of *Euphorbia calyculata* sometimes showed an oval swelling of the anterior extremity and a spiral twisting of the body. Such swelling and twisting has been observed in the flagellates found in fresh latex of *Euphorbia*, but has not appeared before in *Herpetomonas pyrrocoridis* during 3 years of culture in various media.—*Philip Brierley.*

4363. FRANCHINI, G. Essais d'inoculation au chat d'amibes du latex de plantes. [Trial inoculations of cats with amoebae from plant latex.] Bull. Soc. Path. Exotique 15: 931-933. Fig. 1. 1922.—Amoebae from the latex of *Acokanthera venenata* and *Plumeria alba* (Apocynaceae) caused temporary sickness in 2 kittens when inoculated into the rectum. Amoebae were not infrequent in the feces during the period of sickness and some of them had ingested red blood corpuscles. When the kittens recovered, amoebae were no longer found. Inoculation of a 3rd kitten with a culture from the latex of *Ficus carica* "very poor in amoebae" was without result.—Philip Brierley.

4364. FRANCHINI, G. Protozoaires de Muscides divers capturés sur des euphorbes. [Protozoans of various Muscidae collected on Euphorbias.] Bull. Soc. Path. Exotique 15: 970-978. Fig. 1-4. 1922.—Protozoans were abundant in the digestive tracts of flies (*Sarcophaga*, *Muscina*, *Graphomyia*, *Anthomyia*) visiting *Euphorbia palustris* near Bologna, Italy. Flagellates were most common, but forms resembling "gregarines libres" and spirochetes were also seen; some of these forms are figured. Some stages of these flagellates resemble the forms described from *Euphorbia* latex. Latex of *Euphorbia* was recognized in the digestive tract of *Anthomyia*. Droplets of latex extruded from the corolla may become mingled with feces of visiting flies; transfer of flagellates in the feces of flies is thus suggested. The 3 plants on which insects were collected were "very vigorous"; no protozoans were detected in the latex except that leishmaniform parasites were occasional in 1 plant.—Philip Brierley.

4365. HINDS, W. E., and F. L. THOMAS. Poisoning the boll weevil. Alabama Agric. Exp. Sta. Bull. 212. 51-84. 1920.—The results indicate that power dusting and hand dusting are profitable for low-yielding and even more profitable for high-yielding cotton. It was found that moisture supplied by fine spray does not increase the killing efficiency of arsenate of lead. Every effort should be made to continue dusting at 4- or 5-day intervals in spite of threatening weather.—Wright A. Gardner.

4366. KINSEY, ALFRED C. Life histories of American Cynipidae. Bull. Amer. Mus. Nat. Hist. 42: 319-357. Pl. 28-31. 1920.—The paper gives descriptions of plant-galls but is principally a discussion of the life histories of the insects causing them.—Frank E. Lutz.

4367. KINSEY, ALFRED C. New Pacific Coast Cynipidae (Hymenoptera). Bull. Amer. Mus. Nat. Hist. 46: 279-295. Pl. 24. 1922.—This paper gives descriptions of plant-galls and the insects causing them.—Frank E. Lutz.

4368. KINSEY, ALFRED C. New species and synonymy of American Cynipidae. Bull. Amer. Mus. Nat. Hist. 42: 293-317. Pl. 20-27. 1920.—This paper gives descriptions of plant-galls but principally of the insects causing them.—Frank E. Lutz.

4369. KINSEY, ALFRED C. Phylogeny of Cynipid genera and biological characteristics. Bull. Amer. Mus. Nat. Hist. 42: 357a-c, 358-402. Pl. 32. 1920.—This paper is chiefly concerned with the insects causing plant-galls.—Frank E. Lutz.

4370. MARIÉ, P. Influence des coupes de bois faites en 1920-1921 sur le développement des Scolytidae propres au Chêne. [Influence of cuttings on the spread of the oak Scolytidae.] Bull. Soc. Path. Vég. France 9: 306-311. 1922.—The year 1921 was the driest in France for centuries, the rainfall having been less than half that of normal years. Where cuttings were made, the oaks left standing suffered much from sun exposure and were readily attacked by *Xyleobius monographus* Fabr. and *Platypus cylindrus* Fabr., beetles which preferably invade trees exposed to the sun.—J. Dufrénoy.

4371. PARROTT, P. J., and HUGH GLASGOW. The insecticidal properties of tobacco dust. Jour. Econ. Entomol. 16: 90-95. 1923.—The insecticidal properties of tobacco dust on an average were not uniformly as high as that of dust mixtures containing nicotine sulphate.

The concentrated tobacco solutions are apparently more economical than powdered tobacco.

4372. SASSCER, E. R., and C. A. WEIGEL. Further data on fumigation with hydrocyanic acid gas in greenhouses on a commercial basis. *Jour. Econ. Entomol.* 16: 84-87. 1923.—The formula used was 1 ounce averdupois sodium cyanide, $1\frac{1}{2}$ liquid ounces sulphuric acid (1.83 specific gravity), and 3 fluid ounces of water. Frequent 1-hour exposures in a greenhouse containing a large number of different plants, were followed by no permanent injury, though temporary burning occurred on such plants as *Jasminum*, *Salvia*, etc., and the insects were practically eliminated except mealy bugs and these greatly reduced by the killing of immature larvae. Results are also given for the fern scale, the camphor scale, and the Florida red scale.—*Author's abstract.*

INFECTIOUS CHLOROSES (MOSAIC AND PEACH YELLOWS GROUPS, ETC.)

4373. ATANASOFF, D. A. A study into the literature on stipple-streak and related diseases of potato. *Mededeel. Landbouwhoogeschool Wageningen* 26¹: 52 p. 1922.—The writer divides the literature into 2 periods: (1) 1775 to 1900 and (2) 1900 to 1922.—*J. C. Th. Uphof.*

4374. ATANASOFF, D. A. Stipple-streak disease of potato. *Mededeel. Landbouwhoogeschool Wageningen* 24⁵. 32 p., 5 pl. 1922.—In Holland the stipple-streak disease has been seen on a number of varieties. On *Schotsche muis*, *Atlanta*, *Duke of York II*, and *Early Potato*, all early sorts, it has been observed in epidemic form, 20-75 per cent of the plants being infected. In other varieties the disease has been sporadic. In some fields in the Province of North Holland over 75 per cent of the plants were heavily infested or dead before the end of May. On the vines the symptoms of primary stipple-streak vary more or less according to variety, being more numerous and more pronounced in the early, succulent, and light green varieties. The symptoms are at first several, and later more uniformly distributed, dark brown to black, slightly sunken spots between the veins of the lower or middle leaves. Tubers of some varieties at time of digging may be apparently healthy, but when kept for some time, usually 2-3 weeks or longer, show the presence of the disease. In other cases the tubers show distinct pathological effects including pronounced blisters, and early shrinkage. Many tubers from stipple-streak plants never form sprouts. This disease, like leaf-roll and mosaic, is a systemic disease. Sometimes the pathogen, travelling down the infected plant, passes through the mother tuber into the base of the still healthy sister shoots and outward through the stolons into their tubers before reaching other aerial portions. Experiments showed conclusively that the pathogen cannot pass from plant to plant through the soil, water, or air. Thus far it has been possible to transmit this disease from infected to healthy plants only by creating an organic connection between them, as by grafting or by joining sections of healthy and infected tubers. Temperature has a very marked influence upon the appearance and development of stipple-streak, a low temperature retarding the disease. Positively infected tubers disinfected in 2 per cent copper sulphate for 1-2 hours, and in 2 per cent mercuric chloride for 30 minutes, when planted gave secondary disease in all cases. When heated in dry air at 44-46°C. for 5-24 hours a similar result was obtained. Prompt and careful elimination of the infected tubers and young plants showing the disease will be an effective control measure.—*J. C. Th. Uphof.*

4375. BRANDES, E. W. Mechanics of inoculation with sugar-cane mosaic by insect vectors. *Jour. Agric. Res.* 23: 279-283. *Pl.* 1-2. 1923.—Insects feeding on sugar-cane leaves were killed *in situ* and histological examinations made. *Aphis maidis*, a known carrier of mosaic, usually pushes its beak through a thin place in the cuticle of the guard cell of a stomate, then either directly through or between the mesophyll cells, through the starch sheath and into the phloem. Throughout the process of penetration there is a copious salivary secretion. This secretion is thought to be the specific medium by which the infective principle is introduced into the plant. *Peregrinus maidis* and *Draeculacephala mollipes*, neither of which is known to transmit the disease, do not seem to seek the phloem in particular but the large size

of their setae as compared with vascular bundles is such as to preclude a positive statement.—*D. Reddick.*

4376. CHARDON, C. E., and R. A. VEVE. The transmission of sugar cane mosaic by *Aphis maidis* under field conditions in Porto Rico. *Phytopathology* 13: 24-29. *Fig. 1.* 1923.—Although the experiments of Brandes and others have shown that *Aphis maidis* is able to transmit the infective principle of sugar cane mosaic, the fact that this insect is rarely found on sugar cane has caused considerable doubt as to its being responsible for the spread of the disease in the field. Inspection showed that aphids were present in practically every cane field in Porto Rico, not on the cane itself, but on various wild grasses in the fields. When the fields were weeded and the wild grasses killed the aphids passed to the cane, congregating in the central whorl of leaves. This was followed by a sudden increase in mosaic infection. This migration of the aphids and their transmission of cane mosaic has been demonstrated experimentally. Of the wild grasses growing in an experimental cage with diseased cane, 3 (*Syntherisma sanguinalis* Eleusine indica, and *Echinochloa colona*) developed typical mosaic symptoms.—*B. B. Higgins.*

PARASITIC PHANEROGAMS

4390. DELACOSTE, F. Le gui sur l'épicéa. [The mistletoe on spruce.] *Jour. Forest. Suisse* 73: 90-91. 1 fig. 1922.—In 1918 the oak mistletoe (*Viscum album*) was discovered by the author for the first time on *Picea excelsa* in a forest of Saxon, Valais, and also very recently near St. Maurice at 600 m. altitude, with dry soil and northeastern exposure, in a stand composed of Scotch pine, white fir, larch, and Norway spruce. It was found in large and numerous brooms on the first 2 species, not at all on the 3rd, and in exceptional cases on the 4th.—*G. Kempff*.

4391. HENRICHER, E. Mistelträger im Botanischen Garten zu Innsbruck. [Hosts of mistletoes in the botanical garden at Innsbruck.] *Ber. Deutsch. Bot. Ges.* 39: 291-295. 1921.—In 1910 the author made sowings of seed of *Viscum album* on a number of plants. This paper reports 30 species, which had mistletoe plants growing upon them in 1921, representing the following genera: *Pinus*, *Abies*, *Larix*, *Picea*, *Salix*, *Populus*, *Betula*, *Carpinus*, *Corylus*, *Alnus*, *Loranthus*, *Viscum*, *Pyrus*, *Crataegus*, *Rosa*, *Cytisus*, *Robinia*, *Tilia*, *Fraxinus*, *Olea*, and *Syringa*.—*W. C. Muenzner*.

4392. KORSTIAN, CLARENCE F., and W. H. LONG. The western yellow pine mistletoe: effect on growth and suggestions for control. U. S. Dept. Agric. Bull. 1112. 85 p., 5 pl., 4 fig. 1922.—*Pinus ponderosa* Laws. is subject to severe injury by mistletoe (*Razoumofskya cryptopoda* Engelm.), resulting in serious losses and presenting one of the most important silvicultural problems in the Southwest. “Mistletoe infection causes a marked decrease in the rate of growth of the host, which continues until the virulent parasite ultimately causes the death of the tree.” The decrease in the growth rate of the tree is accompanied by a reduction of the leaf surface, and the trees are rendered practically worthless for seed production. The most practical method of control is to remove the infected tree while cutting operations are in progress. A sanitation clause should be inserted in timber-sale contracts when the areas contain much mistletoe, requiring the cutting of all heavily infected or marked moderately infected trees whether merchantable or unmerchantable, and when the entire stand is too heavily infected the areas should be marked for clear cutting under a mistletoe control project. On areas of light to moderate infection diseased trees should be marked for removal and “exceptional care should be taken to leave as heavy a stand of healthy trees as possible in order to compensate for the removal of diseased trees and to maintain better forest conditions.”—*J. T. Buchholz*.

4393. MORRIS, A. Some notes on mistletoes. *Australian Forest. Jour.* 5: 325-327. 1922.—The hosts are given for several species of mistletoe belonging to the genus *Loranthus*. Double parasitism is common; *L. exocarpi* grows upon *L. pendulus* and *L. quandang*.—*C. F. Korstian*.

NON-PARASITIC DISEASES

4396. HARTER, L. L., J. I. LAURITZEN, and J. L. WEIMER. Internal breakdown of sweet potatoes. *Phytopathology* 13: 146-147. 1923.—A pithy condition of sweet potatoes [*Ipomoea batatas* L.] is apparently caused by storage conditions.—*B. B. Higgins.*

4397. RHOADS, ARTHUR S. The formation and pathological anatomy of frost rings in conifers injured by late frosts. U. S. DEPT. Agric. Bull. 1131. 15 p., 6 pl. 1923.—Pathological anatomy of late-frost injury has been studied in detail in 17 conifer species and in apple and pear trees. Characteristic disturbances in the tissue of the growth rings are produced, or extra rings, called *frost rings*, may form at the time of the injury. The injuries involve crumpling of the tender wood cells, a broadening and proliferation of medullary rays with or without their lateral displacement, the presence of radial clefts subsequently filled up by large-celled parenchyma, and more or less broad zones of wound parenchyma. Frost rings may be caused by late or early frost or by freezing of the cambium during the winter when the tree is dormant. Young shoots injured by late frost may wilt and upon recovery bend the point upward, resulting in permanently distorted stems, or they may be killed outright to be replaced by 1 to several volunteer shoots. Late frost injury when occurring after a considerable portion of the growth ring has been formed, results in a false or double ring, very confusing in age determinations. This late frost injury has not been observed in coniferous stems of greater diameter than 2 inches but occurs in larger stems of fruit trees subject to frost injury. Frost rings constitute a plane of weakness in the wood predisposing to the formation of circular shake as well as rendering the wood less valuable where great strength is required in small manufactured pieces.—*J. T. Buchholz.*

4398. SHARPLES, A. A consideration of recent work on the brown bast problem. *Malayan Agric. Jour.* 10: 155-170. 1922.—The author concludes that this disease of the Para rubber tree, *Hevea brasiliensis*, is of physiological origin, non-transmissible, and increased by heavy tapping.—*I. H. Burkill.*

4399. WATERS, R. Apple flesh-collapse or brown-heart. Some recent investigational work. *New Zealand Jour. Agric.* 25: 334-340. 1922.—Experimental evidence to date indicates that brown heart is due in part to the conditions of cool storage and in part to the maturity of fruit and its method of handling previous to storage. It is believed that intermittent cooling will give better results than running the plant continuously.—*N. J. Giddings.*

4400. WATERS, R. Cool storage of apples. *New Zealand Jour. Agric.* 25: 34-39. 1922.—This is an investigation of flesh collapse. This disease, a breaking down of the internal tissues, is very prevalent. Investigations indicate that it is partly due to cold storage conditions.—*N. J. Giddings.*

DISEASES OF UNKNOWN CAUSE

4401. BIOLETTI, FREDERIC T. Black measles, water berries and related vine troubles. *California Agric. Exp. Sta. Bull.* 358. 509-524. 1923.—The theory advanced is based chiefly on observations of the 2 great epidemics, of sporadic cases occurring in many districts over a period of many years, and on a consideration of the coincident environmental conditions in the various cases. It is, briefly, that these diseases are entirely or primarily the effect on the

vines of an excess of output over income and the resulting condition of starvation or malnutrition. The remedies offered are those which naturally suggest themselves if this theory is accepted. They are based on the principle of affording some means of keeping a proper balance between the demands on the vine and its ability to perform, and consist on the one hand in measures tending toward its invigoration, such as improvements in irrigation, cultivation, soil treatment, and the control of known pests and diseases; and on the other in measures tending toward apportioning the amount of crop on the individual vine, arm or cane, in accordance with its size, vigor, and condition of nourishment. The principal, perhaps the sole, measures that can be used for the latter purpose are various degrees and kinds of pruning which determine the number of fruit buds on which a vine is allowed to expend its energies.—Vines showing water berries and black measles, if still alive and showing even a small growth of mature wood and no extensive dead parts, may usually be saved by short pruning (down to base-buds in severe cases) and by fertilization and other cultural measures which tend to invigorate the plants.—*A. R. C. Haas.*

4402. DUFRÉNOY, JEAN. Sur la tuméfaction et la tubérisation. [On the formation of tumors and tubers.] *Compt. Rend. Acad. Sci. Paris* 174: 1725-1727. *Fig. 1-3.* 1922.—Observations are made on *Eucalyptus eugenoides* and on *Arbutus Unedo*. The tumors are found to be very rarely bacterial. Both hyperplasia and hypertrophy occur.—*C. H. Farr.*

4403. GARD, M. Sur le dépérissement des jeunes noyers en 1922. [The decay of young walnut trees in 1922.] *Compt. Rend. Acad. Sci. Paris* 175: 716-718. 1922.—This is a recently discovered disease causing decay of the aerial part of the entire tree. It occurs in spring and early summer on trees 10-20 years old, and in some cases on trees 50-60 years old. A description of the external and internal lesions is given. No parasitic organism was found present in all lesions. Similar effects were also noted to a less degree on figs, noble laurel, and grape.—*C. H. Farr.*

4404. HARTER, L. L., J. I. LAURITZEN, and J. L. WEIMER. Mottle-necrosis of sweet potatoes. *Phytopathology* 13: 145-146. *Fig. 1.* 1923.—A disease of sweet potatoes, characterized by the presence of brown necrotic areas in the tissue of the fleshy roots, was rather abundant about Washington, D. C., during 1922.—*B. B. Higgins.*

4405. LEE, H. ATHERTON. Sereh disease of sugar cane in Singapore. *Phytopathology* 13: 145. 1923.—The sereh disease was found at Singapore Botanical Garden on sugar cane introduced from Java. Attention is called to the danger incurred in importing cane from Java, because of the serious cane diseases which occur there.—*B. B. Higgins.*

4406. MCCLINTOCK, J. A. Aerial galls of peach. [Abstract.] *Phytopathology* 13: 45. 1923.

4407. STAHEL, GEROLD. De zeefvatenziekte (Phloëmnecrose) van de Liberiakoffie in Suriname. [Phloemnecrosis of Liberia coffee in Surinam.] *Dept. Landb. Suriname Bull.* 40. 40 p., 5 pl. 1920.—Phloemnecrosis in Surinam shows 2 forms: (a) the acute form formerly called root disease, and (b) the chronic form. In the acute form all of the apparently healthy leaves suddenly wither without first becoming yellow. Within a few weeks the entire tree is dead. It is characteristic that the black, dead leaves do not drop off as they are unable to form a schizophellogen layer at the base of the petiole. The rootlets are black instead of white as in the healthy trees. In the chronic form the trees do not die suddenly but the leaves become at first light green or yellowish and the old leaves drop off without withering. Only the youngest leaves which are abnormally small remain. Afterwards they wither and die without dropping off. Between these extremes there are intermediate forms. In cutting off diseased plants the wood remains connected with the bark. Diseased trees do not show any starch in the roots and stem. The disease can be controlled only by growing resistant types. The disease is mostly present on bearing trees 4-5 or more years old. No organism causing the disease was found.—*J. C. Th. Uphof.*

GENERAL AND MISCELLANEOUS PATHOLOGICAL LITERATURE

4409. ANONYMOUS. Verslag over het jaar 1919 van het Departement van den Landbouw in Suriname. [Report for the year 1919, Department of Agriculture, Surinam.] 78 p. Paramaribo, 1919.—Reports of the different experiment stations and laboratories are contained. Certain districts were much affected by heart-rot of the coconut palm, and the area had probably been infected for 5 years. *Theobroma pentagonum* or Lagarto cocoa showed great immunity against *Marasmius perniciosus* causing witchbrooms. This *Theobroma* species is more closely related to *T. cacao* than to *T. bicolor* and *T. speciosum*. A 20-acre field planted with *Agave sissalina* produced 463,950 leaves, weighing 232,850 kgm. and yielding 8,755 kgm. of fiber. A report is given on malachra and Sea Island cotton. The native *Elaeis guineensis* suffered much from a heart-rot.—*J. C. Th. Uphof*.

4410. ALLEN, W. J., and W. LE GAY BRERETON. Some suggestions on spray management. *Agric. Gaz. New South Wales* 34: 129-134. 3 fig. 1923.—Practical suggestions are given in the mechanics of spraying relative to waste of material in transport, efficient use of outfit, facilities for mixing, and other factors.—*L. R. Waldron*.

4411. ANDERSON, O. G., and F. C. ROTH. Insecticides and fungicides, spraying and dusting equipment: a laboratory manual with supplementary text material. xvi + 349 p., 71 fig. John Wiley & Sons: New York, 1923.—“This manual is designed to offer instruction in the preparation of insecticides and fungicides; the construction, selection, testing and operation of spraying and dusting equipment.” The material is assembled primarily for collegiate use but with the hope that it will also be useful in vocational schools and in a limited way to those engaged in practical and commercial horticulture. The subject is presented in a simple form so as to be understood by readers with a limited knowledge of chemistry. Stress is laid on the value of spraying as compared with other control measures. In addition to the standard control measures, special ingredients, methods and equipment are discussed with the reasons for rise or decline in their usefulness.—*Lillian C. Cash*.

4412. BAILEY, E. M., and R. E. ANDREW. Report on commercial insecticides and fungicides. Connecticut Agric. Exp. Sta. Bull. 242. 147-165. 1922.—A report of materials sold as insecticides and fungicides is given, including a total of 95, 80 of which were examined and analyzed in 1922. In the 2nd part recent developments in the use of insecticides are discussed. It is pointed out that arsenate of lead in the dry form is used almost to the exclusion of paste. Nicotine sulphate has come into almost universal use since 1907. The order of combination of spray materials for best results is given.—*Henry Dorsey*.

4413. BLODGETT, F. M. Hot water and hot air treatments of potatoes. [Abstract.] *Phytopathology* 13: 55. 1923.

4414. BRITTON, W. E., M. P. ZAPPE, and E. M. STODDARD. Experiments in dusting versus spraying on apples and peaches in Connecticut in 1921. Connecticut Agric. Exp. Sta. Bull. 235. 208-226. Pl. 17-22, fig. 7-11. 1922.—Dusting is compared with spraying in 4 apple orchards with 757 trees and in 2 peach orchards with 263 trees. The equivalents of 334 barrels of apples and of 1,715 baskets of peaches were scored. Niagara dusting machines and Friend and Arlington X.L. power sprayers were used. Sulphur-lead dust, sulphur-lead-nicotine dust and Sanders' dust were compared with liquid lime-sulphur, lead arsenate, and nicotine sulphate on apples. In nearly all cases the best apples were secured from the sprayed plots. Both spray and dust controlled codling moth and chewing insects but the spray was more effective in controlling fungous diseases. On peaches atomic sulphur was used as a spray and was compared with sulphur and sulphur-lime-lead arsenate dusts. The dusted peaches were slightly better. Peach scab and brown rot were controlled by both dust and spray.

Dusting is at present more expensive than spraying in both peach and apple orchards.—*Henry Dorsey*.

4415. BRUMPT, E[MILE]. *Précis de parasitologie*. 3rd ed., xv + 1216 p., 4 pl. (col.), 736 fig. Masson et Cie.: Paris, 1922.—The first part of this much enlarged edition is given up to a general discussion of methods of investigation and scientific nomenclature, parasites, relation of parasite with host, adaptation of parasites, and parasitic maladies.—The remainder of the work deals with specific parasites under the following headings: pathogenic protozoa (Spirocheta, Rhizopoda, Sporozoa, Flagellata, Infusoria); medical helminthology (Trematoda, Cestoda, Nematoda); arthropod parasites (Arachnida, Hemiptera, Diptera); and medical mycology (Hyphomycetes, Ascomycetes, Phycomycetes). The important parasites are discussed as to synonymy, description, habitat, life-history, transmission, and pathology (pathogenesis).—*Frederick V. Rand*.

4416. DODGE, E[THEL] M[ARY]. *Some common diseases of tomato*. 24 p., 11 fig. The Specialty Press of South Africa, Ltd.: Johannesburg, Capetown, 192-?.—In a popular manner this book discusses leafspot due to *Septoria Lycopersici* Speg., blossom-end rot attributed to physiological causes, bacterial wilt due to *Bacterium Solanacearum* EFS, late blight or downy mildew caused by *Phytophthora infestans* DeB., early blight due to *Macrosporium Solani* Ell. & Ev., sleepy disease or wilt (*Fusarium* sp.), anthracnose (*Colletotrichum phomoides* (Sacc.) Chester), and fruit rot (*Phoma destructiva* Plowr.). The signs of the disease, a brief description of the organism, and control measures are given.—*Lillian C. Cash*.

4417. GREMAUD, EDUARD. *Maikrankheit und Dotterblume*. [May disease in bees and the marsh marigold.] Schweiz. Bienenzeitg. 44:88. 1923. This is a statement concerning the possibilities of infection of May disease from *Caltha palustris*. The author traces all his trouble in beekeeping to this cause.—*M. G. Dadant*.

4418. HIGGINS, B. B. Seed treatment in the control of pepper diseases. [Abstract.] *Phytopathology* 13: 57-58. 1923.

4419. KOTILLA, J. E., and G. H. COONS. Spraying and dusting of potatoes in 1922 at Chatham, Michigan. [Abstract.] *Phytopathology* 13: 54-55. 1923.

4420. MASSEE, GEORGE, and FRED. V. THEOBALD. *The enemies of the rose*. The National Rose Society's handbook on the fungus and insect pests of the rose. New ed., 110 p., 8 pl. (col.), 6 fig. Westminster, S. W., [no date].—A popular account of the diseases caused by fungi is given by Massee with a description of mildew (*Sphaerotheca pannosa*), black mildew (*Peronospora sparsa*), rust (*Phragmidium subcorticatum*), black spot (*Actinonema Rosae*), leaf-scorch (*Septoria Rosae*), sooty mold (*Fumago* sp.), parasitic rose canker (*Coniothyrium Fuckelii* Sacc.), and chlorosis. In each case preventive measures are given.—The insect enemies are treated by Theobald, who gives in each case a description of the pest, its life history and habits, and remedies to be applied.—*Lillian C. Cash*.

4421. NEWELL, WILMON. Report of the plant commissioner. Quart. Bull. State Plant Bd. Florida 7: 75-148. Fig. 1-2. 1923.—A general account is given of nursery inspection in Florida, and the activities of the quarantine department.—The sugar cane variety Cayana 10 is mentioned as being highly resistant to mosaic.—Much attention has been given to the eradication of the citrus canker, which occurred in several counties.—*J. C. Th. Uphof*.

4422. NORTH, D. S. The control of sugar cane diseases. Australian Sugar Jour. 14: 687-693. 1923.—This is the 1st of a series of papers on the Australian sugar cane diseases. Australia probably has more serious diseases attacking its cane than any other country. This has been caused by the wholesale, unrestricted importation for 50 years of varieties from abroad without precautionary measures against the introduction of diseases and insect

pests.—Gumming (*Bacterium vascularum* (Cobb) Grieg-Smith), mosaic, red rot (*Colletotrichum falcatum* Went.), and true rust (*Uromyces Kuhnii* Kruger) were introduced with cuttings at an early date. Gumming probably came from Brazil and Mauritius. The Fiji disease (cause unknown), leaf stripe (*Sclerospora Sacchari* Miy.), and leaf scald (*Bacterium* sp.) are suspected of being importations from New Guinea. Besides these better known diseases, cane has been severely affected from time to time by top rot (cause unknown), curly top (cause unknown), knife cut (cause unknown), and certain root and leaf diseases not yet thoroughly investigated. Many minor diseases of leaf, leaf sheath, stem, and root also occur, introduced doubtless with cuttings, largely from New Guinea. It is believed that almost every disease must have been introduced to every cane district. No reason can be given why the Fiji disease has never become established at the Colonial Sugar Refining Company's Queensland mills, while it has been for so long a time highly destructive at the New South Wales mills and in Fiji; or why leaf stripe has not been found in New South Wales or the Childers district, while prevalent at Mackay and all the districts to the north and in Fiji.—Sometimes a disease has been eradicated by the introduction of an immune variety of cane. Thus, the gumming disease which devastated the crops of nearly every mill, has now apparently disappeared from Harwood and Condong, and it has not been heard of from Fiji for several years. On the other hand, gumming is increasing at the Broadwater, Victoria, and Macknade mills, is reappearing at Childers and in scattered small areas elsewhere.—Finding a disease-resistant variety of cane is not the only nor always the best way of combatting a disease of cane. With the new varieties come new diseases. A sugar cane, if properly cared for, can be propagated by cuttings for 150 years and probably longer without degeneration; for example, Lehaina, which is still the chief variety of irrigated plantations on the Hawaiian Islands. It is susceptible to diseases, and was eliminated from cultivation for this reason; but after the diseases in question had disappeared it was reestablished as the standard cane. Similarly, Badilia was attacked by the Fiji disease; but with the control of this disease it has continued to be cultivated. Badilia has been introduced into Australia in the place of superior varieties of cane because it is considered highly resistant to diseases. However, it is not universally immune, for it is too susceptible to gumming for planting at Broadwater, and it is somewhat susceptible to mosaic, leaf stripe, and leaf scald.—*Caroline Rumbold*.

4423. [O]RTWIJN, BOTJES, J., and H. M. QUANJER. Dutch potato varieties resistant to wart disease and internal brown spot. [Abstract.] *Phytopathology* 13: 54. 1923.

4424. OSMUM, A. V., and P. J. ANDERSON. An improved formaldehyde tank for the onion drill. [Abstract.] *Phytopathology* 13: 58. 1923.

4425. PEYRONEL, B. Come avviene e come si previene la diffusione delle malattie crittogamiche delle piante. [The dispersion of cryptogamic parasites and means of control.] *Boll. Mens. R. Staz. Patol. Veg.* [Rome] 2: 119-124. 1921; 3: 3-20. 1922.—This is an extensive review of the literature, without bibliographic citations. The subject is discussed under the following heads: spread from plant to plant in a specific locality, dissemination by means of water, by wind, by animals, and in or upon the tissues of the host.—*D. Reddick*.

4426. RAMSAY, A. A. A home-made tobacco wash for combined sprays. *Agric. Gaz. New South Wales* 34: 58-60. 1923.—Home-made tobacco wash, made by extracting waste tobacco with boiling water, is unsatisfactory when used combined with such a spray as lime-sulphur because of flocculent precipitations. This trouble has been avoided by extracting the tobacco waste in the cold with lime water and then straining. The cost of the preparation is given.—A treble-purpose spray comprising lead arsenate, home-made tobacco wash, and lime-sulphur has been found efficient with no significant increase in amount of soluble arsenic.—*L. R. Waldron*.

4427. RAMSAY, A. A. Storage experiments with lime intended for sprays. Results for the completed period of trial. *Agric. Gaz. New South Wales* 34: 69-70. 1923.—Freshly

slaked lime stored under water for a period of 1 year underwent practically no deterioration, the increase of calcium carbonate being only 0.8 per cent.—*L. R. Waldron*.

4428. REDDICK, DONALD. Ito's potato variety Ekishirazu in New York. [Abstract.] *Phytopathology* 13: 55-56. 1923.—The variety is resistant to *Phytophthora infestans* but susceptible to mosaic.—*F. V. Rand*.

4429. SAMUEL, GEOFFREY. Notes on forest pathology from South Australia. *Australian Forest Jour.* 5: 189-192, 223-226, 253-254. 7 fig. 1922.—The economic importance of tree diseases is emphasized. The present pathological condition of the South Australian pine forests is discussed under the following headings: (1) general observations on growth, (2) "curly needle" disease, and (3) fungus diseases. Experiments were carried out to test the parasitism of *Sphaeropsis* and *Pestalozzia* sp. on *Pinus insignis*. These organisms were found not to be responsible for the disease under consideration. The abnormal types of growth are believed to be due to physiological causes. *Armillaria mellea* is mentioned as a root rot.—*C. F. Korstian*.

4430. SCHNEIDERHAN, F. J. Scab and other things. *Proc. Virginia State Hort. Soc.* 1922: 153-174. 1923.—An analysis of representative lots of cull apples at Winchester, Virginia, showed the cause of culling to be as follows: 53.9 per cent due to fungous diseases, 25.7 per cent to insect pests, and 20.4 per cent to other factors. Scab (*Venturia inaequalis*) was the most important single factor, 30.9 per cent being culled from this cause. A survey of spraying practices indicated that orchards in general are insufficiently equipped for satisfactory work and that the number of spray applications made is insufficient for satisfactory control of diseases and insects. The pink application was found to be of greatest value in scab control. The calculated values of the 4 early-season applications in scab control are as follows: delayed dormant, 3; pink, 41; calyx, 33; 2-weeks, 12.—*F. D. Fromme*.

4431. SMITH, RALPH E., and JOSEPH P. MARTIN. A self-mixing dusting machine for applying dry insecticides and fungicides. *California Agric. Exp. Sta. Bull.* 357. 497-505. Fig. 1-3. 1923.—It should not be assumed that the use of this machine will entirely take the place of factory-mixed dust. The idea at present applies only to a large power machine and is impracticable where hand machines are employed, or in any small scale work. Furthermore, many growers prefer ready-made material to anything which requires accurate measurement and mixing of materials in the field. The self-mixing machine, by increasing the practise of dusting, promises to supplement and extend the use of ready-made mixtures rather than to supplant or lessen their use.—*A. R. C. Haas*.

4432. SOUTH, F. W. Regulations controlling the importation of plants into the Straits Settlements, the Federated Malay States and Johore. *Malayan Agric. Jour.* 10: 228-233. 1922.—This constitutes an exact statement of the rules controlling the importation of plants in force on Oct. 31, 1922.—*I. H. Burkill*.

4433. STEARNS, L. A., and W. S. HOUGH. Spreader tests on apples and peaches. *Proc. Virginia State Hort. Soc.* 1922: 55-59. 1923.—Casein and flour-paste spreaders did not increase the efficiency of spray mixtures in the control of fungous diseases and insect pests of apple and peach. The spray mixtures employed were lime-sulphur for the early applications on apple, and Bordeaux mixture for the late applications. Atomic sulphur was used on peaches.—*F. D. Fromme*.

4434. STUART, WILLIAM. The potato: its culture, uses, history and classification. ix + 518 p., frontispiece + 267 fig. J. B. Lippincott: Philadelphia and London, 1923.—Of this monographic work 101 pages are devoted to potato diseases and their control; insect and animal parasites of the potato and methods of controlling them; fungicides and insecticides, their preparation, use, application, and resultant benefits; spray equipment and classifi-

cation.—Classification and treatment of the parasitic and non-parasitic diseases are first given in tabular form. This tabulation is followed by a discussion of each specific disease, including such data as distribution, symptoms, methods of infection, source of infection, preventive measures and their results, etc. In this manner the main facts are given concerning 17 parasitic and 5 non-parasitic diseases of the potato and their control.—Insect parasites of the potato are treated under (1) leaf-chewing and mining insects; (2) stem- and tuber-eating insects; and (3) sucking insects. Following a tabulation of some 14 of these insects (and the eelworm) with control measures, each is brought under detailed discussion.—The chapter following gives a classification of fungicides and insecticides, with detailed descriptions, and directions for mixture and use.—*Frederick V. Rand.*

4435. TISDALE, W. B. Tobacco diseases in Gadsden County in 1922. Florida Agric. Exp. Sta. Bull. 166. 77-118. Fig. 14-28. 1922.—A description is given of tobacco diseases in Gadsden County, Florida. The common practice in Florida of covering the plant beds with cloth protects the seedlings from insects and no doubt prevents mosaic infection. Most growers also cut the stalks as soon as they have finished priming, which reduces the number of infected plants for insects to feed on. Clearing out the edges of shades, as is practiced by some growers, destroys insects and the source of mosaic infection.—Root-knot is the cause of serious damage; badly infested plants may be entirely killed, especially during the dry season. Except in badly infested areas there is only a slight amount of dwarfing and the yield is but little reduced. Infested fields usually show irregular growth of plants. Wildfire caused by *Bacterium tabacum* Wolf & Foster was reported in Florida in 1921; it spreads rapidly from leaf to leaf. The age of the plant and the weather conditions modify the appearance of the spots. It usually makes its appearance in the plant bed before the plants are ready for transplanting. During rains the wildfire germs are washed out of the diseased tissues of the host plant and are splashed on healthy leaves above and on nearby healthy plants. For control the seedbed should be disinfected before planting. Tobacco seed can be conveniently disinfected by tying loosely in a muslin bag and immersing for 10 minutes in a solution (1-1000) of corrosive sublimate or formaldehyde (1 fluid ounce to 1 pint of water). Used cloth over the beds should be avoided. The plants should be sprayed with 4-4-50 Bordeaux mixture or a dust, such as that of Sanders.—Granville wilt caused by *Bacterium Solanacearum* E. F. S. is very serious. None of the tobacco strains showed any promising degree of resistance. Leafspot caused by *Phyllosticta Nicotianae* E. & E. is very limited in distribution and of minor importance. Specking, due probably to *Cercospora Nicotianae* E. & E. was very prevalent in 1922, but in fields where the leaves could be primed early the crop suffered very little damage; where rains delayed priming it caused considerable loss. It does not occur on vigorous, rapidly growing plants. Whenever growth is checked the disease appears on the lower leaves and advances upwards. The variety Big Cuba is recommended for planting.—Root-rot caused by *Thielavia basicola* (B. & Br.) Zopf. is found in the shaded tobacco fields of Florida and was widespread in 1922. Connecticut Round Tip is highly resistant, while Big Cuba is susceptible. The difference in growth of Big Cuba plants in badly infested fields indicates a difference in degree of resistance between individual plants. A few growers have started selection for resistance.—Black Shank, very likely caused by *Phytophthora Nicotianae* de Haan, has appeared in recent years and is very serious. The varieties Connecticut Round Tip and White Burley are most susceptible. No definite and practical method of control is offered. In Gadsden County the grower moves to new fields. Experimental steaming of several acres of land has demonstrated that the organism can be eradicated from the soil but this method is too expensive to be practical.—*J. C. Th. U'phof.*

4438. ANONYMOUS. *Nos plantes médicinales de France.* [Medicinal plants of France.] 8 pl. Comité Interministeriel des Plantes Médicinales et à Essences: Paris, 1923.—The following plants and their floral and fruiting parts are depicted in colors: *Sarothamnus scoparius* Koch., *Aconitum napellus* L., *Papaver rhoeas* L., *Viola odorata* L., *Bryonia dioica* Jacq., *Digitalis purpurea* L., *Solanum dulcamara* L., and *Sambucus nigra* L. Accompanying each of the plates is an account of the synonyms, parts used, description of plant, time of flowering, collection, preparations, properties, and uses.—H. W. Youngken.

4439. ANNETT, H. E., and M. N. BOSE. *Studies in the meconic acid content of Indian opium.* Mem. Dept. Agric. India Chem. Ser. 6: 215-221. 1922.—It would seem that the physiological process whereby alkaloids are produced in the opium poppy produces meconic acid in amount equivalent to the alkaloids.—J. Sen.

4440. ASTON, B. C. *The poisonous, suspected, and medicinal plants of New Zealand.* New Zealand Jour. Agric. 26: 78-79. 1923.—Members of the Leguminosae, Rosaceae, Saxifrageae, Myrtaceae, Passifloreae, Umbelliferae, Rubiaceae, and Compositae are discussed.—N. J. Giddings.

4441. BALFOUR, ANDREW. *Oil of Chenopodium [and] cultivation of Chenopodium plant.* In: Report on Medical and Sanitary Matters in Mauritius, 1921, 22 p. Waterlow & Sons Ltd.: London, 1922.—*Chenopodium ambrosioides* var. *anthelminticum* is generally regarded as the most satisfactory vermifuge in ankylostomiasis. It grows plentifully in Mauritius, where it is known as Botrys. Yields of oil from local plants proved low. The native plant is being placed under cultivation and high-class seed from the U. S. A. is being secured. Soil and climate appear to be well suited to successful cultivation of the plant.—J. R. Schramm.

4442. BLACK, O. F., W. W. EGGLESTON, J. W. KELLY, and H. C. TURNER. *Poisonous properties of Bikuculla cucullaria (dutchman's breeches) and B. canadensis (squirrel corn).* Jour. Agric. Res. 23: 69-78. Pl. 1. 1923.—*Bicuculla cucullaria* and *B. canadensis* have been considered poisonous to cattle in Virginia, which is confirmed for the former by preliminary feeding experiments on yearling steers. Chemical examination shows that the tops and roots of both species contain toxic alkaloids. Dilutions of the total alkaloids were subcutaneously injected into mice, with the result that it is estimated that *B. cucullaria* is about 6 times as toxic as *B. canadensis*. A highly poisonous and heretofore apparently unknown alkaloid, cucullarine, was found in *B. cucullaria*; its properties are described.—W. C. Muenscher.

4443. CARY, C. A. *Poisonous action of red buckeye on horses, mules, cattle, hogs, and fish.* Alabama Agric. Exp. Sta. Bull. 218. 20 p. 1922.—A description of *Aesculus pavia* L. and a report of tests on the effects of different parts of this plant on several animals are presented. While pigs, mules, cattle, and fish exhibited some symptoms of poisoning when fed parts of the plant, none were killed or permanently injured.—W. A. Gardner.

4444. CHAUVIN, E. *Sur la toxicité de Volvaria gloiocephala DC.* [On the toxicity of *Volvaria gloiocephala*.] Compt. Rend. Acad. Sci. Paris 175: 1231-1233. 1922.—This species was considered deadly until recently, when Gautier reported it not toxic in Algeria. The author tested specimens, collected in France, on dogs, guinea pigs, and on himself, with no ill effects. He hesitates to declare it entirely non toxic, as individuals differ in susceptibility, and specimens are liable to differ according to the soil upon which they grow. *Amanita junquilla* proved slightly toxic at certain seasons.—C. H. Farr.

4445. DALMIER, E., et OLIVEAU. Trois cas simultanés di empoisonnement grave par *Amanita pantherina*. [Three cases of severe poisoning by *Amanita pantherina*.] Bull. Trimest. Soc. Mycol. France 38: 100-105. 1922.—Typical muscarine poisoning of the cerebral type has been caused by eating *Amanita pantherina* mixed with harmless mushrooms.—D. S. Welch.

4446. GREENISH, HENRY G. Microscopical examination of foods and drugs. 3rd ed., xx + 389 p., 209 fig. P. Blakiston's Son & Co.: Philadelphia, 1923.—The subject matter of this book is divided into 15 sections and 2 appendices in which the following topics are considered: starches, hairs and textile fibers, spores and glands, ergot, woods, stems, leaves, flowers, barks, seeds, fruits, rhizomes, roots, adulterants of powdered foods and drugs, general scheme for the examination of powders, reagents of general utility, and varieties of cell walls and cell contents and their identification. Several new methods of microtechnique have been introduced, including a process for the disintegration of tissues by maceration with chromic and nitric acids.—H. W. Youngken.

4447. NELSON, J. C. The bracken as a poisonous plant. Amer. Fern. Jour. 12: 125-127. 1922.—*Pteridium aquilinum* (L.) Kuhn. var. *pubescens*, a weed in the Northwest, has been found poisonous to horses. The poisonous property seems to be due to a "fixed oil, insoluble in water," which is found in many ferns. The eradication of the fern seems impossible due to its deep-seated and drought-resistant rhizome.—F. C. Anderson.

4448. OFFNER, J. Empoisonnement par des champignons secs. [Poisoning by dried fungi.] Bull. Trimest. Soc. Mycol. France 38: 106-108. 1922.—There have been many cases of poisoning from eating mushrooms preserved by drying. It is suggested that a strict supervision should be placed on the industry of collecting and drying of fungi for market.—D. S. Welch.

4449. TANERT, G. Seigle ergoté falsifié. [Adulterated ergot.] Répertoire Pharm. 35: 69-71. 1923.—About 17 per cent of the samples of ergot sold as coming from Sapin consisted of black grains with a grayish-yellow fractured surface. The taste of the article was farinaceous, and the adulterant sank in water. The adulterant consisted of masses of wheat starch paste passed through narrow apertures, and after being broken into suitable lengths, the fragments were colored by immersion, first in red and then in black ink.—H. W. Youngken.

4450. TERRY, O. P. Treatment of Rhus poisoning. Proc. Indiana Acad. Sci. 1921: 141. 1922.—The article describes a method of using Tincture of grindelia for Rhus poisoning.—F. C. Anderson.

4451. ULLMANN, A. Ueber Tyramin (p-Oxyphenyläthylamin) als wirksamen Bestandteil der Droge Semina cardui Mariae (Stechdistelkörner). [Tyramine (p-hydroxyphenylethylamine) as the active principle of the drug Semina cardui Mariae (Cardul thistle seeds).] Biochem. Zeitschr. 128: 402-406. 1922.—A detailed description of the method by which tyramine, identified by physiological action and chemical tests, was obtained from seed of the plant in question.—W. W. Bonns.

4452. WALLIS, T. E. The Lycopodium method of quantitative microscopy. Jour. Roy. Microsc. Soc. London 1920: 169-178. 1920.—In determining the quantity of the elements in an admixture, as of starches, the nature of the substances is first ascertained and a mixture of equal parts of these prepared and a known amount of Lycopodium spores added. Microscopic counts of the three elements are made; then the same quantity of the unknown is mixed with the same amount of *Lycopodium* spores and counts made in the same way. From this the quantity of each of the elements in the unknown is calculated.—Wm. Randolph Taylor.

PROTOPLASM, MOTILITY

4456. CHIBNALL, A. C. A new method for the separate extraction of vacuole and protoplasmic material from leaf cells. *Jour. Biol. Chem.* 55: 333-342. 1923.—The method consists in plasmolyzing the fresh leaves with ether or butyl alcohol, pressing out the major part of the vacuole content in a Buchner press, then washing out the remainder with 0.002 NHCl. Spinach leaves were used. The vacuolar fluid thus obtained contains only traces of protein, but does contain quantities of organic and inorganic phosphates. The cell walls are not ruptured by this treatment and the protoplasm, from which some of the water-soluble constituents may have been washed out, is retained in the cells and may be later obtained by grinding with water. It passes into colloidal solution and can be subsequently flocculated by the addition of acid. It is composed of substances soluble in alcohol and ether, together with a complex, the greater part of which is protein.—G. B. Rigg.

4457. WEBER, FRIEDL. *Reversible Viskositätserhöhung des lebenden Protoplasmas bei Narkose*. [Reversible increase in the viscosity of living protoplasm by narcotic action.] *Ber. Deutsch. Bot. Ges.* 40: 212-216. 1922.—Viscosity changes were measured by Weber's method, which makes use of the change in the position of the starch particles, that is, "Verlagerung" of the "statoliths" with centrifuging in conjunction with the particular treatment given. The author finds that the increase in viscosity with the epicotyls of *Phaseolus multiflorus* brought about by ether is considerable. The viscosity increase is reversible with weak ether concentrations, but higher strengths of the narcotic injures the protoplasm.—F. S. Howlett.

DIFFUSION, PHYSICO-CHEMICAL PHENOMENA, PERMEABILITY

4458. GIRARD, PIERRE. *Au sujet d'une note de M. L. Lapique sur le mécanisme des échanges entre la cellule et le milieu ambiant*. [Concerning a note by L. Lapique on the "mechanism for the interchange between the cell and the surrounding medium."] *Compt. Rend. Acad. Sci. Paris* 175: 64-65, 1922.—The experiments performed by Lapique [*Compt. Rend. Acad. Sci. Paris* 174: 1490] on living algae are reproducible *in vitro*. It is contended that it is impossible to evaluate the osmotic pressure of living cells.—C. H. Farr.

4459. GIRARD, PIERRE, W. MESTREZAT, et LI-SHOU-HOUA. *Schéme physique de la perméabilité sélective des cellules vivantes aux différents ions*. [A physical scheme of selective permeability of living cells to different ions.] *Compt. Rend. Acad. Sci. Paris* 175: 183-185. 1922.—Experiments are made on the selective permeability of anions and cations through

artificial membranes in an attempt to imitate the condition in living cells. It is recognized, however, that the condition in life is less simple than in these experiments, especially in that the intracellular solution is electrolytic and not pure water as in these experiments. BaCl_2 , BaI_2 , and MgCl_2 are used severally with HNO_3 ; and $\text{Ba}(\text{NO}_3)_2$ is used with trichloroacetic acid. Readings are given as to the number of ion-gm. per l. diffusing in 30-60 minutes.—*C. H. Farr.*

4460. LAPICQUE, LOUIS. *Mécanisme des échanges entre la cellule et le milieu ambiant.* [The mechanism of interchange between the cell and the surrounding media.] *Compt. Rend. Acad. Sci. Paris* 174: 1490-1492. 1922.—Studies are made on marine algae. In winter the bulb of *Saccorhiza bulbosa* has a salt content much higher than that of the sea water. With *Ectocarpus* it is found that a plasmolyzed cell in a hypertonic solution rapidly recovers its turgidity and finally acquires an osmotic pressure above that of the hypertonic medium. By dark field illumination it is found that the plasma membrane is not inert, but is constantly in a state of Brownian movement. The cell sap is acid and it is found that the protoplasm contracts in an alkaline and swells in an acid solution. Each particle of the protoplasm which is in motion acts as a sponge imbibing material from the external medium and giving it up to the internal. In this way salt is absorbed.—*C. H. Farr.*

4461. LESAGE, PIERRE. *Expériences pour servir à l'étude du mouvement des liquides dans les massifs cellulaires.* [Experiments of service in the study of the movement of liquids through cellular masses.] *Compt. Rend. Acad. Sci. Paris* 175: 47-50. 1922.—A difficulty is found in comparing the activity of the Dutrochet osmometer with the conduction of liquids from cell to cell. In the osmometer the lower liquid is separated from the solution by an artificial cell. In the experiments reported it is found that with ferrocyanide membranes the exosmosis is less and the evaporation more than with non-ferrocyanide membranes. It is suggested that a study of the structures involved in conduction from cell to cell, such as endodermis, secretory tissue, etc., would be of great importance.—*C. H. Farr.*

4462. MESTREZAT, W., PIERRE GIRARD and V. MORAX. *Perméabilité ionique élective des éléments cellulaires.* [Selective ionic permeability of cells.] *Compt. Rend. Acad. Sci. Paris* 174: 1727-1729. 1922.—It is found that the dissociated molecules do not traverse the membranes in the proportion of chemical equivalents, but that the ions each go in separately, for example the ratio of the absorption of nitrate (NO_3) ion to the calcium (Ca) ion may be $\frac{2}{1.02}$, $\frac{2}{1.32}$ or $\frac{2}{1.04}$. A table of data is given.—*C. H. Farr.*

4463. NEWTON, ROBERT, and ROSS AIKEN GORTNER. *A method for estimating hydrophilic colloid content of expressed plant tissue fluids.* *Bot. Gaz.* 74: 442-446. *Fig. 1.* 1922.—In a previous paper [*Bot. Gaz.* 74: 308-313. 1922] Gortner and Hoffman presented a refractometer method for determining the moisture content of plant saps. The data thus obtained have been applied in the present work. The procedure is as follows: "The freezing point depression of the freshly expressed plant juice is first obtained. Then, having determined the total solids by the refractometric method, a quantity of sucrose just sufficient to make a molar solution in the total water present is added. The freezing point depression is again determined and is usually found to have increased more than the theoretical amount." The method is based on the assumption "that the magnitude of the excess depression is a measure of the quantity of water held in such a way as to be unavailable for the solution of the sugar. The values obtained may be calculated to percentage "bound water." The authors hold that this "bound" water corresponds so regularly with the hydrophilic colloid content that the datum gained is indicative of the amount of such colloid present. Data from actual analyses illustrating the method are given together with formulae to be used.—*B. W. Wells.*

4464. PRAT, S. *Plasmolyse und Permeabilität.* [Plasmolysis and permeability.] *Biochem. Zeitschr.* 128: 557-567. 1922.—Three species of *Spirogyra* were studied for plasmol-

ysis effects. Univalent ions produced plasmolysis progressing in degree with time. In the case of bivalent ions the effect was either constant, or decreased with time. These results held for both anions and cations. In plasmolytic effectiveness the cations formed the following descending series: K, Na, Ca, Mg; and the anions the series NO_3 , Cl, SO_4 . An increase of permeability before death was not noted; on the contrary, a reduced permeability was often noted with monovalent ions. It was found that aniline increases the staining of the alga by methylene blue and neutral red.—*W. W. Bonns.*

4465. ROMIEU, MARC, et FERNAND OBATON. Étude spectroscopique du pigment vert du Chétopère et de la chlorophylle de l'Ulve. [A spectroscopic study of the green pigment of *Chaetophora* and of the chlorophyll of *Ulva*.] *Compt. Rend. Acad. Sci. Paris* 175: 51-54. 1 fig. 1922.—It is concluded that chetopterine is a pigment belonging to the group of the entero-chlorophylls, which it resembles spectroscopically very closely. It is believed to originate from the chlorophyll of the green algae and diatoms which are ingested into the digestive tube, and is not intrinsic with the animal.—*C. H. Farr.* ■

4466. STOKLASA, J. Ueber die Resorption des Aluminum-Ions durch das Wurzelsystem der Pflanzen. [The absorption of aluminum ions by the root systems of plants.] *Biochem. Zeitschr.* 128: 35-47. 1922.—Experiments with hydrophytes, mesophytes, and xerophytes in water cultures show on analysis that aluminum absorption decreases in these groups in the order named. In hydrophytes the ion is absorbed in relatively large amounts; the greatest quantities were found in roots and underground stems. Absorption was greater from dilute than from concentrated solutions. Within some concentration limits the roots of xerophytes appear impermeable to aluminum. Plasmolysis resulting from excess accumulation of aluminum ions occurs rapidly in xerophytes but more slowly in mesophytes and in hydrophytes only in the more concentrated solutions. The author concludes that aluminum absorption depends upon an exchange of cations. The aluminum ion absorption coincides with loss by the cells of other cations, such as Ca, Mg, or Na.—*W. W. Bonns.*

WATER RELATIONS

4467. BOBILIOFF, W. Over de functie van de melksapvaten van *Hevea brasiliensis* als waterreservoir. [The function of the latex vessels of *Hevea brasiliensis* as water reservoirs. *Arch. Rubbercult.* 5: 367-380. 1921.—Consideration is given to the theory that the latex vessels in *Hevea* serve as reservoirs for water storage. The author decides that this can not be the only function of latex. The changes in the water content of the latex are slight, the concentration remaining nearly constant even during periods of relatively dry weather.—*C. D. La Rue.*

4468. MOLISCH, HANS. Ueber den Einfluss der Transpiration auf das Verschwinden der Stärke in den Blättern. [The influence of transpiration on the disappearance of starch in leaves.] *Ber. Deutsch. Bot. Ges.* 39: 339-344. Fig. 1. 1921.—Excised leaves of *Tropaeolum majus* and other plants, previously exposed to strong sunlight, showed very little starch disappearance during the night period of 8-10 hours, provided the leaves were kept in a dark chamber saturated with moisture. Leaves kept in a dry chamber showed complete starch disappearance by morning. Analysis showed a lower percentage of reducing substances in the latter case. The author points out that the starch disappearance took place under conditions very favorable for rapid transpiration, which he considers very markedly slows down the changing of the starch to some form other than reducing sugars.—*F. S. Howlett.*

4469. PATTERSON, C. F. Growth in seedlings of *Phaseolus vulgaris* in relation to relative humidity and temperature. *Trans. Roy. Canadian Inst.* 14: 23-68. 1922.—The author concludes that the influence of relative humidity upon growth in higher plants has been greatly overestimated. Experiments with bean seedlings show that the available moisture in the substratum must be recognized as an important factor, as it may overcome in large measure the harmful effects of low relative humidity and of atmospheres possessing high evaporation coefficients.—*R. B. Thomson.*

MINERAL NUTRIENTS AND SALT RELATIONS

4470. BRIOUX, CH. Assimilabilité comparée du phosphate tricalcique et des phosphates d'alumine et de fer. [Comparative assimilability of tricalcic phosphate and the phosphates of aluminium and iron.] Compt. Rend. Acad. Sci. Paris 175: 1096-1099. 1922.—Tests were made with 6 types of cultivated plants, each with the 3 kinds of phosphate and a control with no phosphate. On the whole the best results were secured with aluminium phosphate, the tricalcium phosphate being next, and the control last.—C. H. Farr.

4471. COUPIN, HENRI. Sur l'origine de la carapace siliceuse des diatomées. [On the origin of the silicious shell of the diatoms.] Compt. Rend. Acad. Sci. Paris 175: 1226-1229. 1922.—The study was made by growing *Nitzschia linearis*, a fresh water species, on Knop's solution with non-nutrient gelatin. No growth was secured without silicon in the nutrient medium, nor was growth obtained with washed sand or colloidal silicon. The diatom grows well on kaolin, pulverized feldspar (orthose), or clay. Potassium and sodium silicate are poisonous. It is concluded that diatoms utilize aluminium silicate in the formation of the shells.—C. H. Farr.

4472. FISCHER, WILHELM. Zur Frage der Kalk Empfindlichkeit unserer Kulturpflanzen und ihrer Behebung durch Kali. [The question of sensitiveness to calcium of our cultivated plants and its neutralization by potassium.] Landw. Jahrb. 58: 1-53. 1923.—Ehrenberg observed a certain relationship between the calcium and potassium assimilation by plants. The calcium-potassium law shows the relationship between the assimilation of calcium and potassium by plants as indicated by ash analysis; when the calcium content rises, the potassium content is automatically depressed, with the same amount of potassium available to plants, resulting in injury to plant growth. Normal plant growth can again be obtained by an increase in potassium fertilization. The author found this law to apply to lupines and flax, but the results with beets could be applied for and against this law. Different plants possess different degrees of sensitiveness to calcium. This is related, in part, to the soil reaction and phosphorus availability. The author discusses further in detail the relation of calcium to the other common fertilizer constituents in the influence upon the growth of various plants.—S. A. Waksman.

4473. GARNER, W. W., J. E. McMURTREY, C. W. BACON, and E. G. MOSS. Sand drown, a chlorosis of tobacco due to magnesium deficiency, and the relation of sulphates and chlorides of potassium to the disease. Jour. Agric. Res. 23: 27-40. Pl. 1-7. 1923.—This chlorosis, prevalent on light sandy soils subject to leaching, resembles potash hunger in beginning at the tips of lower leaves, but the margin of the leaf is not puckered as in that disease. The yellow and green pigments are affected, so that the leaves become very pale yellow or almost white. When cured the formerly chlorotic leaf does not have the correct color; it is light in weight, thin, and inelastic.—The disease is due to magnesium deficiency, as shown by field and laboratory tests with pure chemicals. The ratio of magnesium to soluble sulphates seems to be of prime importance. The deficiency is readily made up by the use of sulphate of potash or of lime which contains some magnesium. One of the values of organic matter of vegetable origin as fertilizer is the continuous supply of magnesium which results from decomposition.—Biochemical studies of tobacco receiving different fertilizer treatments are reported. Potassium sulphate treatments greatly increased the amounts of potassium citrate and malate in the sap. Treatments with the chloride gave no such increases.—The function of Mg, Ca, and S, in a "complete" fertilizer clearly needs to receive consideration along with K, P, and N.—A method of conducting pot cultures in which soil is leached with complete and incomplete nutrient solutions is suggested for use in the study of problems in fertilizer action.—D. Reddick.

4474. LEROUX, L., et D. LEROUX. Contribution à l'étude de la répartition du fer dans les plantes. [The distribution of iron in plants.] Rev. Gén. Bot. 35: 24-33, 57-70. 1923.—Chemical determination of the distribution of iron, calcium, and magnesium in the various

parts of plants from a large number of families are reported. The authors conclude that (1) iron represents a slight proportion of the mineral material of plants; in 246 determinations it exceeded 2 per cent, while once it reached 2.97 per cent. (2) The proportion of iron in the ash was very variable, between 0.10 and 2.97, that is to say from 1 to 30 (which corresponds to a variation of 0.003–0.076 per cent or 1:25 based on dry weight). (3) Iron is unequally distributed in the different plant organs. In herbaceous plants the ash of the roots, and after the latter the ash of the flowers, was found to be particularly rich in iron. The leaves were the richest in calcium, and the organs of support (petioles, etc.) in magnesium. In woody plants the ash of the leaves regularly held the most iron. The ash of the organs of support was richest in calcium, and that of the fruits in magnesium. The great amount of iron in the ash from the branches of conifers is worthy of note.—*J. C. Gilman.*

4475. MAQUENNE, L., and R. CERIGHELLI. *Influence de la chaux sur le rendement des graines pendant la période germinative.* [Influence of calcium on the development of seeds during the period of germination.] *Compt. Rend. Acad. Sci. Paris* 174: 1269–1272. 1922.—The methods previously described by Maquenne and Demoussy were used. The results also agree with those of these authors, namely, that small quantities of calcium, 10 mg. CaSO_4 per l., have a favorable action upon the development of organs elaborated during germination, especially upon their increase in length.—*W. K. Farr.*

4476. MAQUENNE L., et E. DEMOUSSY. *Influence du calcium sur l'utilisation des réserves pendant la germination des grains.* [The influence of calcium on the utilization of food reserves during the germination of seed.] *Compt. Rend. Acad. Sci. Paris* 175: 249–252. 1922.—Two steps are distinguished in the germinative process: the analytic phase, in which the substances pass into the soluble form for translocation, and the synthetic phase, in which they pass back into an insoluble form,—such as cellulose, etc. Extracts of pea embryos were tested. A difference was found between those supplied with calcium and those without it. This difference is attributed to an effect of calcium on enzyme action. The dry weight was slightly greater in the control, and the extracts of cultures showed a slightly different refractive index than did the controls. Examination was also made of wheat, radish and nasturtium, and slight differences found. But it is concluded that calcium is nearly without influence on the transformation of the reserve food in the seed.—*C. H. Farr.*

4477. VERNET, G. *Rôle du chlorure de calcium dans la coagulation du latex d'Hevea brasiliensis.* [The rôle of calcium chloride in the coagulation of the latex of *Hevea brasiliensis*.] *Compt. Rend. Acad. Sci. Paris* 175: 719–721. 1922.—Calcium combines with the soluble phosphates of the latex rendering them less soluble; these remain incorporated in the rubber. The chloride coagulates the albuminoids.—*C. H. Farr.*

PHOTOSYNTHESIS

4478. BORESCH, KARL. *Photokatalysen in Pflanzen.* [Photocatalysis in plants.] *Naturwissenschaften* 10: 505–512. 1922.—This paper reviews the literature on the manifold photochemical effects on plants. The subjects taken up are: the rôle of mineral catalysts in the plant, the autosenesibilization of plant coloring substances, the photolysis of plant pigments, CO_2 assimilation, movements in response to light stimuli as effected by photocatalysis, deleterious light effects, the proportionality laws between the light effect and light absorption, photodynamic effects, and reducing substances. A useful bibliography concludes the article.—*Orton L. Clark.*

4479. KOSTYTSCHEW, S. *Studien über Photosynthese. 1. Das Verhältnis CO_2/O_2 bei der Kohlensäureassimilation.* [Photosynthesis. 1. The ratio CO_2/O_2 in carbon dioxide assimilation.] *Ber. Deutsch. Bot. Ges.* 39: 319–328. 1921.—Leaves exposed to sunlight in CO_2 air showed a high CO_2/O_2 ratio. Continued exposure lowered the ratio to nearly 1, this being especially true for the species of algae worked with. Apparently some of the CO_2 is chemically combined or is in solution with colloidal chlorophyll, since the evidence shows that

practically no CO_2 is held in the intercellular spaces. Respiration and CO_2 assimilation in darkness could not be correlated during the short time of this experiment. It is concluded that the CO_2/O_2 ratio will become practically 1 for any plant after a sufficiently long exposure.—*M. H. Cubbon.*

4480. KOSTYTSCHEW, S. Studien über Photosynthese. 2. Wirkt Wundreiz stimulierend auf die Kohlensäureassimilation am Lichte? [Photosynthesis. 2. Does wounding have a stimulating effect on CO_2 assimilation in light?] Ber. Deutsch. Bot. Ges. 39: 328-333. 1921.—The results secured showed consistently that wounding slightly decreased the assimilation of CO_2 . The author concludes that the cell plasma has nothing to do with CO_2 assimilation but that the chloroplasts function instead. The method used is recommended by the author as one suitable for conducting experiments with leaves when the time of exposure is quite long.—*M. H. Cubbon.*

4481. KOSTYTSCHEW, S. Studien über Photosynthese. 3. Findet eine Kohlensäureassimilation während der Sommernächte in der subarktischen Region statt? [Photosynthesis. 3. Does CO_2 assimilation occur during the summer night in subarctic regions?] Ber. Deutsch. Bot. Ges. 39: 334-338. 1921.— CO_2 assimilation remained fairly rapid up to the time the sun set, but no amount of exposure to the strongly diffused light during the night produced noticeable assimilation. The sudden drop was due to a fall in temperature as well as to inability of stomata to open wider. Conifers gave a rather rapid rate of assimilation after sundown. A very small amount of CO_2 was given off during the exposure to strongly diffused light.—*M. H. Cubbon.*

4482. KOSTYTSCHEW, S. Studien über Photosynthese. 4. Die CO_2 Assimilation der Leguminosen. [Photosynthesis. IV. CO_2 -assimilation by legumes.] Ber. Deutsch. Bot. Ges. 40: 112-119. 1922.—The main results are as follows: (1) CO_2 assimilation, under conditions of increased CO_2 content, is decidedly higher in legumes than in non-leguminous plants; (2) plants growing in soils rich in nitrates assimilate CO_2 much more rapidly than plants of the same species growing in a nitrate-free soil; (3) in experiments of short duration, nitrates do not increase the number of cc. of CO_2 used per square dm. leaf area per hour; (4) in spite of the presence of root tubercles, species of *Alnus* show the same assimilation rate as plants unable to fix free nitrogen.—*W. C. Muenischer.*

4483. WEINBERG, A. VON. Photosynthese (Willstätters neue Assimilationstheorie). [Photosynthesis (Willstätter's new theory of assimilation).] Ber. Senckenberg. Naturf. Ges. Frankfurt am Main 50: 172. 1920.—A report is given of a lecture on Willstätter's theory of assimilation. The respective parts played by chlorophyll, sunlight, and an enzyme are described, and the conclusion is reached that protoplasm or the enzyme is essential to photosynthesis. Isolated chlorophyll acted upon by light can carry on only the first step in the process.—*A. W. Evans.*

METABOLISM (GENERAL)

4484. ADLER, O. Ueber eine Holzreaction nebst Bemerkungen über das Anethol. [A reaction of wood, with observations on anethol.] Biochem. Zeitschr. 128: 32-34. 1922.—This is a consideration of the green color produced by immersing wood in a concentrated acetic acid solution of phenylhydrazine hydrochloride and an effort to determine the nature of the reaction by similar color production with known reagents. The conclusion is reached that the wood reaction is due to a derivative of anethol.—*W. W. Bonns.*

4485. BAILEY, E. M., HELEN C. CANNON, and H. J. FISHER. The potency of some commercial vitamine preparations as compared with that of dry brewers' yeast. Connecticut Agric. Exp. Sta. Bull. 240. 3-51. 1922.—Twenty-two products were partially analyzed chemically and fed to rats; brewers' yeast was used as the control product. In some instances the analyses suggest an explanation of observed impotency of the product in that it has been

diluted or changed by adding various medicaments of established reputation in therapeutics. The feeding test results with rats are given by means of graphs explained by accompanying notes. Yeast Vitamine-Harris tablets, Yeast Vitamine-Harris powder, and Vegex brought the rats to normal weight. The following gave results closely approximating the controls: Cerevisine, Yeast Foam Tablets, Merck's Medicinal Yeast (tablets and powder), and Metagen. Maintenance, or indifferent or inconsistent growth was obtained with Vita Zest, Fleischmann's Yeast, Yeastmine, Vitamon, and Ironized Yeast. The following failed conspicuously in all trials: Magic Yeast, Medic Yeast, Phos-pho Vitamine, Phytamin, Vi-ta-co, Yeastone, and Yeastonic. Yeast Vitamine-Harris powder and tablets, Vegex, and Yeast Foam Tablets were effective in half doses, while Vegex failed in quarter doses. Lower doses than 25 mgm. were not used.—*Henry Dorsey.*

4487. BOAS, F. Untersuchungen über die Mitwirkung der Lipoide beim Stoffaustausch der pflanzlichen Zelle. II Mitteilung. [Studies on the rôle of lipoids in plant cell metabolism, II Contribution.] *Biochem. Zeitschr.* 129: 144-152. 1922.—The permeability of sapotoxin, choleate, glycocholeate, choline and tannocholate of sodium, urethan and quinine hydrochloride was studied with and without NaCl present. Yeast cells were used as permeability indices. Injurious effects of the several reagents are accounted for on the basis of change in the colloidal structure of the cell lipoids, by which permeability is increased to an injurious degree.—*W. W. Bonns.*

4488. BORESCH, K. Ueber die Pigmente der Alge *Palmellococcus miniatus* Chod. var. *Porphyrea Wille n. v.* [Pigments of the alga *Palmellococcus miniatus* Chod. var. *porphyrea Wille n. v.*] *Ber. Deutsch. Bot. Ges.* 40: 288-291. 1922.—This reddish brown alga was grown on agar in the absence of other algae. Water extracts of the cell pigment were examined spectroscopically and found to compare very closely with the pigments of many phycoerythrin containing Schizophyceae. This is apparently the first time that "schizophyceae-phycoerythrin" has been described in a member of the Protococcales or outside of the Schizophyceae.—*W. C. Muenscher.*

4489. BRAECKE, MARIE. Sur la présence d'aucubine et de mélampyre dans plusieurs espèces de mélampyres. [On the presence of aucubine and of melampyre in many species of *Melampyrum*.] *Compt. Rend. Acad. Sci. Paris* 175: 990-992. 1922.—*Melampyrum pratense*, *M. nemorosum*, and *M. cristatum* were studied in particular. Aucubine was found in all and melampyre in the last 2.—*C. H. Farr.*

4490. BRIDEL, MARC, et MARIE BRAECKE. Sur la présence d'aucubine et de saccharose dans les graines de *Rhinanthus Crista-Galli* L. [On the presence of aucubine and saccharose in the seed of *Rhinanthus Crista-Galli*.] *Compt. Rend. Acad. Sci. Paris* 175: 532-534. 1922.—In addition to the polariscopic tests, a study was made of the action of emulsin and invertin. Both aucubine and saccharose were found in the pure state.—*C. H. Farr.*

4491. CANNON, PAUL R., and B. W. MCNEASE. Factors controlling intestinal bacteria. The influence of hydrogen-ion concentration on bacterial types. *Jour. Infect. Diseases* 32: 175-180. 1923.—The higher acidity of the contents of the intestine resulting from carbohydrate as contrasted with protein feeding was correlated with a simplification of the intestinal flora, *B. acidophilus* predominating under the more acid conditions.—*R. L. Starkey.*

4492. COLIN, H., et H. BELVAL. La genèse des hydrates de carbone dans le blé. Présence de lévulosanes dans la tige. [The origin of carbohydrates in wheat. The presence of the levulosanes in the stem.] *Compt. Rend. Acad. Sci. Paris* 175: 1441-1443. 1922.—In the leaves of wheat the only soluble carbohydrates present are saccharose and the products of

its hydrolysis. An analysis is made of the leaves and stems of wheat on 5 dates from May 18 to July 1, material being collected at 4 o'clock in the afternoon. Records were obtained for the total sugar content, the reducing sugars, saccharose, the levulosanes, and the dextrose-levulose ratio. It is found that the levulosanes do not appear until the latter part of this period. The reducing sugars reach a maximum in the stem near the middle of the period and saccharose shows a gradual increase to the end.—*C. H. Farr.*

4493. COMBES, RAOUL, et DENISE KOHLER. *Ce que deviennent les hydrates de carbone quand meurent les feuilles des arbres.* [The destination of the carbohydrates when the leaves of trees die.] *Compt. Rend. Acad. Sci. Paris* 175: 590-592. 1922.—This is a continuation of the study previously reported [*Compt. Rend. Acad. Sci. Paris* 175: 406], using *Fagus silvatica* and *Aesculus Hippocastanum*. Analyses were made of the leaves at the beginning of the yellowing period and after the leaves had turned brown. Between these dates some of the leaves used remained on the tree, and others were picked and kept under similar conditions. It was found that the soluble carbohydrates decrease during yellowing to a greater extent in the attached leaves. It is also found that in such leaves the hydrolyzable, insoluble carbohydrates increase during yellowing to a greater extent. About 45 per cent of the carbohydrate remains in the leaf during yellowing; about 35 per cent is lost in respiration and washing by rain; and about 20 per cent passes back into the stem. It is not believed that the soluble carbohydrates contribute at this time to the hydrolyzable, insoluble carbohydrates.—*C. H. Farr.*

4494. FULTON, JOHN F., JR. *Animal chlorophyll: its relation to haemoglobin and to other animal pigments.* *Quart. Jour. Microsc. Sci.* 66: 339-385. 1922.—The present paper aims to show that the pigment responsible for color in certain representative invertebrates comes from the blood stream, and that in many cases the pigment cells of the blood arise (while in circulation) from unpigmented corpuscles. The animal kingdom is discussed as 2 groups, those without a blood-vascular system and those with such a system. Through the animal kingdom the strong relationship between the body pigments and chlorophyll is shown and the author concludes that there is strong evidence that the respiratory pigment haemoglobin is derived both phylogenetically and physiologically from chlorophyll. An extensive bibliography is appended.—*C. S. Hoar.*

4495. GORTER, K. *Sur la constitution de la lycorine.* [The constitution of lycorine.] *Bull. Jard. Bot. Buitenzorg* III, 2: 1-7. 1920.—A structural formula is assigned to this body, previously described and the properties of several derivatives are defined.—*C. C. Epling.*

4496. GORTER, K. *Sur la distribution de la lycorine dans la famille des Amaryllidacées.* [The distribution of lycorine in the Amaryllidaceae.] *Bull. Jard. Bot. Buitenzorg* III, 1: 352-358; 2: 331-334. 1919-20.—Lycorine, first isolated from *Lycoris radiata* Herb., has since been reported from 13 genera of the family. Negative results are reported in the case of *Pancratium*, *Hippeastrum*, and *Polianthes*.—*C. C. Epling.*

4497. GORTER, K. *Sur l'hyptolide, principe amer d'Hyptis pectinata* Poit. [Hyptolide, the bitter principle of *Hyptis pectinata*.] *Bull. Jard. Bot. Buitenzorg* III, 1: 327-337. 1919.—A lactone obtained from *Hyptis pectinata* Poit. is described and a formula is assigned.—*C. C. Epling.*

4498. GREINER, I. *Ueber die Bestimmung kleiner Zuckermengen nach den Bertrand-schen Verfahren.* [The determination of small amounts of sugar by the Bertrand method.] *Biochem. Zeitschr.* 128: 274-278. 1 fig. 1922.—There is given an outline of the method of procedure, with a table of copper equivalents of sugar.—*W. W. Bonns.*

4499. HELLER, V. G. *Studies on yeast. V. The vitamin B content of yeast.* *Jour. Biol. Chem.* 55: 385-398. 1923.—The vitamin B potency of yeast (*Saccharomyces cerevisiae*

[Race F]) for rats has been determined. Drying the yeast destroys some of its vitamin. This yeast when grown on a synthetic medium is not as rich in vitamin B as when grown on wort. This yeast synthesizes not only the growth-promoting vitamin, but the antineuritic vitamin as well.—G. B. Rigg.

4500. JONESCO, ST. Les pigments anthocyaniques et les phlobatannins chez les végétaux. [The anthocyanic pigments and the phlobatannins of plants.] Compt. Rend. Acad. Sci. Paris 175: 904-907. 1922.—A study is made of the pigments of the red leaves of *Prunus pissardi*. It is concluded that the phlobatannins are not the same as the pseudo-bases of Kurt Noach. The so-called anthocyanins are regarded as of 3 different kinds: (1) the anthocyanins of Willstätter, which are red, blue, or violet, and which do not fade with amyl alcohol; (2) the anthocyanidines, red in color, existing in a free state in the tissues, and fading readily with amyl alcohol; (3) the leuco-anthocyanidines or pseudo-bases, which are yellow, fading with amyl alcohol, and passing over into anthocyanidines upon heating with hydrochloric acid.—C. H. Farr.

4501. JONESCO, ST. Sur la répartition des anthocyanidines dans les organes colorés des plants. [The distribution of the anthocyanidines in the pigmented parts of plants.] Compt. Rend. Acad. Sci. Paris 174: 1635-1637. 1922.—Rosenheim reported anthocyanidines in the free state in leaves of *Vitis vinifera* in 1920, and independently Jonesco discovered them in fruits, leaves, and flowers of other plants. Since then, attempts have been made to find them in plant organs colored red, violet, or blue. Red leaves of *Ampelopsis*, reddish violet leaves of beet, red stems of *Sarrasin argente*, violet flowers of gladioli and *Cobaea scandens*, reddish purple flowers of *Canna* and rose and blue flowers of *Centaurea cyanus* were studied. Anthocyanidines were found in *Ampelopsis* and *Sarrasin*, but in the other 6 forms a yellowish pigment was present in addition to anthocyan. It is concluded that anthocyanidines do not always accompany anthocyanins, but are especially characteristic of red organs.—C. H. Farr.

4502. KOLKWITZ, R. Ueber das Schicksal des Chlorophylls bei der herbstlichen Laubverfärbung. [The fate of chlorophyll in autumnal leaf coloration.] Ber. Deutsch. Bot. Ges. 37: 2-5. 1919.—It has been held by some that autumnal leaf coloration is due to the withdrawal of certain components of chlorophyll from the leaf to the perennial plant parts in order to economize compounds of M, P, and C. The author reports observations and experiments which are interpreted as indicating that this is not the case. He calculates, from data of Willstätter and Stoll, that the N content of chlorophyll *a* and *b* is only about 0.05 per cent of the dry matter of leaves.—W. C. Muenscher.

4503. KOSTYTSCHEW, S. Ueber die Ernährung der grünen Halbsschmarotzer. [Nutrition of green semi-parasites.] Ber. Deutsch. Bot. Ges. 40: 273-279. 1922.—The author discusses previous work done on the nutrition of green semi-parasites. The following species used in the experiments reported in this paper: *Electrolophus major*, *Melampyrum pratense*, *Pedicularis* spp., *Euphrasia* spp., and *Odontites rubra*, all belonging to the Rhinanthaceae under Schophulariaceae. Experiments show that, in general, there is no difference in the CO₂ assimilation rate between turgid cuttings of these species and autotrophic species of the same family. The transpiration rate in these semi-parasites is markedly increased when the roots are removed under water. The author believes that the initial cause for the beginning of parasitism in semi-parasites is the inability of the roots to supply water lost by transpiration so that the plants obtain water through root haustoria from the host, which necessitates the transfer of organic materials into the roots of the semi-parasite. Later this condition may influence the development of the leaf structure and chlorophyll apparatus to such an extent that parasitism may result. The Rhinanthaceae have only taken the first step toward a parasitic mode of living; they show a reduction of the root system but not of the chlorophyll apparatus.—W. C. Muenscher.

4504. KRITCHEVSKY, I. L., and A. L. DOUCHOWSKY. Structure of complement. Jour. Infect. Diseases 32: 187-191. 1923.—The sap of *Cotyledon Scheideckeri* inactivated complement. Absorption of the complement by the precipitate and not decomposition seemed to occur.—R. L. Starkey.

4505. METZNER, P. Ueber den Farbstoff der grünen Bacterien. [Pigments of green bacteria.] Ber. Deutsch. Bot. Ges. 40: 125-129. Fig. 1. 1922.—The author discusses the literature dealing with the pigments found in such green bacteria as *Bacterium viride*, *B. chlorinum*, *Bacillus virens*, and *Streptococcus varians*. In some preliminary experiments the author examined spectroscopically alcoholic extracts of the green pigments obtained from dried masses of green bacteria free from algae. It is concluded that this green pigment which he tentatively calls "bacterioviridin" is not identical with the chlorophyll of the higher plants.—W. C. Muenscher.

4506. MIRANDE, MARCEL. Sur la relation existant entre l'acidité relative des tissus et la présence de l'anthocyanine dans les écailles de bulbes de lis exposées à la lumière. [The relation existing between the relative acidity of the tissues and the presence of anthocyanin in the scales of the lily bulb exposed to light.] Compt. Rend. Acad. Sci. Paris 175: 711-713. 1922.—Leaves detached and exposed to light show an increase in acidity due to wounding and an increase also correlated with pigmentation. In darkness only the first increment is obtained. Acidity of leaves attached, 1.134 cc.; detached, in light, 1.876 cc.; detached, in dark, 1.622 cc. Readings are in cc. of a solution of phenolphthalein and KOH per gm. of fresh weight. It is thus concluded that oxidation occurs in anthocyan synthesis.—C. H. Farr.

4507. ROBERTSON, R. C., and D. J. DAVIS. Food accessory factors (vitamins) in bacterial growth. Observations on the ultimate source of accessory growth substances for yeast VII. Jour. Infect. Diseases 32: 153-158. 1923.—It was observed that while yeast was incapable of giving continued growth upon a synthetic medium, the addition of extracts of beef heart, carrot, potato, and yeast produced a luxuriant and continuous growth. The optimum concentration of the extracts was found to be about 1: 500. The further point was made that these extracts alone will not permit continuous growth, and that the ultimate origin of the seemingly necessary growth stimulating substances is still unknown. The quality of continuity of growth was tested by transplants upon dextrose agar at intervals of 24 hours.—R. V. Allison.

4508. TERROINE, ÉMILE-F., R. WURMSER, et J. MONTANÉ. Influence de la constitution des milieux nutritifs sur la composition de l'*Aspergillus niger*. [The influence of the constitution of the nutritive media on the composition of *Aspergillus niger*.] Compt. Rend. Acad. Sci. Paris 175: 541-544. 1922.—This is a continuation of earlier work [Compt. Rend. Acad. Sci. Paris 175: 228]. A study is made of the effect of stage of development, concentration of $(\text{NH}_4)_2\text{SO}_4$, concentration of carbohydrate, kind of nitrogenous compounds used, kind of carbohydrate, and the influence of starvation. It is found that reserve nitrogen is absent in the presence of high concentrations of ammonium compounds, that ternary substances accumulate in the presence of high concentrations of carbohydrates, and that proteins are consumed in starvation. All data show the correspondence between the physiology of *Aspergillus* and that of the higher animals.—C. H. Farr.

4509. WEBER, U. Beitrag zur Kenntnis der esterbildenden Hefen. [The ester forming yeasts.] Biochem. Zeitschr. 129: 208-218. 1922.—Four yeasts and 2 imperfect fungi were studied for growth, fermentation power, and ester formation, determining the latter by the strength of the resulting odor. Considerable variation in reactions was noted. In some cases, as in an atmosphere of CO_2 , vigorous growth was accompanied by no detectable ester formation. Ester formation occurred where carbohydrate fermentation supplied the energy for proteolysis, or when some energy substitute for the carbohydrates was present. The addition of alcohol effected a change in the nature of the ester odor. Nitrogenous nutrients resulted in ester odor changes only with a corresponding change in the amino acids present. When leucine was added to the substrate the odor of amyl ester resulted.—W. W. Bonns.

4510. WILLE, N. *Phycoerythrin bei den Myxophyceen.* [Phycoerythrin in Myxophyceae.] Ber. Deutsch. Bot. Ges. 40: 188-192. Fig. 1. 1922.—The author reviews the work, especially that of Boresch, dealing with the occurrence of phycoerythrin in the Myxophyceae. The author calls attention to an unpublished note written by him in 1889, reporting phycoerythrin in *Phormidium persicinum* (Rke.) Gom. The absorption spectra of the phycoerythrin of this *Phormidium* were identical with those produced by *Rhodomenia palmata* (L.) Grev. The author considers this, along with other conditions, as evidence of the origin of Florideae from the Myxophyceae.—W. C. Muenscher.

4511. ZIEGENSPECK, H. *Amyloid in jugendlichen Pflanzenorganen als vermutliches Zwischenprodukt bei der Bildung von Wandkohlenhydraten.* [Amyloid as an intermediate product in the building of wall carbohydrates in young plant organs.] Ber. Deutsch. Bot. Ges. 37: 273-278. 1919.—The presence of amyloid was demonstrated in young parts of a number of plants. The author points out reasons why it is difficult to find this product in many plants.—W. C. Muenscher.

METABOLISM (NITROGEN RELATIONS)

4512. BERG, R. *Die Vitamine: kritische Übersicht der Lehre von den Ergänzungsstoffen.* [The vitamins: critical survey of the accessory growth-promoting substances.] 386 p. S. Hirzel; Leipzig, 1922.

4513. BLANCK, E., W. GEILMANN, and F. GIESECKE. *Die Stickstoffwirkung des Hexamethylentetramins auf die Pflanzenproduction.* [The effect of nitrogen in the form of hexamethylentetramine upon plant production.] Jour. Landw. 70: 221-251. 1922.—By means of sand and loam pot experiments the effect of hexamethylenetetramine upon plant growth was ascertained. This complex compound is as favorable a source of nitrogen as is $(\text{NH}_4)_2\text{SO}_4$ as measured by the growth of oats, mustard, and beets. Bacterial activity transforms the organic compound into NH_3 and then into nitrate, a suitable material for the growth of plants. Hexamethylenetetramine is formed by the condensation of NH_3 and HCHO , as well as by the treatment of urea and liquid manure, both of which contain NH_3 , with formalin.—F. M. Schertz.

4514. BRIDEL, M., et C. CHARAUX. *La centaureidine, produit de dédoublement de la centaureine glucoside des racines de Centaurea Jacea L.* [Centaureidine, produced by the splitting of the glucoside centaureine of the roots of *Centaurea Jacea*.] Compt. Rend. Acad. Sci. Paris 175: 1168-1170. 1922.—In a former paper [see following entry] the method of purification and crystallization of the compounds is presented. This paper gives the determination of its exact chemical composition. The reaction is found to be:

The relative amounts of the products are 34.48 per cent glucose and 68.96 per cent centaureidine. The latter is yellow in color but differs from the flavones in composition, as they are $\text{C}_{15}\text{H}_{10}\text{O}_2$.—C. H. Farr.

4515. BRIDEL, MARC, et CAMILLE CHAURAUX. *La centaureine, glucoside nouveau, retiré des racines de Centaurea Jacea L.* [The centaureine, a new glucoside, secured from the roots of *Centaurea Jacea*.] Compt. Rend. Acad. Sci. Paris 175: 833-835. 1922.—The physical and chemical properties of this compound are here given. It contains no N but consists of 50 per cent C and 5 per cent H, and breaks up into CO_2 and H_2O . It hydrolyses into 33.68 per cent glucose and 70.77 per cent centaureidine. It may be obtained in the pure crystalline form.—C. H. Farr.

4516. COHN, E. J. A physicochemical method of characterizing proteins. IV. Jour. Biol. Chem. 55: Proc. XLIV-XLV. 1923.

4517. DAVIDSON, JEHIEL. Reduction of nitrates caused by seed as a possible factor in the economy of nitrogen in crop production. Jour. Amer. Soc. Agron. 14: 338-354. 1922.—Under laboratory conditions, reduction of nitrates is induced by seed. The quantity of seed, the basic radicles of the common nitrates, the concentration of the nitrate solution, and the depth of the liquid in which the seed are submerged did not essentially affect the course of the process within the limits of experimentation by the author. At 50°F. the reduction process was somewhat retarded, otherwise it followed its normal course. Growing seedlings produced a smaller quantity of nitrites than seed which had been rendered incapable of germination by heating or those naturally sterile. Young seedlings induced reduction of nitrates when grown in soil. Actual loss of nitrogen was demonstrated as a result of reduction of nitrates caused by seed.—F. M. Schertz.

4518. FISCHER, EMIL. Untersuchungen über Aminosäuren, Polypeptide und Proteine II (1907-1919). Collected works, edited by M. BERGMANN. Sup. Roy. 8 vo, ix + 922 p. J. Springer: Berlin, 1923.

4519. PRIANISCHNIKOW, D. Ueber den Aufbau und Abbau des Asparagins in den Pflanzen. [Synthesis and decompositions of asparagin in plants.] Ber. Deutsch. Bot. Ges. 40: 242-248. 1922.—The author presents data on asparagin synthesis obtained from experiments with *Lupinus luteus* grown under various conditions of light and carbohydrate supply. The results indicate that the food supply and not the species of the seedlings determines whether an amid (asparagin or glutamin) is synthesized; only when carbohydrates or fats are present, is asparagin synthesized. Otherwise, neither the ammonia supplied externally nor that resulting from respiration can be synthesized into asparagin. It is pointed out that proteins and amino acids of the general formula $R(NH_2)COOH$, by oxidation and secondary synthesis, are changed to acid amids of the general formula $R(NH_2)CONH_2$ (asparagin and glutamin) and, during starvation, by further oxidation, to ammonia. In the presence of carbohydrates the process is reversed, ammonia is changed to acid amids, which in the presence of additional carbohydrates are built up into amino acids and used in protein synthesis. Ammonia is the first and last step in the change of nitrogenous compounds in plants. Asparagin (or glutamin) is a necessary intermediate product in the synthesis and decomposition of proteins.—W. C. Muenscher.

4520. TERROINE, ÉMILE F., et RENÉ WURMSER. L'utilisation des substances ternaires dans la croissance de l'*Aspergillus niger*. [The utilization of ternary substances in the growth of *Aspergillus niger*.] Compt. Rend. Acad. Sci. Paris 175: 228-230. 1922.—This is a continuation of work previously reported [Compt. Rend. Acad. Sci. Paris 174: 1435]. The utilization ratio described therein has been determined for 6 different sugars, the source of nitrogen being 0.5 per cent $(NH_4)_2SO_4$; also the utilization ratio with various concentrations of $(NH_4)_2SO_4$, the sugar being constant—3 per cent glucose; also the utilization ratio with 7 different sources of nitrogen. The ratios for the sugars vary from 46 for levulose to 41 for sucrose, arabinose, and xylose. Among the nitrogen sources HNO_3 gives the highest ratio, 46. Twenty per cent $(NH_4)_2SO_4$ is found to be the best (45) concentration, and 40 per cent the lowest (41). A study is also made of the effect of the acidity of the media in the range pH 1.3-7. It is found that 1.3 is optimum (43) and 5 is minimum (32).—C. H. Farr.

4521. WATERMAN, H. C., C. O. JOHNS and D. B. JONES. Conphaseolin. A new globulin from the navy bean, *Phaseolus vulgaris*. Jour. Biol. Chem. 55: 93-104. 1923.—A hitherto unknown globulin, differing most conspicuously from phaseolin and phasein in its much higher sulphur content, has been isolated from the navy bean and named conphaseolin. It contains 10.69 per cent of lysine, the highest per cent of this amino acid that has thus far been found for any vegetable protein.—G. B. Rigg.

4522. WINOGRADSKY, S. Sur la prétendue transformation du ferment nitrique en espèce saprophyte. [On the supposed transformation of a nitric ferment to a saprophytic species.] Compt. Rend. Acad. Sci. Paris 175: 301-304. 1922.—This is a discussion of the work of the

author's students and of others, especially that of Beijerinck on *Nitrobacter oligotrophum*. Beijerinck maintains that growth and nitrification are separate functions, while the author claims that they are inseparable. Chemosynthesis is likely, though not entirely proven for this form.—C. H. Farr.

METABOLISM (ENZYMES, FERMENTATION)

4523. ATKINS, W. R. G. The hydrogen ion concentration of the cells of some marine algae. Jour. Marine Biol. Assoc. United Kingdom [Plymouth] 12: 785-788. 1922.—The measurements recorded for marine algae of various groups show a sap reaction which in most cases is almost neutral, and in no case of the pronounced acid character met with in many land plants. It follows on evidence previously presented that the enzymes concerned in the metabolism of these algae must differ from those which effect corresponding changes in land plants.—Marshall A. Howe.

4524. BAYLISS, W. M. Enzyme als Kolloide. [Enzymes as colloids.] Naturwissenschaften 10: 983-988. 1922.—This is a general discussion of aspects of enzyme behavior.—C. C. Epling.

4525. CHODAT, R., et E. ROUGE. Sur la localisation intracellulaire d'une oxydase, et la localisation en général. [The intracellular and general localization of an oxydase.] Compt. Rend. Acad. Sci. Paris 175: 252-255. 1922.—A statement of the difficulties and problems involved in localizing enzymes in cells is given. A method is described for making such tests using potato as an example. Similar results are reported for *Leucanthemum vulgare*, *Helianthus tuberosus*, and *Stachys tuberosa*.—C. H. Farr.

4526. EHRENBERG, R. Ueber Eiweissenzyme. [On protein enzymes.] Biochem. Zeitschr. 128: 431-449. 1922.—Dialyzing trypsin and pepsin solutions and preparations of animal tissues, the author found the dialysates to possess enzyme activity.—W. W. Bonns.

4527. FUNK, E. Ueber den Einfluss von Kobaltammoniakaten auf die Fermentwirkung der Katalase und Amylase. [The effect of cobalt ammoniates on the enzyme action of catalase and amylase.] Biochem. Zeitschr. 128: 108-118. 1922.—Amylase and catalase were treated with solutions of hexamminocobaltichloride, xanthocobalt chloride, trinitrotri-aminocobaltiate, potassium tetranitrodiamminocobaltiate, and cobalt sodium nitrite. Catalase activity was inhibited and amylase activity accelerated. Inhibition was proportionate to salt concentration even in very dilute solution, but acceleration (for amylase) with increase of concentration was slight. The minimum concentrations effecting increased activity were greater than minimums inhibiting catalase. With the exception of one salt, inhibition was increased by adding phosphates to neutrality.—W. W. Bonns.

4528. FURTH, O., und F. LIEBEN. Ueber Milchsäurezerstörung durch Hefe und durch Blutzellen. [The destruction of lactic acid by yeast and by blood cells.] Biochem. Zeitschr. 128: 144-168. 1 fig. 1922.—Yeast as well as blood cells are capable, under favorable conditions, of destroying lactic acid in considerable quantities by oxidation. For yeast such destructive power does not appear to have marked relation to the optical properties of the acid, to temperature, oxygen pressure, or the pressure of a "hydrogen acceptor," but close contact of yeast with oxygen seems a necessary condition. Lactic acid destruction is associated with CO₂ evolution in considerable amounts, of which only a part could be ascribed to loss in sugar. In no case was the greater mass of lactic acid split into CO₂ and H₂O, but was reconverted to sugar. The destructive action of yeast was markedly reduced by acetone or by raising to the boiling point.—W. W. Bonns.

4529. GORIS, A., et P. COSTY. Sur l'uréase et l'urée chez les champignons. [On urease and urea in the fungi.] Compt. Rend. Acad. Sci. Paris 175: 998-999. 1922.—Twelve species of Hymenomycetes are compared as to the urease in different parts,—stipe, cap, and hy-

menium. It is present in all parts, being most abundant in the hymenium. Several genera are arranged in descending order of the amount of urease, as follows: *Boletus*, *Clitocybe*, *Trametes*, *Entyloma*, *Russula*, *Lactarius*, *Tricholoma*, *Polyporus*, *Cortinarius*, *Collybia*, *Hydnum*, and *Thelephora*.—C. H. Farr.

4530. GORIS, A., et P. COSTY. *Uréase et urée chez les champignons*. [Urease and urea in the fungi.] *Compt. Rend. Acad. Sci. Paris* 175: 539-541. 1922.—Goris and Mascre (1908) first reported urea in the higher fungi. Since then they have repeated and extended their observations, employing new methods. It is now concluded that nearly all of the Basidiomycetes and Ascomycetes possess urease. Two hundred species have been tested. A list is given of certain higher fungi with the amount of urea found in each. Many of the species in this list do not contain urease. The amount of urea varies from 0.28 to 9.23 per 1000.—C. H. Farr.

4531. HAYDUCK, F., und H. HAEHN. *Das Problem der Zymasebildung in der Hefe*. [The problem of zymase formation in yeast.] *Biochem. Zeitschr.* 128: 568-605. 1922.—This is a report with detailed experiments. The paper considers the following: (1) the conception of fermentive power in a yeast; (2) formation of zymase in *Torula* yeasts; (3) zymase formation and nuclein metabolism. The experiments indicate that a yeast of low activity can by proper subjection to free oxygen be developed into one of high growth activity. The question whether enzyme synthesis has been effected or whether only a zymogen activation has been increased, is left open. Marked nuclein metabolism is noted in conjunction with the zymase formation.—W. W. Bonns.

4532. HIRSCH-POGANY, M. *Liegt der Hitze-Koagulation des Eiweisses eine Hydrolyse zugrunde?* [Is heat coagulation of proteins a hydrolysis?] *Biochem. Zeitschr.* 128: 396-401. 1922.—Analyses of the dried coagulum obtained after heating egg albumen solutions and of the dried substance in the filtrate, as well as analyses of such solutions evaporated at room temperatures, indicate that any hydrolysis that may occur is too small to be determined by such methods.—W. W. Bonns.

4533. HOLWERDA, B. J. *Ueber den Einfluss der Milchsäure auf die Milchsäuregärung*. [The effect of lactic acid on lactic acid fermentation.] *Biochem. Zeitschr.* 128: 465-481. 1922.—The author points out the lack of consistency in dissociation constants as previously determined and the causes of the errors and makes a new study of this point by conductivity, also by the electrometric and the colorimetric method of determining H-ion concentration. His results indicate that 1.5×10^{-4} is a proper constant at 25°. A definite concentration of the acid in undissociated form appeared to check lactic fermentation in peptone broth, irrespective of the buffer action of the latter. The dissociation constant was found to vary at different times, which was ascribed to the action of factors unknown rather than to age of culture. Optical modification did not appear to affect physiological action of the lactic molecule; the dextro and laevo forms have practically the same dissociation constant. A *d*-lactic acid-forming bacterium is checked by the lactic acid molecule of either optical characteristic.—W. W. Bonns.

4534. JACOBY, M. *Über den Formaldehyd als Übergangsstufe zwischen der eigentlichen Assimilation und der Kohlenhydratbildung in der Pflanze. II Mitteilung*. [Formaldehyde as the intermediate between specific assimilation and carbohydrate formation in the plant. II Contribution.] *Biochem. Zeitschr.* 128: 119-121. 1922.—Leaves of *Tropaeolum majus* in an atmosphere of HCHO increased in dry weight over control leaves. This gain occurred both in the presence and absence of O₂. [See also Bot. Absts. 12, Entry 774.]—W. W. Bonns.

4535. JACOBY, M. *Ueber künstliche Zymogene. II Mitteilung*. [Artificial zymogens. II Contribution.] *Biochem. Zeitschr.* 128: 80-88. 1922.—The author, using the Tschugaeff tests for minute quantities of nickel, has determined the effect of this element, both as nickel

powder and as nickel oxide, on urease solutions, in the presence and absence of potassium cyanide. The experiments indicate a reversibility of active and inactive stages.—W. W. Bonns.

4536. JACOBY, M., und T. SHIMIZU. Ueber die Adsorption von Fermenten und Zymogenen. I. Mitteilung. [The adsorption of enzymes and zymogens. I. Contribution.] Biochem. Zeitschr. 128: 100–102. 1922.—Urease solutions were treated with freshly made $\text{Ca}_3(\text{PO}_4)_2$, with NaCl, and with Na_2SO_4 . The first did not adsorb the enzyme in appreciable amounts, but the latter 2 did so in 10 per cent concentrations. The enzyme inactivated by Ni or Co was likewise adsorbed, and could be reactivated by KCN. Dibasic calcium phosphate adsorbed neither urease nor its inactive form.—W. W. Bonns.

4537. JACOBY, M., und T. SHIMIZU. Ueber die Adsorption von Fermenten und Zymogenen. II. Mitteilung. Cholesterin-Wirkungen auf die Urease. [The adsorption of enzymes and zymogens. II. Contribution. The effect of cholesterin on urease.] Biochem. Zeitschr. 128: 103–107. 1922.—The addition of small amounts of 10 per cent NaCl and alcoholic cholesterol solutions to 0.3 per cent urease solution had no apparent adsorptive effect. If the mixture is filtered, low activity results in both filtrate and residuum, and combining them again gives even less action. The addition of glyocoll or serum to a filtrate with such reduced activity results in reactivation. No explanation is offered for the results.—W. W. Bonns.

4538. JACOBY, M., und T. SHIMIZU. Ueber künstliche Zymogene. III Mitteilung. Ueber die Einwirkung von dem Nickel nahestehenden Metallen auf die Sojaurease. [Artificial zymogens. III Contribution. The effect of metals close to nickel (in atomic series) on soy bean urease.] Biochem. Zeitschr. 128: 89–94. 1922.—Ni, Cu, Co, and Zn inactivate urease, but Fe does not. The action of Ni is slower than that of Co, Cu, or Zn, the latter causing strong inactivation even in small quantities. The results appear to support Jacoby's view that the ability of the metals to form compounds with KCN or with amino acids bears on the explanation of their combination with urease and other enzymes to form zymogens.—W. W. Bonns.

4539. JACOBY, M., und T. SHIMIZU. Ueber künstliche Zymogene. IV Mitteilung. Ueber die Inaktivierung und Reaktivierung der Takadiastase. [Artificial zymogens. IV Contribution. The inactivation and reactivation of taka diastase.] Biochem. Zeitschr. 128: 95–99. 1922.—Taka diastase was not rendered inactive by either Ni, Co, Cu, or Fe. It was inactivated by HgCl_2 , and reactivated by KCN.—W. W. Bonns.

4540. JONESCO, ST. Transformation d'un chromogène des fleurs jaunes de *Medicago falcata* sous l'action d'une oxydase. [Transformation of a chromogen of the yellow flowers of *Medicago falcata* under the action of an oxydase.] Compt. Rend. Acad. Sci. Paris 175: 592–595. 1922.—Eleven chemicals are given which may be used in changing the color of the pigment. It is concluded from the tests that the pigment is not a tannin, but a phenol. It is found that it is by oxidation and not by reduction that it is transformed into a violet pigment of anthocyanic nature.—C. H. Farr.

4541. KOLKWITZ, R. Ueber den durch Hefegärung entstehenden Druck. [Pressure produced by yeast fermentation.] Ber. Deutsch. Bot. Ges. 39: 219–223. Fig. 1. 1921.—An apparatus is described and illustrated whereby the pressure produced by yeast during fermentation can be measured. Fermenting yeast produced pressures as high as 24–40 atm. in 3–4 hours. The author states that normally fermentation by yeast is inhibited at about 12 atm. or less, due to the toxic action of the accumulating CO_2 , alcohol, and organic acids, rather than the increased pressure. In the apparatus described a high pressure can be obtained in a relatively short time, before the inhibiting effect of the products of fermentation is produced.—W. C. Muenscher.

4542. KOSER, STEWART A. *Bacillus Welchii* in bread. Jour. Infect. Diseases 32: 208-219. Pl. 1. 1923.—Organisms of the *B. Welchii* type were found in a commercial "starter" used in making salt-rising bread, which organisms were present within the baked loaf in much larger numbers than in ordinary yeast bread. It appears that the Welch bacillus was the active agent in the starter.—R. L. Starkey.

4543. KOSSEL, A. Über physiologische Umformung von Eiweisskörpern. [On the physiological transformation of protein bodies.] Naturwissenschaften 10: 999-1005. Fig. 1-7. 1922.—This is a brief general discussion of the subject.—C. C. Epling.

4544. MIRANDE, MARCEL. Sur la relation existant entre l'anthocyanine et les oxydases. [Relation existing between anthocyanin and the oxydases.] Compt. Rend. Acad. Sci. Paris 175: 595-597. 1922.—It is found that all of the cells in the scales of bulbs in which anthocyanin is produced in light, and only those cells, contain oxydase. It is demonstrated that O_2 is necessary in the production of anthocyanins.—C. H. Farr.

4545. NEUBERG, C., und J. HIRSCH. Zur Klassifikation der Carboligase. [The classification of carboligase.] Biochem. Zeitschr. 128: 608-609. 1922.

4546. NEUBERG, C. und H. OHLE. Zur Kenntnis der Carboligase. IV Mitteilung. Weitere Feststellungen über die biosynthetische Kohlenstoffkettenverknüpfung beim Gärungsvorgänge. [Concerning carboligase. IV Contribution. Further proof of the biosynthetic carbon chain connections in fermentation processes.] Biochem. Zeitschr. 128: 610-618. 1922.

4547. PALLADIN, W., und H. POPOFF. Ueber die Entstehung der Amylase und Maltase in den Pflanzen. [The origin of amylase and maltase in plants.] Biochem. Zeitschr. 128: 487-494. 1922.—A condensed review of previous work on these plant enzymes and a brief description of the authors' experiments with abscised leaves, green and etiolated, of *Robinia*, *Platanus*, and *Ricinus* is given. Such material, subjected to autolysis at high summer temperatures for periods of 1-23 days, contained active diastase in the protoplasts. More enzyme was found in young leaves than in old ones and none in fallen dead leaves. Boiling after autolysis destroyed the enzyme. Diastase in leaves appears almost wholly in combination with the protoplast, but in the course of autolysis the enzyme thus bound splits off and passes into solution. The nature of the enzyme-protoplast combination is not known.—W. W. Bonns.

4548. SANDBERG, M. Ueber den Verlauf der alkoholischen Gärung in Gegenwart von Harnstoff. [The course of alcoholic fermentation in the presence of urea.] Biochem. Zeitschr. 128: 76-79. 1922.—The addition of urea to sucrose solutions consistently decreased alcohol production in fermentation by 3 different bottom yeasts. Quantitative determinations indicate that the urea is not utilized in the process.—W. W. Bonns.

4549. SEARS, H. J., and JOHN J. PUTNAM. Gas production by bacteria in symbiosis. Jour. Infect. Diseases 32: 270-279. 1923.—Gaseous fermentation of substances was determined by various pairs of organisms growing in symbiosis, neither of which could produce the gas alone from these substances. Gas was produced only when an acid-former capable of fermenting the sugar was mixed with a gas-former not able to produce gas from this sugar. No quantitative relationships were noted as to the numbers of each organism that should be present. The symbiosis is not a simple gas production by the gas-former from the acid produced by the acid-former.—R. L. Starkey.

4550. VILMORIN, JACQUES DE, et CAZAUBON. Sur la catalase des graines. [The catalase of seed.] Compt. Rend. Acad. Sci. Paris 175: 50-51. 1922.—In peas a direct relation is found between the amount of catalase and the degree of vitality of the seed. But in certain trees, such as pines and larch, the catalase content of the seed appears to be independent of the vitality.—C. H. Farr.

4551. WESTER, D. H. Ueber den Einfluss von verschiedenen Kationen und Anionen und von Elektrolyt-Mischungen auf die harnspaltende Wirksamkeit von Urease. [The effect of different cations, anions, and mixtures of electrolytes on the urea-cleaving action of urease.] Biochem. Zeitschr. 128: 279-292. 1922.—Urease action in soy bean and canavalia bean extracts was reduced in presence of tannin, iodine, or copper sulphate. It was not noticeably affected by chloroform, thymol, or mustard oil when these were added in amounts sufficient to inhibit bacterial growth. Neither methyl nor ethyl alcohol had any effect on urease activity in concentrations of 1 mol per liter, but amyl alcohol proved slightly inhibitory. With respect to their inhibitive power, the ions studied may be graded in ascending order in several groups comparatively studied as follows: K, Na, Ba; I (Cl, Br, NO₃), SO₄; K, Li. K₂SO₄ plus LiSO₄ had less effect than the sum of the effects of each. Ammonium chloride used alone increased activity, while in presence of other salts it reduced the inhibitory action of the latter.—W. W. Bonns.

METABOLISM (RESPIRATION, AERATION)

4552. ATKINS, W. R. G. The respirable organic matter of sea water. Jour. Marine Biol. Assoc. United Kingdom [Plymouth] 12: 772-780. 1922.—On storing, sea water suffers a decrease in pH value due to the production of carbonic acid by organisms; this probably indicates the amount of plankton present, at least when sewage contamination is negligible. It appears that water near the surface, at 20-25 m., and sometimes at the bottom, 70 m., is particularly subject to change during storage. The total amount of carbon, reckoned as hexose, which is set free by respiration during storage in sea water at 5 m. is about twice that photosynthesized between July and December, taking for the latter the minimum value 3 mgm. per l., giving a total of 6 mgm. per l.—Marshall A. Howe.

4553. COMBES, RAOUL, et DENISE KOHLER. Rôle de la respiration dans la diminution des hydrates de carbone des feuilles pendant le jaunissement automnal. [The rôle of respiration in the diminution of carbohydrates in leaves during autumnal yellowing.] Compt. Rend. Acad. Sci. Paris 175: 406-409. 1922.—Sachs held that all of the substances useful to the tree passed into it from the leaves before the latter fell in the autumn. Wehmer was one of the first plant physiologists to show that this is not the case. *Fagus silvatica*, *Aesculus Hippocastanum*, and *Ampelopsis hederacea* are here studied in this connection. It is concluded that much of the decrease in carbohydrate content of the leaves during yellowing is due to respiration. Some is carried off by washing with rain, and some migrates to the stem.—C. H. Farr.

4554. HARRINGTON, GEORGE T., and WILLIAM CROCKER. A new and efficient respirometer for seeds and other small objects: directions for its use. Jour. Agric. Res. 23: 101-115. Pl. 1, 2 fig. 1923.—With the apparatus described, O₂ consumption and CO₂ production are determined in the same apparatus, for the identical period of time, and with the use of the whole volume of air instead of a sample of it. The gaseous exchanges are determined, at the end of an experimental period, by means of a manometer which is an integral part of the apparatus. Useful tables and directions for making computations are included. A bibliography of 32 titles is appended.—D. Reddick.

4555. MOLLIARD, M. Influence de la nature de l'aliment azoté sur les échanges gazeux. [Influence of the kind of nitrogenous nutrition on gaseous exchange.] Rev. Gén. Bot. 35: 6-23. 1923.—*Sterigmatocystis nigra*, *Stichococcus bacillaris*, and *Isaria densa* were studied and the author's conclusions are as follows: (1) nitrates and other nitrogenous substances, such as sodium urate, increase the respiratory quotient, as well as the intensity of intramolecular respiration of both autotropic and heterotropic plants; (2) this action is of a catalytic nature; (3) asparagin, leucin, and glycocol constitute for *Isaria densa* a complete organic food; (4) egg albumen is a complete organic and mineral food for *Isaria densa*; on this account albumen and diverse protein substances are more profoundly attacked in the absence than in the presence of sugar; (5) the respiratory quotient is higher in the presence than in the absence of sugar for those substances furnishing both carbon and nitrogen.—J. C. Gilman.

4556. STOKLASA, J. Sur la respiration des racines. [The respiration of roots.] Compt. Rend. Acad. Sci. Paris 175: 995-997. 1922.—Nineteen species of plants are studied and the effect of radioactivity on CO₂ liberation determined. In all cases it is found that the liberation is greater with radioactivity than without it.—C. H. Farr.

4557. THUNBERG, T. Besteht ein genetischer Zusammenhang zwischen dem eingeatmeten Sauerstoff der ausgeatmeten Kohlensäure? [Is there a genetical relation between the inspired oxygen and the respired carbonic acid?] Naturwissenschaften 10: 417-420. 1922.

ORGANISM AS A WHOLE

4558. ATKINS, W. R. G. The hydrogen ion concentration of sea water in its biological relations. Jour. Marine Biol. Assoc. United Kingdom [Plymouth] 12: 717-771. 1922.—The paper is largely physico-chemical, but the biological relations of the algae to the composition of the sea water are involved. Sea water may become as alkaline as pH 9.7 as the result of very active photosynthesis, in virtue of the presence of magnesium salts. The salt-water tanks of the Plymouth laboratory are always less alkaline than the water of Plymouth Sound. The water of the Sound varies slightly with the state of the tide; a drop of 0.05 pH may be observed between high and low water and during July is more alkaline than that of the open sea. Over *Laminaria* in shallow water, through which the tops of the algae appear, the water may be 0.15 pH more alkaline than the general mass of water. Rock pools in summer may be at least as much as 0.25 pH more alkaline than the Sound water.—Marshall A. Howe.

4559. ATKINS, W. R. G. The influence upon algal cells of an alteration in the hydrogen ion concentration of sea water. Jour. Marine Biol. Assoc. United Kingdom [Plymouth] 12: 789-791. 1922.—Sea water originally at pH 8.2 became as alkaline as pH 9.4 by the photosynthetic action of *Ulva* in removing carbonic acid. This degree of alkalinity did not prove injurious to *Ulva*, but exposure to it for 2½ hours at 27°C. sufficed to increase the permeability of the superficial cells of *Ceramium rubrum* irreversibly and fatally. It is suggested that the above facts have a bearing upon the distribution of these and similar algae upon the shore.—From Author's summary.

4560. COSTANTIN, J. La dégénérescence des plantes cultivées et l'hérédité des caractères acquis. [Degeneracy and the heredity of acquired characters.] Ann. Sci. Nat. Bot. 4: 267-297. Fig. A, B. 1922.—The peculiar physiological adjustments necessary for best development of the potato (*Solanum*) and the formation of good tubers is attributed to the suppression of certain endophytic, tubercle-producing fungi possessed by the ancestor of the cultivated plant. The same principle is discussed in application to other plants and to the acclimatization of plants, especially perennials.—Paul Weatherwax.

4561. DAVY DE VIRVILLE, ADRIEN, et FERNAND OBATON. Observations et expériences sur les fleurs éphémères. [Observations and experiments on ephemeral flowers.] Compt. Rend. Acad. Sci. Paris 175: 637-640. 1922.—Ephemeral flowers are defined as those which ordinarily open only once. They are found to be very sensitive to external conditions. The effects of temperature, humidity, and light were studied with respect to the opening of *Helianthemum guttatum*, *Anagallis arvensis*, and *Phaenopus muralis*. It is found that they can be prevented from opening by keeping the temperature low. Light is found to have no effect and humidity has very little.—C. H. Farr.

4562. DAVY DE VIRVILLE, ADRIEN, et FERNAND OBATON. Sur l'ouverture et la fermeture des fleurs météoriques persistantes. [On the opening and closing of flowers which open more than once.] Compt. Rend. Acad. Sci. Paris 175: 841-843. 1922.—Two types of these flowers are found, the nocturnal and diurnal. They are in general less sensitive to environment than the ephemeral flowers. Examples discussed are *Erythraea Centaurium*, *Taraxacum Dens-leonis*, *Bellis perennis*, and *Leontodon hispidus*. It is found that the opening and closing is largely dependent upon temperature, as stated by Hoffmann in 1850 and by Royer in 1868. Humidity

has very little effect, and light has no effect. But it is still necessary to consider the movement as affected by hereditary periodicity.—C. H. Farr.

4563. DUFOUT, LÉON. Causes de l'apparition, en grande abondance, de certains champignons à la suite d'un incendie de forêt. [Reasons for the appearance of fungi after forest fires.] Bull. Trimest. Soc. Mycol. France 38: 93-97. 1922.—The occurrence of such forms as *Phicaria leiocarpa*, *Aleuria violacea*, and *Geopyxis carbonaria* on recently burned areas may be due to the increased amount of nitrates found in soil after burning. Increased light and aeration are among the factors responsible, as is indicated by the fact that similar fungi are found on areas from which trees have been removed by cutting. In this case however the process extends over a longer period and the fungi do not appear until the second season after the land has been cleared.—D. S. Welch.

4564. EULER, H. VON, und O. SVANBERG. Einige Versuche über die Aciditätsbedingungen des Zuwachses von *Bacillus macerans* und über den Verlauf der Stärkespaltung. [Experiments on the acidity conditions for growth of *Bacillus macerans* and the course of starch cleavage.] Biochem. Zeitschr. 128: 323-326. 1 fig. 1922.—Optimum acidity for growth was found to be close to pH 6.8 when grown on potato starch. Inhibition was marked between pH 5 and pH 6. Starch cleavage was determined by the iodine test, by loss in weight, by total carbohydrate value in terms of glucose, and by the amount of direct reducing compounds. A point is reached where the iodine reaction disappears, but the total carbohydrate value remains constant and the loss in weight as well as the amount of direct reducing substances remains very small (the latter about 1 per cent of the total starch). The reaction of this organism is greatly affected by the composition of the substrate as well as by the temperature. No determinations of specific enzymes were attempted.—W. W. Bonns.

4565. FRANKENTHAL, K. Zur Biologie des Influenzabacillus. [The biology of the influenza bacillus.] Biochem. Zeitschr. 128: 122-123. 1922.—The author discusses the physiological relation of the influenza bacillus to histidine and its growth on histidine-agar.—C. C. Epling.

4566. FRITZ, CLARA W. Experimental cultures of diatoms occurring near St. Andrews, N. B. Contr. Canadian Biol. 1918-1920: 63-66. 1921.—Marine plankton species of diatoms were experimented with in various media and environments. *Melosira hyperborea* can endure a great variety of light conditions, but the optimum development is obtained in strong diffuse light. It can endure a range of 40 degrees in temperature and a diminution to 40 per cent of sea water, even existing for a time in tap water. Increased concentration of sea water is detrimental. Excellent persistent cultures may be obtained in artificial sea water.—Marshall A. Howe.

4567. MAQUENNE, L., and E. DEMOUSSY. Sur la végétation dans des milieux pauvres en oxygène. [Growth on media low in oxygen.] Compt. Rend. Acad. Sci. Paris 174: 1387-1392. 1922.—Pear, radish, wheat, and colza seeds were germinated under water and grown during 14-30 days. It was found that they can develop with the limited amount of O₂ available, as do aquatic plants. If the plants are placed in sunlight and the water is saturated with air and charged with CO₂, O₂ is liberated in bubbles from 1 or 2 places about 10 cm. from the base of the stem much as from the cut surfaces of aquatic plants.—A study is also made of green plants in a vacuum. It is found that longevity and activity vary much with the species studied. Some, notably the sorrel, do not survive longer than 24 hours. The leaf of aucuba, however, was able to assimilate 2.4 cc. of CO₂ in 6 hours after having been a year in a vacuum before a south window. Another leaf under similar conditions showed a liberation of O₂ of 0.5 cc. In darkness, however, they die. The difference in plants is attributed to the $\frac{CO_2}{O_2}$ ratio of respiration.—C. H. Farr.

4568. MÖBIUS, M. Die Vorbereitung der Pflanze für den Winter. [The preparation of the plant for winter.] Ber. Senckenberg. Naturf. Ges. Frankfurt am Main 51: 32. 1921.—A resumé is given of a lecture on the changes undergone by plants during the autumn. The modifications in the pigments and the separation of the leaves, the nature of the leaf-scars, the structure of the winter buds, and the storage of reserve foods are among the topics considered.—A. W. Evans.

4569. REITH, ALLAN F. Growth of Pfeiffer bacillus in mixed culture in blood-free medium. Jour. Infect. Diseases 32: 243-246. 1923.—The Pfeiffer bacillus was grown in blood-free medium when in association with either *Bacillus subtilis* or *Staphylococcus albus*.—R. L. Starkey.

GROWTH, DEVELOPMENT, REPRODUCTION

4570. KOTTE, WALTER. Wurzelmeristem in Gewebekulture. [Cultures of rootmeristem.] Ber. Deutsch. Bot. Ges. 40: 269-272. Fig. 1-3. 1922.—Root meristems (pieces of root tip 1 mm. long, including the root cap) from *Zea Mays* and *Pisum sativum* were isolated and grown under sterile conditions on Knop's solution plus 1.5 per cent agar and glucose with 1 of several sources of nitrogen supplied. Under these conditions the root tips were able to develop into "apparently normal roots" in 10-12 days. The experiments indicate that the cells of isolated root meristem are capable of division and differentiation. The author concludes that if, as Haberlandt assumes, cell division in primary meristems is dependent upon the influence of hormones, the primary meristem of these root tips must be able to supply these hormones.—W. C. Muenscher.

4571. LUDWIG, C. A. The growth of tree twigs. Proc. Indiana Acad. Sci. 1921: 121-131. Charts 1-6. 1922.—Shoots of *Prunus Persica* (L.) Stokes and *Cornus florida* L. were measured during 1 season of growth, showing a slow rate of growth at first, which then increased to a maximum, and later decreased to zero before the temperature had dropped to the point at which growth started in the spring. The slow growth at the beginning of the season is thought to be due to the cool weather, while the decline is thought to be partly due to lack of available moisture, or in some cases to shading. The capacity of the dogwood to grow in shaded situations seems to be due not to the ability to grow in shade, but to endure it. In these branches growing at an angle to the vertical, the terminal shoot of dogwood grows less than the closely set laterals, the outermost of which takes the lead and becomes the main shoot of the branch.—F. C. Anderson.

4572. MASON, T. G. A note on the growth and the transport of organic substances in bitter cassava (*Manihot utilisissima*). Sci. Proc. Roy. Dublin Soc. 17: 105-112. 1 fig. 1922.—Plants were ringed in order to determine whether there was any factor correlating the activity of the cells of the apical meristem and the growth of the tuberous roots. It was found that the rate of growth of the stem in height was not affected by the operation for 3 weeks, when a retardation was observed. The final weight of the tuberous roots of the ringed plants was about a quarter of that of the unringed, whereas the stem was over 1.2 times as heavy. It was concluded that the activity of the cells of the apical meristem was not controlled by the supply of organic substances available, but by autogenous changes. The rate of growth was conditioned by autocatalytic reactions.—W. R. G. Atkins.

4573. PEARL, RAYMOND, and LOWELL J. REED. A further note on the mathematical theory of population growth. Proc. Nation. Acad. Sci. [U. S.] 8: 365-368. 1922.—The equation $y = \frac{be^{ax}}{1 + ce^{ax}}$, as has been shown, represents well the population growth of the U. S. A. More general equations are here discussed, including forms for successive cycles of population growth, as (for any single cycle), $y = d + \frac{k}{1 + me^{a_1x + a_2x^2 + a_3x^3}}$, where d represents the growth previously attained. One special form is "similar in shape to the autocatalytic curve."—Howard B. Frost.

4574. PENNERS, ANDREAS. Über die Rolle von Kern und Plasma bei der Embryonalentwicklung. On the rôle of the nucleus and of the cytoplasm in embryonal development.] *Naturwissenschaften* 10: 728-733, 761-765. 1922.—The subject-matter is briefly reviewed and a short bibliography appended.—C. C. Epling.

4575. RIEDE, WILHELM. Die Abhängigkeit des Geschlechtes von den Aussenbedingungen. [Effect of external conditions on sex.] *Flora* 115: 259-272. 1922.—Riede has continued his studies on the correlation between the stage in the ontogeny of a plant and the quotient represented by the ratio of carbon assimilation to absorption of inorganic salts, and he finds that in *Zea mays* the quotient must be higher for the development of pistillate flowers than for staminate.—A. G. Stokey.

4576. RIPPEL, AUGUST. Die Wachstumskurve. [Growth curve.] *Ber. Deutsch. Bot. Ges.* 37: 169-175. *Fig. 1.* 1919.—The author finds that growth curves plotted from experimental data with plants agree fairly closely with Robertson's formula, but not with Mitscherlich's.—W. C. Muenscher.

4577. TERROINE, ÉMILE-F., et RENÉ WURMSER. Le rendement énergétique dans la croissance de l'*Aspergillus niger*. [Energy production during the growth of *Aspergillus*.] *Compt. Rend. Acad. Sci. Paris* 174: 1435-1437. 1922.—The utilization ratio (0.44) is the ratio of dry weight of *Aspergillus* produced to weight of glucose consumed. The energy value of the original glucose, of the resulting mycelium, and of the CO₂ liberated in the meantime are determined. It is found that $c = p(a + \frac{1}{2}bt)$ if c = the quantity of glucose consumed at the end of the time t , p = the final dry weight, a = constant representing the consumption necessary to maintain 1 gm. of mycelium, b = a constant representing the consumption necessary to maintain 1 gm. of mycelium per hour; then $b = 2 \frac{c_2 - c_1}{p(t_2 - t_1)}$, if c_1 and c_2 represent the consumption necessary to produce p gm. in t_1 and t_2 intervals of time respectively.—C. H. Farr.

4578. WEBER, FRIEDL. Frühtreiben durch Quetschen. [Forcing by squeezing.] *Ber. Deutsch. Bot. Ges.* 40: 148-152. 1922.—The buds of *Syringa vulgaris* were squeezed for short periods of time with screw cocks. Buds treated in this manner would start to develop into shoots very soon when placed in a greenhouse even at the beginning of the dormant period. The author suggests that forcing is here caused by the wound hormones produced in the injured buds.—W. C. Muenscher.

MOVEMENTS OF GROWTH AND TURGOR CHANGES

4579. AZOULAY, LÉON. Sur le rapprochement provoqué et spontané des feuillets de *Russula Queletii* (Fr.) Bataille et ses variétés. [On the spontaneous and induced union of the gills of *Russula Queletii* and its varieties.] *Compt. Rend. Acad. Sci. Paris* 175: 597-599. 1922.—By passing a brush or a sheet of rough paper between the gills it is found that they stick together so that the paper is drawn out with great difficulty. The gills remain in contact until the fungus becomes dry and withered. There appears thus to be a sensitivity analogous to that of *Mimosa pudica*. It is found that the union does not occur in the presence of ether or chloroform.—C. H. Farr.

REGENERATION

4580. LÖFFLER, BRUNO. Experimentelle Untersuchungen über Regeneration des Gipfels und Kontaktempfindlichkeit bei Windpflanzen. [Experiments on regeneration of the tips of twining plants.] *Ber. Deutsch. Bot. Ges.* 37: 6-24. *Fig. 1-8.* 1919.—The author points out that when the terminal buds are removed from young plants of *Phaseolus vulgaris* and *Humulus Lupulus* the upper axillary bud on the side of the stem in contact with a pole or support develops into the main axis. Experiments here reported indicate that this unequal growth is not due to a difference in illumination or to the position of the bud on the stem but is due to the stimulus of contact from the support.—W. C. Muenscher.

GERMINATION, RENEWAL OF ACTIVITY

4581. HARRINGTON, GEORGE T. Forcing the germination of freshly harvested wheat and other cereals. Jour. Agric. Res. 23: 79-100. 1923.—Wheat [*Triticum*], barley [*Hordeum*] and oats [*Avena*] were included in the test. The forcing of wheat seed in particular is necessary in administering seed laws in winter wheat areas, where the interval between harvest and seeding is very short. Dry heat for 8 days at 40°C. was the most satisfactory of the heat treatments tried. Presoaking the seed in water for 1 hour and for 5 hours increased slightly the percentage of germination at the end of 31 hours but at the end of 4 days the percentage of germination in oats and barley was less than for untreated seed. Surface disinfection of seed with 1 per cent silver nitrate solution did not affect germination. Scratching the embryo along its whole length stimulated germination, and removal or weakening the coat structures of wheat by treatment with sulphuric acid was exceedingly effective in inducing complete germination in a minimum length of time. Increasing the amount of oxygen to 36 per cent (optimum) stimulated germination. Most satisfactory germination is secured when the seed bed is of such nature as to furnish abundant moisture for absorption without actually flooding the grains. Incubation of the seeds at a temperature of 12-16°C. gives the best results.—In all cases it appears that the oxygen relation is the important consideration in the germination of not after-ripened seed of cereals.—Some samples of seed after-ripen much more rapidly than others. After-ripening and loss of water are concomitant processes but are independent, and there is no relation between water content of seed and germinability.—D. Reddick.

4582. HARRINGTON, GEORGE T., and BERTHA C. HITE. After-ripening and germination of apple seeds. Jour. Agric. Res. 23: 153-161. 1923.—Seed of the apple require a period of after-ripening. The dormancy is inherent in the embryo itself. After-ripening is accomplished in a few months when the seed are kept moist and at a temperature between 5 and 10°C.; it does not take place in dry seed nor in moist seed which are stored at 20°C. or above. The optimum temperature for germination of after-ripened seed lies between 10 and 20°C. Removal of seed-coats of after-ripened seed hastens germination but it has no effect on dormant seed. On the other hand, removal of seed-coats of seed held under suitable germination conditions but at a temperature too high to effect after-ripening often germinate well upon removal of the seed-coats. The inner seed-coat is effective in preventing the decay of seed.—D. Reddick.

4583. NOBLE, R. J. Studies on *Urocystis Tritici* Koern., the organism causing flag smut of wheat. Phytopathology 13: 127-139. Pl. 10, fig. 1-2. 1923.—A study was made of the germination of the spores of *Urocystis Tritici* Koern. under various conditions in regard to substratum, temperature, aeration, and age of spores. Several organic and inorganic media were tried; none offered any special advantage. In distilled water the percentage germination was very low. Some germination occurred in soil extract, but the percentage was little if any higher than in distilled water. Germination was not stimulated by changing the H-ion concentration with sodium phosphate, by changing the surface tension of the substratum with soaps of fatty acids, or by the addition of various organic acids. Germination was very markedly stimulated when tissue of young wheat plants was added to distilled water in which the spores had soaked for several days. In this case 70-90 per cent of the spores germinated. A decoction made from young wheat plants, or a distillate from this decoction, produced the same effect when added to spores presoaked in distilled water. Tissue from a number of other plants also stimulated germination. The minimum, optimum, and maximum temperatures for spore germination appeared to be 5, 18-24, and 32°C. respectively. Apparently the spores do not require a rest period before germination.—B. B. Higgins.

TEMPERATURE RELATIONS

4584. GAIN, EDMOND. Sur la résistance comparative à la chaleur des points végétatifs de l'embryon du Grand-Soleil. [On the comparative resistance to heat of vegetative points of the embryo of the sunflower.] Compt. Rend. Acad. Sci. Paris 174: 1557-1559. 1922.—The author

showed in a previous paper that sunflower seed may resist a heat of 145–150°C. for 10 minutes and retain germinating power. It might be considered that the embryo has 5 parts: the root meristem, the shoot meristem, the cotyledons, the hypocotyl, and the base of the cotyledons. The root meristem is anatomically exposed, while the shoot meristem is protected by the cotyledons. Experiments show that the root meristem displays the least resistance to heat, and, if it is destroyed, is replaced by the embryonal cells of the axis of the hypocotyl. The shoot meristem is next most sensitive. It is replaced, if killed or inhibited, by the base of the cotyledons or the axis of the hypocotyl. The base of the cotyledons is found to be most resistant.—*C. H. Farr.*

RADIANT ENERGY RELATIONS

4585. BORESCH, K. Ueber die Einwirkung farbigen Lichtes auf die Färbung von Cyanophyceen. [Effect of colored light upon the color of Cyanophyceae.] Ber. Deutsch. Bot. Ges. 37: 25–39. 1919.—The ability of certain Cyanophyceae to react to the color of the incident light by absorbing a complementary color was shown for *Phormidium foveolarum* in experiments in which light was passed through a spectroscope or color screen. This chromatic adaptation is not related to the discolorations following the exhaustion of the nitrates of the substratum. It was demonstrated that in *Phormidium foveolarum* the discoloration due to colored light depends upon the development of various phycocyanin modifications.—*W. C. Muenscher.*

4586. HARVEY, R. B. Growth of plants in artificial light. Bot. Gaz. 74: 447–451. Fig. 1–2. 1922.—Nitrogen-filled tungsten filament (Mazda) lamps were used. The lamps were placed 5 feet from the plants; reflectors were used. The 1,000 watt lamps proved most economical, lasting for 4 months. The lamps furnished all heat necessary in the basement rooms used. The small grains, flax, buckwheat, white sweet clover, peas, beans, lettuce, and a number of common weeds were successfully grown from seed to maturity in the continuous light and all set good seed. Other plants such as potato, red clover, and squash blossomed but did not set seed. Potato tubers of good size were obtained. With none of the plants was it necessary to furnish a definite illumination period in order to obtain bloom. The author has shown it possible “to produce seed from plants in winter, independent of sunlight, and at no very great expense.”—*B. W. Wells.*

4587. MIRANDE, MARCEL. Influence de la lumière sur la formation de l'anthocyanine dans les écailles des bulbes de lis. [The influence of light on the formation of anthocyanin in the scales of lily bulbs.] Compt. Rend. Acad. Sci. Paris 175: 496–498. 1922.—This is a study of the effect of intensity of light on anthocyan formation. Anthocyan is produced only in diffuse light, but not at all altitudes. For instance it is formed at 300 m., but not at 2,000. Six intensities were used in the experiments, varying from 53 to 7 per cent. At 300 m. no redness is found in 53 per cent; it begins in 39 per cent and reaches a maximum in 22 per cent. At 600 m. redness begins in 22 per cent and the maximum is reached in 13. At 2,000 m. redness begins in 13 and the maximum is in 7 per cent. It is concluded that the visible rays of the spectrum are favorable to reddening, but the ultraviolet and infra red are unfavorable. A study with Wratten filters shows that blue and indigo are most active, red light somewhat, and green not at all.—*C. H. Farr.*

4588. MIRANDE, MARCEL. Sur la formation d'anthocyanine sous l'influence de la lumière dans les écailles de bulbes de certains lis. [The formation of anthocyanin under the influence of light in the scales of the bulbs of certain lilies.] Compt. Rend. Acad. Sci. Paris 175: 429–430. 1922.—Bulb scales of lily are favorable for the study of anthocyanins. Detached scales do not form anthocyan in the absence of light.—*C. H. Farr.*

4589. PETRY, E. Zur Kenntnis der Bedingungen der biologischen Wirkungen der Röntgenstrahlen. II Mitteilung. [The conditions of biological action of X-rays. II Contribution.] Biochem. Zeitschr. 123: 326–353. 1922.—Seed of various economic plants at different

stages of water content were used. A brief period of water absorption ("Quellung") was found to increase susceptibility to X rays, in both dried seeds and dried seedlings. Such susceptibility is explained as a function of hydration degree, analogous to heat injury of plant members, enzymes and albumens. Swelling in the absence of oxygen and under experimental conditions of inhibited germination does not reduce the relation of germination to ray susceptibility. Dried seedlings were generally more susceptible than resting dried seeds. The explanation is an increased susceptibility due to chemical processes of germination.—*W. W. Bonns.*

4590. WEBER, F. **Frühtreiben ruhender Pflanzen durch Röntgenstrahlen.** [Forcing of resting plants with X-rays.] *Biochem. Zeitschr.* 128: 495-507. 1922.—Winter buds of *Syringa vulgaris* responded to X-ray treatment by shortening the rest period. The "dosage" necessary for such effect is high, the maximum being 150 units, the minimum 26. Stronger doses resulted in necrosis and subsequent cropping of buds. The region of greatest susceptibility to the rays appears to be the basal zone of the bud parenchyma, the so-called "oxalate nest"; embryonic cells of the growing tip are less sensitive. As possible explanations of X-ray effects are listed enzyme activation, permeability alteration, respiration increase, and wound hormone formation.—*W. W. Bonns.*

TOXIC AGENTS

4591. BOAS, FRIEDRICH. **Die Wirkungen der Saponinsubstanzen auf die pflanzliche Zelle.** [The effects of saponins upon the plant cell.] *Ber. Deutsch. Bot. Ges.* 40: 249-253. 1922.—In dilute concentrations cyclamin and digitonin stimulate fermentation in yeast but in concentrated solutions fermentation is inhibited. The effect of cyclamin and digitonin is produced by combining with cholesterol of the cell. The precipitation of cholesterol disturbs the structure of the plasma and death follows. No relationship was found between the surface tension of saponins and their effect upon fermentation.—*W. C. Muenscher.*

4592. BOYLE, C. The growth relations of certain fungi to their staling products. [Abstract.] *Phytopathology* 13: 33-34. 1923.

4593. COBET, R., und V. VON D. REIS. **Ueber den Einfluss der arsenigen Säure auf das Bakterium Wachstum. Nebst Bemerkungen über Randwulstbildungen durch sogenannte oligodynamische Metallwirkung.** [The effect of arsenical acids on bacterial growths, with observations on marginal aggregations as the result of the so-called oligodynamic effect of metals.] *Biochem. Zeitschr.* 129: 73-88. *Fig. 1, 2.* 1922.—Placing arsenious acids in the center of agar plates sown with bacteria results in a sterile zone in the immediate vicinity, with a region of specially strong growth contiguous thereto. This is not accounted for as a toxin stimulus. Increased bacterial growth is not due to the presence of the acid. Analogous results are obtained by substituting a silver coin for the acid.—*W. W. Bonns.*

4594. MOLLIARD, MARIN. **Influence des sels de cuivre sur le rendement du Sterigmatocystis nigra.** [Influence of copper salts on the yield of *Sterigmatocystis nigra*.] *Compt. Rend. Acad. Sci. Paris* 175: 838-841. 1922.—The yield is the ratio of weight of mycelium to the weight of sugar consumed. It is found that copper retards the growth and also reduces the yield, that is, the amount of mycelium formed per gm. of sugar. However the sugar (7 gm.) disappears entirely in 10 days without copper, and lasts for 40 days with copper sulphate.—*C. H. Farr.*

4595. NICHOLAS E., et G. [NICOLAS.] **Influence du formol sur les végétaux supérieurs.** [Influence of formalin on higher plants.] *Compt. Rend. Acad. Sci. Paris* 175: 1437-1439. 1922.—The bean was studied as to growth in diameter and increase in weight in various solutions. The control was in Knop's solution. Other solutions contained, in addition to the salts in Knop's solution, 0.321 gm., 0.803 gm., and 1.606 gm. of formalin respectively. The last named solution was markedly toxic. Aerial parts produce greater weight in 0.321 gm.,

but the roots weigh slightly less than in the control. In 0.803 gm. the roots weigh much less, and the aerial parts about the same. It is stated that 0.321 gm. contains 125 mgm. of formaldehyde, which corresponds to 1 dgm. of hexamethylenetetramine. It is concluded that formaldehyde acts in this concentration as a food for the chlorophyll.—*C. H. Farr.*

4596. NICHOLAS, E., et G. [NICOLAS.] L'action de l'hexaméthylènetétramine sur les végétaux supérieurs. [The effect of hexamethylenetetramine on higher plants]. Compt. Rend. Acad. Sci. Paris 175: 836-838. 1922.—The effect of this compound, $(\text{CH}_2)_6\text{N}_4$, on the bean in culture solution is studied. 0.1-0.25 gm. per l. of Knop's solution gives slight stimulation, shown by increased weight of the plant; 0.5-1.5 gm. per l. has a markedly injurious effect, retarding digestion in the cotyledons.—*C. H. Farr.*

4597. PIERI, C. Su alcune alterazione nel ricambio materiale di vegetali che vivono in atmosfera contenente anidride solforosa. [On some alterations in the constitution of plants in an atmosphere containing sulphuric anhydrid.] Mem. Soc. Toscana Sci. Nat. 32: 173-186. 1919.—Young specimens of *Pinus pinea* were subjected to fumes containing sulphuric anhydrid. Analyses of the ash from these plants indicated that the amount of calcium diminished perceptibly, magnesium and silicon slightly, while that of sulphur increased noticeably in proportion to the strength of the gas.—*Edith K. Cash.*

4598. STOKLASA, J. Influence du sélénium sur l'évolution végétale, en presence ou en absence de radioactivité. [The influence of selenium on plant development, in the presence or absence of radioactivity.] Compt. Rend. Acad. Sci. Paris 174: 1256-1258. 1922.—A study was made of *Hordeum distichum*, *Zea mays*, *Polygonum fagopyrum*, *Vicia faba*, *Soja hispida*, and *Lupinus angustifolius* in culture solution. Selenites and alkaline seleniates were added to the amount of $5 \cdot 10^{-6}$ - 10^{-2} atom-gm. per l. It is found that very weak sodium selenite produces a stimulating effect, especially on corn. The higher concentrations are, however, very toxic and finally result in death. If radium is added to the extent of 0.0000056 mg. per plant per day, the plants in all cases showed 2-15 times the dry weight of plants without emanation. It is found that the emanations completely neutralize the toxic effect of the sodium selenite.—*C. H. Farr.*

ELECTRICITY AND MECHANICAL

4599. BERSA, E., und F. WEBER. Reversible Viskositätserhöhung des Cytoplasmas unter der Einwirkung des elektrischen Stromes. [Reversible increase in the viscosity of cytoplasm by the electric current.] Ber. Deutsch. Bot. Ges. 40: 254-258. 1922.—A method outlined by Weber making use of the cataphoretic migration velocity of colloidal particles, that is, of the starch particles or "statoliths," was used to determine whether the cytoplasmic viscosity changes with the passing of an electric current. With *Phaseolus multiflorus* the author finds that the increased viscosity due to the action of the current is not only appreciable but is also reversible, since after a short period of time the protoplasmic viscosity almost or completely reaches the normal viscosity level.—*F. S. Howlett.*

4600. SCHAFFERS, V. La foudre et les arbres. [Lightning and trees.] Compt. Rend. Acad. Sci. Paris 175: 1087-1089. 1922.—The electrical potential of discharge of twigs was measured, as of metal points. A normal, freshly picked leaf was fixed to a 2 cm. disc, isolated, and positively charged with a static machine. The leaf was connected with the ground through a galvanometer. Sixteen kinds of trees were tested. Figures are given for the galvanometer readings and these compared with the percentages of trees of each species struck by lightning as given by Vanderlinden for 1884-1901 in Belgium and by Prohaska in Styria and Carinthia (Austria). No correspondence is found between the lists, hence it is concluded that trees do not protect against lightning.—*C. H. Farr.*

4601. STERN, KURT. Über polare elektronastische Erscheinungen. [Polar electrical phenomena.] Ber. Deutsch. Bot. Ges. 39: 3-10. Fig. 1-4; 11-20. 1921; 40: 43-51. Fig. 1-2: 54-59. Fig. 1. 1922.—Continuing earlier work the author has studied the effect of electrical

stimulation upon several plants. *Berberis nitens* and *B. vulgaris* var. *atropurpurea* showed a strong stimulation of the stamens at the negative electrode with a discharge from a condenser of 36 volts. *B. vulgaris* var. *microphylla* showed no distinct polarity. The leaves of *Biophytum sensitivum* reacted at the negative electrode and the stimulus went toward the positive with 12 volts, but with 60 volts the reaction was at both electrodes. The leaves of *Mimosa Spegazini* were stimulated at the positive electrode with all voltages used. Those of *M. pudica* were stimulated at the negative electrode with 40 volts, direct current, and at the positive electrode with 250 volts. If the circuit was left closed the leaves recovered. Upon opening the circuit there was no response, or a weak one at the positive electrode under strong stimulation. This result was not the same as obtained with animal tissue. It was pointed out that there are other factors than the length of tissue between the electrodes which determines the amount of current which flows. By reversing the current it could be determined whether the reaction at one electrode was due to polarity or to a difference in current intensity at that node. The conduction of stimuli and the reaction time of nodes are discussed with reference to the interpretation of results. Also the effect of leaflets touching each other and the grounding of the pot, thus allowing the current to be divided. It is suggested that sleep movements of plants may be due to changes in conductivity of the air and in potential, thus affecting the currents which naturally pass through the plant, since these movements were interfered with when the plant was insulated from the ground. Using the precautions referred to and gradually increasing the potential it was found that the stimulation of leaves was decidedly stronger at the negative electrode in the majority of cases; in some cases equal or opposite. Sometimes different polarity was obtained with leaves of different ages, but this needs further investigation. The nature of the polarity depends upon internal factors as well as upon the character of the current. The effect of H-ion concentration has not been sufficiently investigated.—*H. H. Clum.*

Mag. 45: 336-337. 1 fig. 1923.—A glass tube with bulb is fitted to a vitreosil pipe of 1 mm. bore. Three or 4 fine platinum wires inserted in the latter serve as a wick to deliver solutions of chlorides of appropriate metals to the Bunsen flame.—*W. R. G. Atkins.*

4603. WEATHERWAX, PAUL. The popping of corn. Proc. Indiana Acad. Sci. 1921: 149-153 1922.—Popping of corn is due to the expansion, under pressure, of moisture contained in the starch grains. The hardness of the endosperm is responsible for the difference between popping and non-popping varieties of corn. For successful popping, the heat must be applied rapidly enough to generate steam faster than it escapes, and slowly enough to allow hydrolysis of most of the starch before the explosion occurs. A temperature of 175°-200°C. reached in 2.5-3 minutes yields best results.—*F. C. Anderson.*

4604. ANONYMOUS. Sub-soiling. Preliminary report of a trial of sub-soiling devices held at High Hildon, Tonbridge, in October, 1922. Jour. Ministry Agric. Great Britain 29: 911-919. 1923.

4605. AMSTEL, J. E. VAN. Algemeen overzicht van ligging en bodem van Suriname. [General review of situation and soil of Surinam.] West Indie 6: 18-24. 1921.—A general discussion of the soils of Surinam in relation to agriculture is presented.—*J. C. Th. Uphof.*

4606. AMSTEL, J. E. VAN. **Chemisch onderzoek van eenige Surinaamsche kleigronden.** [Chemical observations of some clay soils of Surinam.] Dept. Landb. Suriname Bull. 41. 33 p. 1921.—The clay soils of Surinam, though apparently uniform, show many differences. Though sticky and plastic when wet, in the dry season they are characterized by their hardness and broad shrinkage checks. They have high water-absorbing power, strong capillarity and evaporating power, and contain a large amount of colloidal silicates. The effect of applications of organic substances, lime, potash, phosphorus, and nitrogen is considered.—*J. C. Th. Uphof.*

4607. ARNHOLD, FRITZ. **Über die Bedeutung des Schlicks als Mittel zur Pflanzenernährung und Bodenverbesserung.** [On the importance of mud for plant nutrition and soil improvement.] Landw. Jahrb. 53: 205–250. 1923.—Sea mud originates from the interaction during tides of soluble and suspended particles in rivers with salts and suspended matter in sea water, while river mud originates from the settling of suspended matter in the water when the stream velocity diminishes. Sea mud is a uniform mixture of clay, silt, lime, and humus particles with organic matter of plant and animal origin. When fresh it is plastic, fatty, dark brown; when stored it is light gray and has been found useful as a manure and also for plant protection, and for curative purposes in veterinary and human medicine. For manurial purposes 80–100 cubic m. (25,000 kgm.) are applied per hectare, especially on light and peat soils; various plants, especially legumes, are favorably affected.—The mud contains about 7 per cent Ca, 0.8 per cent Mg, 0.2 per cent P_2O_5 , and 9.5 per cent N, and consists chiefly of colloidal silicic acid, lime, clay, and humic substances. River mud has a higher content of finer particles, of P and N, but less, K, Mg, and Ca. Sea mud is rich in algae and often contains diatoms, and has a high Ca content due to the presence of shells. Among the bacteria found in the mud are *Azotobacter*, *Radiobacter*, butyric acid and legume bacteria, sulphur bacteria oxidizing H_2S to sulphate, and nitrifying and nitrate-reducing bacteria. The favorable results from mud for soil improvement are due to the influence on the physical condition of the soil, the addition of nutrients, and the introduction of active bacteria.—*S. A. Waksman.*

4608. BALDWIN, I. L., U. L. COBLE, and J. W. CHAMBERLAIN. **Crop rotation as affecting nitrate production.** Proc. Indiana Acad. Sci. 1921: 283–293. Pl. 1. 1922.—Experiments to determine the effect of corn, wheat, oats and soybeans, and crop rotation on the nitrate content and nitrifying power of the soil are described. Results showed that cultivation greatly increased the rate of nitrate formation; that the addition of lime to acid soil improved conditions for the development of nitrifying bacteria; and that the growing crop and the soil treatment are more important than the effect of previous treatment of soil on nitrate production. The rate of nitrate production is not necessarily a limiting factor to plant growth.—*F. C. Anderson.*

4609. BALDWIN, I. L., W. E. WALTERS, and F. K. SCHMIDT. **Fertilizer treatment as affecting nitrate production.** Proc. Indiana Acad. Sci. 1921: 295–309. 1922.—Experiments showed that cow manure was more efficient than horse manure. "Use of nitrogen with phosphorus or potassium was superior to either of the treatments used alone." Ammonium sulphate-treated samples seemed to show greatest nitrifying power in May, June, and July. There seems to be a correlation "between the amount of nitrate found in the soil under natural conditions with growing crops and the amount accumulating under optimum conditions."—*F. C. Anderson.*

4610. BERTRAND, G., et MOKRAGNATZ. **Sur la présence du cobalt et du nickel dans la terre arable.** [The presence of cobalt and nickel in arable land.] Compt. Rend. Acad. Sci. Paris 175: 112–114. 1922.—In the samples of soil studied the cobalt content was 0.0028–0.0039 gm. per kgm. of soil, and the nickel 0.0136–0.0174 gm. per kgm.—*C. H. Farr.*

4611. FRAPS, G. S. **Organic constituents of the soil.** Texas Agric. Exp. Sta. Bull. 300. 14 p. 1922.—The determination of organic carbon in the soil throws little light upon the soil quality and is unnecessary since the percentage can be judged from the percentage of nitro-

gen present. The average percentage of pentosans increases with the average nitrogen content. Pentosans from cottonseed meal disappeared rapidly from the soil during the 1st week. At the end of 8 weeks there were present 7 per cent of the original pentosans from cottonseed meal, 31 per cent from Sudan grass, 61 per cent from rice bran, and 75 per cent from sheep excrement. The amount of reducing substance, calculated as sugars, produced by heating the soil with $1\frac{1}{2}$ per cent H_2SO_4 varied from 0.002 to 0.215 per cent with an average of 0.058 per cent for 77 soils.—*L. Pace.*

4612. KELLY, J. W. Probable cause of the toxicity of the so-called poisonous greensand. Jour. Agric. Res. 23: 223-228. 1923.—An investigation of 3 greensands like those of Newcastle, Virginia, Redbank, New Jersey, and Courtland, Virginia revealed the fact that the last is toxic to corn. The toxicity is due to the solubility of Fe, Mn, and Al in slightly acid media. While the other 2 sands contain these toxic substances in nearly like quantity the presence of marl renders them relatively insoluble. The addition of lime to Courtland greensand inhibits its toxic effects.—*L. Knudson.*

4613. KONIG, J., J. HASENBAUMER, und J. SCHÄFERS. Beziehungen zwischen dem Nährstoffgehalt des Bodens und der Nährstoffaufnahme durch die Kartoffel. [On the relation between the nutrient content of the soil and nutrient absorption by potatoes.] Land. Jahrb. 58: 55-85. 1923.—One per cent citric acid extraction furnishes a good index of the content of readily available K and phosphoric acid in the soil. It is important to allow enough citric acid for the $CaCO_3$ present in the soil. The relation between K, N, and phosphoric acid for a proper crop of potatoes should be 100:70:25. The actual amount of fertilizer needed can be determined from the relative composition of a good crop of potatoes and fertilizing elements available. Each 1000 gm. of weight of a normal potato crop requires approximately 25 gm. K, 18 gm. N, and 6 gm. P_2O_5 .—*S. A. Waksman.*

4614. KONIG, J., J. HASENBAUMER, und E. KROGER. Beziehungen zwischen dem Nährstoffgehalt des Bodens und der Nährstoffaufnahme durch den Hafer nebst einem Beitrag über den Einfluss von Pflanzen und Düngern auf die Bodensäure. [On the relation between the nutrient content of the soil and the absorption of nutrients by oats, with a contribution on the influence of plants and manures upon soil acidity.] Landw. Jahrb. 58: 87-124. 1923.—The quantities of artificial fertilizer used in practice are sufficient to exert an influence upon the soil reaction which can be measured, after a certain time, by determining electrometrically or colorimetrically the H-ion concentration in the soil. Growing plants also influence the reaction of the soil. In general, plants increase the acidity of the soil, the degree of change depending on the kind of plant. In the presence of $CaCO_3$ the acids secreted by the plants are neutralized and can thus not be determined. This indicates that alkaline or neutral fertilizing salts should be used for acid soils; in the case of a very high acidity, the favorable influence of the fertilizer is apparent only after a sufficient addition of lime. Alkali soils require physiologically acid salts.—*S. A. Waksman.*

4615. MAZÉ, P. Sur les conditions pratique de l'emploi de la cyanamide calcique comme engrais. [On practical conditions in the use of calcium cyanamide as fertilizer.] Compt. Rend. Acad. Sci. Paris 175: 1093-1096. 1922.—This compound is transformed into urea in the soil by microorganisms. To avoid toxic effects it must be put in the soil several days before seeding. Records given of the yields of wheat and oats show favorable results for this fertilizer, an application at the rate of 40 kg. of N per hectare giving the best results.—*C. H. Farr.*

4616. MITSCHERLICH, E. A., [with the assistance of] F. DURING, C. KRULL, S. V. SAUCKEN, und K. BOHM. Der Düngerversuch (Gefäss- und freiland Versuch). [Fertilizer experiments—pot and field experiments.] Land. Jahrb. 58: 125-158. 1923.—Field experiments present advantages over pot experiments in that plants can be grown to maturity in the same soil. There are, however, many disadvantages, especially the physical and chemical variability of the soil, which may lead to comparatively large errors. This can be obviated by using large

numbers of small plots. Since field tests may suffer from weeds, plants should be selected which require cultivation and which, like potatoes, give large yields. The experimental error can thus be reduced to 1-2 per cent. But due to the lack of uniformity of the soil, the particular experiment holds true only for the particular part of the field. Also, in certain years an unfavorable growth factor (drought) interferes with field experiments yielding conclusive results.—Pot experiments have the advantage that the growth factors, like water, heat, light, and nutrients, can be controlled, and the soil made more representative and uniform. Disadvantages are that the soil is not comparable with the same soil under field conditions, and wrong conclusions may be drawn, and that plants giving greatest yields can not be used because of space required.—Pot experiments are reported on the influence of the N, K, and P fertilizers on oats. The authors conclude that pot experiments should be carried out on a large scale to determine the fertilizer need of the soil. To enable him to use fertilizers most rationally, each farmer is entitled to have his soil properly investigated.—*S. A. Waksman.*

4617. PETIT, A. Sur la nocuite du terreau du fumier. [Concerning the noxiousness of manure compost.] *Compt. Rend. Acad. Sci. Paris* 174: 1362-1364. 1922.—A previous report indicated that manure is a more effective fertilizer after it is leached. Some plants, as *Primula obconica*, are not benefited by such treatment, while others, such as *Cineraria* hybrids, are even injured. It is found that calcium increases the injurious effect of the fertilizer and iron reduces it.—*C. H. Farr.*

4618. ROMELL, LARS-GUNNAR. Luftväxlingen i marken som ekologisk faktor. [Aeration of the soil as an ecological factor.] *Meddel. Statens Skogsförsöksanst.* 19: 125-359. *Fig. 1-6.* 1922.—Movement of gases through the soil takes place primarily by diffusion, the rate being little affected by soil structure or by weather, except that it is greatly reduced in clays and in waterlogged soils. The author finds that a surface layer of organic matter promotes aeration while on bare soils torrential rains may cause a sealing of the surface pores with fine material. A cover of leaf litter, moss, or similar material prevents such action which hinders aeration. On the well-drained moraines and sandy forest soils of Sweden, aeration is not a problem, while waterlogged soils are liable to be poorly aerated. Drainage opens the way for the entrance of oxygen, but the removal of moss and litter is unnecessary, or even harmful. [Summary in German.]—*G. A. Pearson.*

4619. RUSSELL, EDWARD J. Soil conditions and plant growth. 4th ed., xii + 406 p., 32 fig. Longmans, Green and Co.: London, 1921.—The general characteristics of the older editions are retained, the subjects being treated broadly and outlines emphasized. This edition is included in a new series, The Rothamsted Monographs on Agricultural Science. I. Historical and introductory. Development of agriculture from Roman to modern times is treated. During this period the agricultural chemist is acquiring a taste for mathematical formulae and constants unknown to the older generation of workers.—II. Soil conditions affecting plant growth. Such conditions as water and air supply, temperature, and especially the effect of different chemical elements, singly and combined, are discussed.—III. The composition of the soil. The main topics considered are: (1) mineral matter derived from rock material with their physical properties and soil acidity; (2) calcium carbonate and phosphate derived from decomposed organisms; (3) soil solution; (4) organic matter.—IV. The colloidal properties of soil. Relations of soil colloids to absorption of water and the chemicals in the soil solution, and their relation to flocculation of clay and silt and the formation of hard pan are developed. The central part of the thesis is that soil phenomena are dynamic and not static.—V. The carbon and nitrogen cycles in the soil. The decomposition of carbon compounds, the fixation of nitrogen, and denitrification are emphasized and attention called to a number of suggestive lines of work. The biological hypothesis explaining such transformation "remains the simplest and most satisfactory, but there is room for more evidence before it can be regarded as positively established."—VI. The biological conditions in the soil. Water supply is discussed from the point of view of the plant physiologist and ecologist and of the soil physicist. "The soil solution may safely be regarded as the minimum food supply, which is

reinforced to an unknown extent by the soluble substances in the soil." Emphasis is placed on the fact that the soil organisms live on a highly "colloidal complex of organic and inorganic compounds, usually more or less saturated with water, that envelopes the mineral particles. There is no evidence of the presence of soluble toxins in normally aerated soils sufficiently supplied with plant food and with calcium carbonate, but toxins may occur on 'sour' soils badly aerated and lacking in calcium carbonate or on exhausted soils."—VII. The micro-organic population of the soil and its relation to the growth of plants. Algae, fungi, Actinomyces, and bacteria, are regarded as leading their own lives and are not classified as in previous editions according to their usefulness to higher plants. Investigation on the partial sterilization of soil is discussed in connection with soil protozoa.—VIII. The soil in relation to plant growth. Attention is called to the relationship of vegetation to the 5 great soil divisions, clays, loams, sands, calcareous soils, and soils rich in organic matter.—IX. Soil analysis and its interpretation. Soil analysis is restricted to a comparison of soils and to a correlation between "the chemical and physical properties of the soils of a given area and the crops and agricultural methods generally associated with them."—Appendices include a description of methods of soil analysis and tables showing amounts of various substances absorbed from the soil by the common agricultural crops of England. A selected biography of 323 papers on soil conditions and plant growth, and author and subject indices follow.—*Earl S. Johnston.*

4620. RUSSELL, JOHN. The possibility of using town refuse as manure. Jour. Ministry Agric. Great Britain 29: 685-691. 1922.

4621. TULAIKOV, N. Drought and the means of overcoming its evil effects in the Volga region of European Russia. Jour. Amer. Soc. Agron. 15: 6-15. 1923.—An efficient system of field agriculture, introduction of methods of cultivation used by the experiment stations, improvements of methods in all branches of agriculture, and use of water resources are suggested to combat the evil effects of drought in southeastern Russia.—*F. M. Schertz.*

4622. VERNADSKY, W. J. Sur le problème de la décomposition du kaolin par les organismes [The problem of the decomposition of kaolin by organisms.] Compt. Rend. Acad. Sci. Paris 175: 450-452. 1922.—Murray and Irvine reported that diatoms could live successfully in water free of silicon, if it contained a small amount of clay. The author points out that the decomposition of clay liberating silicon is a chemical reaction requiring a large amount of energy, such as a temperature of 1000°C., or the action of strong acids, like H₂SO₄. A study was made of the effect of diatoms and accompanying bacteria upon the decomposition of argillaceous soils to form free aluminium hydrates. It is not determined as yet whether the reaction is the result of the work of the bacteria, the diatoms, or their symbiosis.—*C. H. Farr.*

4623. VINCENT, V. Sur la mesure de l'acidité des sols par les liqueurs alcalines. [On the measurement of the acidity of soils by alkaline solutions.] Compt. Rend. Acad. Sci. Paris 175: 1233-1234. 1922.—Calcium hydrate, sodium bicarbonate, and calcium bicarbonate were used. It is found that calcium hydrate is preferable since in soils treated with this solution the ferric hydrate, aluminium hydrate, and silicon hydrate are precipitated.—*C. H. Farr.*

4624. VOICU, J. Influence de l'humus sur la sensibilité de l'*Azotobacter Chroococcum* vis-à-vis du bore. [The influence of humus on the sensitivity of *Azotobacter Chroococcum* to boron.] Compt. Rend. Acad. Sci. Paris 175: 317-319. 1922.—It was found that the total amount of nitrogen fixed was greater without boron, but boron may occasionally increase the amount of nitrogen fixed per gm. of sugar consumed. Humus was found to increase markedly the amount of nitrogen fixed, the sugar consumed, and the nitrogen fixed per gm. of sugar consumed. The retardative effect of boron is more marked in the presence of humus.—*C. H. Farr.*

4625. WENHOLZ, H. Some recent views on the liming of soils. Agric. Gaz. New South Wales 34: 7-13. 1923.—It is pointed out that the soils of Australia present unique problems from the standpoint of the use of lime.—*L. R. Waldron.*

4626. ZUNKER, F. *Die Bestimmung der spezifischen Oberfläche des Bodens.* [The determination of the specific surface of the soil.] Landw. Jahrb. 58: 159-205. 1923.—The specific surface is a general measure of the degree of division of a substance. Penetrability of water in the soil, which determines the distance between the drains, is a function of the specific surface. Various formulae are developed for the determination of the specific surface. Practically it is carried out as follows: soil samples (1 kgm.) are taken at a depth of 0.5, 1.0, and 1.5 m., and air dried. The soil in each sample is mixed and larger stones separated out; 300 cc. of distilled H₂O and 30 cc. of normal ammonia solution are added to 200-300 gm. of sandy loams, 100-150 gm. of loams, 50-100 gm. of clays, and 50 gm. of heavy clays taken in parallels, the moisture having been determined. These remain 24 hours, are shaken 2 hours in a rotating apparatus, and after standing a few seconds the suspension is poured off from sediment; more distilled water is added to the latter to free it from finer particles; the sediment is then dried and weighed. The suspension is diluted and specific weight determined by means of a special apparatus. By using a formula ($U = \frac{6.971}{\sqrt{T_o}} \cdot \frac{G\%}{H} \cdot F^1$), the specific surface is obtained. The distance of the drains is then determined from the specific surface of the soil.—S. A. Waksman.

TAXONOMY OF VASCULAR PLANTS

GENERAL

4627. BLACK, J. M. *Flora of South Australia. Part I. Cyatheaceae-Orchidaceae.* 8 vo, 154 p., 19 pl., 34 fig. R. E. E. Rogers: Adelaide, 1922.—This publication is the first of a series of handbooks of the flora and fauna of South Australia, issued by the British Science Guild (South Australian Branch). The treatment of the Orchidaceae in the present part is contributed by R. S. ROGERS. Following the author's preface are short chapters on the history of botany in South Australia and a glossary of botanical terms. Dichotomous keys lead to the families, genera, and species, and each category is briefly characterized. The geographical range of the species is given and the time of flowering and fruiting of each species is also indicated. The following names are definitely indicated as new combinations: *Leptochloa digitata* (*Eleusine digitata* Spreng.), *Cladium tetragonum* (*Lepidosperma tetragona* Labill.), and *Dichopogon fimbriatus* (*Arthropodium fimbriatum* R. Br.).—J. M. Greenman.

4628. GAMBIER-PARRY, T. [Rev. of: SKENE, MACGREGOR. *Common plants.* 8vo., 271 p. A. Melrose: London and New York.] Rept. Bot. Soc. and Exchange Club British Isles 6: 350. 1921. [1922].—[See also Bot. Absts. 11, Entry 1085.]

4629. HITCHCOCK, A. S. *Remarks on Mr. Sprague's suggestion.* Science 57: 209. 1923.—The author expresses his willingness to accept the compromise suggested by T. A. Sprague [see Bot. Absts. 12, Entry 4634] to harmonize the Type-basis Code and the International Rules of Nomenclature. He also requests that taxonomic botanists submit statements of their views on such a compromise in the hope that all those concerned will be prepared for action at the next International Botanical Congress.—C. J. Lyon.

4630. KNOCHE, HERMAN. *Flora Balearica. Étude phytogéographique sur les Isles Baléares.* [Flora of Balearica. Phytogeographical study of the Balearic Islands.] Vol. II. Roy. 8vo, 585 p. Roumégous and Déhan: Montpellier, 1922.—This volume continues on the same plan as the first one and includes the natural groups from *Laurus* of the Lauraceae to *Scorzonera* of the Compositae. The following new species, names, varieties, and combinations

are included: *Umbilicus vulgaris* L. var. *pendulinus* (*U. pendulinus* DC.), *U. vulgaris* L. var. *gaditanus* (*U. gaditanus* Pau & Pons-Guer.), *Genista acanthoclada* DC. var. *fasciculata*, *Anthyllis Vulneraria* L. var. *balearica* (*A. balearica* Coss.), *Ruta chalepensis* L. var. *bracteosa* (*R. bracteosa* DC.), *Euphorbia Maresii* (*E. Gayi* Mar. & V., not Salis) and var. *balearica* (*E. Gayi* var. *balearica* Willk.) and var. *minoricensis* (*E. Gayi* Porta, not Salis), *Viola odorata* L. var. *alba* (*V. alba* Becker), *Bupleurum frutescens* L. var. *Barceloi* (*B. Barceloi* Cosson), *Pimpinella Tragium* Vill. var. *balearica*, *Adiantum Bicknellii*, *Ligusticum pyrenaicum* Gouan. var. *Huteri* (*L. Huteri* Porta), *Primula acaulis* (L.) var. *alba*, *Statice virgata* Willd. var. *minuta* (*S. minuta* L.), *Teucrium Polium* L. var. *majoricum* (*T. majoricum* Rouy), *Calamintha Nepeta* Savi var. *glandulosa* (*C. glandulosa* Benth.), *Micromeria biflora* Benth. var. *Rodriguezii* (*M. Rodriguezii* Freyn. & Janka), *Thymus Serpyllum* L. var. *Richardii* (*T. Richardii* Pers.), *Verbascum Boerhavi* L. var. *Portae* (*V. Portae* Willk.), *Chaenorrhinum organifolium* Lange var. *formenterea* (*C. Formenterae* Gand.), *C. rubifolium* Willk. & Lange var. *Bianorii*, *Digitalis purpurea* L. subsp. *dubia* (*D. rubia* Rod.), *Sibthorpia balearica* (*S. africana* Bourg. not L.), *Plantago Psyllium* L. var. *dubia*, *Galium rubrum* L. var. *balearicum*, *Cephalaria rigida* (L.) Schrad. var. *balearica*, *Cirsium lanceolatum* (L.) Scop. var. *echinatum* (*C. echinatum* (DC.)), *Centaurea Calcitrapa* L. var. *myacantha* (*C. myacantha* DC.), *C. diana* (*Carduncellus dianius* Webb.), and *Leontodon hirtus* L. var. *hispida* (*Thrincia hispida* Rod.). 1910. Vol IV. 1-47 pl., maps 3-5, and frontispiece. 1923.—This volume contains illustrations of about 50 species and varieties of plants and a number of reproduced photographs showing characteristic views of natural vegetation, particularly on the island of Majorca.—J. M. Greenman.

4631. MIYABE, KINGO, and YUSHUN KUDO. *Icones of the essential forest trees of Hokkaido*. Folio. Fasc. 7, pl. 20-22. May, 1922; fasc. 8, pl. 23-25, Aug., 1922; fasc. 9, pl. 26-28, Feb., 1923. Published by the Hokkaido Government.—The present fascicles contain descriptions and colored illustrations of 9 species of trees including 1 variety, 3 in each fascicle. These are: *Juglans Sieboldiana* Maxim., *Pterocarya rhoifolia* Sieb. & Zucc., and *Carpinus cordata* Bl.; *C. laxiflora* Blume, *Ostrya japonica* Sarg., *Betula Maximowicziana* Rgl.; *B. Ermanii* Cham., *B. japonica* Sieb., and *Alnus japonica* Sieb. & Zucc. var. *arguta* Call. A very full bibliography and synonymy are given in each case.—J. M. Greenman.

4632. PEARSALL, W. H. [Rev. of: Moss, C. E. *The Cambridge British flora*. Vol. III. *Portulacaceae to Fumariaceae*. xvi + 200 p. Cambridge University Press: 1920 (see Bot. Absts. 8, Entry 2232).] Rept. Bot. Soc. and Exchange Club British Isles 6: 75-79. 1920 [1921].—[See also Bot. Absts. 9, Entry 1078; 10, Entry 335.]

4633. SCHAFFNER, JOHN H. *Field manual of trees including southern Canada and northern United States to the southern boundary of Virginia, Kentucky and Missouri, westward to the limits of the prairie*. 2nd ed., small 8vo, 154 p. R. G. Adams & Co.: Columbus, 1922.—The present edition remains substantially the same as the one published in 1914. Certain corrections and a few minor changes only have been made. Two keys to the genera are given; one is based mainly on leaf and twig characters of the plant in the summer condition, the other chiefly on twig and stem characters in the winter condition. Each genus is briefly characterized, and under the larger genera keys to the species are included. Habitat and general geographical distribution are indicated.—J. M. Greenman.

4634. SPRAGUE, T. A. *Suggestions for a world-code of plant nomenclature*. Science 57: 207-208. 1923.—The author proposes a compromise between the Type-basis Code (Science 49: 333. 1919; 53: 312. 1921) and the International Rules of Botanical Nomenclature. Recent discussions in The Journal of Botany (1921 & 1922) have pointed out differences between the 2 codes and the resulting handicaps to systematic botany. Nine definite suggestions are given, and their acceptance is urged by both sides. Such action would involve sacrifices by both sides but would lead to harmony and 1 set of rules for all [See also Bot. Absts. 12, Entry 4629].—C. J. Lyon,

4635. WU, Y. T. [The criterion for classification of plants.] Ko-Hsueh [Science-Publ. Chinese Sci. Soc.] 7: 785-797. 1922. [Text in Chinese.]—A treatise is presented on the general principles in classifying plants.—*Chunjen C. Chen.*

PTERIDOPHYTES

4636. BLATTER, E., and J. F. d'ALMEIDA. The ferns of Bombay. *Small 8vo, viii + 228 p., 15 pl., 42 fig., and frontispiece.* D. B. Taraporevala Sons & Co.: Bombay, 1922.—This work is a popular presentation of the ferns of the Bombay Presidency. A synoptical key to 54 genera is given, as well as keys to the species under the larger genera. *Ophioglossum Aitchisoni* d'Almeida is described and illustrated as new to science. [See also following entry.]—*J. M. Greenman.*

4637. BRITTON, E. G. [Rev. of: BLATTER, E., and J. F. d'ALMEIDA. The ferns of Bombay. viii + 228 p., 15 pl., 42 fig., and frontispiece. D. B. Taraporevala Sons & Co.: Bombay, 1922 (see preceding entry).] *Torreya* 23: 11. 1923.

4638. GRAVES, E. W. An interesting trip. *Amer. Fern Jour.* 11: 86-88. 1921.—The trip was made in May, 1917, to Bucks Pocket, Alabama, to collect specimens of *Trichomanes Petersii* Gray. Eight species of ferns and a number of angiosperms were seen.—*F. C. Anderson.*

4639. HERTER, W. Lycopodiaceae borneenses. [Lycopodiaceae of Borneo.] *Philippine Jour. Sci.* 22: 179-184. 1923.—Twelve species of *Urostachys* and 3 of *Lycopodium* are recognized as occurring in Borneo. The following new combinations, species, and varieties appear: *Urostachys Selago* (*Lycopodium Selago* L.), *U. borneensis*, *U. nummularifolius* (*L. nummularifolium* Blume), *U. Hellwigi* (*L. Hellwigi* Warb.), *U. Lauterbachi* (*L. Lauterbachi* Pritz.), and *Lycopodium cernuum* Linn. vars *typica*, *longiflora*, and *vulcanicum*.—*E. D. Merrill.*

4640. HERTER, W. Lycopodiaceae philippinenses. [Lycopodiaceae of the Philippines.] *Philippine Jour. Sci.* 22: 57-76. 1923.—Two genera, *Urostachys* with 15, and *Lycopodium* with 7 species are recognized. Keys to the genera and species are given. The following are new: *Urostachys minimus*, *U. Whitfordi*, *U. Toppingi*, *U. Merrilli*, *U. Elmeri*, *U. banayanicus*, *U. salviniodes*, and *U. Delbruckii*. By transfer from *Lycopodium* the following new combinations appear: *Urostachys serratus* (Thunb.), *U. verticellatus* (Linn. f.), *U. squarrosus* (Forst.), *U. Magnusianus* (Hert.), *U. carinatus* (Desv.), *U. pinifolius* (Blume), and *U. phlegmaria* (Linn.). The paper closes with a comprehensive consideration of the geographic distribution of the various species.—*E. D. Merrill.*

4641. HUNTER, MABEL R. The present status of *Scolopendrium* in New York state. *Amer. Jour. Bot.* 9: 28-36. 2 fig. 1922.—The 4 stations previously reported for *Scolopendrium vulgare* Sm. in central New York were located and the species found to be still present there. Two new substations were discovered. Evidence is presented through counts of individual plants in 1916 and 1921 that this fern is becoming somewhat more abundant.—*E. W. Sinnott.*

4642. KNOWLTON, C. H., W. S. RIPLEY, JR., and C. A. WEATHERBY. Third report of the Committee on Floral Areas. *Rhodora* 23: 209-220. 1921.—This report covers the Ophioglossaceae, Marsileaceae, Salviniaceae, Equisetaceae, Lycopodiaceae, and Selaginellaceae, and is published as a part of the Preliminary Lists of New England Plants. A table gives the distribution of the plants by states; they are further classified into geographical and ecological groups.—*James P. Poole.*

4643. LEWIS, CHARLES S., and WILLIAM F. LEWIS. A list of ferns found in New Hampshire. *Amer. Fern Jour.* 11: 82-85. 1921.—The list consists of 34 species distributed among 14 genera 10 varieties, and 5 hybrids. The ferns were collected during the summer of 1916, near Melvin Village including Mt. Shaw and near North Woodstock; and during summer, 1918, near Whitefield and the Presidential Range including Mt. Washington.—*F. C. Anderson.*

4644. MARSHALL, M. A. Proliferous ebony spleenwort. Amer. Fern Jour. 13: 7-13. Pl. 1. 1923.—Growing in the basement of Woodstock Academy, Woodstock, Connecticut was found a colony of *Asplenium platyneuron* (L.) Oakes with small plants growing on the stipes of many of the plants.—F. C. Anderson.

4645. MUNZ, PHILIP A., and IVAN M. JOHNSON. The distribution of southern California pteridophytes. Amer. Fern. Jour. 13: 1-7. 1923.—The Selaginellaceae and Equisetaceae are discussed. This is the conclusion of a paper begun earlier [see Bot. Absts. 12, Entry 2858].—F. C. Anderson.

4646. RUGG, HAROLD GODDARD. *Adiantum pedatum* var. *aleuticum* in New England. Amer. Fern Jour. 12: 128-130. Pl. 8. 1922.—The new station recorded for this species is near Montgomery Center, Vermont.—F. C. Anderson.

4647. TILTON, GEORGE H. The fern lover's companion. Pocket size, 240 p, 159 illus. Originally published by the author: Melrose, Massachusetts, 1922 (now in the hands of Little, Brown & Co., Boston).—This is a book for amateurs. A brief account of reproduction in ferns, explanations of some of their characters and of the corresponding descriptive terms, and directions for making herbarium specimens are given, with an illustrated key to the genera. Then follow brief, nontechnical descriptions of the (82) species of Euflicineae and Ophioglossales in the Gray's Manual region, with habitat and range data and miscellaneous information. The English names commonly used are given for all species; the Latin nomenclature follows in the main that the 7th edition of Gray's Manual, with synonymy covering fairly well usage in the U. S. A. back to 1890. Names such as *Pteretis nodulosa*, which have come into use since the publication of the 7th edition are shown in distinctive type. The descriptive part is followed by short biographical sketches of 10 "fern authors," a bibliography, a list of times of fruiting of different species, a glossary of technical terms, and a check-list of the Latin names.—C. A. Weatherby.

4648. WHEELER, LESTON A. *Botrychium obliquum*, var. *dissectum* in Vermont. Amer. Fern Jour. 12: 127-128. 1922.

4649. WHERRY, EDGAR T. Wall ferns in Wilmington, North Carolina. Amer. Fern Jour. 13: 17-18. 1 fig. 1923.—*Pteris multifida* Poiret and *Adiantum Capillus-Veneris* L. were found growing on walls.—F. C. Anderson.

SPERMATOPHYTES

4650. ANONYMOUS. *Feijoa Sellowiana*. Amer. Bot. 29: 13-15. 1923.—The article gives a brief description and illustration of the fruit of the South American *Feijoa Sellowiana*.—Susan P. Nichols.

4651. BAILEY, L. H. Two species of *Hibiscus* from China. Gentes Herbarum 1: 109-110. Fig. 50. 1922.—The new species described are *Hibiscus sinosyriacus* and *H. paramutabilis*.—Alfred Rehder.

4652. BURKILL, I. H., and F. W. FOXWORTHY. Notes on Dipterocarps. No. 6. On the genus *Pachynocarpus*. Jour. Straits Branch Roy. Asiatic Soc. No. 86, p. 271-280. 1922.—The genus *Pachynocarpus* is overgrown and should surrender to *Vatica*; *P. Wallichii* King, *P. ruminatas* Brandis, and *P. Ridleyanus* J. W. Anderson become *V. Wallichii* Dyer, *V. ruminata* Burck, and *V. Ridleyana* Brandis. *Pachynocarpus* is then left with two species, *P. umbonatus* Hook. f., of Borneo, which should be sought for and reexamined, and *P. Stapfianus* King, which occurs in the Malay Peninsula from Lower Siam to Selanger and Pahang. The known distribution of *Vatica Wallichii* is given; and to it *V. obtusifolia* Ridl. and *V. Kelsalli* Ridl. are reduced. Its fruits are distributed by water.—I. H. Burkill.

4653. HŪ, H. H. [The two newly-discovered plants of Chekiang province.] Ko-Hsueh [Science-Publ. Chinese Sci. Soc.] 7: 608-612. Pl. 1-2. 1922. [Text in Chinese.]—*Rubus Hui* and *Mollinia Hui*, among the author's collection of plants in Chekiang, have been identified and determined as new species by Diels and Pilger respectively. Descriptions in Chinese and Latin are appended.—*Chunjen C. Chen.*

4654. HUTCHINSON, J. A contribution to the flora of northern Nigeria. Kew Bull. 1921: 353-407. Fig. 1-10. 1921.—This is an annotated catalogue of plants collected by H. V. Lely on the Bauchi Plateau, a region but little known botanically. The following species are described as new: *Artabotrys nigericus*, *Cissus Lelyi*, *Crotalaria crepitans*, *C. naragutensis*, *Smithia speciosa*, *Vigna longissima*, *Dissotis graminicola*, *D. cinerascens*, *Pycnocycla occidentalis*, *Pentas globifera*, *Vernonia saussureoides*, *Coreopsis camporum*, *Senecio Lelyi*, *Centaurea nigerica*, *Maba secundiflora*, *Margaretta inopinata*, *Ceropegia pedunculata* Turrile, *Peristrophe pilosa*, *Clerodendron Lelyi*, *Acrocephalus albobiridis*, *Protea argyrophaea*, *Eulophia propinqua*, *Satyrium nigericum*, and *Lapeyrouisia montana*.—*T. J. Fitzpatrick.*

4655. MACKENZIE, KENNETH KENT. Notes on *Carex*-XII. Bull. Torrey Bot. Club 49: 361-373. 1922.—*Carex Richii* (Fernald) Mackenzie, *C. cumulata* (Bailey) Mackenzie, and *C. Merritt-Fernaldii* Mackenzie are described as new species. *Carex Longii* Mackenzie is a new name given to the plant which has recently been treated as *C. albolutescens* Schw., the type specimen of the latter having been shown to be a plant of *C. straminea* Schk.—*P. A. Munz.*

4656. MERRILL, ELMER D. New or noteworthy Bornean plants. Jour. Straits Branch Roy. Asiatic Soc. No. 85, p. 151-201. 1922.—The following new genera, species, and combinations are published: *Pandanus sandakanensis*, *P. Matthewsii*, *P. obovatus*, *P. pachyphyllus*, *Mapania sessilis*, *M. affinis*, *M. gracilipes*, *M. heterocephala*, *Schismatoglottis ferruginea*, *Pleomele borneensis*, *Smilax gigantea*, *S. Woodii*, *Curculigo borneensis*, *Phrynium inflatum*, *Artocarpus Clementis*, *A. borneensis*, *A. peltata*, *Laportea oblanceolata*, *Fissipetalum* n. gen. (Olacaceae), *F. borneense*, *Jussiaea* n. gen. (Menispermaceae), *J. borneensis*, *Tinospora glandulosa*, *Cyclea caudata*, *Talauma megalophylla*, *T. borneensis*, *Artabotrys Clementis*, *A. borneensis*, *A. trichopetalus*, *A. trigyna*, *Fissistigma Clementis*, *Oxymitra grandifolia*, *O. acuminata*, *Goniothalamus stenophyllus*, *G. nitidus*, *G. dolichocarpus*, *Polyalthia tenuipes*, *P. xanthopetala*, *Phaeanthus impressinerviis*, *Woodiella* n. gen. (Anonaceae), *W. sympetala*, *Knema Winkleri*, *K. oblongata*, *K. nitida*, *Actinodaphne diversifolia*, *Litsea cuprea*, *L. caulocarpa*, *L. sandakanensis*, *L. megalophylla*, *L. elliptica*, *Agelaea Agamae*, *A. sarawakensis*, *A. Woodii*, and *Connarus euphlebius*.

The following old species are added to the flora of Borneo: *Themeda frondosa* Merr., *Panicum carinatum* Presl, *P. distachyum* Linn., *Dincholea pubiramea* Gamble, *Cyperus procerus* Rottb., *Forrestia glabrata* Hassk., *Curculigo glabrescens* (*C. latifolia* Dry. var. *glabrescens* Ridl.), *Dioscorea flabellifolia* Prain & Burkill, *Phacelophrymum bracteosum* K. Schum., *Helicia excelsa* Blume, *Viscum angulatum* Heyne, *Polyalthia dolichophylla* Merr., *P. subcordata* Blume, *P. lateriflora* (Blume) King, *Popovia velutina* King, *Uvaria micrantha* (DC.) Hook. f., *Litsea grandis* (Wall.) Hook. f., *L. megacarpa* Gamble, *L. bancana* (Miq.) Boerl., *L. odorifera* Valetton, *Dehaasia triandra* Merr., *Lindera malaccensis* Hook. f., *Illigera celebica* Miq., *Polyosma integrifolia* Blume, and *Cnestis palata* (*Thysanus palata* Lour.).—*I. H. Burkill.*

4657. MERRILL, ELMER D. New or noteworthy Bornean plants. Part II. Jour. Straits Branch Roy. Asiatic Soc. No. 86, p. 312-342. 1922.—Descriptions of the following new species are published: *Derris pachycarpa*, *Canavalia bracteolata*, *Sarcotheca pinnata*, *Erodia punctata*, *Chisochiton brachyanthum*, *C. kinabaluensis*, *Aglais baramensis*, *Glochidion lancispalum*, *Galearia stenophylla*, *G. sessiliflora*, *Melanochyla ferruginea*, *Semecarpus borneensis*, *S. oblanceolata*, *Salacia nitidissima*, *Phytocrene anomala*, *Elaeocarpus brevipes*, *Grewia pyriformis*, *Sterculia trichopetiolata*, *Saurauia amplifolia*, *Gordonia grandiflora*, *Taraktogenos grandiflora*, *Casearia borneensis*, *Begonia angustilimba*, *Eugenia sandakanensis*, *E. Woodii*, *Myrtus Moul-*

tonii, *Melastoma laevifolium*, *Dalenia pubescens*, *Dissochaeta Ramosii*, *Kibessia verrucosa*, and *Alangium borneense*. The names *Actinidia latifolia* and *Gordonia amboinensis* are proposed for *Actinidia Champoioni* Benth. and *Laplacea amboinensis* Miq., respectively, and the first is added to the list of known Bornean plants. The following are also added to the list: *Erodia binloca* Blanco, *Aphanamixis sumatrana* Harms, *Santiria samarensis* Merr., *Canarium pseudo-commune* Hochr., *Dichapetalum holopetalum* Merr., *Homonoia javensis* Muell. Arg., *Mallotus Blumeanus* Muell. Arg., *M. Moritzianus* Muell. Arg., *Actephila dispersa* Merr., *Cleistanthus megacarpus* C. B. Rob., *Omphalea bracteata* (Blanco) Merr., *Salacia oblongifolia* Blume, *Iodes philippinensis* Merr., *Neesia syndandra* Mast., *Boschia Griffithii* Mast., *Linostoma pauciflorum* Griff., *Eugenia palawanensis* C. B. Rob., *Clidemia hirta* (Linn.) D. Don, and *Pachycentria constricta* Blume.—I. H. Burkill.

4658. MUNZ, PHILIP A., and IVAN M. JOHNSTON. Miscellaneous notes on plants of southern California—II. Bull. Torrey Bot. Club 49: 349-359. 1922.—Species new to southern California and extensions of range for others are mentioned. The following nomenclatorial changes and additions are made: *Phoradendron californicum* var. *distans* f. *leucocarpum* Trelease f. nov., *Eriogonum nodosum* var. *Jaegeri* var. nov., *Eriogonum fasciculatum* var. *flavoviride* var. nov., *Scopulophila Rixfordii* (Brandege) comb. nov., *Claytonia lanceolata* var. *Peirsonii* var. nov., *Draba corrugata* var. *saxosa* (Davidson) comb. nov., *Sphaeralcea rosacea* sp. nov., *Oenothera cardiophylla* var. *splendens* var. nov., *Asclepias eriocarpa* var. *microcarpa* var. nov., *Phlox bernardina* sp. nov., *Penstemon Clevelandi* var. *connatus* var. nov., *Galium angustifolium* var. *pinetorum* var. nov., and *G. Hallii* sp. nov.—P. A. Munz.

4659. PENNELL, FRANCIS W. Some overlooked Scrophulariaceae of Rafinesque. Torreya 22: 77-84. 1922.—The author's review of the Scrophulariaceae [see Bot. Absts. 3, Entry 3013; 5, 2392, 2393, 2393; 6, 436] is supplemented by a list of names published by Rafinesque in works so rare that they have not yet been catalogued. Twenty-seven species and varieties from the Autikon Botanikon and one from the American Monthly Magazine are listed and referred to their modern equivalents. Two new combinations are published: *Mecardonia acuminata* (Walt.) Small var. *microphylla* (Raf.) Pennell, and *Scrophularia lanceolata* Pursh var. *occidentalis* (Rydb.) Pennell.—J. C. Nelson.

4660. RIDLEY, H. N. New and rare Malayan plants. Series XII. Jour. Straits Branch Roy. Asiatic Soc. No. 86 pp. 292-311. 1922.—The following new species and varieties are described: *Turraea breviflora*, *Zizyphus pernettoides*, *Eugenia alata*, *Trevesia rufo-setosa*, *Turraea calcarea*, *Pavetta graciliflora* Wall., *P. pauciflora*, *Psychotria lanceolaria*, *P. atroviridis*, *Cephaelis melanocarpa*, *Borreria pilulifera*, *B. parviceps*, *Embelia subcordata*, *Ervatamia pauciflora*, *E. pauciflora* var. *minor*, *Hoya citrina*, *Cynanchum Seimundii*, *Gaertnera ovata*, *G. rigida*, *Didissandra castaneaefolia*, *Didymocarpus castaneaefolia*, *Loxocarpus minimus*, *Cyrtandra patula*, *Ebermaiera longispica*, *Strobilanthes latebrosa*, *S. leucopogon*, *Barleria siamensis* Craib var. *glabrescens*, *Gymnostachyum Robinsonii*, *Eranthemum candidum*, *Justicia Robinsonii*, *J. microcarpa*, *Sphinctacanthus malayanus*, *Elytranthe tubaeiflora*, *Ficus patens*, *Elatostemma inaequilobum*, *Thrixspermum iodochilus*, *Neuwiedia ocrea*, *Alpinia campanaria*, *A. Seimundii*, *Amomum spicatum*, *Amorphophallus elegans*, *Pothosa lorispatha*, *Areca latiloba*, *Pinanga glaucescens* and *Pandanus pilaris*. The following new combinations appear: *Pavetta indica* var. *canescens* (*P. canescens* Wall.), *Borreria laevicaulis* (*Bigelovia laevicaulis* Miq.), *B. setidens* (*Bigelovia setidens* Miq.), and *Kampferia cyanescens* (*Elettariopsis cyanescens* Ridl.). The following are recorded as occurring in the Malay Peninsula: *Polygala pulchra* Hassk., *Pavetta tomentosa* Roxb., *P. graciliflora* Wall., *Borreria latifolia* K. Schum., and *B. hispida*, K. Schum. Lastly there is a note upon the occurrence inland of *Ipomoea Pes-caprae* Roth.—I. H. Burkill.

4661. ROSE, J. N. Byrnesia Weinbergii. Addisonia 7: 37, 38. Pl. 243 (col.). 1922.—This ornamental Crassulaceous herb, recently introduced is made the type of a new genus *Byrnesia*, which is here proposed. The plant is probably Mexican.—T. J. Fitzpatrick.

4662. ROSE, J. N. *Eucrosia Morleyana*. *Addisonia* 7: 3, 4. *Pl.* 226 (col.). 1922.—This herb of the Amaryllidaceae is here described as new. The type locality is Huigra, Ecuador, altitude 4,000 feet.—*T. J. Fitzpatrick*.

4663. ROSE, J. N. *Graptopetalum pachyphyllum*. *Addisonia* 7: 45, 46. *Pl.* 247 (col.). 1922.—This Crassulaceous species, here described as new, was discovered in 1905 in Querétaro, Mexico.—*T. J. Fitzpatrick*.

4664. ROSE, J. N. *Runyonia longiflora*. *Addisonia* 7: 39, 40. *Pl.* 244 (colored). 1922.—*Runyonia* (Amaryllidaceae) gen. nov. and *R. longiflora* sp. nov. are described as new. This plant, from southeastern Texas and northern Mexico, was discovered by Arthur Schott in 1853 and sent to the Torrey herbarium; it was rediscovered by Robert Runyon in 1921.—*T. J. Fitzpatrick*.

REVISIONS AND MONOGRAPHS

4665. BRITTON, N. L., and J. N. ROSE. *The Cactaceae, descriptions and illustrations of plants of the Cactus family*. Vol. III. Carnegie Inst. Washington Publ. 248. 23 + 29 cm., vii + 255 p., 24 pl. (19 colored), 250 fig. Oct. 12, 1922.—The subtribes *Echinocereanae*, *Echinocactanae* and *Cactanae*, of the tribe *Cereeae*, are treated in this volume. Thirty-six genera and 306 species are recognized and are described with complete bibliography, type locality, distribution, and list of previously published illustrations. There are 21 new genera, as follows: *Austrocactus*, *Chamaecereus*, *Lobivia*, *Denmoza*, *Copiapoa*, *Toumeya*, *Epithelantha*, *Neoporteria*, *Arequipa*, *Oroya*, *Matucana*, *Hamatocactus*, *Strombocactus*, *Ferocactus*, *Echinomastus*, *Homalocephala*, *Hickenia*, *Frailea*, *Mila*, *Sclerocactus*, and *Utahia*. There are 36 new species, as follows: *Echinocereus grandis*, *E. Standleyi*, *E. perbellus*, *E. Fitchii*, *E. scopulorum*, *E. Palmeri*, *E. Lloydii*, *E. sarissophorus*, *E. Barthelowanus*, *Lobivia Bruchii*, *L. ferox*, *L. longispina*, *L. boliviensis*, *L. Shaferi*, *L. pampana*, *L. grandiflora*, *L. grandis*, *Echinopsis Spegazziniana*, *E. Shaferi*, *E. aurea*, *Copiapoa megarhiza*, *Echinofossulocactus Lloydii*, *E. zacatecasensis*, *E. confusus*, *Ferocactus Townsendianus*, *F. horridus*, *F. santa-maria*, *F. Corillei*, *F. Rostii*, *Mila caespitosa*, *Discocactus subnudus*, *D. Zehntneri*, *D. bahiensis*, *Cactus Broadwayi*, *C. bahiensis*, and *C. Zehntneri*. There are 2 new names as follows: *Gymnocalycium Spegazzinii* and *Cactus Townsendii*. There are 156 new combinations with name-carrying synonyms in parentheses, as follows: *Echinocereus pacificus* (*Cereus phoeniceus pacificus* Engelm.), *E. octacanthus* (*Echinopsis octacantha* Mühlenpfordt), *E. sciurus* (*Cereus sciurus* Brandg.), *E. mamillatus* (*Cereus mamillatus* Engelm.), *Austrocactus Bertinii* (*Cereus Bertini* Cels), *Rebutia pseudominuscula* (*Echinopsis pseudominuscula* Speg.), *R. pygmaea* (*Echinopsis pygmaea* Fries), *R. Steinmannii* (*Echinocactus Steinmannii* Solms-Laubach), *Chamaecereus Silvestrii* (*Cereus Silvestrii* Speg.), *Lobivia cachensis* (*Echinopsis cachensis* Speg.), *L. caespitosa* (*Echinopsis caespitosa* Purpus), *L. saltensis* (*Echinopsis saltensis* Speg.), *L. cinnabarina* (*Echinocactus cinnabarius* Hooker), *L. Pentlandii* (*Echinocactus Pentlandii* Hooker), *L. lateritia* (*Echinopsis lateritia* Gürke), *L. corbula* (*Mammillaria corbula* Herrera), *L. andalgalensis* (*Cereus andalgalensis* Weber), *L. haematantha* (*Echinocactus haematanthus* Speg.), *L. thionanthus* (*Echinocactus thionanthus* Speg.), *L. chionanthus* (*Echinocactus chionanthus* Speg.), *L. Cumingii* (*Echinocactus Cumingii* Hopffer), *Denmoza rhodacantha* (*Echinocactus rhodacanthus* Salm-Dyck), *Copiapoa cinerea* (*Echinocactus cinereus* Philippi), *C. marginata* (*Echinocactus marginatus* Salm-Dyck), *C. coquimbana* (*Echinocactus coquimbanus* Karwinsky), *C. cinerascens* (*Echinocactus cinerascens* Salm-Dyck), *C. echinoides* (*Echinocactus echinoides* Lemaire), *Toumeya papyracantha* (*Mammillaria papyracantha* Engelm.), *Epithelantha micromeris* (*Mammillaria micromeris* Engelm.), *Neoporteria nidus* (*Echinocactus nidus* Söhrens), *N. occulta* (*Echinocactus occultus* Philippi), *N. nigricans* (*Echinopsis nigricans* Linke), *N. Jussieui* (*Echinocactus Jussieui* Monville), *N. subgibbosa* (*Echinocactus subgibbosus* Haworth), *N. chilensis* (*Echinocactus chilensis* Hildmann), *N. fusca* (*Echinocactus fuscus* Mühlenpfordt), *Arequipa leucotricha* (*Echinocactus leucotrichus* Philippi), *A. myriacantha* (*Echinocactus myriacanthus* Vaupel), *Oroya peruwiana* (*Echinocactus peruvianus* Schumann), *Matucana Haynei* (*Echinocactus Haynii* Otto), *Hamatocactus setispinus* (*Echinocactus setispinus* Engelm.), *Strombocactus disciformis*

(*Mamillaria disciformis* DC.), *Echinofossulocactus hastatus* (*Echinocactus hastatus* Hopffer), *E. multicostatus* (*Echinocactus multicostatus* Hildmann), *E. Wippermannii* (*Echinocactus Wippermannii* Mühlenpfordt), *E. heteracanthus* (*Echinocactus heteracanthus* Mühlenpfordt), *E. albatu*s (*Echinocactus albatu*s Dietrich), *E. lamellosus* (*Echinocactus lamellosus* Dietrich), *E. grandicornis* (*Echinocactus grandicornis* Lemaire), *E. arrigens* (*Echinocactus arrigens* Link), *E. violaciflorus* (*Echinocactus violaciflorus* Quehl), *E. pentacanthus* (*Echinocactus pentacanthus* Lemaire), *E. dichroacanthus* (*Echinocactus dichroacanthus* Martius), *E. tricuspidatus* (*Echinocactus tricuspidatus* Scheidweiler), *E. lancifer* (*Echinocactus lancifer* Dietrich), *Ferocactus Stainesii* (*Echinocactus Stainesii* Hooker), *F. Pringlei* (*Echinocactus pilosus* Pringlei Coulter), *F. Fordii* (*Echinocactus Fordii* Orcutt), *F. chrysacanthus* (*Echinocactus chrysacanthus* Orcutt), *F. Wislizeni* (*Echinocactus Wislizeni* Engelm.), *F. Lecontei* (*Echinocactus Lecontei* Engelm.), *F. acanthodes* (*Echinocactus acanthodes* Lemaire), *F. Diguettii* (*Echinocactus Diguettii* Weber), *F. peninsulæ* (*Echinocactus peninsulæ* Weber), *F. rectispinus* (*Echinocactus Emoryi rectispinus* Engelm.), *F. Haage jr.,) *F. cataphracta* (*Echinocactus cataphractus* Dams), *F. pygmaea* (*Echinocactus pygmaeus* Speg.), *F. caespitosa* (*Echinocactus caespitosus* Speg.), *F. Knippeliana* (*Echinocactus Knippelianus* Quehl), *Sclerocactus Whipplei* (*Echinocactus Whipplei* Engelm.), *F. polyancistrus* (*Echinocactus polyancistrus* Engelm. & Bigelow) *Utahia Sileri* (*Echinocactus Sileri* Engelm.), *Discocactus Hartmannii* (*Echinocactus Hartmannii* Schumann), *D. heptacanthus* (*Malacocarpus heptacanthus* Rodrigues), *Cactus Lemairei* (*Echinocactus Lemariii* Monville), *C. oreas* (*Melocactus oreas* Miquel), *C. Ruestii* (*Melocactus Ruestii* Schumann), *C. salvador* (*Melocactus salvador* Murillo), *C. obtusipetalus* (*Melocactus obtusipetalus* Lemaire), and *C. Neryi* (*Melocactus Neryi* Schumann). [See also Bot. Absts. 3, Entry 1824; 7, Entry 2194; 12, Entry 4667.]—*J. N. Rose.*

4666. MAIDEN, J. H. A critical revision of the genus *Eucalyptus*. Vol. VI. Part 6. *P. 255-340, pl. 228-231.* John Spence: Sydney. September, 1922.—The present part contains descriptions and illustrations of the following Australian species: *Eucalyptus Jensenii* n. sp., *E. umbrawarrensis* n. sp., *E. leptophylla* F. v. M., *E. uncinata* Turez., *E. angusta* n. sp., *E. marginata* Sm., *E. buprestium* F. v. M., *E. Bosistoana* F. v. M., *E. altior* (*E. Luehmanniana* F. v. M. var. *altior* Deane & Maiden), *E. conglobata* (*E. dumosa* A. Cunn. var. *conglobata* (R. Br.) Benth.), *E. angulosa* Schauer, and *E. Johnstoni* n. sp. A chapter is added in which the author presents a general discussion on the leaf of *Eucalyptus*.—*J. M. Greenman.*

4667. TAYLOR, NORMAN. [Rev. of: BRITTON, NATHANIEL L., and J. N. ROSE. *The Cactaceae, descriptions and illustrations of plants of the Cactus family*. Vol. III. Carnegie Inst. Washington Publ. 248. 1922 (see Bot. Absts. 12, Entry 4665).] *Science* 57: 272-273. 1923.

4668. WILLIAMSON, H. B. A revision of the genus *Pultenaea*, Part II. *Proc. Roy. Soc. Victoria* 33: 133-148. *Pl. 6-7.* 1921.—This revision covers 34 species, including 4 new varieties and 4 new species, as follows: *Pultenaea humilis* Benth. var. *glabrescens*, *P. juniperina* Labitt. var. *planifolia*, *P. acerosa* R. Br. var. *acicularis*, *P. laxiflora* Benth. var. *pilosa*, *P. radiata*, *P. costata*, *B. recurvifolia*, and *P. divaricata*. One new combination, *P. ferruginia* Rudge var. *Deanei* (*P. Deanei* R. T. Baker) is made.—*Eloise Gerry.*

FLORISTICS AND PLANT DISTRIBUTION

4669. BENNETT, ARTHUR. *Pyrola rotundifolia* Linn. in Caithness, with notes on the genus. *Trans. and Proc. Bot. Soc. Edinburgh* 28: 71-75. 1921.—The distribution of this and allied species in Scotland is discussed.—*Roxana Stinchfield Ferris.*

4670. CHUN, WOON YOUNG. [Chinese pines compared with the Japanese pines cultivated in China.] *Ko-Hsueh [Science-Publ. Chinese Sci. Soc.]* 7: 379-384. 1922. [Text in Chinese.]—The author gives an analytical key to 2 groups of pines: *Haploxylon* and *Diploxylon*. The following species are given detailed descriptions: *Pinus Massoniana* D. Don, *P. Armandi* Franch., *P. Bungeana* Zucc., *P. sinensis* Lamb., and *P. densiflora* Sieb. & Zucc. of Chinese pines and *P. Thunbergii* Parl., *P. koraiensis* Sieb. & Zucc., and *P. parviflora* Sieb. & Zucc. of Japanese pines.—*Chunjen C. Chen.*

4671. CHURCHILL, J. R. *Cimicifuga racemosa* in Massachusetts. *Rhodora* 23: 201-203. *Pl. 132.* 1921.—Two colonies of *Cimicifuga racemosa* (L.) Nutt. near Sheffield, Berkshire County, are described; a photograph illustrates the extent of 1 colony. This species has rarely, if ever, been found indigenous in New England north of Connecticut.—*James P. Poole.*

4672. COCKERELL, T. D. A. Flora of Porto Santo. *Torreya* 22: 4-10. *Fig. 1, 2.* 1922.—This island of the Madeiras is between 6 and 7 miles long and 3 miles across, reaching an altitude of 1,660 feet. The surface is rough and rocky, and the vegetation xerophytic. There are recorded 315 terrestrial vascular plants not in cultivation, to which the author adds

Adonis microcarpa DC.; only 7 of these are endemic. At least 160 species are introduced. The 3 Desertas islands, in plain sight from Porto Santo, have 138 species of vascular plants, with 2 endemic.—J. C. Nelson.

4673. DEAM, CHAS. C. *Trees of Indiana*. 1st rev. ed. 17 × 26 cm., 317 p., 137 pl. Dept. Conservation State of Indiana: 1921.—Descriptions, and photographic illustrations from herbarium specimens, are given of the trees occurring naturally in Indiana. There are described 178 species and 29 varieties. Twenty-three species included in previous lists, are excluded because of the lack of sufficient evidence of their occurrence in the state. Measurements are given of some of the largest trees of common species that have been found in Indiana.—Truman G. Yunker.

4674. DENSLOW, H. M. *An intensive local study in Rhode Island*. *Torreyia* 23: 9-10. 1923.—Albert E. Lownes has intensively studied a square mile of terrain near Providence. *Habenaria hyperborea* (L.) R. Br. is new to Rhode Island. A hybrid *Spiranthes* was critically observed, apparently *S. cernua* × *gracilis*.—J. C. Nelson.

4675. DIELS, L. *Die Theaceen Mikronesiens*. [The Theaceae of Micronesia.] *Bot. Jahrb.* 56: 526. 1921.—This is No. 13 of the series: Beiträge zur Flora von Mikronesien und Polynesien II, edited by L. Diels. *Eurya japonica* Thunb. and *E. japonica* Thunb. var. *nitida* Korth. are listed for this region.—K. M. Wiegand.

4676. DIELS, L. [List of determinations of plants collected in Chekiang.] Ko-Hsueh [Science-Pub. Chinese Sci. Soc.] 7: 705-706. 1922. [Text in Chinese.]—The author presents a list of 61 plants collected in the province of Chekiang and determined with botanical names.—Chunjen C. Chen.

4677. EHLERS, J. H. *Panicum virgatum* var. *cubense* in Michigan. *Rhodora* 23: 200. 1921.—An abundant and vigorous growth of this variety was found in 1 locality in Cheboygan County. The species, *P. virgatum* L., has been reported previously in Michigan.—James P. Poole.

4678. FERNALD, M. L. *The Gray Herbarium expedition to Nova Scotia*. 1920. Part II. Noteworthy vascular plants collected in Nova Scotia, 1920. *Rhodora* 23: 184-195, 223-245, 257-278, 284-300. 1921.—Part II contains an enumeration, with notes on their occurrence and critical discussions, of several hundred species, 110 of them new to the flora of Canada, 232 new to Nova Scotia. The newly described or renamed plants are: *Thelypteris palustris* f. *suaveolens* (Clute) n. comb., *Botrychium dissectum* f. *obliquum* (Muhl.) n. comb., *Panicum longifolium* var. *tusketense* n. var., *P. depauperatum* var. *psilophyllum* and f. *cryptostachys* n. var. and n. f., *P. linearifolium* var. *Wernerii* (Scribn.) n. comb., *P. Lindheimeri* var. *septentrionale* n. var. var. *fasciculatum* (Torr.) n. comb., var. *implicatum* (Scribn.) n. comb., *Agrostis hyemalis* var. *elata* (Pursh) n. comb., *Glyceria grandis* f. *pallescens* n. f., *Agropyron pungens* var. *acadiense* (Hubbard) n. comb., *Eleocharis tuberculosa* var. *pubnicoensis* n. var., *Scirpus acutus* f. *congestus* (Farwell) n. comb., *S. atrovirens* var. *georgianus* (Harper) n. comb., *Eriophorum* (Hamissonis) f. *albidum* (F. Nylander) n. comb., *Codium mariscoides* f. *congestum* n. f., *Carex scoparia* f. *peracuta* n. f., *C. albulutescens* var. *cumulata* × *scoparia* n. hybr., *Juncus effusus* var. *costulatus* n. var., *J. canadensis* var. *sparsiflorus* n. var., *J. subcaudatus* var. *planisepalus* n. var., *Lophiola septentrionalis* n. sp., *Habenaria flava* var. *virescens* (Muhl.) n. comb., *Pogonia ophioglossoides* var. *brachypogon* n. var., *Calopogon pulchellus* f. *albiflorus* (Britton) n. comb., *Polygonum robustius* (Small) n. comb., *P. hydropiperoides* var. *digitatum* n. var., *Drosera longifolia* × *rotundifolia* n. hybr., *Pyrus dumosa* (Greene) n. comb., *Amelanchier stolonifera* var. *lucida* n. var., *A. laevis* var. *nitida* (Wiegand) n. comb., *Rubus glandicaulis* var. *neoscoticus* n. var., *Ilex verticillata* var. *fastigiata* (Bicknell) n. comb., *Viola eriocarpa* var. *leiocarpa* Fernald & Wiegand n. var., *Bartonia paniculata* var. *intermedia* n. var., var. *sabulonensis* (Fernald) n. comb., var. *iodandra* (Robinson) n. comb., *Asclepias incarnata* var. *neoscotia* n. var., *Mertensia*

maritiana f. *albiflora* n. f., *Lycopus uniflorus* f. *flagellaris* n. f., *Linaria vulgaris* f. *leucantha* n. f., *Agalinis neoscotica* (Greene) n. comb., *Utricularia subulata* f. *cleistogama* (Gray) n. comb., *Solidago unilugulata* var. *terrae-novae* (T. & G.) n. comb., var. *neglecta* (T. & G.) n. comb., *S. tenuifolia* var. *pycnocephala* n. var., *Antennaria appendiculata* n. sp., *A. neodioica* var. *chlorophylla* n. var., *A. petaloidea* var. *noveboracensis* n. var., *Bidens connata* var. *inundata* n. var., *Senecio pauperculus* var. *Balsamitae* (Muhl.) n. comb., *Prenanthes altissima* f. *hispidula* (Fernald) n. comb.—*M. L. Fernald.*

4679. GARDNER, H. M. Note on the occurrence of *Podocarpus* trees near Nairobi. Jour. East Africa and Uganda Nat. Hist. Soc. No. 18. P. 36-37. 1923.—Record is made of a group of about 25 trees, apparently *Podocarpus gracilior*, found near Nairobi. One tree seems as much as 150 years old, and there are many seedlings. No other colony is known within 100 miles.—*Wm. Randolph Taylor.*

4680. GRAY, FRED W. Scores of stations for *Gaylussacia brachycera* in West Virginia. *Torreyia* 22: 17-18. 1922.—*Gaylussacia brachycera* (Michx.) Gray, the box huckleberry, previously found at only 3 stations in the eastern U. S. A., has been reported from about 75 stations in West Virginia and Virginia. About 40 of these in 3 counties of West Virginia were confirmed by the writer during the summer of 1921. The common name for the plant in this region is Juniper Berry.—*J. C. Nelson.*

4681. GRIMES, E. JEROME. A new station for *Pogonia affinis*. *Rhodora* 23: 195-197. 1921.—A brief description is given of the location, topography, vegetation, and soil character at this station near Williamsburg, Virginia. Descriptions and measurements are given for the 15 plants found.—*James P. Poole.*

4682. HARDY, M. E. Flora of the Michigan sand dunes. *Amer. Bot.* 28: 6-9. 1922.

4683. HIERN, W. P. Tenth report of the botany committee. *Trans. Devonshire Assoc. Adv. Sci. Lit. and Art.* 50: 219-227. 1918.—Local lists of plants from the 8 botanical districts of Devonshire are given, the lists including not only vascular plants but also bryophytes, algae, and fungi. The longest lists are from the Barnstable and Torquay Districts, with 62 and 48 species, respectively. At the close of the report the editor reviews a paper by G. T. HARRIS on the Desmid Flora of Dartmoor, published in 1917.—*A. W. Evans.*

4684. HOLLICK, ARTHUR. Local flora notes—Staten Island. *Torreyia* 22: 1-3. 1922.—Many native species in this area have disappeared because of the growth of the community, and an equal number of alien species have been added. Two areas are of special interest (1) the Todt Hill area, an unglaciated ridge with a characteristic native flora. Ten introduced species rare or wanting elsewhere on the island are recorded. (2) The vicinity of Arlington station, made up of waste material. Of 16 introduced species found here in 1908, only 4 remained in 1921. Six species new to the flora of the island were noticed. The mass of the vegetation, made up of introduced weeds, seems permanently established.—*J. C. Nelson.*

4685. JOHNSTON, H. H. Additions to the flora of Orkney as recorded in Watson's "Topographical Botany," second edition (1883). *Trans. and Proc. Bot. Soc. Edinburgh* 28: 51-66. 1921.—This is the 3rd of a series of papers reporting additions to the flowering plants and cryptogams of Orkney.—*Roxana Stinchfield Ferris.*

4686. LAUTERBACH, C. Die Simarubaceen Mikronesiens. [The Simarubaceae of Micronesia.] *Bot. Jahrb.* 56: 513-514. 1921.—This is no. 8 of the series: Beiträge zur Flora von Mikronesien und Polynesien II, edited by L. DIELS. Only 3 genera, monotypic in that region, are known from these islands. The species are inhabitants of the coastal region, only 1 extending up the rivers. Those listed are: *Suriana maritima* L., *Samadera indica* Gaertn., and *Soulamea amara* Lam.—*K. M. Wiegand.*

4687. LAUTERBACH, C. *Die Rhamnaceen Mikronesiens*. [The Rhamnaceae of Micronesia.] Bot. Jahrb. 56: 524-525. 1921.—This is no. 12 of the series: Beiträge zur Flora von Mikronesien und Polynesien II, edited by L. DIELS. Three species, *Smythea pacifica* Seem., *Colubrina asiatica* Brongn., and *Alphitonia excelsa* Reiss. are listed for this region.—K. M. Wiegand.

4688. LAUTERBACH, C. *Die Lecythidaceen Mikronesiens*. [The Lecythidaceae of Micronesia.] Bot. Jahrb. 56: 527-528. 1921.—This is no. 14 of the series: Beiträge zur Flora von Mikronesien und Polynesien II, edited by L. DIELS. Two species are listed: *Barringtonia racemosa* Bl. and *B. speciosa* L. f. The former is generally distributed at lower altitudes.—K. M. Wiegand.

4689. LINDSTRÖM, A. *Marstrandsöns Ormbukar och Fanerogamer*. [The ferns and phanerogams of the Island of Marstrand.] Bot. Notiser 1920: 177-210. 1920.—The island is very rocky and the shores very barren. A meager flora might be expected, especially as part of the island is occupied by the town and the old fortress. After 14 years of study by the author and partly by Nordstedt, a list of 13 fern worts and more than 600 species, varieties, and hybrids of phanerogams is published. Among these there are described 2 subspecies, 3 varieties, 1 hybrid and 19 species of *Rosa*. As the author has a very peculiar system in this genus, it is scarcely possible to tell whether these should be regarded as species or subspecies, he using binomials for both categories and calling both "sp. nov." As an appendix are added lists, without notes, of the plants found on neighbouring small islands: Hamneskär 33, Gråen 91, Östra Kråkan 76, Vestra Kråkan 52, and Kråkan at Rösselvik 56 species and varieties.—P. A. Rydberg.

4690. LONG, BAYARD. *A station for Croton glandulosus in New Jersey*. Rhodora 23: 221-223. 1921.—A description is given of a large well established colony as a new station for this species along the railroad embankment near Atco, New Jersey. This is a tropical American species known in northeastern U. S. A. as one of the ballast plants formerly found about certain Atlantic seaports. It is suggested that this colony may have originated from seed dropped with car-sweepings.—James P. Poole.

4691. LONG, C. A. E. *Some rare plants from Knox county, Maine*. Rhodora 23: 198-199. 1921.—This is an addition to a previously published list of noteworthy Matineus plants, together with a list of a few interesting species collected from other parts of Knox County.—James P. Poole.

4692. LYNES, H. *Notes on the natural history of Jebel Marra*. Sudan Notes and Records 4: 119-137. 1921.—Notes are recorded of the occurrence of a number of vascular plants in this region, based on specimens obtained in the expedition of 1920.—C. W. Dodge.

4693. MERRILL, E. D., L. DIELS, and REHDER. [List of determination of plants collected in Kiangsi and Chekiang.] Ko-Hsueh [Science-Publ. Chinese Sci. Soc.] 7: 958-964. 1922.—A list is given of 211 plants collected in the provinces of Kiangsi and Chekiang, with the botanical names.—Chunjen C. Chen.

4694. NELSON, AVEN. *Flora of the Navajo Indian Reservation II*. Amer. Bot. 28: 20-25. 1922.

4695. NELSON, JAMES C. *Notes on the ballast-vegetation at Linnton, Oregon*. Torreya 23: 1-3. 1923.—The list of plants as reported in Torreya 17: 151-161. 1917, has been much diminished by the construction of a ship-yard on the area. A list is presented of 20 species that still persist, and seem likely to become permanent additions to the flora of Oregon.—J. C. Nelson.

4696. PARKER, CHARLES S. *Lathyrus Nissolia* a recent introduction in the state of Washington. *Rhodora* 23:246. 1921.—The author found this species growing on a dry hillside near Pullman, blooming in profusion about July 1.—*James P. Poole*.

4697. ROMPAEY, EM. VAN. Ingebrachte planten in de omgeving van Antwerpen. [Introduced plants in the vicinity of Antwerp.] *Naturwettenschapp. Tijdschr.* 3: 134-138. 1921.—The author presents a list of 80 introduced seed plants with notes on acclimatization and original sources of introduction.—*C. D. La Rue*.

4698. SMALL, JOHN K. Another *Sonchus* for America. *Torreyia* 21:100-101. 1921.—*Sonchus uliginosus*, Bieb., a species of Russia not previously reported from the U. S. A., is represented in the herbarium of the New York Botanical Garden by specimens collected near Hecktown, Northampton County, Pennsylvania, by Eugene A. Rau, July 21, 1921.—*J. C. Nelson*.

4699. STANCLIFF, J. O. Botanical notes from Tahiti. *Amer. Bot.* 29: 3-6. 1923.—A few popular notes on the common plants of that region are recorded.—*S. P. Nichols*.

4700. STEVENS, O. A. The Turtle Mountains of North Dakota. *Amer. Bot.* 28: 9-14. 1922.—The author presents an account of the topography and flora of the region.—*S. P. Nichols*.

4701. TOVEY, J. R. The introduced flora of Victoria. *Jour. Dept. Agric. Victoria* 19: 614-618. *Fig. 1-6*. 1921.—Brief comments are given on 14 species of introduced plants.—*Wm. E. Lawrence*.

4702. WHITE, C. T. Notes on the genus *Flindersia* (Family Rutaceae.) *Proc. Linnean Soc. New South Wales* 46: 324-329. 1921.—This genus was founded by R. Brown in 1814 on *Flindersia australis*, the "crow's ash" of Queensland or "teak" of northern N. S. W. Eighteen species are known, only 3 of which are found outside Australia. The others all grow in Queensland while 6 of these extend into N. S. W. The genus includes some of the most important timbers of Eastern Australia, as "crow's ash" (*F. australis*), "yellow wood" (*F. Oxleyana*), "North Queensland maple" (*F. Brayleyana*), "silk wood" (*F. Pimenteliana*), and "silver beech" or "Putts pine" (*F. acuminata*). Detailed notes and references are given on the following species: *F. Pimenteliana* F. v. Muell., *F. Bourjotiana* F. v. Muell., *F. Brayleyana* F. v. Muell., *F. Schottiana* F. v. Muell., *F. pubescens* (F. v. Muell.), Bail., *F. collina* Bail., *F. maculosa* (Lindl.) Benth., *F. Strzeleckiana* F. v. Muell., *F. papuana* F. v. Muell. (doubtful).—*Eloise Gerry*.

SAM F. TRELEASE, *Assistant Editor*

4703. ANONYMOUS. Ore deposits revealed by plants. *Sci. Amer.* 127: 100. 1922.—This is a summary of an article by LIDGELY, E., in *Proc. Australian Mining Inst.*, the date is not given. In Michigan and Wisconsin *Amorpha canescens* indicated the presence of underlying galena beds; *Convolvulus althacoides* in Spain showed the presence of underlying deposits of phosphate ore; and in Montana, *Erigonum ovalifolium* the existence of silver ores; etc.—*Chas. H. Otis*.

4704. ANDREWS, F. M. *Trillium nivale*. *Proc. Indiana Acad. Sci.* 1921: 81-86. *Pl. 1, 1 fig.* 1922.—Specimens of *Trillium nivale*, transplanted from the woods, were kept under observation for several years. Many phases of the plants were studied.—*F. C. Anderson*.

4705. ATKINS, W. R. G. The preparation of permanently non-acid formalin for preserving calcareous specimens. Jour. Marine Biol. Assoc. United Kingdom [Plymouth] 12: 792-794. 1922.—Commercial formalin, 40 per cent, may be as acid as pH 2.8. Formalin that is permanently non-acid and only slightly alkaline, close to pH 9, may be prepared by the addition of borax until a good red color is shown with phenolphthalein, or a slaty blue with thymol blue, when added to the diluted formalin.—*Marshall A. Howe.*

4706. BENEDICT, R. C. A Fern Society campaign for wild plant conservation. Amer. Fern. Jour. 12: 131-133. 1922.

4707. BENEDICT, R. C. Progress of the Fern Society program for wild plant protection. Amer. Fern Jour. 13: 18-22. 1923.—The article contains comments on the question of "game laws" and a plea for cooperation in the preservation of wild plant life.—*F. C. Anderson.*

4708. CASTLE, H. The catapult of the fern. Sci. Amer. 127: 330. 5 fig. 1922.—This is a popular article on the sporangium and dispersal of spores in ferns.—*Chas. H. Otis.*

4709. COLLINS, J. H. Sugars of great price. Sci. Amer. 126: 313, 362-363. 2 fig. 1922.—The author considers the prices, characteristics, and some of the uses of rare sugars.—*Chas. H. Otis.*

4710. GARDENWITZ, A. Plants as inventors. Sci. Amer. 126: 402-403. 6 fig. 1922.—A brief review is given of FRANCÉ, R. H., Die Pflanze als Erfinder, in which it is shown that sound engineering principles are practiced by plants.—*Chas. H. Otis.*

4711. HAUSMAN, L. A. The microscopy of foods. A study of starch, the world's premier alimental substance. Sci. Amer. 127: 256-257. 7 fig. 1922.—This is a popular treatment of the subject.—*C. H. Otis.*

4712. KEGEL, K. Aufbereitung und wirtschaftliche Verwendung der Kohlen, insbesondere der Braunkohlen. [Preparation and industrial use of coal, especially lignite.] Naturwissenschaften 10: 855-861, 882-888. 10 fig. 1922.

4713. KLUGH, A. B. The plunger pipette—a new instrument for isolating minute organisms. Jour. Roy. Microsc. Soc. London 1922: 267-268. 1 fig. 1922.—A description is given of a capillary pipette with a delicate glass rod plunger actuated by pressure on the end of the rod and controlled by the resiliency of a piece of rubber tube connecting the pipette with the glass rod.—*Wm. Randolph Taylor.*

4714. McCLUNG, L. The seventy-five mile city. Sci. Amer. 127: 156-157, 213-214. 3 fig. 1922.—This popular exposition of Henry Ford's proposed development of Muscle Shoals presents the agricultural and fertilizer manufacturing aspects.—*Chas. H. Otis.*

4715. SHEPPARD, E. J. A new method of treating and mounting celloidin sections. Jour. Roy. Microsc. Soc. London 1921: 20-22. 1921.—Mounts from 95 per cent alcohol to "Euparal" were satisfactory, the method counteracting the frilling of the celloidin and furnishing a simplified technique.—*Wm. Randolph Taylor.*

4716. STRACHAN, J. The microscope in the paper mill. Jour. Roy. Microsc. Soc. London 1922: 249-260. 1922.—With the introduction of many new fibers into paper manufacture in the latter half of the 19th century, the use of the microscope increased for the determination of these fibers. It is also used in the identification of sizing starches, mineral filling powders and foreign matter, and in connection with the control of fiber length, the grinding of pulp, etc. An outline is given of new or little known ways in which the microscope could be used in commercial practice.—*Wm. Randolph Taylor.*

4717. SUTCLIFFE, H. The use of the microscope in the rubber industry (Eastern plantations). Jour. Roy. Microsc. Soc. London 1922: 245-248. Pl. 12, 13. 1922.—The microscope is used to detect the presence of faults, such as air bubbles, water droplets, rust due to bacteria, yeasts and molds in the pans, and fragments of the bark of the tapped tree; also in the study of diseases of the trees.—*Wm. Randolph Taylor*.

BOTANICAL ABSTRACTS

A monthly serial furnishing abstracts and citations of publications in the international field of botany in its broadest sense.

C. V. PIPER, *Editor*

MARY R. BURR, *Assistant Editor*

(See also in this issue Entries 4790, 4801, 4878, 4886, 4892, 4907, 4932, 4960, 4990, 5118, 5121, 5126, 5179, 5203, 5240, 5260, 5268, 5270, 5271)

4718. ANONYMOUS. A classification and detailed description of oats of Australia. *Inst. Sci. and Indust. Australia Bull.* 23. 31 p., 4 pl., 4 (col.) fig. 1922.—Australian grown oats of 3 species, *Avena sativa*, *A. orientalis*, and *A. sterilis*, are classed in 27 agricultural varieties and an identification key is presented. The botanical and agricultural characters used in classification are discussed in detail. Of the varieties, 6 were produced by breeding in Australia.—*L. R. Waldron.*

4719. ANONYMOUS. A classification and detailed description of the barleys of Australia. *Inst. Sci. and Indust. Australia Bull.* 22. 33 p., 1 pl., 4 fig. 1922.—Australian-grown barleys of 4 botanical varieties are grouped into 7 classes, 15 types, and 35 agronomic varieties. The botanical and agricultural characters used in classification are discussed in detail.—*L. R. Waldron.*

4720. ANONYMOUS. Australian salt-bush in South Africa. *Jour. Dept. Agric. Victoria* 19: 635-636. 1921.—The characteristics of 7 species of Australian salt-bushes are briefly described and cultural methods for Australian conditions briefly discussed.—*H. L. Westover.*

4721. ANONYMOUS. Local trials with sunflowers as silage. *Agric. Gaz. New South Wales* 34: 158. 1923.—The silage was unpalatable due probably to its high acidity.—*L. R. Waldron.*

4722. ANONYMOUS. Sudan grass: *Andropogon sorghum sudanensis*. *Jour. Dept. Agric. Victoria* 19: 507-508. 1921.—This article describes the grass and discusses its culture, including climatic and soil conditions, seed-bed preparation, time and methods of sowing, fertilizers, pasturing, and harvesting. Among the fertilizers tested Sudan grass responded very readily to superphosphate, 100 pounds per acre giving an increase of 73 per cent in yield above the unmanured check plot.—*H. N. Vinall.*

4723. ANONYMOUS. **The cultivation of maize.** Jour. Dept. Agric. Victoria 19: 668-676. 4 fig. 1921.—The essentials of maize culture are considered, including such topics as varieties, rotations, preparation of seed bed, rate, date and method of planting, fertilizers, cultivating, harvesting and selecting, testing, and caring for the seed.—*F. D. Richey.*

4724. ANONYMOUS. **Undersogelser over Landbrugets Driftsforhold Regnskabsresultater fra Danske Landbrug.** [Examination of results of agricultural experiments.] Tidsskr. Landokonomi 1923: 74-87. 1923.—The different soil characteristics in North and South Jutland, the Island of Zealand and other Danish islands including Bornholm in the Baltic Sea, are discussed.—*Albert A. Hansen.*

4725. BARTLETT, H., and W. D. KERLE. **Farmers' experiment plots. Wheat, oat and barley experiments, 1922.** Agric. Gaz. New South Wales 34: 161-170. 1923.—Cooperative experiments were conducted upon 27 private farms. Tables show precipitation, cultural details, and yields. Federation, Hard Federation, and Canberra wheats gave satisfactory results. Plots receiving phosphatic fertilizers produced significantly greater yields in comparison with check plots.—*L. R. Waldron.*

4726. BECHDEL, S. I. **Sunflower silage for milk production.** Pennsylvania Agric. Exp. Sta. Bull. 172. 16 p. 1922.—Sunflower silage and corn silage are compared as to quantity of milk and butter fat produced and effect on the weight of dairy cows. It was found that sunflower silage contains about 4 per cent less dry matter than corn silage but is practically equal to the latter in all the principal food elements except nitrogen-free extract.—The results of 2 feeding tests with dairy cows indicated that (1) sunflower silage was less palatable than corn silage, (2) the cows produced only 86.4 per cent as much milk when fed sunflower silage as when fed corn silage, and (3) a silage $\frac{1}{2}$ sunflower and $\frac{1}{2}$ corn fed in normal amounts produced less than 92.6 per cent as much milk as a corn silage ration.—*H. N. Vinall.*

4727. BLAKELY, W. F. **Weeds of New South Wales.** Agric. Gaz. New South Wales 34: 181-185. 1 fig. 1923.—*Carduus arvensis* (Canada thistle) is reported for the 1st time in N. S. W. It is described and methods of control are suggested.—*L. R. Waldron.*

4728. BRACKEN, JOHN. **Dry farming in western Canada.** xxi + 386 p. The Grain Growers' Guide, Ltd.: Winnipeg, Canada, 1921.—This is a text book in 17 chapters dealing with the soil and its management under western conditions. It covers the development of dry farming; the climate of western Canada in its relation to crop production; the soil; the moisture problem; dry farm crops and cropping practices; the principles of tillage; breaking the virgin prairie; preparing park belt land for its first crop; tillage of stubble land; summer fallow; crop rotations; weeds and their control; irrigation farming in western Canada; causes and control of low yields; management of special soils; lessons from experience; and the problems of crop production. The chapter on soils was contributed by ROY HANSEN; the chapter on irrigation by W. H. FAIRFIELD; and the chapter on lessons from experience, by 10 of the leading agronomists of the Great Plains region of Canada and the U. S. A. The book "presents under one cover a more or less complete statement of our present knowledge concerning the methods of producing crops at a profit under relatively dry conditions."—*John S. Cole.*

4729. CALL, L. E. **Increasing the efficiency of agronomic research.** Jour. Amer. Soc. Agron. 14: 329-338. 1922.—Presidential address.—*F. M. Schertz.*

4730. CH[ÉVALIER], A. [Rev. of: ROUEST, (L.). *Le soja et son lait végétal, applications agricoles et industrielles.* (Agricultural and industrial applications of the soybean and soybean milk.) 8°, 157 p., 8 fig. Bibliothèque de technique agricole moderne; Paris, 1921.] Rev. Bot. Appl. et Agric. Coloniale 2: 34-37. 1922.—The reviewer believes that the new varieties of soybeans mentioned by the author as well fixed should not be so regarded until years of selection have made them constant. He agrees with the author that there should be a station established for the study of applied genetics in France, and also that the cultivation of the soybean should be extended throughout France and her colonies.—*Paul Russell.*

4731. CONNER, S. D. **Use of muck soils for the production of general farm crops.** Jour. Amer. Peat Soc. 16: 5-9. 1923.—In the U. S. A. there are some 15 million acres of swamp land, consisting largely of peaty soils. In Michigan and Indiana alone there are over 3 million acres of swamp land. Experiments have proved that practically all crops grown on other soils in the same locality can be grown on peat.—*Mary R. Burr.*

4732. DUCELIER, L. **Les pâturages du Maroc. Considérations générales sur l'amélioration de la production fourragère dans l'Afrique du Nord.** [The pastures of Morocco. General considerations on the improvement in the production of forage in northern Africa.] 52 p. Imprimerie algérienne: Algeria, 1919. [Bibliothèque du colon du Nord de l'Afrique.]—In spite of the great importance of forage in Morocco, the pastures and hay fields of the country yield much less than would be the case if greater care were given them. Means suggested to increase the yields and the value of the forage include the prevention of the seeding and spreading of weeds, proper cultural care of the fields, better methods of harvesting hay, the growing of forage plants, and the domestication and cultivation of native plants of forage value. Lists are given of the grasses, legumes, and other plants growing in the fields of the various regions of Morocco, with notes on their relative importance as sources of forage.—*Jessie Wood.*

4733. GREENWOOD, F. W. **Liming and manurial trials with rape at Martinsborough.** New Zealand Jour. Agric. 24: 213-218. 1922.—Experiments were carried out to determine whether lime was beneficial to rape and whether uncrushed lime from the local deposit could be used as profitably as burnt lime or ground limestone, which was shipped in and cost on the land twice as much as the local lime. Another problem was the effect of the lime on certain phosphate fertilizers. The results showed that (1) lime yields beneficial results; (2) while the imported ground limestone acts more quickly the local screened limestone is more economical; (3) superphosphate and lime gave better results than superphosphate alone. All tests were made on rape.—*H. N. Vinal.*

4734. HARTWELL, BURT L. **Liming with high-magnesium versus high-calcium limes.** Rhode Island Agric. Exp. Sta. Bull. 186. 19 p. 1921.—Results of field experiments from 1909 to 1920 are reported. In 1917, the ratio of magnesium oxide to calcium oxide in dried endive was, respectively, 1 to 1.1 and 1.5 with magnesian hydrate and limestone; whereas it was 1 to 2.2, 3.0, and 2.8 with calcic hydrate and limestone, and with no lime.—Certain sensitive crops have been benefited very much by the liming; the beet crop, for example, was frequently increased 6 fold. Even such sensitive crops, however, did not react to liming in such a way as to warrant generalizations concerning specific effects of the different kinds of lime.—As an example of the effect of crops on a following crop, on the unlimed soil, onions at the rate of 92 bushels were produced after sugar beets, 288 after beans, 319 after onions, and 400 after endive; whereas, on the adjoining limed plot, the range was only from 485 to 590 bushels.—In a mixture, the proportion of red clover and timothy was about twice as great on the limed areas as on the unlimed plot, whereas the reverse was true of the alsike clover and red top.—*B. L. Hartwell.*

4735. HARTWELL, BURT L., and F. R. PEMBER. **The feeding power of certain cereals, and their response to fertilizer ingredients.** Rhode Island Agric. Exp. Sta. Bull. 190. 27 p. 1922.—In the field was exhibited (1) a low response to nitrogen by spring rye, to phosphorus by buckwheat, oats, and millet, and to potassium by rye, oats, millet, and spring wheat; (2) a medium response to nitrogen by oats and wheat, to phosphorus by barley, rye, and wheat, and to potassium by barley and buckwheat; and (3) a high response to nitrogen by millet, buckwheat, and barley. Usually the conditions favored oats, buckwheat, and millet more than the other crops.—With liberal fertilizer each cereal grew somewhat better following wheat, barley, and oats than following rye, and also following buckwheat instead of millet. The growth of buckwheat was much depressed by a preceding crop of millet.—Feeding power of crops may depend more on their longevity, and on the fact that the most active growth occurs at different times, than to marked differences in ability to absorb nutrients during one definite period under a uniform set of soil conditions.—*B. L. Hartwell.*

4736. HOLLISTER, BERTHA A. **The relation between the common weeds of Michigan and those found in commercial seed.** Rept. Michigan Acad. Sci. 22: 187-188. 1920.—In general the relative frequency of weed seeds in samples of commercial seeds shows a close correlation to the abundance of the weeds in the state. This does not hold true for some weeds where such seeds are very easily and thoroughly cleaned out of the commercial seed by only moderate fanning, e.g., *Linaria linaria*, *Asclepias syriaca*, *Leontodon tarazacum*. On the other hand the pappus of *Cirsium arvense* is so easily detached from the akene that the latter remains with the crop seed and only the pappus is removed by the fanning. The origin of the seed may often be determined by the weed seeds present.—*Ernst A. Bessey*.

4737. HOPKINS, C. G. **How Greece can produce more food.** Illinois Agric. Exp. Sta. Bull. 239. 433-467. Fig. 1-15. 1922.—Cyril G. Hopkin's report on agricultural conditions existing in Greece and recommendation of some practical scientific methods for improving the conditions is reprinted as it was prepared by him for presentation to the people of Greece.—*O. H. Sears*.

4738. HOWELL, J. PRYSE. **The productivity of hill farming, being the report of an inquiry in three typical districts.** 23 p. Oxford University Press: London, 1922.—A study of the problems confronting parts of West Britain relating to improvement of breeds, destruction of goose heather and bracken, shelter belts, marketing, control of commons, drainage, and manuring and short rotations is reported.—*A. J. Pieters*.

4739. HOYER, JAMES. **Det Kgl. danske Landhusholdningsselskabs Kontrol med Korn og Foderstoffer i Kobenshavns Frihavn i Aaret 1922.** [The Royal Danish Agricultural Society's control with wheat and cattlefood in Copenhagen's free harbor during the year 1922.] Tidsskr. Landokonomi 3: 157-164. 1923.—The Royal Danish Agricultural Society maintains a "control and inspection" office at the famous Free Harbor of Copenhagen. The inspector here reports results for the year 1922.—*Albert A. Hansen*.

4740. HULBERT, H. W. **Factors affecting the stand and yield of sweet clover.** Jour. Amer. Soc. Agron. 15: 81-87. 1923.—Various methods of seeding sweet clover lead to the following conclusions: the higher the rate of seeding the greater the loss in stand. Where a nurse crop was used the reduction in stand was greatest. The lighter rates of seeding produced satisfactory yields, but the poorest was very coarse and stemmy. Peas made a more desirable nurse crop than any of the small grains. There was apparently no relation between the water requirement of the crop and its desirability from the standpoint of effect upon stand and yield of sweet clover.—*F. M. Schertz*.

4741. KERLE, W. D. **Field wheat and fallowing competition.** Eugowra P., A., and H. association. Agric. Gaz. New South Wales 34: 153-158. 1923.—Crops were scored on yield, freedom from disease, cleanliness, type, evenness and condition, with appropriate weighting. Flag smut and certain root-rot diseases are increasing in the district.—*L. R. Waldron*.

4742. McCULLOCH, W. J. **Recent lucerne experience at Weraroa.** New Zealand Jour. Agric. 25: 162-164. 1922.—A cultivation test to assist in maintaining a stand proved practically valueless. It is concluded that the amount of attention necessary to control the grass and clover renders the production of lucerne economically unsound. A mixture of permanent grasses and clover gave much more satisfactory results.—*H. L. Westover*.

4743. MCFADZEAN, J. S. **Mangels and maize for summer fodder.** Jour. Dept. Agric. Victoria 19: 445-446. 1921.—The author discusses the importance of an abundance of fodder in dairy farming and the methods of soil preparation, planting, cultivating, and utilizing mangels and maize.—*F. D. Richey*.

4744. NOLL, CHARLES F. **The effects of phosphates on early growth and maturity.** Jour. Amer. Soc. Agron. 15: 87-99. 1923.—Data and observations on the effect of phosphate on early growth are summarized, with a few unpublished results secured on fertilizer plots at the Pennsylvania Experiment Station.—*F. M. Schertz.*

4745. PFEIFFER, TH. **Die Möglichkeit eines teilweisen Ersatzes der Phosphorsäure durch Kieselsäure in den Pflanzen.** [The possibility of a partial substitution of phosphoric acid by silicic acid in plants.] Mitteil. Deutsch. Landw. Ges. 38: 196-198. 1923.—This is a review of a paper by O. LEMMERMANN and H. WIESSMANN [Zeitschr. Pflanzenernährung und Düngung, Heft 5, 1922], who showed that when plants are well supplied with nitrogen and potash, silicic acid in addition to phosphoric acid increases the yield of grain in oats. Pfeiffer suggests that silicic acid can replace part of the phosphoric acid in stems and leaves and thus leave more phosphoric acid free for the organic combinations present in the grain.—*A. J. Pieters.*

4746. PITT, J. M. **Farmers' experiment plots. Winter green fodder experiments, 1922.** Agric. Gaz. New South Wales 34: 175-180. 2 fig. 1923.—Heaviest yields were secured from certain varieties of oats combined with a legume. Inclusion of a legume with oats made a very decided increase in yield. Satisfactory yields were secured from wheat grown for green forage.—*L. R. Waldron.*

4747. POLE, EVANS, I. B. **Ambari or Deccan hemp: Hibiscus cannabís L.** Jour. Dept. Agric. Union of South Africa 1: 570-580. Pl. 1-4. 1921. [Reprinted from South African Jour. Indust. 1: No. 3.]—Ambari, an erect annual yielding a bast fiber called Bimlipitam jute, Deccan hemp, and Gambo, is native in Africa and now widely distributed through India, Asia, and Australia. It is cultivated in India (also in Senegal where its fiber is called "da"). It is abundant and troublesome as a weed in some localities in South Africa. The plant grows 5-11 feet high, with considerable variation in branching, time of maturity, and robustness. The stem and leaf stalks are prickly and the seed pods bristly. No attempt has been made to produce the fiber in South Africa, but samples of the fiber from plants in different stages of maturity and different periods of water retting, 27-72 days, have been submitted to the Imperial Institute in London, which reports that if properly prepared, this fiber might find a ready market, serving the same purpose as jute. Experiments at Pretoria show that the plants may be retted in 10-14 days with water at 18-26°C., yielding 10.7-11.9 per cent of good fiber. Improving the plants and developing methods for preparing the fiber are necessary to establish the industry in South Africa.—*Lyster H. Dewey.*

4748. POPP, M., und J. COUTZEN. **Die Bedeutung einer Magnesiadüngung für unsere Kulturpflanzen.** [The importance of magnesium fertilization for cultivated plants.] Landw. Jahrb. 58: 313-354. 1923.—This is a study of the influence of magnesium on the growth of cultivated plants. The results may be summarized as follows: The addition of various salts of magnesium to potassium salts, both on sandy and peat soils, did not influence appreciably the yield of various crops. The crop yield is greatly influenced by the physiological reaction of the fertilizing salts, depending on the reaction of the soil. The potassium content of plants is greatly influenced by the potassium fertilizer; however, the former cannot be used as an index of the latter. In some cases of low crop yields, due to lack of potassium fertilizer, as in the cases of grasses and straw, the percentage content of potassium may be higher than in the crops receiving applications of this fertilizer. The magnesium content of plants has usually been incorrectly recorded. The tables of Stutzer need to be corrected. The magnesium content of plants is not influenced appreciably by potassium or magnesium fertilizer. The utilization of soil potassium is usually parallel to that of soil magnesium. The quantities of magnesium present in most soils are sufficient for the need of the cultivated plants tested.—*S. A. Waksman.*

4749. PRIDHAM, J. T. *Jottings on the past season at Cowra.* Agric. Gaz. New South Wales 34: 159-160. 1923.—Varieties of oats, wheat, and peas are discussed.—*L. R. Waldron.*

4750. SMALL, JOHN K. *The Austrian field cress again.* Torreyia 23: 23-25. 1923.—Supplementing the notes of A. A. Hansen in Torreyia 22: 73-77 [see Bot. Absts. 12, Entry 48] on the occurrence in New York, of *Roripa austriaca* Spach, for which Small here creates the new combination *Radicula austriaca* (Crantz) Small, the author reports the finding of the same plant by A. L. Stone on the farm of the University of Wisconsin. It produces no fruit, and is propagated readily by the roots. It seems to have been imported in alfalfa seed from Turkestan, and is spreading rapidly.—*J. C. Nelson.*

4751. STROUP, FREEMAN P. *Corn and its products.* Amer. Jour. Pharm. 94: 788-797. 1922.—A popular lecture.—*Anton Hogstad, Jr.*

4752. STUART, W. *The potato: its culture, uses, history, and classification.* ix + 518 p, 5 pl., 267 fig. J. B. Lippincott Co.: Philadelphia and London, 1923.—This is a comprehensive and practical treatise dealing with the many factors involved in the production of potatoes in the U. S. A. The industrial uses of the crop are enumerated, the botany and history are given in summary form, and potato breeding and selection are discussed. Classifications are reviewed, a modification of that of the author (U. S. Dept. Agric. Bull. 176) being supplemented by plates in colors of typical tubers and floral organs of leading varieties. A student's project in growing potatoes for profit, a list of varieties with their characteristics, groups and origin for each, and the yearly average acreage and production by states and by the Canadian provinces are appended.—*H. M. Steece.*

4753. WAGNER. *Die Bedeutung der Gründüngung unter den heutigen Verhältnissen.* [The significance of green manuring under present conditions.] Mitteil. Deutsch. Landw. Ges. 38: 201-203. 1923.—In this address the speaker reports his personal experiences with green manures. The value of clover, either red or a mixture of red, alsike and white, seeded in grain and turned under for the next grain crop, is especially emphasized.—*A. J. Pieters.*

4754. WILSON, H. C. *Comparative costs of production of oats for grain and hay on stubble and fallow land.* Jour. Dept. Agric. Victoria 19: 306-309. 1921.—Comparative experiments indicate that oats for grain and hay can be grown at much less cost per bushel and ton, respectively, on fallowed land than on stubble or green ploughed land, even in a season of good rainfall, when the stubble land has the advantage. Yield of hay per acre was 61 hundred weight on fallowed land and 38 hundred weight on stubble land, which made the cost of production 29 s. 3 d. and 39 s. 3 d. per ton, respectively. When grown for grain, fallow land gave 62.4 bushels and stubble land 38 bushels per acre. After allowing for the sale of straw, the actual cost per bushel was 1 s. $\frac{1}{2}$ d. for fallow land and 1 s. 4 $\frac{1}{2}$ d. for stubble land.—*W. J. Morse.*

4755. YANTIS, R. E. *Farm acreages, values, etc.* Texas Dept. Agric. Bull. 70. 42 p. 1922.—A map of Texas shows chief crops of each area. Statistics are given in tabulated form by counties, of ownership, expenditures, acreage, etc.—*L. Pace.*

4756. ANONYMOUS. *A curatorship of plant pathology.* Brooklyn Bot. Gard. Rec. 10: 18-19. 1921.—Announcement is made of a gift to the Brooklyn Botanic Garden of \$50,000 to become available over a period of 4 years from Jan. 1, 1921, for research in plant pathology. Also announcement of the appointment of George Matthew Reed as curator of plant pathology to have charge of the new work.—*C. S. Gager.*

4757. ANONYMOUS. **A new botanic garden.** Brooklyn Bot. Gard. Rec. 12: 23. 1923.—This proposed new botanic garden and arboretum at Joliet, Illinois, has a nucleus of 327 acres, on which, according to Willard N. Clute, commissioner in charge of the grounds, practically every kind of American tree that will stand the climate has been growing for nearly 20 years. Other commissioners are Messrs. James H. Ferriss and Pilcher of Joliet.—*C. S. Gager.*

4758. ANONYMOUS. **A new botanic garden in Holland.** Brooklyn Bot. Gard. Rec. 11: 111-112. 1922.—The University of Utrecht has come into possession of a 2nd botanic garden, presented to the botanical department of the university by the heirs of August Janssen, deceased in 1919. The tract, known as "Cantonspark," is situated on the outskirts of the village of Boarn, about 18 km. from Utrecht. A. Pulle, professor of systematic botany, University of Utrecht, has been made director of the new garden, while F. A. F. C. Went retains the directorship of the botanical garden in Utrecht.—*C. S. Gager.*

4759. ANONYMOUS. **An index to periodical literature.** [Rev. of: *The subject index to periodicals. K: science and technology. 555 p. Library Association: London, 1922.*] Nature 111: 214-215. 1923.—This contains titles of 15,000 papers published in 400 periodicals during the years 1917-19.—*O. A. Stevens.*

4760. ANONYMOUS. **Note.** Nature 111: 266. 1923.—An exhibit has been installed at Kew Gardens, consisting of funeral wreaths, etc., from Egyptian tombs of 1100 and 1700 B. C. The flowers chiefly used are *Nymphaea coerulea*, *Acacia arabica* var. *nilotica*, together with leaves of *Mimusops Schimperii* and *Salix Safsaf*. These are identical with species found growing at the present day.—*O. A. Stevens.*

4761. ANONYMOUS. **Obituary. Prof. Gaston Bonnier.** Nature 111: 265. 1922.—This is a brief note on the activities of Bonnier. "His published research on the correlation of function, form, and structure of plant organs is as remarkable for its simplicity and clearness of style as for its scientific value." He "played a most important part in the reform and extension of the teaching of the natural sciences in France."—*O. A. Stevens.*

4762. ANONYMOUS. **The Knox Arboretum and Botanic Garden.** Brooklyn Bot. Gard. Rec. 11: 113. 1922.—The new arboretum and garden between Thomaston and Warren, Maine, is being developed under the auspices of the Knox Academy of Arts and Sciences. This institution, established in 1908, now has 60 acres. The director is Norman W. Lermond. There is a growing library and herbarium, and a List of Trees and Shrubs in the Knox Arboretum has been published.—*C. S. Gager.*

4763. ANONYMOUS. **The old Linnean garden at Upsala.** Brooklyn Bot. Gard. Rec. 11: 112. 1922.—This is a quotation from an article by C. S. SKOTTSBERG [Bull. Misc. Information, Kew, No. 6, 1920] on the restoration of Linnaeus' botanic garden according to the original plan.—*C. S. Gager.*

4764. ANONYMOUS. [Rev. of: RHODE, ELEANOUR SINCLAIR. *The old English herbals. xii + 243 p. Longmans, Green and Co.: London, 1922.*] Nature 111: 143. 1923.—The book is very readable, but the limitation to English herbals is unfortunate in the respect that few of these had any influence on the course of botany.—*O. A. Stevens.*

4765. BRIDEL, MARC. **Emile Bourquelot, 1851-1921.** Bull. Soc. Chim. Biol. 3: 253-258. 1921.—A biographical sketch is presented. Bourquelot discovered 6 enzymes,—trehalase, pectosase, pectinase, seminase, gease, and gentiobiase,—and considerably extended knowledge of inulase, invertin, lactase, maltase, gaulterase, and the oxidases. His most important contribution to enzyme chemistry was the discovery of the synthetic action of certain enzymes and consequently of the reversibility of enzyme action.—*Joseph S. Caldwell.*

4766. EBERLE, E. G. **Clement Belton Lowe.** Obituary. *Amer. Jour. Pharm.* **95**: 159-162. *Pl. 1.* 1923.—This is a sketch of the life and activities of Dr. Lowe, Professor Emeritus of *Materia Medica*, Philadelphia College of Pharmacy, who died Feb. 5, 1923. He was editor of *The Medicinal Plants of the Philippines*, author of *A Syllabus of the Botanical Natural Orders*; and an active member of the American Pharmaceutical Association.—*Anton Hogstad, Jr.*

4767. EBERLE, E. G. **Edward Morell Holmes.** *Jour. Amer. Pharm. Assoc.* **12**: 193-195. *Pl. 1.* 1923.—This is a brief sketch of the British botanist, who has concluded a half-century as curator of the Museum of the Pharmaceutical Society of Great Britain. He was awarded the British Pharmaceutical Society's bronze medal for an herbarium of British plants, the Flückiger medal, and the Hanbury medal. Reference is made to some of the collections of the museum sorted and catalogued by Holmes.—*Anton Hogstad, Jr.*

4768. EBERLE, E. G. **Émile Perrot, D. ès-Sc.** *Jour. Amer. Pharm. Assoc.* **12**: 289-290. *Portrait.* 1923.—Perrot, Hanbury medalist, 1922, distinguished himself by his researches on *materia medica*, which include the various species of *Cinnamomum* and *Strychnos*, the gentians, coriander fruits, Kinkeliba, savin, ginseng, kola nuts, balsam tolu, etc. The most important research is that published with M. Goris, on the stability of vegetable drugs and the preparation of what have been termed "physiological vegetable extracts" or "intracts." The process for these involves the destruction of all enzymes, whereby the drugs and their preparations possess the physiological action of the fresh plant and retain it indefinitely.—*Anton Hogstad, Jr.*

4769. GERSHENFELD, LOUIS. **Louis Pasteur.** *Amer. Jour. Pharm.* **94**: 766-782. 1922.—The life and varied scientific activities of Louis Pasteur are reviewed.—*A. Hogstad, Jr.*

4770. HAAN, H. R. M. DE. **Overzicht der koffieliteratuur.** [Survey of coffee literature.] Mededeel. Proefsta. Malang. **39.** 58 p. 1923.—A list of 678 numbered titles arranged alphabetically by authors is followed by a classified list in which the titles are referred to by number only.—*J. R. Schramm.*

4771. LAWALL, CHARLES H. **The romance of spices.** *Amer. Jour. Pharm.* **95**: 193-223. *Fig. 1-8.* 1923.—This popular lecture contains brief notes concerning individual spices.—*Anton Hogstad, Jr.*

4772. LENDNER, A. M. **Eugène Privat, Avocat.** [Eugene Privat.] *Bull. Soc. Bot. Genève* **13**: 34-35. 1921.—This charter member and former president of the Botanical Society of Geneva died Dec. 1, 1921.—*W. H. Emig.*

4773. MALTE, M. O. **The first fifty years of the Arnold Arboretum.** *Canadian Field Nat.* **37**: 28-30. 1923.—A synopsis is given of a paper with the above title appearing in the *Jour. Arnold Arboretum* **3**: 127-171. 1923.—*W. H. Emig.*

4774. NEWCOMBE, C. F. **Menzies' Journal of Vancouver's Voyage, April to October, 1792.** *Archives of British Columbia, Victoria*, 1923.—Besides the text of the Journal, the publication contains a biography of Menzies (by J. Forsyth), and a list of Menzies' publications and of plants collected by him on the northwest coast of America. The plants are grouped as follows: (1) ferns and flowering plants, 335 species; (2) mosses, 24 species; (3) lichens, 18 species; (4) marine algae, 22 species.—*G. B. Rigg.*

4775. NICLOUX, MAURICE. **Armand Gautier, 1837-1920.** *Bull. Soc. Chim. Biol.* **3**: 248-252. 1921.

4776. RUDOLPH, ADELAIDE. **Henry Vincome Arny.** *Jour. Amer. Pharm. Assoc.* **12**: 99-100. *Pl. 1.* 1923.—This is a brief sketch of the president-elect of the American Phar-

maceutical Association for 1923-1924. As teacher, author, editor, research worker, and association worker his labors have been unremitting and effective. He was awarded the Remington Honor Medal for 1922.—*Anton Hogstad, Jr.*

4777. SEDGWICK, WILLIAM THOMPSON. *Darwin and Pasteur: an essay in comparative biography*. Science 57: 286-289. 1923.—This essay, left unfinished at the death of the author, compares the methods and results of these 2 men.—*C. J. Lyon.*

4778. SMITH, LOUIE H. Professor J. G. Mosier. Jour. Amer. Soc. Agron. 15: 29-30. 1923

4779. STURMER, J. W. Johnny Appleseed. Amer. Jour. Pharm. 94: 699-702. 1922.—The life and activities are sketched of John Chapman, better known as Johnny Appleseed, one of the most picturesque pioneers of the Ohio Valley. Arriving there in 1806, he planted his first nursery near the present town of Steubenville. His seedlings and seeds were distributed without charge, and several of the trees, near Fort Wayne, Indiana, are still bearing fruit. He preceded the country doctor and the village apothecary, being a pioneer in supplying medicine to the settlers. [Printed also in Jour. Amer. Pharm. Assoc. 11: 1022-1024. 1922.]—*Anton Hogstad, Jr.*

4780. UPHOF, J. C. TH. An historic spot for students of genetics. Jour. Heredity 13: 343-345. 3 fig. 1923.—A description is given of the place where in 1886 Hugo de Vries found his mutations of *Oenothera Lamarckiana* on the Spanderswoud estate near Hilversum, Netherlands. At that time the land was a neglected potato field; at present it is partly covered with *Fagus sylvatica* and *Picea excelsa*. By 1921 the forest had developed to a point where it threatened the early extinction of the *Oenotheras*. Accompanying photographs, probably the first ever published of this place, show a general view of the field as it was in 1908, with *Oenotheras* under the beech forest, a wild mutant of *O. oblonga*, and 2 plants of *O. Lamarckiana*.—*J. C. Th. Uphof.*

4781. WHITE, ORLAND E. Botanical exploration in Bolivia. Brooklyn Bot. Gard. Rec. 11: 93-105. 1922.—This is a report to the Director of the Brooklyn Botanic Garden on the botanical work of the Mulford Expedition for the Biological Exploration of the Amazon Basin, June 1, 1921-April 14, 1922.—*C. S. Gager.*

4787. CLARKE, LILIAN J. The botany gardens of the James Allen's Girls' School, Dulwich. 52 p., 10 pl., 1 map, 2 diagr. Board of Education Educational Pamphlet. No. 41. H. M. Stationery Office: London, [date ?] The history and work of the botany gardens, used as an adjunct or outdoor laboratory in connection with the botany classes, is recounted. The main object in developing the gardens has been to make the teaching of botany thoroughly practical by closely associating indoor with outdoor work. Textbooks have been abandoned, the girls being taught to make their own. The garden, of about $\frac{3}{4}$ of an acre, is divided into plots for photosynthesis experiments, plots for pollination experiments, climbing plants on upright screens, beds showing the natural orders (families), vegetable gardens, plant associations including chalk plants, heath plants, a pebble beach, a sand dune, a salt marsh, a small wood produced by planting chiefly *Quercus pedunculata*, and a lane. The instruction given under the above heads is outlined in detail, and lists are given of the species successfully grown in each of the above plots. Only 40 minutes a week is allowed the pupils for this work.—C. S. Gager.

4788. CONARD, HENRY S. That plant. Science 57: 359-360. 1923.—In response to Martin's request [see Bot. Absts. 12, Entry 2984] for suggestions for a good definition of a plant, the writer states that he has used the following, which, is particularly useful in showing that definitions are at best a mere makeshift: "A plant is a living thing which manufactures its own food from the raw materials of earth and air, or one whose ancestors did so."—C. J. Lyon.

4789. DUCEILLER, F. [Rev. of: CHODAT, R. La biologie des plantes. I. Les plantes aquatiques. (Biology of plants. I. Aquatic plants.) 311 p. Atar: Geneva, 1922.] Bull. Soc. Bot. Genève 13: 36. 1921.—The "Biology of plants" by R. Chodat is a book which has no equal.—W. H. Emig.

4790. ETHERIDGE, W. C., and M. L. FISHER. Report of the committee on lectures for a standard introductory course in field crops. Jour. Amer. Soc. Agron. 15: 41-42. 1923.

4791. GORTNER, R. A. What is a plant? Science 57: 614. 1923.—The author, a chemist, suggests a chemical definition for a plant, "a living organism whose cell walls consist predominately of carbohydrate materials."—C. J. Lyon.

4792. GREAVES, JOSEPH E. Agricultural bacteriology. xv + 437 p., 48 fig. Lea & Febiger: Philadelphia and New York. 1922.—The book is divided into 36 chapters. The first 4 are devoted to the history of bacteriology, occurrence, morphology, and classification of bacteria. Physiology is treated in the following 7 chapters, including the composition and metabolism of bacteria, bacterial enzymes, and influence of temperature, light, and other physical factors as well as chemical agents upon bacteria. Soil bacteriology occupies the largest portion of the book, covering the next 15 chapters. These are devoted to the study of the influence of heat, volatile antiseptics, arsenic, salts, and manure on bacterial activities in the soil; followed by a study of methods for the determination of the soil flora, solvent action of bacteria, carbon-, nitrogen-, sulfur-, and phosphorus-cycle of bacteria and the most important transformations in the soil, namely, decomposition of nitrogenous and non-nitrogenous organic matter, nitrification and denitrification, symbiotic and non-symbiotic nitrogen fixation, and crop rotation. Of the remaining 10 chapters, 1 is devoted to bacteria in air, 2 to water bacteriology, 1 to sewage, 2 to milk, 3 to food bacteriology, food poisoning, and preservation of food, and 1 to bacteria in arts and industries.—S. A. Waksman.

4793. GUIGNARD, LÉON. Le jardin botanique de la faculté de pharmacie de Paris. [The botanic garden of the faculty of pharmacy of Paris.] 3rd rev. ed., 179 p. Librairie-Marquette:

Toulouse, 1922.—The principal characters of the various groups of plants cultivated in this botanic garden are given. A few plants not grown in the botanic garden are mentioned because of their interest.—*C. S. Gager.*

4794. JORDAN, E. O. *A text-book of general bacteriology. 7th ed., 744 p.* W. B. Saunders Co., Ltd.: Philadelphia and London, 1922.—In this edition the chapters on influenza and anaerobes have been entirely rewritten, and chapters on streptococci, pneumococci, and typhus fever extensively revised. Important additions have been made to the sections on immunity, yellow fever, and others. The chapter on methods of studying bacteria has been entirely rewritten and enlarged.—*C. S. Gager.*

4795. KENDALL, ARTHUR ISAAC. *Bacteriology, general, pathological, and intestinal, 2nd ed. rev., xi + 680 p., 99 engravings, 8 col. pl.* Lea and Febiger: New York and Philadelphia, 1921.—Section I, general bacteriology; section II, pathogenic bacteria; section III, higher bacteria, molds, yeasts, filterable viruses, and diseases of unknown etiology; section IV, gastro-intestinal bacteriology; section V, applied bacteriology. The author emphasizes what bacteria do, rather than what they are,—how they enter tissues, how they feed, excrete, and reproduce, how they escape from the body, and the chemistry of bacterial activity. New technique of handling bacteria, laboratory equipment, and applications of bacteriology in preventive medicine, serology, and vaccine treatment of disease are emphasized.—*C. S. Gager.*

4796. LÖHNIS, F., and E. B. FRED. *Textbook of agricultural bacteriology. ix + 283 p., 9 pl., 66 fig.* McGraw-Hill Book Co. Inc.: New York, 1923.—Most of the material was published in 1913 under the title *Vorlesungen über landwirtschaftliche Bakteriologie*. The present book is not merely a translation from the earlier German work, but is also a thorough revision and rearrangement with the aim of better adapting the book to American and British needs. The introduction is followed by Part I, general morphology and physiology of bacteria and related organisms, with 7 chapters, respectively on: morphology of bacteria and related organisms; development of bacteria, etc.; classification of bacteria, fungi, and protozoa; relations of microorganisms to their environment; counting, isolating, cultivating, and testing bacteria, etc.; sterilization, pasteurization, antisepsis, and asepsis; activities of bacteria, etc. Part II, dairy and soil bacteriology, with 7 chapters, respectively on: bacteria, etc., in food-stuffs; bacteria, etc., in milk; bacteria, etc., in butter; bacteria, etc., in cheese; sewage disposal; bacteria, etc., in barnyard manures; bacteria, etc., in soils.—*C. S. Gager.*

4797. MADISON, HAROLD L. *Trees of Ohio identified by their leaves. 9 x 19 cm., 24 p., 116 fig.* Cleveland Museum of Natural History: Cleveland, Ohio, 1922.—This booklet constitutes No. 1 of the Pocket Natural History series to be issued by the Museum.—*J. R. Schramm.*

4798. REYNOLDS, E. S., and R. T. HANCE. *Pruning the academic tree.* Science 57: 408–410. 1923.—This is an argument for a general survey course in biology to take the place of 2 specialized courses in elementary botany and zoology. It is claimed that this arrangement is much better for the general student; and for the student going on in either field the necessary technical training is given in the next higher courses.—*C. J. Lyon.*

4799. SOSMAN, ROBT. B. *A first revised edition of the Academy's list of one hundred popular books in science.* Jour. Washington [D. C.] Acad. Sci. 12: 469–476. 1922.

4800. TIFFANY, L. H. "What is a plant?" Science 57: 359. 1923.—The writer states his belief that it is better to let the student form his own definition from his observations, rather than to have him learn such a definition as Martin seeks [see Bot. Absts. 12, Entry 2984].—*C. J. Lyon.*

4801. WOLFE, J. K. **Comparative grades in field crops courses.** Jour. Amer. Soc. Agron. 13: 59-66. 1923.

4802. YOUNGKEN, H. W. **Pharmacognosy and the pharmacist.** [Editorial.] Jour. Amer. Pharm. Assoc. 12: 5-6. 1923.—The author calls attention to the many opportunities for those specializing along different lines of pharmacognosy. Commenting upon the requirements for those who desire to become trained pharmacognosists, the author states that the 2-year course is entirely inadequate, and that preparation for the profession should embody, in addition to the necessary studies of the first 2 years, many other subjects, such as English, German, French, zoology, advanced chemistry, etc.—*Anton Hogstad, Jr.*

CYTOLOGY

GILBERT M. SMITH, *Editor*

(See also in this issue Entries 6967, 5070, 5283)

4803. ARBER, A. **Studies on the binucleate phase in the plant cell.** Jour. Roy. Microsc. Soc. London 1920: 1-21. *Pl. 1, fig. 1-2.* 1920.—The binucleate condition is a normal feature of the cells in certain parts of the plants studied. The appearance and the origin, as interpreted by the author, of the duplicate nuclei is described for the following plants: *Eremurus himalaicus*, *Asparagus officinalis*, *Helianthus Nuttallii*, *H. tuberosus*, *Syringa vulgaris*, *Monstera deliciosa*, *Hemerocallis fulva*, *Nothoscordum fragrans*, *Alisma Plantago*, *Polygonum cuspidatum* (= *Polygonum Sieboldii* other authors?) *Morus nigra*, *Hippuris vulgaris*, *Eloдея canadensis*, and *Stratiotes aloides*. Some of these were reexamined in view of the findings of previous authors that the binucleate phase had arisen in them by amitosis, which view is combated.—*Wm. Randolph Taylor.*

4804. BEER, R., and A. ARBER. **On multinucleate cells: an historical study (1879-1919).** Jour. Roy. Microsc. Soc. London 1920: 23-31. 1920.—This historical review emphasizes the authors' view that the reported cases of amitotic duplicate nuclei in vegetative cells are in reality due to mitosis.—*Wm. Randolph Taylor.*

4805. CHAMBERS, R. **New apparatus and methods for the dissection and injection of living cells.** Jour. Roy. Microsc. Soc. London 1922: 373-388. *Fig. 1-5.* 1922.—By means of 3 screws, bars held together at the ends by springs are forced apart so that the free arm of the series can have motion imparted to it in 1 or more of 3 planes. To this end is attached a carrier for a dissection needle or capillary pipette. The "Micro-manipulator" may be attached directly to the microscope or to a pillar. An improved type of pipette for injection into the cells consists of a Luer syringe attached by means of delicate brass tubing to the "micro-pipette." The methods of using the apparatus are described.—*Wm. Randolph Taylor.*

4806. CONN, H. J. **Safranin and methyl green.** Science 57: 304-305. 1923.—A sample of pure, concentrated safranin obtained from the National Aniline Co. gives excellent results in contrast staining and is as good as pre-war Grüber safranin O. Both the Providence Chemical Laboratories and the above company have submitted samples of methyl green that are satisfactory and comparable with the Grüber product.—*C. J. Lyon.*

4807. COWDRY, EDMUND V., and PETER K. OLITSKY. **Differences between mitochondria and bacteria.** Jour. Exp. Med. 36: 521-533. 1922.—The suggestion that mitochondria, found in almost all active cells, are symbiotic microorganisms, would, if verified, exercise a profound influence in biology and medicine. The only reaction thus far claimed to be specific is that of coloration with Janus green B. The authors have attempted to make a direct comparison of Janus green reactions of mitochondria in living lymphocytes and bacteria under exactly the same conditions. Bacteria showing all possible variations have been studied. To rabbit blood was added a small drop of bacterial emulsion and a solution of Janus green in

0.85 per cent saline solution; the whole was mixed by the weight of the cover glass. Mitochondria stained with intensity up to a dilution of 1:100,000. The bacteria were not colored in so high a dilution. The pancreas of a rabbit was also injected with various bacteria, killed, fixed, and stained by various methods. The authors state that the mitochondria and bacteria show "microchemical and tinctorial differences which can only be attributed to a fundamental dissimilarity in their chemical constitution."—*C. S. Hoar.*

4808. DANGEARD, P. A. **Recherches sur la structure de la cellule dans les Iris.** [Concerning the structure of the cells of Iris.] *Compt. Rend. Acad. Sci. Paris* 174: 1653-1659. *Fig. 1 a-e; 2 a-f.* 1922.—A study is reported of the mesophyll and epidermal cells of young and mature leaves of *Iris germanica*. Fixation with the Laguesse solution is preferable to that of Regaud. The development of the plastids in young leaves is described. It is found that the epidermal cells contain elongated slender mitoplasts of an oily nature. Dangeard herewith abandons entirely the terms chondriome, mitochondria, chondriocotes, and chondriomites. He reaffirms his usage of vacuome for the metachromes and ordinary vacuoles, which may give rise to metachromatic corpuscles, anthocyan, or tannin; plastidome, in which are included plastids, mitoplasts, amyloplasts, chloroplasts, etc; and sphérôme, the micromes which are related to the formation of oil.—*C. H. Farr.*

4809. DANGEARD, P. A. **Sur la structure de la cellule chez les Iris.** [Concerning the structure of the cells of Iris.] *Compt. Rend. Acad. Sci. Paris* 175: 7-12. *Fig. 1 (A, B, C), 2 (A, B, C, D), 3 (A, B, C, D, E).* 1922.—A study is made of the conductive tissues, petals, sepals, stamens, ovary, and ovules of *Iris germanica*. Figures are shown of cells from the conductive tracts, stamens, and ovary. It is concluded that the plastidome and sphérôme are permanent cell organs like the nucleus, and that they are transmitted independently from generation to generation. The plastids of the plastidome have various forms as spheroplasts, mitoplasts, and discoplasts, and perform various functions, as xanthoplasts, carotinoplasts, chloroplasts, amyloplasts, oleoplasts, etc. The microsomes of the sphérôme are normally spherical (spherosomes), but may be rod-shaped (mitosomes), and there is some evidence that they may form fat globules (oleosomes). The plastidome and sphérôme exist in the pollen grains and embryo sacs, and are therefore to be considered in discussing the transmission of hereditary characters.—*C. H. Farr.*

4810. DREW, A. H. **Preliminary tests on the homologue of the Golgi apparatus in plants.** *Jour. Roy. Microsc. Soc. London* 1920: 295-297. *4 fig.* 1920.—Fixation of onion root tips with a formol-cobalt nitrate-sodium chloride mixture at 37°C., cutting on a freezing microtome, washing and mordanting at 50-55°C. with chromic-osmic mixture, and staining with iron-alum haematoxylin and pyridine showed numerous granular or short rod-shaped mitochondria. With longer mordanting these became less evident and oval and elongate bodies appeared. With still longer treatment the Golgi apparatus showed as filaments and rods near the nuclei.—*Wm. Randolph Taylor.*

4811. GATENBY, J. B. **Further notes on the oögenesis and fertilization of *Grantia* compressa.** *Jour. Roy. Microsc. Soc. London* 1920: 277-282. *Pl. 5.* 1920.—In the sponges the sperm does not penetrate the egg directly but first enters another cell which transfers it to the ripe oocyte. This is unique among animals. The sperm enters a collar cell where it changes from a probably filiform to a rounded shape. Confirmation is offered of Dendy's description of a process whereby in oögenesis pieces of the nucleolus are extruded into the cytoplasm.—*Wm. Randolph Taylor.*

4812. GATENBY, J. B., and J. H. WOODGER. **On the relation between the formation of yolk and the mitochondria and Golgi apparatus during oögenesis.** *Jour. Roy. Microsc. Soc. London* 1920: 129-156. *Pl. 2, fig. 1-4.* 1920.—An outline is given of the appearance of different cytoplasmic inclusions when prepared by different methods, and definitions of these elements of the cell. In yolk formation in *Grantia* eggs the yolk granules were found to be formed

in the ground cytoplasm independently—not from mitochondria. In Mollusca (*Helix* and *Limnaea*) Golgi elements, mitochondria, and yolk spherules are present in the ripe egg. The germinal epithelia contain Golgi elements and probably also mitochondria. These spread out during development, throughout the oocyte. In the mollusc *Patella* the Golgi elements take an important part in yolk formation, which is more complicated than in *Helix* and *Limnaea*. In Amphibia and Insecta, represented by *Rana* and *Triton*, or *Apanteles* and *Dytiscus* respectively, the mitochondria form a filamentous mass on the peripheral part of the growing oocyte. Later when yolk formation begins the mitochondria may be throughout the oocyte but the yolk discs are formed only at the periphery. "It seems natural to conclude that the yolk grains of the egg are formed from metamorphosed mitochondria, as is believed to occur in other animals." In *Stenobothrus* and *Dytiscus* the Golgi elements seem to be unconnected with the yolk. In *Periplaneta* some of the yolk spheres seem to be formed in the nucleolus and shot out into the egg cytoplasm. For Ascidians the work of Hirschler (1915) is quoted. In *Ascaris* the work of Hirschler (1913) is preferred to that of Fauré-Fremiet, excepting that the mitochondria occasionally swell up to form the large yolk granules. The Golgi elements are not generally intimately associated with the yolk spheres. In Mammalia the Golgi apparatus is at first juxta-nuclear and excentric, but later spreads out, possibly taking no direct part in the formation of yolk or fat. Although true chromatinic chromidia occasionally occur in the cytoplasm during oogenesis (Hymenoptera) almost all cases in Metazoa are really misinterpretations of the mitochondria. Reports of chromatin emission during oogenesis probably are ill-founded.—Wm. Randolph Taylor.

4813. GRAY, JOHN. A critical study of the facts of artificial fertilization and normal fertilization. Quart. Jour. Microsc. Sci. 66: 419-437. 1922.—The author refers to the theory of Loeb that artificially fertilized eggs are activated by 2 substances, a specific cytolyisin, which brings about the destruction of the surface layer of the egg, and a substance which limits or controls the destructive influence of the cytolyisin; and to the theory of F. R. Lillie that the union of the egg and spermatozoon is possible only in the presence of a specific substance or fertilizin secreted by the unfertilized egg. The author claims that not enough attention is given to the physical forces. Loeb's theory serves only for artificial fertilization and Lillie's only for the natural type. The facts appear to indicate that the normal action of the spermatozoon on the egg is essentially physical. Evidence is advanced that the activation of an unfertilized egg by a spermatozoon is due to the electromotive force set up when the 2 gametes come into contact. After activation, normal development occurs only when 2 asters are present. The formation of a fertilization membrane in echinoderm eggs is discussed. Finally the view is expressed that the only essential effect of egg secretions on spermatozoa is the capacity of these substances, in certain cases, of increasing the activity of the male gametes.—C. S. Hoar.

4814. GRAY, JOHN. Surface tension and cell division. Quart. Jour. Microsc. Sci. 66: 235-245. 1922.—It has long been held that surface tension plays the dominant rôle in cleavage. Surface tension has been thought to differ at various places on the cell surface. The author shows that regions of differential surface tension are an unnecessary assumption. It is an equilibrium between a force inside the cell and surface tension which determines shape of the dividing cell. The author uses fertilized eggs of *Echinus miliaris*, *Coleps hirtus*, and 2 oil drops in acid and normal sea water to prove his point. He claims that cell division is due to movement of 2 asters away from each other and that the cleavage furrow is due to an equilibrium between the effect of this movement on the protoplasm and the surface tension of the cell surface.—C. S. Hoar.

4815. GUIGNARD, L. Sur l'existence de corps protéiques particuliers dans le pollen de diverses Asclépiadacées. [On the existence of certain protein bodies in the pollen of diverse Asclepiads.] Compt. Rend. Acad. Sci. Paris 175: 1015-1020. Figs. 1-16. 1922.—In *Asclepias syriaca*, *A. curassavica*, *A. linifolia*, and *Gomphocarpus fruticosus*, pollen tubes, pollen mother cells, and microspores were studied as to the protein granulations and plastids. The protein

bodies are said to resemble chondriosomes, especially chondriocontes. They appear first as granulations, which form short beads, and then slender rods. These protein bodies are for a time within the plastids, later the breaking down of the plastids leaves the protein bodies free. In the last stage these bodies fuse together in a mass.—*C. H. Farr.*

4816. GUILLIERMOND, A. *Observation cytologique sur un Leptomitus et en particulier sur le mode de formation et la germination des zoospores.* [Cytological observations on a Leptomitus and especially the mode of formation and germination of its zoospores.] *Compt. Rend. Acad. Sci. Paris* 175: 377-379. *Fig. 1-6.* 1922.—This is a fungus found on dead fish. Figures and a description are given of mitochondria,—here observed in living condition for the first time in an aquatic fungus.—*C. H. Farr.*

4817. GUILLIERMOND, A. *Remarques sur la formation des chloroplastes dans le bourgeon d'Elodea canadensis.* [Remarks on the formation of chloroplasts in the bud of *Elodea canadensis.*] *Compt. Rend. Acad. Sci. Paris* 175: 283-286. *Fig. 1-11.* 1922.—Mitochondria and chondriocontes are described in the cells of the tissues studied. The author reaffirms his interpretation that there are 2 categories of chondriosomes, one having to do with photosynthesis; the function of the other is not known precisely.—*C. H. Farr.*

4818. HOGBEN, L. T. *A preliminary account of the spermatogenesis of Sphenodon.* *Jour. Roy. Microsc. Soc. London* 1921: 341-352. *Fig. 1-18.* 1921.—Five types of chromosomes are present, 26 being tentatively suggested as the diploid number. The possibility is offered that the 3 pairs with the sub-terminal fiber attachment are really pairs of paired chromosomes, thus giving 32 as the diploid number. The chromosomes of the different complexes correspond in size and shape. There are inconstant bodies (of nucleolar origin?) which pass with the chromosomes to the poles of the spindle. The parasynaptic view of chromosome origin is accepted and the stages described in this light.—*Wm. Randolph Taylor.*

4819. JEFFREY, E. C. *Professor Lloyd and vegetable crystals.* *Science* 57: 442-444. 1923.—This is a defense and reiteration of previous statements as to the manner of growth of druses in cells.—*C. J. Lyon.*

4820. KOZLOWSKI. *Critique de l'hypothese des chondriosomes.* [A criticism of the hypothesis of the chondriosomes.] *Rev. Gén. Bot.* 34: 641-658. *Pl. 11.* 1922.—In the cytoplasm of plant cells substances frequently occur in the form of droplets in suspension. One substance is in the form of very refractive, colorless droplets (lipoid droplets); another in the form of very small less refractive droplets (mitochondria). Mitochondria appear as more or less long series of pearls called chondriomites or chondriocontes; as spheres; or as amoeboid formations called plastids. The form of these agglomerations is dependent on the structure of the protoplasmic network. In the living cells, the granular structure of the chondriocontes, the chondriomites, and the plastids is readily discernable; in fixed and stained preparations this structure becomes less distinct,—even if the granular structure is not altered by the fixative, staining with haematoxylin effaces it. Investigators of fixed and stained tissues have frequently observed the chondriosomes as short rods or filaments and homogeneous globules differing in one dimension and have concluded that the small droplets elongate in the same direction and form in this way the homogeneous filaments. The latter transform themselves, so they say, by swelling, into plastids. A study of living tissues does not justify this hypothesis. Guillermond explains the granular structure of these formations, having studied them in living cells, as the result of an alteration of homogeneous filaments under the influence of water. This explanation is not justified because the granular structure of the chondriomites is very distinct in the living cells of aquatic plants that can be studied directly with the microscope. The hypothesis of the formation of plastids from chondriosomes, supported by Forenbacher, Lewitsky, Meves and Guillermond is justified, but the interpretation of the mechanism of this phenomenon does not correspond to the reality, according to the author. The plastids are formed by the agglomeration of droplets and not by their swelling. The hypothe-

sis of multiplication of chondriosomes and of plastids by division is incorrect. The dumb-bell form of chondriosomes and plastids is produced by the juxtaposition of 2 elements, not by their division. Finally, the author holds that the different hypotheses concerning the diverse physiological functions of the chondriosomes most frequently arise from preconceived ideas.—*J. C. Gilman.*

4821. KRAEMER, HENRY. **The starch grain.** *Science* 57: 175. 1923.—The author, stimulated by Sponsler's paper [see Bot. Absts. 12, Entry 4843], describes his own attempt to study the complex nature of the grain by treatment with aniline dyes, experiments which were once successful but which have never been repeated in spite of many trials.—*C. J. Lyon.*

4822. KULMATYCKI, W. J. **Bemerkungen über den Bau einiger Zellen von *Ascaris megalcephala* mit besonderer Berücksichtigung des sogenannten Chromidialapparates.** [Observations regarding the structure of certain cells of *Ascaris megalcephala*, with special consideration of the so-called chromidial apparatus.] *Arch. Zellf.* 16: 473-551. *Pl.* 22-26. 1922.—An account is given of the structure of the cells of the digestive tract, of the body wall muscles, and of the copulatory organs of *Ascaris megalcephala*, with special reference to the presence and nature of chromidia and the Golgi apparatus. "Chromidia" (the term is enclosed within quotation marks throughout the paper) are found in the flat epithelial-muscular cells of the oesophagus, in the subcutaneous and glandular cells of the rectum, in the pre-rectal dilator muscles, and in the muscles controlling the action of the copulatory spicules. None was found in the cells of the mid-gut, of the body wall muscles, or of the pre-rectal sphincter muscles. The "chromidia" vary in form; spherical ones are commonest in all cells, often strung together like a string of pearls. No evidence was found of the passage of material forming the "chromidia" from the nucleus. On the other hand, when stained by means of Benda's mitochondria method, they react exactly as do mitochondria. For this reason, and because of their general similarity in form and appearance, the author considers them to be closely related to mitochondria. He therefore rejects the term "chromidia," as applied to the structures observed in this genus, and calls them "Ascaridochondria." In the mid-gut cells, there are small spherical bodies surrounding the nucleus, which react to 2 per cent osmic acid and probably represent Golgi bodies. Their nature is not perfectly certain, owing to the absence of "ascaridochondria." In the subcutaneous cells of the spicular sheath, however, both "ascaridochondria" and Golgi bodies are present, the latter in the form of rods and spheres, evenly scattered throughout the cell. "Ascaridochondria" and Golgi bodies are probably unrelated structures.—*R. E. Cleland.*

4823. LENOIR, MAURICE. **La cinèse somatique dans la tige aérienne d'*Equisetum arvense* L.** [On the somatic mitosis in the aerial stem of *Equisetum arvense*.] *Compt. Rend. Acad. Sci. Paris* 174: 1559-1562. 1922.—A description is given of the nuclear condition in the interphase, prophase, metaphase, anaphase, and telophase. It is concluded that the fundamental substance of the chromosome is the nucleoline, called by other authors pyrenine or plastine, and that chromatin is a derivative.—*C. H. Farr.*

4824. LENOIR, MAURICE. **Les nucleoles pendant la prophase de la cinèse II du sac embryonnaire du *Fritillaria imperialis* L.** [The nucleoli during the prophase of the second division of the embryo sac of *Fritillaria imperialis*.] *Compt. Rend. Acad. Sci. Paris* 175: 985-987. 1922.—The substance of the nucleoli passes without apparent modification into a spirematic filament by a sort of aspiration. Between the beginning of this phenomenon and the formation of the chromosomes there is a period during which an equilibrium is established between the 2 chromatic substances, the chromatic network and the nucleoli.—*C. H. Farr.*

4825. LLOYD, FRANCIS E. **The cytology of vegetable crystals.** *Science* 57: 273-274. 1923.—The views of the writer are in opposition to those expressed by Jeffrey (*Science* 55: 566. 1922). Lloyd finds that druses in the cells of the buds of Ginkgo develop in the cytoplasm, grow, and crowd the nucleus and cytoplasm to the sides of the cell. More than one druse may

appear in a cell. The cell wall does not grow or change its shape to allow for the growth of the druse but actually seems to limit the shape of the druse. Conclusions from observations of conditions in Cactaceae, Orchidaceae, Iridaceae, and Begoniaceae are in harmony with those stated for *Ginkgo*.—*C. J. Lyon*.

4826. LUDFORD, R. J. **Contribution to the study of the oögenesis of *Patella*.** Jour. Roy. Microsc. Soc. London 1921: 1-14. *Pl. 1-2*. 1921.—The yolk forms under the influence of the Golgi bodies, and this proceeds until the egg is filled with spherical yolk bodies surrounded by Golgi elements. The layer of Golgi elements then breaks up and fragments form a layer under the vitelline membrane as well as around the nucleus. Nucleolar material is extruded into the cytoplasm. Mitochondria are present, but take no direct part in yolk formation.—*Wm. Randolph Taylor*.

4827. LUDFORD, R. J. **The behavior of the nucleolus during oögenesis, with special reference to the mollusc *Pattella*.** Jour. Roy. Microsc. Soc. London 1921: 121-133. *Pl. 3-4*. 1921.—During the transition from an undifferentiated cell of the germinal epithelium to an oocyte the cytoplasm changes from oxyphil to basophil, in which condition it remains until the time the Golgi elements have become scattered, when the oxyphilia increases again. The nucleolus has definite oxyphil and basophil parts, which usually separate into distinct spherical bodies. There is an extrusion of an oxyphil substance from the nucleolus during the differentiation of the nucleolus that may be related to yolk formation; the basophil part may be related to the condensation of the discrete chromosomes.—*Wm. Randolph Taylor*.

4828. LUDFORD, R. J. **The morphology and physiology of the nucleolus. Pt. 1. The nucleolus in the germ-cell cycle of the mollusc *Limnaea stagnalis*.** Jour. Roy. Microsc. Soc. London 1922: 113-150. *Pl. 3-5*. 1922.—The nucleus is lacking in the cells of the germinal epithelium, but in the development of an oocyte 1 appears that increases in size during development, performing amoeboid movements, with the extrusion of portions into the cytoplasm. A portion of the oxyphil nucleolus becomes basophil, which part persists till the end of oogenesis, when it breaks up and is distributed over the nuclear reticulum; the oxyphil part mostly passes out into the cytoplasm during oogenesis. In spermatogenesis an oxyphil nucleolus is present in the spermatocyte that persists until drawn into the massed reticulum in synesis, disappearing before diakinesis and not reappearing during the further stages in the maturation of the sperm. In the Sertoli (nurse-) cells of the ovatestis the nucleolus is characteristically enlarged. During nuclear fusion in fertilization the nucleoli seem to be absent. By the time of the late blastula stage an oxyphil nucleolus is again observable which disappears during each prophase and reappears at telophase. Mesoderm cells in the gastrula have especially large nucleoli. The cells of the adult in active metabolism have large nucleoli, the quiescent cells small ones.—*Wm. Randolph Taylor*.

4829. LYON, M. W., JR. **Acetone in tissue work.** Science 57: 444-445. 1923.—F. M. McFarland's observations [see Bot. Absts. 12, entry 194] on the successful use of acetone in place of alcohols for dehydrating tissues used for paraffin sections are confirmed. Pure acetone is used between xylene and water and may also be used as a solvent of such stains as eosin.—*C. J. Lyon*.

4830. MCKENZIE, G. A. **Methods used in animal histology.** Ann. Rept. Trans. Manchester Microsc. Soc. 1921: (Reprinted without change of page nos. from Lancashire and Cheshire Nat., June 1921, pp. 259-262). 1922.—Brief notes are given on fixatives (with formulae), the paraffin method, the celloidin method, and on staining with haematoxylin and Van Gieson's stain.—*C. E. Allen*.

4831. MARTENS, P. **Le cycle du chromosome somatique dans les phanérogames. I. *Paris quadrifolia* L.** [The cycle of the somatic chromosome in phanerogams. I. *Paris quadrifolia*.] La Cellule 32: 333-428. 4 pl. 1922.—The chromosome of *Paris quadrifolia* is at all

stages composed of 2 morphologically distinct constituents: a homogeneous achromatic matrix and a chromatic substance enclosed within it. In early prophase the chromatic constituent ("chromonematic element") lies peripherally in the matrix in the form of transverse or oblique curved strands; many of these are joined in the form of a zigzag thread, but they do not form a continuous spiral throughout the length of the chromosome. The chromosome elongates, the chromonematic element taking the form of a slender filament with the achromatic matrix condensed irregularly about it. As the chromosome again shortens and thickens, the matrix regains its regular lateral outlines and becomes a flattened ribbon. The zigzag chromonematic element now undergoes a "bilateral repartition": the chromatic substance flows from its transverse portions and collects at its angles along the margins of the ribbon, thus forming 2 lateral rows of swellings connected by the attenuated transverse portions. These swellings become somewhat elongated, and as the chromosome shortens further those in each row unite to form a continuous filament along the chromosome margin. The 2 marginal filaments are thrown into zigzags by the continued shortening of the chromosome. The achromatic ribbon then divides by a simple repartition into 2 longitudinal portions, completing the division of the chromosome, except for a few fine chromatic connections which remain until anaphase. The division of the chromosome does not involve a longitudinal cleavage of the slender chromatic filament, and it is not brought about by an alveolation: it occurs later, after the chromosome is somewhat shortened, by a bilateral repartition (not splitting) of the chromonematic element into 2 new zigzag filaments, this being followed by the division of the achromatic matrix. The slender chromatic filament of the prophase forms only a portion of the metaphase chromosome, and not all of it as some have supposed. In each daughter chromosome of the metaphase the chromonematic element occupies the periphery of the matrix except on the side toward the sister chromosome: each chromosome has a sort of bilateral symmetry, and the chromatic portions of the 2 may be likened to a pair of troughs facing each other. There is no continuous spireme, no transverse division of chromosomes, and no division of chromomeres.—During late prophase, metaphase, and anaphase, the achromatic matrix shows a pronounced chromaticity, which obscures the structure of the chromosome; this is probably due to an impregnation by the material of the nucleolus which disappears during these stages and reappears after the tassement polaire when the matrix again becomes achromatic.—In telophase the chromatic substance becomes arranged in 2 parallel masses in the chromosome, apparently along the edges of the chromatic "trough" seen at metaphase, thus establishing an actual duality within the chromosome. This duality is not the result of alveolation, and it does not represent the first stages of division, for it gradually disappears in late interphase or early prophase, leaving the chromatic matter in the form of a simple filament, which in later prophase gives rise to 2 daughter filaments by repartition. Chromosome division is therefore prophasic, and involves a repartition of both the chromonematic element and the achromatic matrix.—*L. W. Sharp.*

4832. MASCRÉ. Sur l'étamine des Borraginées. [The stamens of the Boraginaceae.] *Compt. Rend. Acad. Sci. Paris* 175: 987-989. 1922.—The following species were studied; all were found to be alike: *Symphytum officinale*, *Anchusa italica*, *Cynoglossum officinale*, *Borrago officinale*, *Echium vulgare*, *Pulmonaria officinalis*, *Cerithe major*. The formation of the partition separating the pollen chambers, the dissolution of the tapetum, the changes of the archesporial cells, and the transformation of the chondriosomes into chondriocones and plastids are described. As in the Solanaceae, the tapetum passes through 3 successive stages: differentiation; elaboration or secretion; and degeneration.—*C. H. Farr.*

4833. MASUI, KIYOSHI. The spermatogenesis of domestic mammals, I. The spermatogenesis of the horse (*Equus caballus*). *Jour. Coll. Imp. Univ. Agric. Tokyo* 3: 357-376. *Pl.* 11-13, *fig.* 1-2. 1910-1919.—Conjugation of the chromatin threads is by parasynapsis. The heterotypic division is followed by the homotypic. In the resulting 4 cells, 2 have 18 chromosomes and 2 have 19, 1 in each of the latter being the accessory chromosome. Mitochondria appear during the postsynaptic stages.—*E. R. Walker.*

4834. MASUI, KIYOSHI. **The spermatogenesis of domestic mammals, II. The spermatogenesis of cattle (*Bos taurus*).** Jour. Coll. Agric. Imp. Univ. Tokyo 3: 377-403. Pl. 14-16, fig. 1. 1910-1919.—Conjugation of the chromatin is probably by telosynapsis. The heterotypic division is followed by the homotypic. In the 4 resulting cells $\frac{1}{2}$ have 16 chromosomes and $\frac{1}{2}$ have 17, 1 being the accessory chromosome. Mitochondria appear abundantly during growth stages.—*E. R. Walker.*

4835. MEYER, ARTHUR. **Die "Hülle" der Chromatophoren.** [The "envelope" of the chromatophore.] Ber. Deutsch. Bot. Ges. 40: 161-167. 1 fig. 1922.—The outer region of the chromatophore was described by Senn (1908) as a "peristromium," which was thought to be concerned with the movement of the chromatophore. The writer is inclined to the view that this structure belongs to the slimy cytoplasm and that the latter is responsible for the movement of the chromatophore. The slimy cytoplasm is of one kind, but it may show different microscopical modifications. When "normal" it is very fluid and contains granules; when "metabolisiert" it is relatively firm and free from granules. The latter type surrounds the chromatophores giving a false impression of a differentiated part of the chromatophore.—*L. F. Randolph.*

4836. PARTINGTON, J. R., and D. B. HUNTINGBORD. **The reduction of osmic acids by lipoids.** Jour. Roy. Microsc. Soc. London 1921: 15-19. 1921.—"The substance formed by the reduction of osmic acid by olein in tissue staining was found to be a hydrated form of osmic dioxide, OsO_2 , and not metallic osmium, as has sometimes been stated."—*Wm. Randolph Taylor.*

4837. PISEK, A. **Chromosomenverhältnisse, Reduktionsteilung und Revision der Keimentwicklung der Mistel (*Viscum album*).** (Vorläufige Mitteilung.) [Chromosome relations, reduction division and revision of the embryogeny of the mistletoe (*Viscum album*). (Preliminary note.)] Ber. Deutsch. Bot. Ges. 40: 406-409. 1922.—In *Viscum album* the somatic chromosome number is 20, and a reduction to 10 occurs in both micro- and megasporogenesis. Normal fertilization takes place 10 days after pollination. A month later the endosperm begins to develop slowly, and after another month the fertilized egg divides. The species is amphimitic, the development of embryos by ovulate plants protected from insects reported by Heinricher being the result of wind pollination rather than apogamy.—*L. W. Sharp.*

4838. SÁNCHEZ Y SÁNCHEZ, MANUEL. **Sur la nature et la fonction de l'appareil réticulaire de Golgi.** [On the nature and function of the reticular apparatus of Golgi.] Compt. Rend. Acad. Sci. Paris 175: 1439-1440. 1922.—This study was made on the seed epidermal cells of *Faba vulgaris*. Argentophile granules are found. Infranuclear, perinuclear, and supranuclear trabeculae are present, confirming the earlier work by others on the presence of this apparatus in plant cells.—*C. H. Farr.*

4839. SCHRADER, FRANZ. **A study of the chromosomes in three species of *Pseudococcus*.** Arch. Zellf. 17: 45-62. Pl. 5-6. 1923.—The following were studied: *Pseudococcus nipae*, *P. maritimus*, and *P. citri* (order Homoptera, family Coccidae). The earliest phase of the growth period of the primary spermatocyte is characterized by the presence of a loose, delicate chromatin network, and, also, by a large deeply staining mass. From each of these, 5 chromosomes are organized. Those arising from the large mass are formed earlier, and tend to remain closely associated; those coming from the reticulum develop later, and lie loosely scattered around the others. When fully formed, all 10 chromosomes show a single longitudinal split. There is no pairing at this stage, and the 1st division is an equational division, not a reduction division. In anaphase, the 10 chromosomes passing to each pole are in 2 groups of 5 each. At the pole they are arranged as before, into 1 group of 5 closely associated chromosomes, and another of 5 loosely scattered ones. There is no regular interkinesis. In the 2nd spermatocyte division, reduction occurs, but apparently in an anomalous manner, the 2 groups of 5 being separated to different parts of the cell. This nuclear division is not followed by cyto-

plasmic division. Each cell is a double spermatid, and gives rise to 2 spermatozoa. No such anomalous behavior was observed during the maturation of the egg. It was not possible to tell, however, whether the female is homozygous for the massed, or for the loose group of chromosomes. In the somatic cells of the male, the clump of densely staining chromatin appears again, as well as the more lightly staining and flocculent network. Corresponding cells in the female show no clumping. It may be that the loose group of chromosomes lacks certain properties which would make them equivalent to the massed group. This lack may be indicative of a loss, or it may be that the group is in the way of disappearing, in which case the origin of haploid males is near solution. The female of *Pseudococcus* is homozygous, and the male heterozygous for sex.—*Ralph E. Cleland.*

4840. SCHÜRHOFF, P. N. Die Befruchtung von *Viscum album* L. [Fertilization in *Viscum album*.] Ber. Deutsch. Bot. Ges. 40: 314-316. Fig. 1-6. 1922.—The generative nucleus, while still in the pollen grain, divides after the pollen tube is formed. The 2 male nuclei and the vegetative nucleus then pass into the pollen tube.—*W. C. Muenscher.*

4841. SMITH, EDNA L. The histology of certain orchids with reference to mucilage secretion and crystal formation. Bull. Torrey Bot. Club 50: 1-16. Pl. 1. 1923.—Study of the floral organs of the orchids *Aspasia* sp. and of *Oncidium stipitatum* shows that mucilage cells are found in young actively growing regions and are associated with raphides. It is argued that mucilage originates in the protoplast, since the mucilage is separated from the cell wall by the thin layer of cytoplasm and the nucleus, which are in a living and active condition. The raphides are imbedded in the mucilage and separated from it by a sheath of different staining capacity. In *Polystachya minuta* and *Orchis spectabilis*, also, raphides and mucilage are found occurring together.—*P. A. Munz.*

4842. SPAUL, E. A. The gametogenesis of *Napa cinerea* (water scorpion). Jour. Roy. Microsc. Soc. London 1922: 231-242. Pl. 10-11. 1922.—The diploid complex for the male was 35, short rods with little size variation beyond 2 pairs of short chromosomes. The spireme forms the bouquet stage, followed by contraction to 1 pole. Later the diplotene filaments emerge from this, showing signs of cleavage. After the tetrad stage the chromosomes form the plate with 1 unpaired chromosome, which may precede the rest to the pole or lag behind. This is the "heterochromosome," which divides in the 2nd division. In the oogonia the diploid number was 36, so that this chromosome is there paired. The nucleolus seems to emit particles which take part in the formation of yolk.—*Wm. Randolph Taylor.*

4843. SPONSLER, O. L. The structure of the starch grain. Amer. Jour. Bot. 9: 471-492. 9 fig. 1922.—The problems presented by starch and various theories concerning the structure of the grain are discussed. These grains have been regarded by most investigators as sphere-crystals. By means of X-rays it is possible to determine whether a given powdered substance is amorphous or crystalline; and if the latter, its crystal system may be determined. This method of study consists in photographing the X-rays which are reflected from the various atomic planes of a crystal and produce definite lines. In describing this method, the modern conceptions of the crystal, the atom, and the X-rays are discussed. The author applied the method to a study of starch and describes in detail the apparatus used. This apparatus was tested by photographing with it crystals of sodium chloride, the structure of which is known. Definite lines were produced in photographs of this substance, but none by such an amorphous substance as dextrin. When studied thus, starch was found to produce definite lines on the photographic negative, thus resembling true crystalline structures. Ground and crushed starch grains, however, did not show these lines but behaved like an amorphous substance. If starch is truly crystalline such crushing should make no difference. Pulverized cane sugar, for example, gave results identical with the crystallized sugar. The author concludes that there is a regular and fairly uniform arrangement of atoms in the starch grain but that this regularity is destroyed by crushing the grain and hence cannot be that of a true crystal. The regularity of starch may not be that of planes but that of curved layers.—*E. W. Sinnott.*

4844. TAKAHASHI, NABUYOSHI. *Ueber Kernveränderungen in Ganglienzellen der Fische.* [Nuclear changes in the ganglion cells of fishes.] Arch. Zellf. 16: 463-472. Pl. 21. 1922.—In the central nervous system and spinal ganglia of a large number of fishes there is an invagination, or series of invaginations, in one side of the nuclear membrane. As a result the nuclei appear to be eaten out; in some cases roughly, in others smoothly. They may even become crescentic in shape. At times the chromatin of the nucleus is massed near this region, but not in all cases. This phenomenon seems to be restricted to the spinal sensory cells and to the sheath elements. It is still further localized, being found only in the largest cells, and in those which are packed into solid tissues; i.e., in cells which because of their size and compactness are unfavorably situated from the standpoint of respiratory and metabolic change. So far as studied all of the species of any one order of fishes reveal a like localization of this condition.—R. E. Cleland.

4845. T'SERCLAES, J. DE. *Le noyau et la division nucléaire dans le Cladophora glomerata.* [The nucleus and its division in *Cladophora glomerata*.] La Cellule 32: 313-326. 2 pl. 1922.—Nuclear division in *Cladophora glomerata* is similar to that of higher plants in chromosome behavior, but differs in its complete lack of an achromatic figure, as well as in the fact that the nuclear cavity remains clearly delimited throughout the entire process.—Material collected in winter and kept in running water at 12°C. in the laboratory showed most active nuclear division between 9 and 10 p.m. The resting nucleus has a delicate reticulum and 1 or more nucleoli. In prophase the reticulum becomes more chromatic and breaks up into reticulate elements, the chromosomes, which condense into separate slender threads—there is no continuous spireme. In some cases the chromosomes are more condensed from the first, as in higher plants with small chromosomes. In either case they eventually assume the form of short thick rods. In 1 nucleus 68 were counted. After shortening, the chromosomes split longitudinally, this being the first clearly described case of such splitting in green algae. There is no indication of chromomeres. The nucleus becomes lenticular in shape, and the split chromosomes group themselves variously about its major axis, not forming a regular equatorial plate as in forms having achromatic figures.—The nucleus elongates in the direction of its former shorter axis; its membrane remaining intact as the longitudinal halves of the chromosomes separate and pass toward opposite poles within it. Although the different chromosomes do not separate simultaneously, they form 2 distinct opposed groups at late anaphase. Meanwhile the principal nucleolus (other small ones have disappeared) elongates, stretches and breaks at the middle into 2 portions associated with the 2 chromosome groups. Occasionally the breaking up is more irregular, some nucleolar fragments being left in the cytoplasm between the 2 new nuclei, where they are later resorbed.—In telophase the chromosomes soon lose their parallel orientation, develop small openings, and become joined by connections arising through contacts to form a continuous reticulum, in which the chromosomes may be recognized as heavier strands. The nuclear cavity is now dumb-bell shaped, but just how the 2 new nuclear cavities are finally completed is uncertain; it is possible that the tubular connecting portion may sometimes constrict as other authors have described, but often the connection, with nucleolar fragments in it, is still visible after the cavities of the daughter nuclei are almost completely closed in.—L. W. Sharp.

4846. WAGNER, KARL. *Ueber die Entwicklung des Froscheies.* [The development of frogs' eggs.] Arch. Zellf. 17: 1-44. Pl. 1-4. 1923.—An extensive study was made of the development of the female germ cells of *Rana fusca* Roes., from the earliest appearance of oogonia until the formation of the polar bodies. Particular attention is given to the question of the continuity of the chromosomes during this period, and to the relation between the chromosomes and the nucleoli. The author, by a proper use of stains, traces the chromosomes entirely through the germinal vesicle stage. During this period the chromosomes, in form like a "cylindrical chimney brush," gradually lose both basi- and oxy-chromatin substances, and consist almost entirely of linin. Hence the failure of certain authors to observe them at this time. The principal conclusions reached are: (1) the chromosomes are demonstrable at all times during the period of egg development; (2) they are not derived from the nucleoli.—Ralph E. Cleland.

4847. WEISS, F. E. **Variations in the nuclear constitution of plants. Presidential address to the Manchester Microscopical Society.** Ann. Rept. and Trans. Manchester Microsc. Soc. 1921: (Reprinted without change of page nos. from Lancashire and Cheshire Nat., Mar.-Apr. 1922, p. 193-199). 1922.—A brief account is given of the present state of knowledge, with special reference to chromosome behavior. The author discusses the doubling of the chromosome number in gametic unions, chromosome reduction in *Spirogyra*, *Puccinia graminis*, ferns, and seed plants, the relation of chromosome number to mutation, the causes of changes in the number of chromosomes, and the relation of chromosomes to sexual differences.—C. E. Allen.

4848. WOLFF, CLARA. **Ueber konzentrische Strukturen im Eikern von Coleopteren. [Concentric structures in the egg nuclei of the Coleoptera.]** Arch. Zellf. 16: 443-462. Pl. 20, fig. 1-11. 1922.—The young oocytes were studied in the following beetles: *Sitodrepa panicea*, *Chlorophanus gibbosus*, *Calandra oryzae*, and *Niptus hololeucus*. Entire ovaries were dissected out in Koch's solution, and fixed in Petrunkevitch's, Carnoy's, Bouin's, and strong Flemming solutions. The inner central portion (Centralkörper) of the nucleus contains the chromatin. Surrounding this, and separated from it by a membrane, is a rather broad region (Binnenzone) which gradually enlarges and in which are formed successively a number of additional concentric membranes. Around this is formed a 3rd region (Randzone) containing a coarse network, and separated from the cytoplasm and from the Binnenzone by definite membranes. The mode of development of these regions differs in detail in the different animals. The author believes that the outer concentric regions belong to the nucleus since the membrane outside the periphery is firmer than the ones that separate the 3 regions from one another; also because in *Niptus* the central region and the Binnenzone are not separated from each other until a late period. The formation of the membranes is discussed, and compared to the formation of Liesegang's rings. They are considered to be precipitation membranes.—R. E. Cleland.

4849. WOODBURN, WILHAM LOGAN. **Spermatogenesis in *Asterella hemispherica*, Beam.** Ann. Botany 36: 535-540. Pl. 20. 1922.—Previous to the last division of the spermatogenous cells, 2 small dense cytoplasmic caps appear on opposite sides of the nucleus from which spindle fibers become organized. They are neither permanent cell structures nor are they centrosomes. The blepharoplast is first seen as a densely staining body on the inner surface of a membrane which develops between the nucleus and the boundary of the protoplast. The mature sperm consists of a curved, club-shaped part, the nucleus, tapering to a slender point which is continued by the thread-like blepharoplast bearing 2 cilia.—W. P. Thompson.

ECOLOGY AND PLANT GEOGRAPHY

GENERAL, CONDITIONS, MEASUREMENTS

4850. ANONYMOUS. [REV. OF: BLOMEFIELD, L. **A naturalist's calendar, kept at Swaffham Bulbeck, Cambridgeshire.** 2d ed., edited by Sir FRANCIS DARWIN. xviii + 84 p. Cambridge University Press: London, 1922 (see Bot. Absts. 12, Entry 2301). Nature 111: 112. 1923.

4851. BATESON, W. **Area of distribution as a measure of evolutionary age.** [Rev. of: WILLIS, J. C. **Age and area: a study in geographical distribution and origin of species.** With chapters by HUGO DeVRIES, H. B. GUPPY, MRS. E. M. REID, and JAMES SMALL. x + 259 p. Cambridge University Press: London, 1922.] Nature 111: 39-43. 1923.—"Every evolutionist agrees that, apart from disturbing elements, area is a measure of age. * * * Unfortunately no means are suggested by which we may tell whether a species or genus is a novelty or a relic." The reviewer is very skeptical about the hypothesis, but believes the book serves an excellent purpose in renewing the debate on mode of evolution and in making geographical distribution a live study.—O. A. Stevens.

4852. HOLDEFLEISS, P. *Methodologische Bemerkungen zu "Die Trieblänge der Fichten und das Wetter."* [Methodological observations on "The twig length of spruce and the weather."] *Mitteil. Deutsch. Landw. Ges.* 38: 158. 1923.—The author arranges the figures given by C. Kassner [see Bot. Absts. 12, Entry 2995] to show that the spring rainfall has the greatest influence on growth of new shoots of spruce.—A. J. Pieters.

4853. HOWELL, A. BRAZIER. *Agencies which govern the distribution of life.* *Amer. Nat.* 56: 428-438. 1922.—Various types of life are considered. Active forms are aquatic, fossorial, terrestrial, arboreal, volant. In case of sedentary types (most plants) character of habitat and type of seed distribution are important. Direct physical barriers are discussed. Life zones are determined by latitude, altitude, proximity to sea, prevailing winds, extreme or delimiting temperatures, and mean temperature during reproductive period. Faunal regions are largely determined by humidity. Smaller associations are determined by local conditions and chemical and mechanical character of the soil. Food conditions are of great importance in determining distribution. Enemies also limit ranges. These are grouped as passive competitive forms, which are perhaps the more important, and active enemies, which may be simply irritating or actually exterminating.—P. W. Whiting.

4854. RUTHVEN, ALEXANDER G. *The opportunities for research on the Michigan biota provided by the Michigan Geological and Biological Survey.* *Rept. Michigan Acad. Sci.* 22: 105-115. *Pl.* 1-8. 1920.—The author discusses the types of surveys conducted by the Biological Survey on the fauna and flora of Michigan, with maps showing the portions of the state where such surveys have already been conducted.—Ernst A. Bessey.

STRUCTURE, BEHAVIOR, SYMBIOSIS

4855. CHAPMAN, H. W. *Aster tripolium* on salt marshes. *Nature* 111: 256. 1923.—Individuals of this species observed at Dovercourt on fields overflowed at every high tide were all fleshy and rayless, but on fields separated by dykes the plants were thin and wiry, with well developed rays.—O. A. Stevens.

4856. RICHTMYER, F. K. *The reflection of ultraviolet by flowers.* *Jour. Optical Soc. Amer. and Rev. Sci. Instruments* 7: 151-168. 8 fig. 1923.—The author used a small portable, quartz spectrograph giving a spectrum 1.6 cm. long from $\lambda = .30\mu$ to $\lambda = .50\mu$ to get on the same plate and under approximately the same conditions of day light illumination a spectrogram of magnesium oxide surface (arbitrary standard for comparison) and several spectrograms, of increasing length of exposure, of the flower in question, in daylight. The slit of the spectrograph was sufficiently narrow to resolve clearly the Fraunhofer lines, which served to identify wavelengths. The flower and spectrograph were protected from direct sunlight by white cloth 2 feet above the flower. Data were secured on the ultra-violet reflection of some 30 Colorado flowers and 1 yellow spider. The precision is apparently of the order of 10-20 per cent. The tentative conclusions drawn are: (1) Few flowers reflect any considerable proportion of ultraviolet. Of 25 flowers studied only 4 (*Laciniaria punctata*, *Onagra biennis*, *Rudbeckia laciniata*, and *Solanum rostratum*) reflect more than 10 per cent of radiation shorter than $.38\mu$. (2) Certain yellow flowers show a distinct ultraviolet reflection band; others show no trace of it. It is pointed out that if the human luminosity curve were extended proportionately toward shorter wave lengths so that it stopped at $.3\mu$ instead of at $.4\mu$, the color of *Rudbeckia* would be purple instead of yellow. (3) Flowers differ in reflection of ultraviolet as widely as in the reflection of the visible spectrum. Contrary to expectation, no white flower reflected more than 4 per cent of $\lambda = .39\mu$. (4) There seems to be no similarity in the ultraviolet reflection of closely related species.—J. R. Schramm.

4857. SEIFRIZ, WILLIAM. *The gregarious flowering of the orchid Dendrobium crumenatum.* *Amer. Jour. Bot.* 10: 32-37. 1923.—All individuals of this species within the same general locality, including plants of very different ages, flower simultaneously. This flowering is not rhythmic, the intermediate periods varying from a few days to several months. In confirma-

tion of the theory of Burkill from data obtained at the Straits Settlements, the author finds that precipitation at Buitenzorg is unusually heavy about the 8th day before flowering. He concludes that simultaneous flowering in this species is the expression of a heritable factor, but that the exact time at which it takes place is determined by some environmental condition—either heavy rainfall or the accompanying temperature change.—*E. W. Sinnott.*

4858. STEVENS, O. A. **An amateur wild flower bed.** *Amer. Midland Nat.* 8: 164-171. 1923.—This is an account of observations made on a wild flower bed in Fargo, North Dakota, which was given ordinary treatment and ordinary neglect. Over 50 species were planted or allowed to grow.—*Sister M. Ellen.*

VEGETATION

4859. BEAUVERD, G. **Herborisations de 1921.** [Field trips for the year 1921.] *Bull. Soc. Bot. Genève* 13: 20-29. 1921.

4860. BERNARD, CH. **Coup d'oeil sur la végétation des Indes Néerlandaises.** [A survey of the vegetation of the Dutch East Indies.] *Bull. Soc. Bot. Genève* 13: 9. 1921.

4861. CAMPBELL, DOUGLAS, HOUGHTON. **Australian botanical notes. I. Queensland and New South Wales.** *Amer. Jour. Bot.* 10: 38-56. 5 fig. 1923.—This is an account of the author's visit to Queensland and New South Wales in 1921. He discusses the topography and climate of the regions through which he passed, describes in general their vegetation, and presents notes on a large number of those species which are particularly conspicuous or otherwise interesting.—*E. W. Sinnott.*

4862. GUYOT, H. **Contribution phytogéographique sur le versant méridional des Alpes Pennines.** [A phytogeographic contribution for the southern slope of the Pennine Alps.] *Bull. Soc. Bot. Genève* 13: 185-216. 1921.—The character of the plants found in this region indicate that the valley of Valsorey has not been in intimate communication with the valley of Ollomont.—*W. H. Emig.*

4863. IRBY, L. G. **The redistribution and readjustment of tree life as it affects Australian and Tasmanian forestry.** *Proc. Australian Forest. Conference [Brisbane]* 1922: 58-61. 1922.—The geographical distribution of plants and some of the causes leading to limitations of natural distribution are discussed.—*C. F. Korstian.*

4865. STEHLE, MABEL E. **Surface plankton protozoa from Lake Erie in the Put-in-Bay region.** *Ohio Jour. Sci.* 23: 41-54. Fig. 1-3. 1923.—The list of surface plankton protozoa includes 27 flagellates, 25 ciliates, and 14 rhizopods. The chlorophyll-bearing forms are thought to be present in greatest numbers at the surface between 3 and 5 p.m.—*H. D. Hooker, Jr.*

FLORISTICS

4866. BARBEY-CAMPERT, MME. **La flore des "Picos de Europa" (Espagne).** [The flora of the "top of Europe" (Spain).] *Bull. Soc. Bot. Genève* 13: 9-10. 1921.

4867. CHODAT, R. **La botanique en Italie d'après les monuments anciens.** [The flora of Italy in the vicinity of the ancient monuments.] *Bull. Soc. Bot. Genève* 13: 32-34. 1921.

4868. GUYOT, H. **Sur la flore du versant méridional des Alpes Pennines.** [The flora of the southern watershed of the Pennine Alps.] *Bull. Soc. Bot. Genève* 13: 17-18. 1921.—The xerophytic alpine flora in the valley of Ollomont reaches a higher altitude than the xero-

phytic flora in the valley of Valsorey. The area occupied by xerophytic plants is directly related to the distribution of *Pinus sylvestris*.—W. H. Emig.

4869. WILDEMAN, E. DE. *Les bambous en Afrique*. [Bamboos of Africa.] 36 p., 1 diagr. Extract from Congo. Rev. Gen. Colonie Belge. J. Goemaere: Brussels, 1921.—An examination of continental Africa leads to the conclusion that there is a definite relationship between the flora of the eastern part of the continent and that of Asia; this conclusion is supported by a study of bamboos. The following genera are recognized as indigenous to Africa: *Arundaria* Michaux, *Microcalamus* Franck, *Puelia* Franck, *Bambusa* Schreb., *Atractocarpa* Franck, *Oxytenanthera* Munro, *Oreobamboo* K. Schum., and *Guaduella* Franchet. Palaeontology gives no very definite evidence of the distribution of bamboos. The genera *Atractocarpa*, *Guaduella*, *Puella*, and *Oreobamboo* are apparently endemic but their affinities are far from well defined. In a general way it may be said that in the center and east of the continent tall bamboos dominate above rain forests at a relatively high altitude, rarely below 3,000 feet and often above 7,000 feet, frequently associated with certain types of conifers. The limits of the distribution of bamboos in Africa are given but the problems of bamboos in Africa are regarded as far from solution.—Henri Micheels.

APPLIED ECOLOGY

4870. BALDENSPERGER, PH. J. *Honey production in Egypt*. Amer. Bee Jour. 62: 418-419. 1922.—Honey is stored mainly in early spring from broad bean (*Vicia Faba*) and later from cotton and a variety of other plants.—J. H. Lovell.

4871. CARLING, A. *The hairy vetch*. Amer. Bee Jour. 62: 563. 1922.—*Vicia villosa* is a hardy biennial, enduring well weather that is hot and dry.—J. H. Lovell.

4872. COX, W. L. *Beekeeping in southwest Washington*. York's Bees and Honey 3¹⁰: 7-8. 1922.—Fireweed (*Epilobium angustifolium*) is the most important honey plant.—J. H. Lovell.

4873. DADANT, M. G. *Errors concerning honey-producing plants*. [Translation of: WUST, O. *Irtümer unserer Bienennährpflanzen*. Deutsche Illus. Bienenzeitg. 38: 86-88. 1921 (see Bot. Absts. 11, Entry 3647).] Amer. Bee Jour. 62: 266-267. 1922.—Plants with inconspicuous or green flowers are generally regarded as unattractive to bees, but many of them are good honey plants.—J. H. Lovell.

4874. DEMUTH, GEO. S. *Beekeeping and agriculture*. Gleanings in Bee Culture 50: 229-233. Fig. 1-4. 1922.—Notes are given on the pollination of coffee; buckwheat; alsike, red, and sweet clovers; and cotton.—J. H. Lovell.

4875. HENDRICKSON, A. H. *Wonder work of bees*. Gleanings in Bee Culture 50: 226-229. 1922.—Pollination of fruit-trees is popularly described.—J. H. Lovell.

4876. HOUSE, L. C. *Beekeepers look to "The Land of Honey."* Beekeepers Rev. 37: 5. 1922.—*Trifolium repens* and *T. hybridum* are so abundant in the Northern Peninsula of Michigan that this section is often called "Cloverland." Other common and valuable honey plants are dandelion, wild raspberry, and *Epilobium angustifolium*. An average of 50 pounds of honey per colony is easily obtained.—J. H. Lovell.

4877. KINDIG, B. F. *Nectar producing resources of Michigan*. Michigan Dept. Agric. Bull. 4. 19 p. 1922.—*Trifolium hybridum* and *T. repens* are the 2 chief sources of honey in Michigan, being especially well adapted to the low-lying heavy soils of the old lake bed. *T. hybridum* is extremely abundant in the northern part of the Lower Peninsula, and in the Upper Peninsula it covers thousands of acres with no bees to gather its nectar. A heavy growth of *Rubus idaeus* var. *aculeatissimus* follows the cutting of the hardwood forests, forming

almost impenetrable thickets. Its blooming period (about 2 weeks) precedes that of alsike clover. The honey is light in color and has a mild, excellent flavor. Following forest fires *Epilobium angustifolium* springs up in great abundance, and for several years yields a large surplus of fine water-white honey. In the northwestern counties of the Lower Peninsula *Asclepias syriaca* has extended over a large area; the honey is a very light amber color and has a rich fruity flavor. *Tilia americana*, formerly a major honey plant of the state, has become so rare that little basswood honey is produced. *Cirsium arvense* honey is stored in some localities yielding a white honey of very good flavor. The goldenrods (*Solidago rugosa*, *S. graminifolia*, etc.) are the most valuable sources of fall honey, furnishing a golden-yellow product with pronounced flavor. In the southern third of the Lower Peninsula *Bidens aristosa* is common in the swamps, and yields an amber-colored, strong-flavored honey.—Other honey plants of value are asters (*Aster multiflorus*, *A. vimineus*, *A. paniculatus*, etc.). *Verbena hastata*, *Mentha spicata*, *M. piperita*, *Acer rubrum*, *A. saccharum*, *Fagopyrum esculentum*, *Eupatorium perfoliatum*, cucumbers, and fruit bloom.—It is estimated that there are over 10,000 beekeepers in the state, and that 8,000,000 pounds of extracted honey and 2,000,000 pounds of comb honey are produced annually.—J. H. Lovell.

4878. KINDIG, B. F. The honey resources of Michigan. Amer. Bee Jour. 62: 545-547. Fig. 1-4. 1922.—*Trifolium hybridum* and *T. repens* grow together throughout the state but are most abundant on clay soils, particularly those once forming a part of the beds of lakes Huron and Superior. *Rubus idaeus* var. *aculeatissimus* is most common in the Upper Peninsula and in the Lower Peninsula north of a line drawn east and west through Cadillac. *Asclepias syriaca* is of value to the beekeeper in the northwestern part of the Lower Peninsula. There is a flow of light amber honey in the fall of the year which seems uniformly to have been overlooked. An average of 50 pounds or more per colony from goldenrods, Spanish needles, bone-set, buckwheat, purple vervain, and asters is not uncommon.—J. H. Lovell.

4879. LATHAM, C. J. Wild cucumber a honey plant. Gleanings in Bee Culture 50: 595. 1922.—*Echinocystis lobata* blooms 4-5 weeks and yields a light amber honey, which is very thick and of excellent flavor.—J. H. Lovell.

4880. MABBOTT, D. C. Food habits of seven species of American shoal-water ducks. U. S. Dept. Agric. Bull. 862. 67 p. 1920.—The vegetable food of these ducks consists mainly of species of *Niadaceae*, *Gramineae*, *Cyperaceae*, *Polygonaceae*, *Sparganiaceae*, *Nymphaeaceae*, *Rubiaceae*, *Compositae*, algae, and a few representatives of other shore or water plants.—Julia M. Haber.

4881. McATEE, W. L. Waterfowl and their food plants in the sandhill region of Nebraska. U. S. Dept. Agric. Bull. 794. 37-77. 1920.—The sago pondweed, *Potamogeton pectinatus* and wild rice, *Zizania palustris*, form the best duck food.—Julia M. Haber.

4882. MERRILL, J. H. Honey plants of Kansas. Amer. Bee. Jour. 62: 7-10. Fig. 1-4. 1922.—Kansas may be divided into 4 sections according to its honey plants and beekeeping conditions. In the northeast corner the rainfall ranges from 33 to 43 inches. The soil along the Missouri River consists of loess which is well adapted to fruit growing. In the western portion of this section the soils are glacial. This is the only part of the state in which *Trifolium repens* is valuable, but nectar secretion varies greatly in amount in different seasons. *T. hybridum* is not largely grown. *Melilotus alba* is nearly equal to white clover. Other honey plants are *Taraxacum officinale*, *Acer saccharinum*, *Tilia americana*, *Bidens aristosa*, and *Polygonum Persicaria*.—The soils in the southeast corner are derived from shale and are too acid for leguminous plants. The important honey plants are *Bidens aristosa*, *Melilotus alba*, *Polygonum Persicaria*, and *Solidago*. *Disopyros virginiana* furnishes early pollen and nectar.—The central part or the state lies between the altitude of 1000 feet on the east and 2000 feet on the west. The rainfall ranges between 21 and 31 inches. The soils are derived from sandstone, limestone, and shale. Beekeeping conditions are very favorable in the valleys of the

Arkansas, Kaw, Blue, Verdigris, and Solomon rivers. The most important honey plants are *Melilotus alba*, *Medicago sativa*, *Polygonum Persicaria*, and *Taraxacum*. *Monarda punctata* is abundant in the Arkansas River Valley; it has yielded 4 good honey crops in 10 years and averaged 100-150 pounds. The western section varies in altitude from 2000 to over 3000 feet; popularly it is known as the "short-grass region." The soils contain a high percentage of lime. *Cleome serrulata* grows in profusion and is a valuable honey plant. Alfalfa and sweet clover are the principal crops.—J. H. Lovell.

4883. PARK, WALLACE. **Time and labor factors involved in gathering pollen and nectar.** Amer. Bee. Jour. 62: 254-255. Fig. 1-2. 1922.—During the period of observation in 1920 and 1921 average colonies of bees stored respectively about 5 and a little over 1 pounds per day from *Melilotus alba*. In the 1st instance weather conditions were highly favorable; in the 2nd, mediocre to poor.—The maximum number of trips recorded in 1 day for a nectar carrying bee was 24 in 1920, and 17 in 1921. The average number of trips per day was $13\frac{1}{2}$ in 1920, and 7 in 1921. The average time per day spent in nectar-carrying, in 1920, was $8\frac{1}{2}$ hours, and, in 1921, $7\frac{1}{2}$ hours.—The maximum number of trips made per day by a bee gathering pollen from corn was 20, in 1920; in 1921, only 11. The averages were about 8 and $5\frac{1}{2}$ trips per day for the respective years. As a rule corn pollen was not available in the afternoon; the above figures therefore represent only about $\frac{1}{2}$ day in actual time.—The average minimum flying weight of an Italian bee is approximately 82 mgm. Maximum loads of nectar weighed nearly 70 mgm.; average loads, about 40 mgm. A maximum load of pollen weighed about $\frac{1}{2}$ of the weight of the bee, and less than $\frac{1}{2}$ that of a maximum load of nectar.—J. H. Lovell.

4884. PARKS, H. B. **The American hollies as honey yielders.** Beekeepers' Item 6: 9-10. 1922.—*Ilex opaca* extends from Massachusetts to Texas. Where abundant it yields well, and in some localities is the chief source of surplus. The honey is nearly white and has a mild flavor. Yaupon (*I. vomitoria*) and dahoon (*I. Cassine*) yield a very large amount of honey in the swamplands of the central South. The honey is amber-colored and has a peculiar flavor. It does not granulate quickly. Gallberry (*I. glabra*) and swamp gallberry (*I. decidua*) form immense thickets in the lowlands along the Atlantic and Gulf coasts. They bloom from May to June and yield an immense amount of honey. The average surplus stored per colony is usually 35-40 pounds, but a colony has been known to gather 150 pounds. The honey is light amber, very heavy, has a mild flavor, and does not granulate.—J. H. Lovell.

4885. PELLETT, F. C. **Honey regions of Iowa.** Amer. Bee Jour. 62: 453-455. Fig. 1-3. 1922.—The surface, climate, and soils of the state are briefly described. *Trifolium repens* is the main source of surplus honey in nearly every county. In every 5 years there is likely to be 1 big crop, 2 fair crops, 1 light crop, and 1 failure. *T. hybridum* is important in a few counties. The floral tubes of *T. pratense* are so long that, except under unusual conditions, it is not a valuable honey plant. The area of *Melilotus alba* is rapidly extending. In woodlands *Symphoricarpos orbiculatus* and *S. racemosus* yield a surplus in mid-summer. Other honey plants are heartsease, Spanish needle, willows, maples, dandelion, asters, and fruit-trees.—J. H. Lovell.

4886. PELLETT, F. C. **Prickly comfrey.** Amer. Bee Jour. 62: 109. Fig. 1. 1922.—*Symphytum asperrium* yields perhaps as large amounts of forage as any plant known. The bloom is attractive to bees, but there is no information available as to the amount of honey procurable from it.—J. H. Lovell.

4887. PELLETT, F. C. **The annual sweet clover.** Amer. Bee Jour. 62: 95-97. Fig. 1-5. 1922.—Annual or Hubam sweet clover (*Melilotus alba* var.) can be used in a 2-year rotation. While the Hubam is better for a catch crop, the biennial is apparently better in fields, when it is desired to grow sweet clover for a series of years. Hubam clover offers a long honey flow, and each acre of this plant, it is believed, will support 1 colony of bees.—J. H. Lovell.

4888. PHILLIPS, E. F., and G. S. DEMUTH. **Beekeeping in the buckwheat region.** U. S. Dept. Agric. Farmer's Bull. 1216. 26 p., 6 fig. 1922.—The buckwheat beekeeping region includes New York, Pennsylvania, northeastern Ohio, western Maryland, and West Virginia; $\frac{2}{3}$ of the entire buckwheat area in the U. S. A. is in New York and Pennsylvania. In New York buckwheat yields nectar freely during the forenoon: the flow ceases early in the afternoon. Secretion is reduced or stopped when the temperature falls below 70°F. It is most abundant when the nights are cool and the days warm and calm. Early bloom or late bloom secretes little, or not at all. In the glaciated plateau region of New York and Pennsylvania nectar is secreted best on the Volusia and DeKalb soils, formed by the disintegration of shale and limestone. The honey is dark colored and strong flavored. Only extracted buckwheat honey should be produced.—As buckwheat secretes nectar so late in the summer, the colonies of bees under proper care are likely to reach maximum strength before the nectar is available. A system of management is required which will result in a full honey crop and at the same time control European foulbrood, which is very prevalent in the buckwheat region.—*J. H. Lovell.*

4889. PHILLIPS, E. F., and G. S. DEMUTH. **Beekeeping in the clover region.** U. S. Dept. Agric. Farmers' Bull. 1215. 27 p., 7 fig. 1922.—The clovers doubtless furnish more honey than any other genus of plants. The best clover honey region in the U. S. A. lies in western Vermont, northern and central New York, northwestern Ohio, northern Indiana, and Illinois, Michigan, Wisconsin, Minnesota, and northeastern Iowa. The quantity of nectar secreted varies enormously according to soils, climatic conditions, and other environmental factors. The chief blooming period of *Trifolium repens* begins in the spring about 5 or 6 weeks after the last killing frost and lasts 3-5 weeks. Nectar secretion is not uniform throughout the range of this species. The plants thrive best in localities with ample rains in July, August, and September. Abundant rain in May prolongs the period of blooming and of nectar secretion. White clover is a major source of honey only where the soils are calcareous and the average summer temperature not above 75°F. Secretion is most rapid under a considerable daily range temperature,—night temperature below 65°F. and day temperature above this point. *T. hybridum*, unlike white clover, is regularly cultivated as a farm crop. The conditions controlling nectar secretion are essentially the same as in white clover. *T. pratense* is losing ground as a farm crop because of the increasing deficiency of lime in the soils. It does not thrive in cold wet land. As is well known the flowers of red clover secrete nectar more freely than do those of white clover or alsike clover. Under normal conditions the floral tube of red clover is much longer than the tongue of the honey-bee. Honey is secured from the bloom only when the floral tubes are shortened by drought, or, owing to very favorable conditions of soil and climate, nectar is secreted so abundantly that it rises in the tubes until a part of it becomes accessible to the honey-bee.—Many beekeepers in this region are failing to obtain the full available honey crop because of deficiencies in their practice of bee culture. A system of management is given promising full crops.—*J. H. Lovell.*

4890. PHILLIPS, E. F., and G. S. DEMUTH. **Beekeeping in the tulip-tree region.** U. S. Dept. Agric. Farmers' Bull. 1222. 25 p., 6 fig. 1922.—A method is given for the management of apiaries to secure full honey crops from *Liriodendron tulipifera*. The tulip-tree region is restricted largely to Tennessee, Kentucky, the western portion of the Carolinas and Virginia, the Piedmont Plateau of Maryland, West Virginia and the Ohio River Valley. Although the bloom is a most dependable source of nectar, not much honey is at present secured from it (2.8 per cent of the total U. S. A. crop). The flowers open about 3 weeks after the average date of the last killing frost, and the blooming period lasts about 2 weeks. Trees begin to bloom when 15 years old. The honey is dark amber in color and has a strong flavor. Extracted honey alone should be produced from this source. Complete directions for the proper care of bees in this region are given.—*J. H. Lovell.*

4891. SCHMID, SEPP. **Beekeeping in Austria.** Amer. Bee Jour. 62: 512. Fig. 1. 1922.—Austria with a population of 6,400,000 and a territory of 32,000 square miles has about 60,000 beekeepers. In 1921, 350,000 colonies produced 1,320,000 pounds of honey, and 286,000 pounds

of wax. In the fine honey locations of Marchfeld, Under-Carinthia, and Burgenland 100 pounds of honey per colony is often obtained in good years.—The common honey plants are acacia, basswood, maples, brambles, esparcette, white clover, heather, buckwheat, and golden-rod.—*J. H. Lovell.*

4892. SHEPPARD, W. J. The Siberian yellow-flowered alfalfa. *Amer. Bee. Jour.* 62: 420-421. 1922.—*Medicago falcata* is a good honey and forage plant, and well adapted to the dry belt of the interior of British Columbia.—*J. H. Lovell.*

4893. SHEPPARD, W. J. The spreading dogbane is a good honey plant. *Agric. Jour.* [British Columbia] 7: 252. 1923.—The honey from *Apocynum androsaemifolium* L. is water white and cannot be distinguished from that from fireweed by its color, but is better flavored and usually denser.—*J. W. Eastham.*

4894. SHEPPARD, W. J. The spreading dogbane is a good honey plant. *Amer. Bee Jour.* 62: 562-563. 1922.—[See preceding abstract.]

4895. SHEPPARD, W. J. Hairy vetch as a honey plant. *York's Bees and Honey* 3^o: 8-9. 1922.—In many orchards of British Columbia, *Vicia villosa* used as a cover crop is a good honey plant. The pale amber honey is secured in June and July.—*J. H. Lovell.*

4896. SHEPPARD, W. J. The hairy vetch as a honey plant. *Amer. Bee Jour.* 62: 455. 1922.—[See preceding abstract.]

4897. SMITH, B. F. Quality of honey influenced by soil. *Amer. Bee Jour.* 62: 31. 1922.

4898. SWENK, M. H. The honey regions and honey plant of Nebraska. *Amer. Bee Jour.* 62: 197-201. *Fig. 1-4.* 1922.—Nebraska is divided by the author into an eastern or white clover region and a western or alfalfa region. The dividing line runs irregularly through Holt, Boone, Garfield, Custer, Lincoln, and Hitchcock counties. East of this line the soil is loess, west of it sandy loams, or sand. The fertile loess is a comparatively moist soil, and the plants of this section are mesophytes or hydrophytes; on the sandy semi-arid western soils the plants are xerophytes. The annual rainfall in the eastern portion of the state ranges from 30 to 32 inches; in the western portion, from 12 to 15.—The chief sources of nectar in the eastern region are *Trifolium repens*, *Acer saccharinum*, *Taraxacum officinale*, *Robinia Pseudacacia*, *Gleditsia triacanthos*, *Catalpa speciosa*, *Asclepias syriaca*, *Brassica nigra*, *Cassia fasciculata*, *Helianthus annuus*, *Polygonum Persicaria*, and others. To the honey flora of the western region belong *Medicago sativa*, *Ribes setosa*, *Cleome serrulata*, *Cleomella angustifolia*, *Gaura coccinea*, *Orcocarya suffruticosa*, and many species of *Bidens*, *Aster*, *Solidago*, and *Helianthus*.—A number of honey plants are widely distributed throughout the state. Probably white sweet clover and yellow sweet clover yield a larger surplus than any other 2 species.—*J. H. Lovell.*

4899. VORGHESEANI, G. A. R. L'ecologia vegetale e le sue applicazioni. [Vegetable ecology and its application.] *Riv. Biol. Rome.* 4: 521-534. 1 *pl.* 1922.

4900. WETMORE, A. Wild ducks and duck foods of the Bear River marshes, Utah. *U. S. Dept. Agric. Bull.* 936. 20 *p.*, 4 *pl.* 1921.—Of foods attractive to 11 species of ducks found in the Bear River marshes, *Potamogeton pectinatus* and *Scirpus paludosus*, both occurring in abundance, furnish a large part of the vegetable portion. In all, 49 plants were available as duck foods.—*Julia M. Haber.*

4901. WILDER, J. J. Red bay as a honey plant. *Dixie Beekeeper* 4^o: 10. *Fig. 1-2.* 1922.—*Persea bordonia* grows in swamps near the coast from Virginia to Texas. The small flowers yield abundantly a very thick nectar from March to May. The honey is dark, strong in flavor, and is sold as grade No. 2. In the low Coastal Plains the honey never granulates although very thick.—*J. H. Lovell.*

4902. WILDER, J. J. **St. Mary's River.** Dixie Beekeeper 41: 4-6. Fig. 1. 1922.—The rich, swampy land along the river is covered with a dense growth of *Nyssa aquatica*, one of the best honey plants of this section, and *N. biflora*. *Serrenoa serulata*, *Acer rubrum* and *Ilex glabra* are also common. This territory would support an immense number of colonies of bees, and could be stocked either by land or water transportation.—J. H. Lovell.

4903. WINKLER, E. A. **How Hubam clover increased my honey crop.** Amer. Bee Jour. 62: 556. 1922.

4904. YOUNG, FLOYD D. **Influence of cover crops on orchard temperatures.** Monthly Weather Rev. 50: 521-526. Fig. 1-8. 1922.—A cover crop has little effect on temperature a few feet from the ground. Because of the shading there is a cooling effect upon the soil which tends to decrease the temperature and therefore to increase the possibility of frost.—E. N. Munns.

4905. ANONYMOUS. **Biological terminology.** Nature 109: 733-736. 1922.—Scientific terms persist but their content requires continual readjustment. Vagueness occurs because biologists are not disciplined in methodology and the art of formulation. A term like "acquired character" is used by competent biologists in the same sense but it might be better to drop it in favor of some term like "somatic modification." Distinction between hereditary characters and modifications has been criticized. The relation between hereditary factors and environment is pointed out and the nature of new hereditary characters is discussed. The important point is not what terms are used but that biologists understand one another. Although inheritance depends upon factors, it is not necessary always to mention hereditary factors rather than hereditary characters. Concerning acquired characters more facts are needed and critical interpretation rather than discussion of terminology. The mistake of making an antithesis between "nature" and "nurture,"—2 components of 1 resultant—is not one to which a biologist can plead guilty.—Walter Scott Malloch.

4906. ÅKERMAN, Å. **Beiträge zur Kenntnis der Speltoidmutationen des Weizens. I. Untersuchungen über eine Speltoidform aus schwedischem Sammetweizen.** [Studies on speltoid mutations in wheat. I. Investigations on a speltoid form of Swedish velvet wheat.] Hereditas 4: 111-124. 2 fig. 1923.—An abnormal plant produced 9 offspring like the normal variety type, 4 like the abnormal parent plant, and 1 weak, small, bearded speltoid type plant. The 4 proved to be heterozygous and the 1 homozygous, with regard to the speltoid character. The homozygous speltoid type plant was shorter than the normal or heterozygote, and the head was more lax. With respect to shape, size, and pubescence of glume, and size and endosperm character of grain, the heterozygote form is between the normal and the speltoid. The heterozygote produced normals, heterozygotes, and speltoids in the ratio of 1.75 : 2.02 : 0.23 instead of the usual 1 : 2 : 1. This corresponds to Nilsson-Ehle's speltoid type A, the heterozygotes equalling the sum of the 2 homozygotes. This result is evidently brought about by the elimination of ♂ speltoid gametes. This is evidenced by certain crosses. Normal type ♀ × heterozygote ♂ produced 126 normals and 22 heterozygotes. The reciprocal cross gave the normal ratio of 1 : 1. It is assumed further that the amount of ♂ gamete

elimination is a variable factor directly correlated with the vitality of the speltoid soma. A variant heterozygote speltoid is described corresponding to Nilsson-Ehle's type B with a ratio of normals to heterozygotes of approximately 1:3 with only an occasional homozygous bearded speltoid appearing. This arose in this experiment from a plant of type A, already described.—*L. R. Waldron.*

4907. APPEL, O. *Über die Anfälligkeit und Widerstandsfähigkeit verschiedener Kartoffelsorten gegen Krebs.* [Susceptibility and resistance of different potato varieties to wart.] Arbeit. Ges. Förderung Baues u. Verwendung Kartoffeln 15. 19 p., 1 pl. 1918.—The author recalls the unpromising results of soil treatment for protection against wart and emphasizes the value of resistant varieties. His summary of varieties tested shows many more susceptible than immune. No connection is evident between time needed for maturing and susceptibility. Experiments point to inheritance of susceptibility. The hybrid character of potato stocks makes genetical interpretation difficult. A study of varietal pedigrees reveals such facts as the following: of 6 varieties descended from the crossing of Jubel and Deutsches Reich 4 were more or less resistant and 2 susceptible. Jubel is wart-resistant while the reaction of the other parent is unknown. Hindenburg (resistant) and Laurus (susceptible) arose from Jubel and 2 susceptible varieties as parents. Fürst Bismarck (susceptible) has given rise to 2 named resistant varieties, the other parents of which were untested. An extensive list of potato varieties is given in which the varieties are grouped into non-susceptible, slightly susceptible, strongly susceptible, and very strongly susceptible.—*J. P. Kelly.*

4908. BAILEY, VERNON. *Beaver farming.* Jour. Heredity 13: 215-218. 5 fig. 1922. [1923].—This is an untouched field of investigation, and great diversity exists in the various wild races of beavers.—*R. C. Cook.*

4909. BECKER, J. *Über vegetative Bastardspaltung.* [Somatic or vegetative segregation.] Zeitschr. Pflanzenzücht. 8: 402-420. 2 fig. 1922.—Somatic modification of factors is apparent only when the changed cell becomes the mother cell of a lateral bud, flower, leaf, etc. The writer believes it occurs many times but remains hidden. Vegetative segregation has been observed in carnations, snapdragons, tulips, wheat, poppy, dahlia, *Vicia villosa*, lupine, peas, beans, barley, oats, azalea, Pelargonium, asters, *Scabiosa*, *Dianthus*, *Petunia*, *Campanula*, *Aquilegia*, *Verbena*, and some fruits such as pears, grapes and tomatoes.—Fruwirth was the earliest worker in the field; E. v. Tschermak and Baur also report somatic segregation. It is variously regarded as mutation, bud variation, and xenia. Becker's classification shows all gradations from recessive to dominant occurring in cases of somatic segregation.—Intensified environmental conditions are reported as causing somatic segregation or mutations. Becker attributes all cases fundamentally to an unequal division of the nucleus.—*Helen D. Hill.*

4911. BLUHM, AGNES. [German rev. of: MACDOWELL, E. CARLETON. (1) *Alcohol and white rats. A study of fertility.* Proc. Soc. Exp. Biol. and Med. 19: 69-71. 1921. (2) *The action of alcohol upon germinal material.* [Abstract.] Anat. Rec. 23: 92. 1922 (see Bot. Absts. 11, Entry 1393).] Arch. Rass.- u. Ges. Biol. 14: 357-360. 1922.

4912. BLUHM, AGNES. [German rev. of: PEARL R. *The experimental modification of germ-cells.* Jour. Exp. Zool. 22: 125-186, 241-310. 1917.] Arch. Rass.- u. Ges. Biol. 14: 355-356. 1922.

4913. BONNIER, GERT. *Studies on high and low non-disjunction in Drosophila melanogaster*. *Hereditas* 4: 81-110. 2 fig. 1923.—Bridges had found that females having 1 Y and 2 X chromosomes give exceptions to the usual scheme of sex linkage, owing to synapsis of an X with the Y and subsequent non-disjunction of the 2 X's, in about 4 per cent of the reduction divisions, but in 1 such non-disjunctive line he found the XXY females to give 21 per cent of exceptions. Bonnier finds that the high per cent of X-Y synapsis in this line depends upon something that must be present in both the X chromosomes of the XXY female of the "high line," and not upon anything elsewhere located, since XXY descendants of outcrosses of the high line, which had received 1 of their X's from another line, always showed the low percentage, whereas XXY descendants which had received both X's from the high line but often the Y and some autosomal material from other lines invariably showed the high percentage. When, through outcrosses involving crossing-over, XXY flies were made up in which only the left ends of the X chromosomes of the high line were represented in both of their X's (neglecting whatever derivative of the high line might be present in only 1 of the X's), an intermediate proportion of exceptions (8 to 13 per cent) was obtained; in 1 such case only that portion of both X's to the left of cut (locus about 20) was derived from the high line. When only the right end of both X's came from the high line (in an extreme case only apart to the right of vermillion, locus 33), there was also an intermediate per cent—10.6 to 15.5. Therefore, the high original per cent (21) is not dependent on 1 pair of genes, but either on 2 or more,—or, as Bonnier believes, on some peculiarity of the entire length of the chromosome, resident in what he calls the "genebasis" in distinction to the genes themselves. On this hypothesis the length of "genebasis" ("z"), common to both chromosomes, that was derived from the high line, determines the percentage of exceptions ("y"). Bonnier calculates that, accepting this supposition and taking his data at their face value, and neglecting the great variability in percentage between different supposedly genetically identical cultures, the following empirical formula holds: $y = 4.3 + 0.2 z$.—H. J. Muller.

4914. BREITENBECHER, J. K. *Hereditary shortness of thumbs*. *Jour. Heredity* 14: 15-22. 5 fig. 1923.—Hereditary shortness of thumbs is a unique human abnormality, not previously described, discovered about 10 years ago. The abnormal trait is associated with a long narrow hand; but the most evident feature is a thick, short, broad thumb. Briefly, the abnormal thumb is shorter than the normal by the length of the 1st phalanx. In the family under observation the writer traced this abnormal thumb through 5 generations, 13 members having it. The character is neither sex-limited nor sex-linked in its transmission. The evidence proves that it is an autosomal Mendelian dominant.—J. K. Breitenbecher.

4915. BROWN, W. R. *Pusht-i-Kuh × Hashtnagari sheep at the agricultural experiment station, Peshawar*. *Agric. Jour. India* 17: 264-270. 3 pl. 1922.—The author describes the results of crosses made in the Northwest Frontier Province of India between a Pusht-i-Kuh or long-wooled Persian ram, obtained on the Tigris, with native ewes of a closely similar breed, the Hashtnagari. Efforts to make matings with fat tailed Peshawari ewes were unsuccessful. Both the Pusht-i-Kuh and the Hashtnagari are fat tailed sheep but the former has a much broader and more massive tail. Both carry a heavy fleece of good carpet wool quality. The Pusht-i-Kuh is a much heavier sheep. The crossbreds showed marked improvement in rate of maturity, in live and dead weight, and in the quality and weight of the fleece. The rams exceed even the Pusht-i-Kuh in weight and constitution. It is suggested that this is an effect of crossing.—Sewall Wright.

4916. COLE, LEON J., and DEWEY G. STEELE. *A waltzing rabbit*. *Jour. Heredity* 13: 290-294. 1 fig. 1922 [1923].—A rabbit which exhibited circular movements similar to those of waltzing mice and rats occurred among the descendants of males treated experimentally with lead and with alcohol. Several other nervously defective individuals cropped out in the same line of descent, and it is possible that all may have been induced by the effects of the poisoning on the germ plasm. Simple Mendelian inheritance of the waltzing behavior, as it occurs in mice, could not be demonstrated in the rabbit.—L. J. Cole.

4917. COLIN, HENRI, et Y. TROUARD-RIOLLE. **Dissociation de l'hybride: orge noire à barbes lisses × orge Albert.** [Hybrid segregation: Black Bearded Barley × Albert.] *Compt. Rend. Acad. Sci. Paris* 176: 854-856. 1923.—A black barley with awns smooth except at the extremity was pollinated by Albert, a homozygous, white, rough-awned barley. Of the 20 "hybrid" kernels secured, 14 were germinated. Black kernel color is dominant, though many less well developed kernels are merely grayish and the awns range all the way from black to white. The authors report that the F_1 population includes smooth-awned, rough-awned, and intermediate forms and that smooth-awned F_1 plants gave rise to only smooth-awned F_2 plants. The rough-awned plants are reported to have a segregating F_2 progeny, but no numerical data are given for the segregating classes. The authors claim that "disjunction of characters" occurred in F_1 , without mentioning the possibility of self pollination.—*Kwen S. Hor.*

4918. COLLINS, J. L. **Culture of Crepis for genetic investigations.** *Jour. Heredity* 13: 329-336. 4 fig. 1922 [1923].—The paper describes cultural and hybridization methods used in studying inheritance in a genus of the Compositae. Achenes may be sprouted in shallow pans of sterilized soil or in a glass jar-moist chamber germinator. Advantages of each are given. Achenes may be sterilized with formaldehyde vapor or a solution of calcium hypochlorite to prevent growth of injurious fungi. The young seedlings are sub-irrigated in pots. Hybridization is accomplished by removing fresh pollen from the pistil with a fine jet of water; also by emasculation. Tools necessary for emasculation are described. Anthesis of the flowers occurs at regular periods of the day. Methods of securing seed from sterile and fertile strains and of protecting plants from parasitic organisms are given.—*J. L. Collins.*

4919. CREW, F. A. E. **A black Leghorn hen which turned white.** *Jour. Heredity* 13: 299-303. 4 fig. 1922 [1923].—A Black Leghorn hen ceased laying and developed head characters like those of the male; the plumage remained hen-like in type but with each successive moult became whiter until the bird was white with black flecks. She died from internal hemorrhage. A large tumor containing abundant luteal cells replaced the ovary. The conclusion is that the formation of large quantities of pigment in the luteal cells is a sign of degeneration, the final stage of which is a structureless mass of pigment lying among the stroma. In this case the cells were almost functionless and had the bird lived she would probably have become cock-feathered. The adrenals could not be found and it is thought they became incorporated in the tumor-growth; this may explain the changes in pigmentation. It must be noted that in the young fowl ovarian and adrenal tissues are histologically continuous.—*F. A. E. Crew.*

4920. CUNNINGHAM, J. T. **Species and adaptation.** *Nature* 109: 775-777. 1922.—The author criticizes Bateson's address at Toronto [see *Bot. Absts.* 11, Entry 3806].—*P. C. Mangelsdorf.*

4921. DANIEL, LUCIEN. **Variations des parfumes sous l'influence du greffage.** [Variations in perfume through the influence of grafting.] *Compt. Rend. Acad. Sci. Paris* 176: 999-1001. 1923.—The author obtained morphological and biochemical variations in grafted plants possessing odoriferous products. A variable type of *Artemis absinthium*, induced by such grafting, produced a seedling which in turn furnished plants which varied morphologically as well as in odor and flavor.—*Richard Wellington.*

4922. DUNN, L. C. **Color inheritance in fowls.** *Jour. Heredity* 14: 23-32. 4 fig. 1923.—Detailed evidence illustrated by photographs is presented on the inheritance of plumage color and pattern in crosses of Columbian pattern (Light Brahma) fowls with black and with buff fowls. The Columbian is found to differ from the buff coloration by a single dominant sex-linked gene which inhibits the development of buff pigment in the feathers and by multiple genes affecting the amount of black pigment in certain parts of the plumage. The Columbian coloration is found to differ from self black by 2 main genes,—the sex-linked gene for inhibition

of buff (present in Columbians, absent in blacks) and a dominant autosomal gene for extension of black to all or nearly all of the plumage (present in blacks, absent in Columbians).—*L. C. Dunn.*

4923. FEDERLEY, HARRY. *Bilden Chromosomenkonjugation, Mendelspaltung und Fertilität bei Speziesbastarden einen Dreibund?* [Does chromosome conjugation, Mendelian segregation and fertility in species hybrids form a triple alliance?] *Hereditas* 4: 161–170. 1 fig. 1923.—“Non-conjugation of the chromosomes in the gametogenesis of species hybrids results in partial or total sterility in F_1 , and non-segregation in F_2 and in back-crosses. In the species hybrid *Chaerocampa porcellus* ♀ × *Ch. elpinor* ♂ [hawk-moths], all the 29 *porcellus*-chromosomes conjugate with the 29 *elpinor*-chromosomes both in the spermatogenesis and in the oogenesis. In this case fertility in F_1 and segregation in F_2 and in back-crosses is consequently to be expected.” The F_1 , for a species-hybrid, is remarkably fertile. Difficulty in making a mating to produce F_2 arose from the fact that the 15 females acquired full development within 2 weeks, while the males matured much more slowly. Two males were carried to maturity in 4 weeks, the 7 others wintered over. Only 1 mating was obtained, and from it only 11 eggs, of which 5 hatched, all dying as caterpillars. The overwintering males eclosed earlier than the parent species, but a mating with a *porcellus* ♀ was brought about. All of the 38 eggs then laid hatched but, though apparently structurally normal, only 7 larvae would eat (*Epilobium angustifolium*), and all except 1 female died before pupation. Hybrid viability depends not only on successful conjugation of chromosomes but also upon other unknown conditions.—The horn of the young larva of *elpinor* is long and dark; that of *porcellus* is a raised wart. The F_1 was like *elpinor*, and the 5 F_2 caterpillars likewise had the horn, but no segregation occurs, for the 38 larvae of the back-cross (*porcellus* ♀ × F_1 ♂) all have the *porcellus*-like small cone.—*J. H. Gerould.*

4924. FEHLINGER, H. *Geschlechtsverhältnis der Geborenen und Alter der Eltern in der Stadt Amsterdam.* [Sex ratio of births and age of parents in Amsterdam.] [German rev. of: *Statistisch Jahrb. d. Stadt Amsterdam*, 1917. (Statistical year book of the city of Amsterdam, 1917.)] *Arch. Rass.- u. Ges. Biol.* 14: 230–231. 1922.

4925. FETSCHER. [German rev. of: WEIL, A. *Die innere Sekretion.* (The internal secretion.) 140 p., 35 fig. Julius Springer: Berlin, 1921.] *Arch. Rass.- u. Ges. Biol.* 14: 186–187. 1922. [See also Bot. Absts. 11, Entry 3892; 12, Entry 4944.]

4926. FICK. *Die Familie Fick.* [The Fick family.] *Arch. Rass.- u. Ges. Biol.* 14: 159–175. 1922.—This paper describes the genealogical tree and special characteristics of the descendants of one Herman Fick, born 1702, in Oberfranken, Germany. In this family are found 6 persons of well-known ability, 7 unusually gifted but less gifted than the 6 first mentioned, 15 gifted more than the average, and 10 others, with more than average ability but who died before reaching full maturity, 4 of these being killed during the World War. The activities of some of those of distinguished ability are noted; also the activities of those of less exceptional ability, among them teachers, governesses, and 1 farmer. The description gives a complete picture of the activities of all the descendants in the 1 line traced through to the present date. The physical traits, such as general build, skin, and hair and eye color, are noted in many individuals. No attempt is made to analyse from any point of view the data presented. The plea is made that more genealogical-biographical studies be made of the aristogenic families of Germany.—*A. H. Estabrook.*

4927. FOLSON, DONALD. *Mutations of the potato. Two somewhat unstable leaf-form sports of the Irish potato.* *Jour. Heredity* 14: 45–48. 3 fig. 1923.—One type of sport was originally observed only once, and the other type 4 times, in over 350,000 plants examined for foliage diseases. The former type, characterized by simple leaves, was followed through a series of 4 vegetative generations and in the 3rd generation reverted partly and temporarily to the compound-leaf norm. The latter type, characterized by thick, distorted, and glabrous leaves, was grown through 1 series of 5 vegetative generations, and frequently reverted in part to the norm.—*Donald Folsom.*

4928. FRANZ, V. [German rev. of: BECHER, SIEGFRIED. *Flügefärbung der Kolibris und geschlechtliche Zuchtwahl*. (Wing color of humming birds and sexual selection.) *Anat. Heft* 57: 447-482. 1919.] *Arch. Rass.- u. Ges. Biol.* 14: 180-181. 1922.

4929. FRANZ, V. [German rev. of: LEHMANN, ERNST. *Variabilität und Blütenmorphologie*. (Variability and flower morphology.) *Biol. Zentralbl.* 38: 1-38. 1918 (see *Bot. Absts.* 7, Entry 1796).] *Arch. Rass.- u. Ges. Biol.* 14: 346-347. 1922.

4930. FRANZ, V. [German rev. of: LUBOSCH, W. *Der Akademiestreit zwischen Geoffroy St.-Hillaire und Cuvier im Jahre 1830 und seine leitenden Gedanken*. (The debate between Geoffroy St.-Hillaire and Cuvier in 1830 and its main issues.) *Biol. Zentralbl.* 38: 357-384, 397-455. 1918.] *Arch. Rass.- u. Ges. Biol.* 14: 345. 1922.

4931. FRETS, G. P. *The index cephalicus*. *Genetica* 4: 481-534. 1922.—Original statistical data are given for the head index of 3,600 persons, gathered from patients and visitors at the Asylum Maasoord of Rotterdam, and also from field trips from the institution. The author's data are compared with these of Galton and others, citing their results. He studied the movement of growth of the head in children, showing that the head index of children changes little during growth.—Summary of findings: (1) variability of head index with men is larger than with women; (2) index of male is lower than that of the female, of brothers lower than sisters; (3) among the low indices there are more males than females, among the high indices there are more females than males; (4) the variability of head-length and head-breadth is larger for the male than for the female; (5) probably the skew curve of frequency of distribution for the index fits better for the author's and the Swedish material of Retzius than the normal curve does.—The author considers that his data show "that the index cephalicus is a characteristic which has a racial and sexual element as a basis and alterations of this take place according to the law of compensational growth, in its effect varying for different capacities of the head." The rule for compensational growth is that alterations of the form of the head take place by an increase or decrease of each of the 3 dimensions of the head in a correlated proportion. Tables giving lengths and breadths with head capacities, taken from Tocher, are shown to demonstrate this compensational growth. Effects of compensational growth are not always the same; in the case of large heads, with an increase of breadth, the height decreases rather than the length shortening, and in the case of small heads, a growing shorter is accompanied by less length rather than by less height.—A. H. Estabrook.

4932. FRUWIRTH, C. *Handbuch der landwirtschaftlichen Pflanzenzüchtung*. 4. neu bearb. Aufl. Bd. 3. *Die Züchtung von Kartoffel, Erdbirne, Lein, Hanf, Tabak, Hopfen, Buchweizen, Hülsenfruchtern und kleeartigen Futterpflanzen*. [Handbook of agricultural plant breeding. 4th rev. ed. Vol. 3. Breeding of potatoes, Jerusalem artichoke, flax, hemp, tobacco, hops, buckwheat, leguminous fodder plants.] xvi + 227 p., 45 fig. Paul Parey: Berlin, 1922.—This edition covers the literature of the subject up to the spring of 1921 [see *Bot. Absts.* 6, Entry 1670]. Extensive changes appear in the chapter on hybridization of peas and beans and some revision in the chapters on potatoes, hemp, flax, and red clover. Recent researches by the author on potatoes, hemp, buckwheat, and leguminous forage plants are included.—L. A. Waitzinger.

4933. GOWEN, MARIE S., and JOHN W. GOWEN. *Studies in milk secretion*. XVII. *Relation between milk yields and butter-fat percentages of the 7 day and 365 day tests, of Holstein-Friesian advanced registry cattle*. *Maine Agric. Exp. Sta. Bull.* 306. 21-60. 1922.—The authors find a correlation of +.660 as the weighted average of correlations between different 365-day milk yields among advanced registry Holstein-Friesian cows. The correlation between a 7-day milk yield and 365-day milk yield of the same lactation is +.598. That between 7-day milk yield and 365-day milk yield of a different lactation is +.462. The corresponding correlations dealing with butter fat percentage were +.715, +.531, and +.423

respectively. All of the regressions were fairly close to linear. Linear prediction formulae are given for various age groups. The analysis indicates no changes in recent years in the correlations which would tend to corroborate the common view that recent discoveries of methods of manipulating feeding and care for the 7-day test have vitiated its value. It is concluded that the 7-day test gives a valuable indication of the potential milk yield and butter-fat percentage of Holstein-Friesian cows although less valuable than a 365-day test.—*Sewall Wright*.

4934. GUILLAUMIN, A. *Les Phalaenopsis cultivés et leurs hybrides*. [The cultivated Phalaenopsids and their hybrids.] *Rev. Hort.* 95: 316-318. 1923.—The cultivated Phalaenopsids and their introduction are noted. Numerous hybrids are mentioned with brief statements as to origin.—*Richard Wellington*.

4935. HARLAN, HARRY V., and MERRIT N. POPE. *Many-noded dwarf barley*. *Jour. Heredity* 12: 269-273. 3 fig. 1922.—A barley plant having a large number of leaves and extremely short internodes was found in an agricultural variety of *Hordeum distichon nudum*. One seed from this plant was germinated in the greenhouse and produced a greatly modified plant somewhat taller than the parent, which was about 50 cm. from crown to tip of awns. Two seeds from this plant produced many-noded dwarf plants about 50 cm. tall. Hybrids of the dwarf strain were made successfully with 4 other varieties of barley. No "dwarf" characteristics were found in the F_1 , but in the F_2 segregation occurred in a ratio of approximately 3 normals to 1 dwarf. The most plausible explanation of the appearance of this dwarf is that it is a mutation.—*R. C. Cook*.

4936. HARLAN, HARRY V., and MERRITT N. POPE. *The use and value of back-crosses in small-grain breeding*. *Jour. Heredity* 13: 319-322. 1922 [1923].—Back-crossing has long been used to fix desired characters in animal breeding, but has not been so widely used in plant breeding, even when the plants used are self-fertilized and therefore immune to the evil effects of the method. An account is given of an experiment to produce smooth-awned barley by back-crossing which has so far given very promising results. In this case all the characters except the smooth awns are desired from 1 parent, and only the smooth awns from the other. Assuming only 20 factors, and no linkage, there would be 1 chance in 1,048,576 that the 20 desired characters would be found in any 1 segregate, and 1 chance in 4 that this segregate would be smooth-awned. It obviously would be impossible to grow such a generation. On the other hand, by back-crossing there would be a rapid elimination of the undesirable characters. The number of plants necessary would be much less, and the chances of finding the desirable one proportionally greater.—*R. C. Cook*.

4937. HERWERDEN, M. A. VAN. [Dutch rev. of: WESZECSKY, O., and F. VERZAR. *Rassenbiologische Untersuchungen mittels Iso-hämagglutininen*. (Racial-biological investigations with iso-haemagglutinins.) *Biochem. Zeitschr.* 26: 33-39. 1921.] *Genetica* 4: 479-480. 1922.

4938. HIRSCH. [German rev. of: WOLTERECK, R. *Variation und Artbildung. Analytische und experimentelle Untersuchungen an pelagischen Daphniden und anderen Cladoceren*. I. Morphologische, entwicklungsgeschichtliche und physiologische Variations-Analyse. (Variation and species formation. Analytical and experimental investigations on pelagic Daphnids and other Cladocerans. I. Morphological, developmental, and physiological analysis of variations.) 145 p., 6 pl., 55 fig. Francke: Bern, 1919.] *Arch. Rass.-u. Ges. Biol.* 14: 179-180. 1922.

4939. HUXLEY, JULIAN. *Glands and development; amphibian metamorphosis considered as consecutive dimorphism controlled by the glands of internal secretion*. *Jour. Heredity* 13: 349-358, 1922; 14: 3-11. 8 fig. 1923.—The essence of metamorphosis is the rapid passage from one form to another during the life history. This morphological change in all cases hitherto

investigated is associated with a physiological change. This in amphibia is concerned with the thyroid, in insects with N-metabolism.—Similar morphological and physiological changes are seen in protandric and protogynous hermaphrodites, and in the type of intersexuality (consecutive) seen in Goldschmidt's moths, produced by crossing geographical races of *Lymantria*. All are cases of consecutive dimorphism.—Why do different *Anuras* require different times to reach metamorphosis? How is it that the limbs react differently to thyroid treatment in *Anura* and *Urodela*? Why do *Necturus* and other perenibrachiates fail to metamorphose even after thyroid treatment? One is driven to believe (1) that the relative rate of thyroid growth varies in different species, metamorphosis occurring only after a certain relative concentration occurs in the blood. (2) That different tissues of the organism are "sensitized" differently to the thyroid hormone, some (e.g., limbs of *Anura*) reacting to it by (a) increased growth, others (e.g., Anuran tail) by (b) breakdown; still others are unaffected (e.g., lung). This probably implies that the different tissues are adapted to different optima of metabolic rate. (3) That the same tissue may be sensitized differently in different species. Attention is drawn to the importance of the study of relative rates of processes for a proper understanding of the physiology of development.—*J. Huxley*.

4940. JENKINS, M. T. A new method of self-pollinating corn. Jour. Heredity 14: 41-44. 2 fig. 1923.—A modified technique for self-pollinating corn is described which is considered more rapid and as safe as older methods. The tassel is pulled and enclosed with the shoot in a 12-pound paper bag. To keep the tassel shedding, its stem is inserted in a small bottle of water attached to the stalk.—*M. T. Jenkins*.

4941. JOHANNSEN, W. Some remarks about units in heredity. Hereditas 4: 133-141. 1923.—Relationships of many terms used in genetics are discussed and the inadequacy of some pointed out; "unit-character," particularly, is one that should be "exterminated." The author suggests that the so-called experimentally demonstrated units are nothing more than expressions for local deviations from the original ("normal") constitutional state in the chromosome; that the whole of Mendelism is "perhaps nothing but an establishment of very many chromosomal irregularities, disturbances or diseases of enormously practical and theoretical importance but without deeper value for an understanding of the 'normal' constitution of natural biotypes."—*Merle C. Coulter*.

4942. KAJANUS, BIRGER. Über Ährchenabstand und Ährchenzahl bei Nachkommen-schaften von Speltoid-Heterozygoten. [Internode length of spikes and number of spikelets in the descendants of speltoid heterozygotes.] Hereditas 4: 10-16. 1923.—In progenies of a cross between 2 common wheats, heterozygous speltoid plants showed almost uniformly greater internode length and fewer spikelets than shown by the *vulgare* plants. Homozygous speltoid plants showed these modifications over both normal and heterozygous plants but in a less pronounced manner. In progenies of a cross between a common wheat and a speltoid type the above facts were established even more clearly. The observed differences are certainly genetical in part but probably due partly to environmental conditions.—*L. R. Waldron*.

4943. KELLY, J. P. *Astylis* Phlox; the relation of this variation in Phlox Drummondii to the large-eyed flower. Jour. Heredity 13: 338-342. 5 fig. 1922 [1923].—In cultures of Drummond's phlox plants with exceptionally small ruffled and styleless flowers occurred; they set no seed although pollen was abundant. This type was named *astylis*; crossed with normals it gave normal progeny. Inbreeding F_1 plants led to a segregation in F_2 of about $\frac{1}{4}$ *astylis*, indicating a unifactorial difference. It was discovered that *astylis* crossed to colored types with small white eyes led to the large-eyed colored types named in commercial circles, *orbicularis*. *Orbicularis* plants always split when inbred into about 25 per cent *astylis*, 50 per cent *orbicularis*, and 25 per cent small-eyed plants.—*J. P. Kelly*.

4944. KOEHLER, O. [German rev. of: WEIL, A. Die innere Sekretion. Eine Einführung für Studierende und Ärzte. (The internal secretion. An introductory text for students and physicians.) 140 p., 35 fig. Julius Springer: Berlin, 1921.] Zeitschr. Indukt. Abstamm.- u. Vererb. 29: 136-138. 1922. [See also Bot. Absts. 11, Entry 3892; 12, Entry 4925.]

4945. КОЗО-ПОЛЯНСКИЙ, Б. М. [Kozot-Poljanski, B. M.] **Финал Эволюции.** [The finale of evolution.] Буревестник Краснопар [Burevestnik Krasnodar] 24 p. Советской Типографии Куечердоняграотреста [Soviet Printing Presses]: Woronesh, 1922.—A cardinal cause is the interference of man after his emigration from the Pacific continent.—B. M. Kozot-Poljanski.

4946. LÉCAILLON, A. Sur la fécondité des hybrides obtenus par le croisement du Cunard Pilet mâle (*Dafila acuta* L.) et du Cunard sauvage femelle (*Anas boschas* L.). [Fertility of hybrids obtained through crossing a male pintail duck with a female wild duck.] Compt. Rend. Acad. Sci. Paris 174: 1431-1433. 1922.—The hybrids resulting from the crossing of different species of ducks are usually sterile. Those from the mating of a pintail male with a wild female are an exception. In the Toulouse zoological gardens 3 such hybrids have been obtained. A hybrid male mated to a wild female has produced 12 offspring. Young have been obtained when the latter were mated *inter se*.—H. W. Feldman.

4947. LILLIE, F. R., and K. F. BASCOM. An early stage of the free-martin and the parallel history of the interstitial cells. Science 55: 624-625. 1922.—The sex differentiation in the female of cattle before birth is due to genetic factors, while in the male the genetic factors are intensified by the production of a hormone. The interstitial cells appear in the testis of a calf embryo by the time it is 3 cm. long. The interstitial cells secrete the sex hormone, which, circulating in the blood, inhibits the growth of the entire female gonad. The interstitial cells in the gonads of female calves do not appear until about the time of birth; so that the deleterious effect of the male hormone can not be counteracted in the early stages.—W. S. Anderson.

4948. MANGELSDORF, P. C. Heritable characters of maize. XII.—Mealy endosperm. Jour. Heredity 13: 359-365. 4 fig. 1922 [1923].—Mealy endosperm is a type of defective seed in which the corneous endosperm does not develop normally. The character is inherited as a simple recessive. The strain has been crossed with other defectives and found to be distinct. The factor for mealy is linked with a factor for albino seedlings.—P. C. Mangelsdorf.

4949. MELLON, RALPH R. Observations on the origin of biotypes (variants) in pure lines of bacteria. [Abstract.] Absts. Bact. 7: 18. 1923.—Variability in *Bacillus* sp. is identified with the pleomorphic cycle. "Pleomorphism for this form is regarded as a true life cycle and and in reality represents potential variation."—D. Reddick.

4950. MENDIOLA, NEMESIO B., and J. M. CAPINPIN. Breeding ornamental Hibiscus. Philippine Agric. 11: 217-230. 2 pl. 1923.—Species and varieties of *Hibiscus* grown in the Philippines are briefly described and the variability of certain characteristics noted. Methods of improvement by breeding and selection, and propagation methods are discussed. Brief descriptions are given of numerous seedlings produced from parents of unknown purity.—Richard Wellington.

4951. MINER, JOHN RICE. The probable error of the vital index of a population. Proc. Nation. Acad. Sci. [U. S. A.] 8: 106-108. 1922.—The author derives the formula for the probable error of the birth-death ratio or vital index for use in estimating the significance of differences in this index in different communities. Letting B = number of births in a year and D = number of deaths in a year, he obtains the approximate formula $PE \left\{ \frac{100 B}{D} \right\} = 67.449 \frac{B}{D} \sqrt{\frac{1}{B} + \frac{1}{D}}$. A more complex formula, which involves slightly less approximation but requires knowledge of the population of the community, is also given.—Sewall Wright.

4952. MIYAKE, KIICHI, and YOSHITAKA IMAI. Genetic studies in the opium poppy (*Papaver somniferum* L.). I. On the flower color. Bot. Mag. Tokyo 37: (1)-(13). 1 fig. 1923. [In Japanese.]—The chief results obtained are as follows: (1) The allelomorphs investigated

are the following 5: R, r ; in the presence of the subsequent D factor, R is responsible for the red flower, and its recessive mate, r , represents purple flower. The flower color of the hybrid is dark red, being almost intermediate between both zygotes.— D, d ; these allelomorphs are responsible for the eye color of the flower, i.e., either purple or white. The R factor working with double d produces red flower with white center, but the flower remains colorless in its double recessive combination.— I, i ; this dominant factor changes white centered red flower into white, acting as an inhibition to the colored.— S, s ; the former is responsible in producing the "Sakura" flower, and the s s -composition represents a recessive white flower.— H, h , the dominant factor acts as an inhibitor to "Sakura," changing the flower color into white. (2) There are 2 kinds of white flower, i.e., the dominant and the recessive to every white-centered red and "Sakura" flower. (3) A linkage of high intensity was found between the r and i factors."—*Kiichi Miyake and Yoshitaka Imai*.

4953. MOHR, OTTÓ L. A somatic mutation in the singed locus of the X-chromosome in *Drosophila melanogaster*. *Hereditas* 4: 142-160. 3 fig. 1923.—The article describes a striking case of a mosaic male, the left half of which, except head, had singed hairs and bristles; adjoining portion of right dorsal side of thorax and small adjoining portion of right side of head was also singed, the line of demarcation between singed and normal being clear everywhere. The singed had arisen by mutation as the composition of the fly in other respects was tested and found to conform to expectation based on its supposed parents, which were of non-singed stock. The germinal tissue also was mosaic, for about $\frac{1}{2}$ the sperm transmitted singed and $\frac{1}{2}$ transmitted normal hairs. Hence the mutation occurred in a nucleus of an early cleavage (2-cell?) stage, and this nucleus must have been destined to give rise both to part of the germinal and part of the somatic tissue, contrary to the condition found by Morgan and Bridges in their gynandromorphs. Identity of locus of the new singed (s_a3) with the old was proved by crosses with the old and by its linkage with other genes. It is a different allelomorph, however, since the homozygous female lays fertile, normal-appearing eggs, unlike the female homozygous for the original singed gene. "Compound" females, having both an "old" and a "new" singed gene, also lay fertile, normal-appearing eggs.—*H. J. Muller*.

4954. NAGAI, ISABURO. Notes on the species hybrids in the genus *Mosla*. Japanese Jour. Bot. 1: 93-104. 2 pl. 1923.—At least 7 species of the genus *Mosla* are known at present: *M. Orthodon*, *M. Hadai*, and *M. punctata* are closely allied to each other, while *M. punctata* and *M. grosseserrata* are distinct species. The F_1 hybrids between *M. Orthodon* and *M. punctata* and between *M. leucantha* and *M. punctata* are completely sterile; some of the characters resemble one parent, some the other, while the remainder are intermediate. The F_1 hybrid between *M. leucantha* and *M. Orthodon* bore purple flowers like *M. Orthodon* and in F_2 the plants segregated into a ratio of 1 purple:2 tinged:1 white. Population also segregated into a 1:2:1 ratio for branching habit. A natural P_1 hybrid between *M. grosseserrata* and *M. punctata* was sterile and more nearly resembled *M. punctata* although traces of *M. grosseserrata* were present. *M. Orthodon* produces thymol while *M. Hadai* produces the isomer carvacrol but no thymol. In morphological characters the P_1 resembles pure *M. Hadai* except in branching habit in which it resembles *M. Orthodon*. In F_2 segregation takes place in a number of characters giving rise to new forms. A ratio of 15 normal and half-dwarfs to 1 dwarf was obtained and other segregants occurred. Selection was effective in later generations in raising the percentage of oil over that of either parent. To measure the degree of resemblance of hybrids to parental species the author uses the formulae: $Rp = \frac{1}{n} \times p$, $Rm = \frac{1}{n} \times m$, $Rpm = \frac{1}{n} \times pm$, where R = degree of resemblance, n = total number of characters examined, p = number of paternal characters, m = number of maternal characters, pm = number of intermediate characters. He used $Rp + Rm$ as a measure of heterogeneity, and $Rp - Rm$ as a measure of dominancy.—*Walter Scott Malloch*.

4955. NIRODY, B. S. Investigations in avocado breeding. California Avocado Assoc. Ann. Rept. 1921-22: 65-78. 4 fig. 1922.—The author discusses the 3 groups or "races" and

some leading commercial varieties of avocado, especially as to their horticultural merits and demerits, and lists qualities desirable in commercial varieties. Promising combinations of varieties with which crossing was attempted are listed and discussed. A tabular statement gives the time of day at which the flowers of various varieties open, shed their pollen, and close, and another lists pairs of varieties suitable for interplanting, selected on the basis of season of blooming and daily time of shedding pollen. The special technique of avocado cross-pollination is described.—*Howard B. Frost.*

4956. OSBURN, R. C. Some common misconceptions of evolution. *Ohio Jour. Sci.* 22: 173-192. 1922.

4957. POLL, H. [German rev. of: TENDELOO, N. PH. *Konstitutionspathologie und Erbllichkeit.* (Constitutional pathology and heredity.) 32 p. Julius Springer: Berlin, 1921.] *Zeitschr. Indukt. Abstamm.- u. Vererb.* 29: 213-214. 1922.

4958. RASMUSON, HANS. Über die Rübenpfropfungen von Edler und einige neue ähnliche Versuche. [On Edler's beet grafts and several new experiments of similar character.] *Hereditas* 4: 1-9. 1923.—Edler found that sugar beet seedlings grafted on red beet and the latter grafted on sugar beet split up into different colors. He concluded that the segregation was due to the influence of the root stock. Rasmuson finds no color segregation and therefore concludes that the results obtained by the former investigator were due either to impure stock or to cross-fertilization.—*Richard Wellington.*

4959. ROSEN, DANIEL. Some remarks about the distance between the genes in *Drosophila melanogaster*. *Hereditas* 4: 231-234. 1923.—The author proposes that all "contiguous," linked genes dealt with may really be the same distance apart, the different per cents of separations observed between them being due not to different chromosome distances, as the chromosome maps seem to indicate, but to different frequencies of crossing over in the chromosome, caused by "different degrees of affinity" between the respective "contiguous" genes.—*H. J. Muller.*

4960. SAUNDERS, C. E., and G. G. MOE. Some observations on the inheritance of awns and hoods in barley. *Proc. and Trans. Roy. Soc. Canada* III, 16: 15-26. 6 pl. 1922.—Arlington barley is 6-rowed and as grown at Ottawa is not entirely awnless, the median floret carrying short awns. In 3 years out of 7 at Ottawa, Arlington developed winter type although spring sown. Time of sowing in the spring was not the determining factor in this respect. Arlington, used as ♀ parent, was crossed with (1) a 6-rowed bearded and hullless variety, (2) a 2-rowed hooded and hullless variety, and (3) a 2-rowed bearded and hulled variety. The ♂ parents were recent extractives but evidently nearly or quite homozygous. The F₁ plant of cross (1) showed intermediacy in regard to awns. In the F₂ generation segregation was of a simple 1: 2: 1 character in regard to beards. The numbers obtained were 44 plants like the ♂ parent, 67 plants like Arlington, and 114 intermediates; classification was difficult.—In cross (2) the F₁ plants were almost perfectly 6-rowed, 2-rowedness being recessive. Four phenotypes resulted in the F₂: I, 2-rowed, awnless, and hooded; II, 6-rowed or nearly so, awnless and hooded; III, 2-rowed, awned; IV, Arlington type, with lateral rows not always completely fertile. Phenotype I contained 2 genotypes: (A) hooded and homozygous, and (B) awnless and heterozygous producing I (A), I (B) and III. Phenotype II contained 4 genotypes: (A) homozygous 6-rowed, hooded; (B) heterozygous 6-rowed, producing II (A), II (B), and IV (A); (C) homozygous hooded but heterozygous 6-rowed, producing I (A), II (A), and II (C); and (D) heterozygous 6-rowed and awnless, producing representatives of the 9 genotypes. Phenotype III was simply genotypic and homozygous. Phenotype IV contained 2 genotypes: (A) Arlington type (homozygous) and (B) a heterozygous Arlington type producing III, IV (A) and IV (B). The F₂ plants rather roughly approximated a 3: 9: 1: 3 ratio.—In cross (3) the F₁ plants were again almost completely 6-rowed. The F₂ showed 2 phenotypes: I, 2-rowed and awned, and II, like the F₁ plant. Two genotypes are found in II: (A) a heterozygous form and (B) a homozygous form apparently identical with Arlington. The F₂ plants only approximated a 1: 3 ratio.—*L. R. Waldron.*

4961. SAX, KARL. **Sterility relationship in Maine apple varieties.** Maine Agric. Exp. Sta. Bull. 307. 61-76. 1 fig. 1922.—This bulletin is mainly a study of the sterility relationship of apple varieties and the part played by insects in fertilization.—George L. Slate.

4962. SCHAFFNER, JOHN H. **Sex reversal in the Japanese hop.** Bull. Torrey Bot. Club 50: 73-79. 2 pl. 1923.—Experiments were made for sex reversal in *Humulus japonicus* Sieb. and Zucc., which is a dioecious plant. The results of these and similar previous experiments lead the writer to conclude that "dioeciousness with its accompanying sexual dimorphism is not due to the absence in either the staminate or carpellate individual of a complete set of hereditary factors for the expression of all the sexual characters, both male and female; nor is the monosporangiateness of the normal individual due to the presence of a homozygous or heterozygous condition of any kind of hereditary sex determination whatsoever."—P. A. Munz.

4963. SCHEERER. [German rev. of: JABLONSKI. **Zur Vererbung der Myopie.** (The inheritance of myopia.) Klin. Monatsbl. Augenheilkunde 68: 110. 1922.] Arch. Rass.-u. Ges. Biol. 14: 447. 1923.

4964. SCHEIDT. [German rev. of: WERTH, E. **Der fossile Mensch.** [Fossil man.] 336 p. Gebrüder Borntraeger: Berlin, 1921.] Arch. Rass.-u. Ges.-Biol. 14: 361-362. 1922.

4965. SCHMIDT, JOHS. **Racial investigations. VII. Annual fluctuations of racial characters in *Zoarces viviparus* L.** Compt. Rend. Trav. Lab. Carlsberg 14¹⁶: 1-24. 1921 [1922].—Individuals of *Zoarces* in a warmer, less saline water produce offspring showing a significant increase in number of vertebrae, and a decrease in number of rays in pectoral fins and pigment spots, when compared with offspring reared in the original environment. The number of hard rays in the dorsal fin was examined in addition to these 3 characters, over a period of 10 years. The averages of various characters show independent fluctuations from year to year, depending upon the conditions at the "sensitive period" in the embryo stage. The population is biotypically stationary, but the phenotype is continually changing.—A comparison of the average number of pectoral rays in populations at Roskilde Fjord and at Ise Fjord, about 50 km. kilometers distant, in years 1915-1921, shows that corresponding annual fluctuations occurred; the same external factor or factors has influenced both, although it was more impressive at Roskilde Fjorde. A study of the number of hard rays in the populations at Roskilde Fjord and at Kjels Nors, Langeland, for 1913-1919, also reveals the similar effect of environment at both places; but the constant wide differences between the races indicates the presence of genetic dissimilarities. Experiments on the common trout show that temperature may be a factor. The lowest number of vertebrae was produced from a quantity of eggs developed at the intermediate of 3 temperatures.—H. W. Feldman.

4966. SCHMIDT, JOHS. **Racial investigations VIII. The numerical significance of fused vertebrae.** Compt. Rend. Trav. Lab. Carlsberg 14¹⁶: 1-5. 1921 [1922].—A type of fused vertebrae occurring in the 5 last vertebrae of trout was observed in which the haemal arch is double in its proximal part, being thus bifurcated; the neural arch is double. In dealing with data on the vertebrae numbers it is satisfactory to count fused vertebrae as 1½. When this is done, the averages of samples of normal individuals are found to coincide with those of individuals with double arches.—H. W. Feldman.

4967. SCHWARZENBACH, FRITZ. **Untersuchungen über die Sterilität von *Cardamine bulbifera* (L.) Crantz unter der Annahme eines hybriden Ursprungs dieser Art.** [The sterility of *Cardamine bulbifera* with reference to the theory of a hybrid origin.] Flora 115: 393-514. 3 pl., 22 fig. 1922.—The peculiarities of *C. bulbifera*—reduced sexual fertility, prolific formation of bulbils, and a chromosome number double that of other species of *Cardamine*—were studied with reference to the possibilities of its origin as a mutant or as a hybrid. The study covered ecology and geographical distribution, the cytology of pollen and ovule, comparisons with other hybrids—especially spontaneous hybrids of *Cardamine* species of the *Dentaria*

group—and experimental attempts to produce *C. bulbifera* anew by crossings. The latter were not successful. The other investigations favor the theory of a hybrid origin.—A. G. Stockey.

4985. TANAKA, TYÔZABURÔ. Citrus fruits of Japan; with notes on their history and the origin of varieties through bud variation. *Jour. Heredity* 13: 243-253. *Frontispiece*, 2 fig. 1922 [1923].—Nearly $\frac{7}{10}$ of the Japanese "orange" crop consists of *Unshû Mikan* (called "Satsuma" in U. S. A.), belonging to the mandarin species. The Owari variety of Satsuma has produced 2 variant forms known as *Kairyô Unshô* and *Wasé*; it is considered certain, in view of the pollen sterility of Satsumas, that they did not arise from fertilized eggs. The *Wasé*, which differs in many characters from Owari, has been found in several localities; slight differences among these strains indicate an independent origin and several of them are known to have originated by bud variation. The *Wasé* frequently produces branches of Owari, and this ready reversion to the parental type suggests that the *Wasé* may be a chimera. Other cases of genetic bud variation in *Citrus* are mentioned, including a form with corrugated fruit which always has 2 types of leaf and fruit on the same tree. The author discusses the characteristics and Japanese history of other varieties of *Citrus*. The Washington navel orange is made fruitful, in spite of the cool, moist climate, by a dwarfing process.—Howard B. Frost.

4986. TEMPLETON, G. S. Unusual color inheritance. *Jour. Heredity* 14: 39-40. 1 fig. 1923.—One calf of the Angus bull, Quoman of Tierra Alta 248,048, by a Hereford cow is red instead of black, the usual color in this cross. The 38 other calves sired by this bull are all black; nevertheless the only logical way to account for the color of this 1 calf is to assume that the bull is heterozygous for red. As 35 of these calves were out of pure-bred Angus cows, the heterozygous condition of the sire would hardly be expected to show in these crosses.—R. C. Cook.

4987. THAYER, PAUL. Raspberry breeding notes. *Jour. Heredity* 14: 12-13. 1 fig. 1923.—The writer describes a cross between a yellow *Rubus occidentalis* and a yellow *Rubus strigosus* resulting in the production of a yellow *Rubus neglectus*. This suggests the possible production of red- or black-fruited "purple caps" by using a yellow fruited or albino variety as 1 parent.—Crosses of Cuthbert and Ranere showed a surprising number of plants with sterile bloom, especially when the close botanical relationship of the 2 is considered.—Paul Thayer.

4988. TRABUT, LOUIS. *Carpoxénie et mutations gemmaires chez les citrus cultivés.* [*Carpoxenia* and bud mutations in cultivated citrus.] *Compt. Rend. Acad. Sci. Paris* 176: 772-774. 1923.—The author discusses the so-called "bud mutations" of citrus, and suggests that part of these variations may be due to cross-pollination. For several years he has noted variant fruits on citrus trees, especially with navel oranges. Occasional navel oranges have contained seed, which are due to cross-pollination since these varieties have no pollen; variant sectors of rind have been noted on such fruits. One fruit of Golden Buckeye navel orange had a sector of rind resembling the rind of the fruit of a citron tree near by. It is suggested that cross-pollination may modify the fruit ("*carpoxenia*") and even buds near it ("*cladoxenia*").—*Howard B. Frost.*

4989. TURESSON, GÖTE. *The scope and import of genecology.* *Hereditas* 4: 171-176. 1923.—Advance in ecology has been mainly along 2 lines: individual organism as related to environment (autecology) and plant communities, or vegetation, as related to environment (synecology). Autecology has a twofold aspect, viz., the ecology of the individual organism as well as of the species. This paper points out the radically different nature of the problems involved.—Modifications of organisms in response to different environmental factors have already been studied, but the hereditary variation in relation to habitat has been neglected. Hereditary variations within the species are rarely mentioned in autecological works.—The Linnean species is composed of a great number of hereditary forms of different and complex types confined to definite habitats. The species and their hereditary habitat types, as related to environment, constitute a phase of ecology not previously studied. This study necessitates cultivation, under the same conditions, of a great number of individuals of the species collected in different habitats. These plantings must be supplemented by breeding experiments.—Species-ecology is denoted by the term genecology as distinguished from the ecology of the individual organism, or autecology. From the point of view of genecology the Linnean species represent a genetically complex community the distribution and composition of which are determined largely by ecological factors and the genotypical constitution of the individuals composing the species community. The name *ecospecies* has been employed by the author. Hereditary variation within the *ecospecies* and its relation to habitat conditions is one of the most important problems in genecology. The *ecospecies* becomes differentiated into different hereditary types when distributed over an area presenting different habitats. Ecotype is a term used to cover the ecological sub-unit of the *ecospecies* arising as a result of the differentiation of the species-population in response to particular habitat conditions.—The main objects of genecology are to determine the grouping in nature of individuals into *ecospecies* and *ecotypes* which represent various combinations of Mendelian factors and to determine the causes which control this grouping.—Genecological units do not necessarily coincide with the units of the systematists, due to a large extent to different conceptions of the species. From the genecologist's point of view the species represent an intercrossing community, the members of which have secondarily become clustered in groups, namely, *ecotypes* on account of the differentiating effect of environmental factors upon the genotypically heterogeneous population. From the systematist's point of view a species is composed of a "*forma genuina*" and deviations are subordinated under this type as varieties and forms of less systematic value.—Aside from the untenability of this view, the supposed type may include a number of *ecotypes* and several varieties may conversely be found as normal constituents of one and the same *ecotype*. There is a tendency too by systematists to split the species into smaller ones, creating many units, all of which rank as species.—Only as long as these small species (elementary species, vicarial species, *microspecies*, etc.) represent *ecotypes*, a point to be investigated in each case, and only as long as they are present as constituent parts of the community of individuals called *ecospecies* do they tell anything of the morphology of that community from a genecological point of view.—Purely genetical units do not cover the genecological. The genetical analyses of Linnean species proved the constancy of the genotype, which then became the real unit in genetics while the Linnean species, being an aggregate of individuals with different genotypical construction, is still held to be a purely conventional conception.—To transfer the species concept to the pure line

concept on account of the constancy of the genotype is to ignore the ecological side of the species problem. Because of its genetically heterogeneous nature the Linnean species is able to cover a vast region by responding genotypically to a wide range of different habitats within the region. A knowledge of the origin of the genecological units can thus be gained by studying the ecotypes.—The behavior of species hybrids in nature is of particular interest in geneecology. When it has been found by experimentation that individuals belonging to different Linnean species may be crossed and give fertile offspring, the question is raised as to the causes of the rarity of such species hybrids in nature. A closer study of the distributional peculiarities of these hybrids, i.e., their localization at isolated points within the region covered by the 2 species, their sporadic occurrence between the distribution areas of the 2 parent species, and the tendency of certain species hybrids to increase when nature is disturbed by man tend to emphasize the view that the study of the species problem along the lines indicated is urgently needed as a complement to the Mendelian study of the species problem, if a deeper understanding of the questions involved is to be attained.—The importance of geneecology for other branches of natural science in its relation to plant geography both as to questions of species in regard to plant communities, is especially apparent. The analysis of plant communities during the past few years, particularly in Sweden, had disclosed that associations are made up of groups of plants of different associative values. Some of these species are constantly found wherever the particular association occurs and hence are called constants. Because the species belonging to the constant group accompany the association over a wide geographical range it is concluded that these species do not respond to ecological factors prevailing in the different regional points but remain constant, forming the fixed frame-work of the association. This conclusion, however, is not warranted from a geneecological point of view. A geneecological study of the constants of the particular association from different geographical points of its distribution area is needed before such a statement can be made. Many of these constants are notoriously variable, which points rather to the fact that it is the ability of these species to respond genotypically to a wide range of different ecological factors that enables them to establish associations in dissimilar climatic regions.—*H. L. Shantz.*

4990. WEATHERWAX, P. *The story of the maize plant.* (Univ. of Chicago Sci. Ser.) 247 p., 2 col. pl., 174 fig. University of Chicago Press: Chicago; Cambridge University Press: Cambridge, 1923.—This is a general treatise on the history, origin, morphology, culture, and heredity of maize. The several theories of the origin of maize are discussed and the conclusion is reached that maize developed by simple evolution from an ancestral form common to *Zea*, *Tripsacum*, and *Euchlaena*.—Xenia, multiple factors, hybrid vigor, methods of breeding, and the technique of hybridization are discussed in 2 chapters devoted to heredity and breeding, but much material of interest to geneticists is found throughout the book. The flowering habits, the process of fertilization, and the development of the endosperm are discussed in detail as well as the morphology of the vegetative parts of the plant. The chapters devoted to these subjects are compiled largely from the author's previously published papers.—*J. H. Kempton.*

4991. WINGE, Ö. *On a partial sex-linked inheritance of eye color in man.* Compt. Rend. Trav. Lab. Carlsberg 14¹²: 1-23. 1921 [1922].—Statistics from diverse sources for the most part agree in showing a perceptibly greater frequency of brown eyes among women than among men. There would seem to be only 2 possible explanations: either there is a differential death rate with reference to sex and eye-color or there is some form of sex-linked heredity. A critical examination of data based on 1399 Danish children and their parents furnishes the basis for a discussion of this question. No satisfactory evidence is found for a selective death rate, but there seems to be evidence for a sex-linked factor. This evidence is illustrated by families in which one parent has blue eyes, the other brown. In such matings, if the father has brown eyes there is an excess of brown-eyed daughters; if he has blue eyes there is an excess of blue-eyed children of both sexes. Two dominant factors for brown eye pigment are postulated; *B*, the one generally recognized, and *W*, a sex-linked factor. It is further

assumed that *b W* eggs do not survive. When the theoretical relative frequency of different types of matings is computed on this hypothesis the agreement between the observed and expected distribution of eye color in children from matings of all types is remarkably close. The hypothesis would also account for some of the rare but undoubted cases in which blue-eyed parents produce brown-eyed children. Others of these cases are due to a restrictive factor, which results in blue eyes in a genotypically brown-eyed individual. This latter factor also tends to affect the visual acuity.—*C. H. Danforth.*

4992. WRIGHT, SEWALL. **The effects of inbreeding and crossbreeding on guinea-pigs.** U. S. Dept. Agric. Bull. 1090. 63 p., 6 pl., 11 fig. 1923.—Inbreeding of guinea pigs by brother-sister matings has been continued for 13 years, 1906–1919. Each of 23 families, with 2 exceptions, originated from 1 pair of animals. Of these, 18 existed in 1915; in 1917, 5 were selected for perpetuation. As many as 23 generations had been recorded in 1921. In 1911 records were started on a control stock which was maintained by avoiding matings as close as those between second cousins.—I. A slow average decline in vigor in all characteristics has occurred. In fertility (frequency and size of litter) the effect was most marked; it can not be accounted for by environmental conditions. "The decline is greater in the gains after birth than in birth weight, and greater in the percentage raised of the young born alive than in the percentage born alive. The ability to raise large litters has fallen off much more than ability to raise small litters. A comparison of the inbred guinea-pigs with a control stock, raised under identical conditions without inbreeding, and derived in the main from the same line bred stock as the inbred families, indicates that the inbreds have suffered a genetic decline in vigor in all characteristics. The decline in fertility is again shown to be most marked. Experimental inoculation with tuberculosis has shown that the inbreds were inferior on the average to the controls in disease resistance." The sex ratio was unaffected.—II. An obvious differentiation in various characters occurred among the inbred families, which increased as inbreeding progressed. Each family became strikingly uniform in color; members could be readily recognized by their color and pattern. "In a similar way, certain subfamilies became differentiated from other subfamilies and from other families by developing a strong tendency toward reappearance of an ancestral 4th toe on the hind feet." * * The tendency to produce a given type of monstrosity has been characteristic of certain families. Such a tendency has had no connection with the vigor of the family in other respects. * * There was evidence of heredity within the families of the tendency to produce these abnormalities. There was no evidence that inbreeding has any specific causal connection with the origin of the monsters. Inbreeding seems merely to have brought to light genetic traits in the original stock.—Traits of vigor, including size and frequency of litters, percentage born alive, percentage raised of those born alive, birth weight, and gain to 33 days showed greater differences between families than could be due to chance. A positive correlation, in some cases high, existed between averages of these characters in early and late periods of the history of each family. The records of individual families show no correlation in the average of the different groups of characters, with the exception of birth weight or gain and size of litter. Some families showed extreme vigor in some respects and extreme weakness in others; some showed a combination of extreme vigor in all respects; others a combination of weakness. "The conclusion seems warranted that there was heredity of all traits studied. There did not appear to be heredity of general vigor." Hereditary factors which affect each character by itself are easily distinguished from environmental factors which affect alike growth, mortality among the young, and fertility in all their aspects.—*H. W. Feldman.*

4993. ZIEGLER, H. E. [German rev. of: HERTWIG, OSKAR. *Zur Abwehr des ethischen, des sozialen, des politischen Darwinismus.* (A defense of Darwinism, ethically, socially, and politically.) 2nd ed., 121 p. Jena, 1921.] Arch. Rass.- u. Ges.-Biol. 14: 212–218. 1922.

HORTICULTURE

FRUITS AND GENERAL HORTICULTURE

4994. ANONYMOUS. *Berichte der Höheren Gärtnerlehnanstalt zu Dahlem, der Höheren Staatlichen Lehranstalt für Wein, Obst, und Gartenbau zu Geisenheim a.Rh. und der Höheren Staatlichen Lehranstalt für Obst- und Gartenbau zu Proskau für die Rechnungsjahre 1920 und 1921.* [Reports of the higher horticultural institute in Dahlem, the higher government institute for wine, fruit, and truck crops in Geisenheim on Rhine, and the higher government institute for fruit and truck crops in Proskau for the period of 1920-1921.] Landw. Jahrb. 57: *Ergänzungsband I*, 1-139, 1-107, 1-117. 1922.—Reports are given of progress of the various experiments carried on in the above named institutions and detailed description of the activities.—*S. A. Waksman.*

4995. ANONYMOUS. [Rev. of: METHUEN, A. *An alpine A B C and list of easy rock plants.* $x + 35$ p. Methuen and Co.: London, 1922.] *Nature* 111: 216. 1923.

4996. ARENS, P. *Zijn aan het tappen met driptins voordeelen verbodden?* [Are drip-tins advantageous in tapping?] *Arch. Rubberecult.* 3: 36-41. 1919.—The notion that tins from which water drips upon the cut surface after tapping are helpful in securing increased yields of rubber is not well founded. The author tapped 3 fields without tins and used tins on 3 adjacent fields. The following month tins were used on the first 3 fields and removed from the others. No differences were observed either in total yield or in percentage of grades of rubber.—*C. D. La Rue.*

4997. BALLOU, F. H., and I. P. LEWIS. *Spraying experiments in southeastern Ohio, 1922.*—*Monthly Bull. Ohio Agric. Exp. Sta.* 8: 42-50. 1923.—A report is given of spraying experiments for the control of apple scab and blotch in southern Ohio on trees over 30 years of age. Fruit was classified as follows: (1) free from scab; (2) only slightly scabbed; (3) blemished but not deformed by scab; and (4) deformed by scab. Varying strengths of lime sulphur and bordeaux mixture were used. A special feature of the plots sprayed with bordeaux was the variation and the quantities of lime and copper sulphate employed.—*R. C. Thomas.*

4998. BEACH, FRANK. *Picking, packing, and loading apples in bushel baskets and barrels.* *Monthly Bull. Ohio Agric. Exp. Sta.* 7: 197-200. 1923.—The author emphasizes that perfectly grown apples should be so picked and packed as to retain their original value. Methods for packing in bushel baskets and barrels are covered; 19-inch basket pads and star covers are preferred for covering bushel baskets. Proper loading of bushels into cars is discussed.—*R. C. Thomas.*

4999. BRISON, F. R. *Variations in pecans.* *Jour. Heredity* 13: 366-368. 1 fig. 1923.—The pecan is monoecious and wind-pollinated. A high percentage of cross-pollination takes place. Each pecan is apt to vary in genetic constitution from all other pecans on the tree owing partially to the difference in paternal influence as well as to the heterozygous character of the pecan. Seed from the Mother San Saba pecan tree was planted. Pecans produced by the resulting seedlings varied in size from those as large as beans to those over 2 inches in length, indicating that the pecan will not reproduce true from seed. Variations in shape, thickness of shell, and cracking quality were also marked. The development of the pecan is so recent that there remains great opportunity for finding seedlings good enough to introduce as named varieties.—*F. R. Brison.*

5000. BURKETT, J. H. **The pecan in Texas.** Texas Dept. Agric. Bull. 73. 146 p., 9 pl., 25 fig. 1922.—Pecan growing is becoming an important industry in Texas.—The author discusses varieties, methods of grafting, planting, soils, diseases, and insect pests.—*L. Pace.*

5001. DE CASTELLA, F. **Home wine-making.** Jour. Dept. Agric. Victoria 19: 89-102, 176-180. 1 fig. 1921.

5002. DETLEFSEN, J. A., and W. A. RUTH. **An orchard of chestnut hybrids.** Jour. Heredity 13: 305-314. 7 fig. 1923.—A brief résumé of the introduction of the European and Japanese chestnuts is followed by the description of a cross between the American Sweet and the Japanese. Observations on 175 F_2 segregating trees showed loss of remarkable vigor of F_1 and greatly increased variability in many characters, such as size of nut, amount of tomentum, number of nuts to a burr, character of the burr, time of ripening, size of trees, resistance to weevils, etc.—*J. A. Detlefsen.*

5003. GOURLEY, J. H. **Peach growing in Ohio.** Monthly Bull. Ohio Agric. Exp. Sta. 8: 35-42. 1923.—This is a general summary of best practices. The management of young and old orchards is reviewed, including necessary spray programs. Mention is made of the distribution of the peach industry in the state, the soils best adapted to growing, and the varieties best suited to Ohio conditions.—*R. C. Thomas.*

5004. KEIL, J. B. **Apple pollination.** Monthly Bull. Ohio Agric. Exp. Sta. 8: 51-58. 1923.—A report is given of pollination experiments between 1914 and 1917 with the more common commercial varieties of apples; 2479 pollinations were made, which gave a 25 per cent setting. The investigations offer some explanation for the behavior of orchards when planted with large blocks of a similar variety and bring out the desirability of mixed plantings.—*R. C. Thomas.*

5005. RIJKS, A. B. **Bastonderzoek en uitdunning.** [Bark examination and thinning.] Arch. Rubbercult. 4: 345-360. 1920.—Results obtained on the Djasinga Estate in Java are discussed. The author considers bark examination a better criterion for thinning than measurement of the latex yield.—*C. D. La Rue.*

5006. SCHOLL, ERNEST E. **Orcharding in Texas, and nursery inspection.** Texas Dept. Agric. Bull. 72. 247 p., 108 fig. 1922.—Texas nuts and fruits for 1919 were valued at \$14,952,135.—The discussion includes: hazards, preparation of soil, selection and planting, tillage and cover crops, pruning, spraying, grafting, kinds of fruit, orchard pests.—*L. Pace.*

5007. SWINGLE, WALTER T., and T. RALPH ROBINSON. **Two important new types of citrus hybrids for the home garden.**—Citrangequats and limequats. Jour. Agric. Res. 23: 229-238. Pl. 1-5. 1923.—Thomasville citrangequat is a trigeneric hybrid produced by using pollen of Willits citrange (*Citrus sinensis* \times *Poncirus trifoliata*) to fertilize flowers of the oval kumquat, *Fortunella margarita*. The trees are large and vigorous, endure winter temperatures as low as 12°F., are not readily forced by warm weather in late winter, and possess the resistance to citrus canker [caused by *Pseudomonas Citri*] of the female parent. The fruit resembles that of the lime. The oil of the peel is not bitter and the pleasantly acid juice can be used for ade from July to October, after which the fruits are sweet enough to eat out of hand.—Other citrangequats are mentioned and technical descriptions are presented of the following new varieties: Thomasville, Telfair, Sinton.—Eustis limequat is a hybrid resulting from fertilizing the flowers of common or West Indian lime with pollen from the round kumquat. The tree is much harder than the lime and probably can be grown in the warmer parts of the U. S. A. Gulf Coast. It is more or less everbearing. The fruits resemble closely the lime in color, flavor, size, and texture, and the rind is edible. Technical descriptions are presented of the following varieties: Eustace, Lakeland, and Tavares.—*D. Reddick.*

5008. VISCHER, W. *De anatomische bouw van het latexvaten-stelsel bij Hevea in verband met de latex-productie.* [The anatomical structure of the latex-vessel system of Hevea in relation to the latex yield.] Arch. Rubbercult. 4: 473-492. 1920.—The latex capacity of the roots is found to be far less than that of the trunk; the roots cannot, therefore, be considered a latex reservoir. Two types of distribution of latex vessels are found. In 1, the number of vessels is approximately the same for a considerable distance from the base of the tree; in the other the number decreases rapidly from the base upwards. Trees of the latter type are less valuable. Most of the vessels of the roots and the trunk are in direct connection and latex-movements of considerable extent may take place. Radial connections between different rings of vessels are uncommon. Tapping a cut has a direct influence on the pressure in the vessels 1 m. from the cut. Tapping a tree affected with brown bast disease is injurious even though the tapping cut is on a surface which is still healthy. Tapping with 2 cuts, 1 above the other, is condemned because the yield from the upper cut is low in proportion to the bark used and the exhaustion of the vessels in the bark between the cuts may increase susceptibility to brown bast disease.—C. D. La Rue.

5009. VRIES, O. DE. *Verdere gegevens over den invloed van het tappen op latex en rubber.* [Further data on the influence of tapping on latex and rubber.] Arch. Rubbercult. 4: 314-330. 1920.—Prolonging the tapping cut has the same effect as heavier tapping in general: the rubber-content of the latex decreases; the specific gravity increases; and the rubber vulcanizes more rapidly. Increasing the number of tapping cuts has the same effect as lengthening the cut. Two cuts, 1 low and 1 high but on a different surface, gave rubber that was practically identical for both cuts. Two tapings on the same cut in 1 day were tried, but no difference was found in the rubber. Tapping to the wood gave the same results as lengthening the tapping cut but to a more marked degree. Tapping a piece of bark isolated by a cut to the wood all round it did not give a latex with low rubber content and high specific gravity, as was expected. Tapping at different hours of the day gave no differences in the properties of the rubber. The use of drip tins does not affect the properties of the rubber.—C. D. La Rue.

FLORICULTURE AND ORNAMENTAL HORTICULTURE

5010. ANONYMOUS. *Note.* Nature 111: 267. 1923.—It is announced that bulbs of *Chionodoxa*, *Galanthus*, *Scilla*, *Fritillaria imperialis*, *F. Meleagris*, *Muscari*, *Ixia*, and *Eranthis* have been added to the list of bulbs permitted unlimited entry into the U. S. A. for 3 years beginning January 1, 1923.—O. A. Stevens.

5011. BALLOU, F. H. *Ornamental planting in development of the small homestead.* Monthly Bull. Ohio Agric. Exp. Sta. 8: 8-13. Fig. 3-6. 1923.—The development of a ramshackle barn lot into an attractive landscape is illustrated and discussed. Emphasis is placed on the plant materials used, and the short time required to reach an effective landscape scene.—R. C. Thomas.

5012. BARRON, LEONARD. *Lawn-making. Together with proper keeping of putting greens.* vi + 176 p., 31 pl. Doubleday, Page & Co.: New York, 1923.—The 14 chapters treat of renovating the old lawn; how to make a lawn once for all; economical grading; which is better, turf or seed; the fine art of mowing, rolling, and watering; how to feed a lawn; solving the seed problem, insects, etc; the truth about "lawn mixtures," seed mixture for special purposes; lawns for subtropical regions; the best lawn tools and their use; how to make lawn pictures; the peculiar requirements of putting greens; guide to the best lawn grass. This is a practical treatise on the making and maintenance of a lawn.—J. H. Gourley.

5013. BENEDICT, R. C. *Which Boston fern is best?* Jour. Heredity 13: 254-263. 7 fig. 1922.—An experiment is outlined to determine which of the numerous varieties of the Boston fern are most desirable for florists and for the home. Only the once-pinnate varieties are included in this test of 6 months duration. Sets of these varieties are available for distribution to growers who wish to cooperate.—R. C. Cook.

5014. HOTTES, ALFRED C. **A little book of annuals.** 116 p., 51 fig. A. T. De La Mare Co.: New York, 1922.—“This little book of annuals has been written for the increasing throng of amateurs who grow flowers for the love of them. It is meant to be a guide through the season of annual bloom.” The chapters (unnumbered) treat of the use and culture of annuals grown for their flowers; of ornamental grasses; everlastings; decorative seed pods; and annual vines.—*J. H. Gourley.*

5015. HOTTES, ALFRED C. **A little book of perennials.** 170 p., illus. A. T. De La Mare Co.: New York, 1923.—This work treats of the commonly grown perennials, flowers and ornamental plants. The propagation, culture, uses, and treatment for disease and insect pests of perennials are treated.—*J. H. Gourley.*

5016. HOTTES, ALFRED C. **Practical plant propagation.** 224 p., 108 fig. A. T. De La Mare Co.: New York, 1922.—“This book attempts to explain briefly the art and science of increasing plants so that the florist, orchardist, nurseryman, and amateur plant lover may have a guide in the work of properly increasing his stock.” The chapters treat of seeds; cuttings, bulbs, layers and divisions; graftage and stocks; important florists' plants; herbaceous perennials, annuals, bulbous plants; and tree and shrub list.—*J. H. Gourley.*

5017. MAKINS, F. K. **Olive cultivation in the Ionian Islands.** *Indian Forest.* 48: 521-530. 1922.

5018. PALMER, F. E. **Milady's house plants.** 176 p., illus. A. T. De La Mare Co.: New York, 1922.—The author indicates the purpose of the volume as being “to set down briefly and clearly all the more important facts for the benefit of those who are seeking knowledge on this particular subject.” The following subject heads indicate the character of material treated: companionship of flowers; fundamental requirements of all plants; foliage plants for house decorations; flowering plants for house decoration; bulbous plants; house plants out-of-doors in summer; sowing of seeds and rooting of cuttings; outside window boxes in winter; insect pests and remedies; how to treat cut flowers; and sun parlors as plant rooms.—*J. H. Gourley.*

5019. ROGERS, W. S. **Planning your garden.** x+301 p., 105 fig. Doubleday, Page & Co.: Garden City, New York, 1923.—“This volume is designed for those who are not inclined to make use of the service of a professional garden designer. Either excessive cost or intense personal interest in the development of the home grounds may effect this result.” It is a practical treatment of the subject of garden making and the art of landscaping home grounds or estates. The 21 chapters give a comprehensive treatment of the various phases of such a problem including the planting and working out of the grounds, the details of making flower borders and beds, lawns, rock garden, rose garden, vegetable garden, use of water in the landscape, fences and hedges, and other details.—*J. H. Gourley.*

5020. SAFFORD, W. E. **Discovery of the ancestral form of *Dahlia Juarezii*.** *Jour. Heredity* 13: 377-381. 3 fig. 1923.—All cactus Dahlias come from a single plant sent to Europe from Mexico about 1863. This was a “double flowered” form quite similar to the modern variety “Khalif,” and was taken as the type-specimen of a new species, *D. Juarezii*. In 1916 the simple, 8-rayed progenitor of this species was found in Guatemala by Wilson Popenoe.—It is not generally known, but to the Aztecs belongs credit for originating the double-flowered Dahlias, by crossing the wild forms native to the mountains of Mexico.—*R. C. Cook.*

5021. STOUT, A. B. **Sterility in lilies.** *Jour. Heredity* 13: 369-373. 3 fig. 1923.—It is pointed out that in lilies at least Darwin's “Law of Compensation” does not apply, the failure to set seed so often noted being due to incompatibility of the pollen used. In some varieties, chiefly hybrids between different species, complete impotence of pollen is found, but this is unusual. It has been found possible to produce seed of almost all species of lilies studied, by proper selection of pollen, although this has been difficult in some cases.—*R. C. Cook.*

5022. THOMAS, CHARLOTTE RIDER. *Garden whimseys*. vii + 171 p. Macmillan Co.: New York, 1923.—This is a little volume for the amateur flower lover, unpretentious but full of enthusiasm throughout. No attempt is made to give cultural directions and yet, almost parenthetically, many good suggestions are made. The book is well written, evidently designed to win converts to the small yard garden, and deserves a place in the library of every gardener. The 12 chapters deal with bulbs, irises, peonies, roses, perennials, annuals, shrubs, and garden pets.—*J. H. Gourley*.

VEGETABLE CULTURE

5023. FREEMAN, ELLA M. *The home vegetable garden*. vi + 214 p., 8 pl. Macmillan Co.: New York, 1922.—This is the 2nd in a series of books known as the Open Country Books, edited by L. H. Bailey. The purpose of this volume is to interest amateurs in the vegetable garden in part from the nature-study standpoint as well as for the large returns obtainable from a small acreage. The cultural directions are brief and the lists of varieties seem scarcely adequate even for a work of this character. The 30 chapters deal with the pleasure of gardening; laying out, planting, and care of the garden; insect and disease pests; and the culture of the various crops.—*J. H. Gourley*.

5024. KAKAZAKI, Y. *Self-sterility in Chinese cabbage*. Jour. Heredity 13: 374-376. 1 fig. 1923.—Chinese pe-tsai cabbage is ordinarily almost entirely self-sterile. The author desired a quantity of self-fertilized seed, and it was thought possible that there might be greater compatibility between flowers of the different branches of the same plant. The following experiments were tried: (1) flowers were bagged without pollinating artificially; (2) flowers were pollinated artificially with pollen from (a) the same flowers, (b) different flowers in the same inflorescence, (c) different inflorescences on the same plant, (d) different plants. The degree of self-sterility was the same from whatever part of the plant the pollen came, but considerable variation was found in the degree of self-sterility in different plants. It is suggested that a self-fertile strain might be secured by selection.—*R. C. Cook*.

5025. KEIL, J. B. *Dependable varieties of vegetables*. Monthly Bull. Ohio Agric. Exp. Sta. 8: 23-25. 1923.—The article offers a list of vegetables which may serve as a guide to beginners and gardeners of more experience. This list does not include all of the good varieties but aims to call attention to really meritorious ones.—*R. C. Thomas*.

5026. PEMBER, F. R. *A study of the influence of physical soil factors and of various fertilizer chemicals on the growth of the carnation plant*. Rhode Island Agric. Exp. Sta. Bull. 187. 94 p. 1921.—As a 6-year average 40 per cent of the number of flowers produced in 9 months, October-June, were gathered during the first 6 months.—The keeping quality of the flowers was not materially affected by the soil treatment.—Retaining the same soil, plus manure, for 5 years reduced the yield of the best grade of flowers by an average of about 5 per cent below that from fresh soil and manure.—Splitting of the calyces was not affected by sodium silicate nor by extreme progressive increase or decrease in the application of the fertilizer; but where nitrogen was added in large amounts to either soil and manure, or to sand, the percentage of split calyces was reduced.—Chlorosis was unaffected by limestone and by ferrous sulphate.—When the dry material contains about 2 per cent of nitrogen, 0.5 per cent phosphoric oxide, and 1.5-2 per cent potassium oxide the nutritional needs for these ingredients probably have been supplied.—*B. L. Hartwell*.

5027. ROCKWELL, F. F. *Gardening under glass*. x + 297 p., illus. Doubleday, Page & Co.: Garden City, New York, 1923.—The volume is divided into 2 parts, the 1st dealing with gardening under glass, and the 2nd with cultivation of special crops.—This is a well prepared book of a distinctly popular nature. The 1st part treats of cultural matters and the 2nd of growing violets, pineapples, palms, grapes, fruit trees in pots, vegetables in frames, greenhouse and bedding plants, vegetables under glass, and roses.—*J. H. Gourley*.

5028. WOOLEY, R. V. GIFFORD. *Tomato cultivation under glass and outdoors.* 32 p., 2 fig. Country Life: London; Charles Scribner's Sons: New York, 1922.—Chapters on winter cropping, seed sowing, and pests and diseases are included.—C. S. Gager.

MORPHOLOGY, ANATOMY AND HISTOLOGY OF VASCULAR PLANTS

E. W. SINNOTT, *Editor*

(See also in this issue Entries 4806, 4829, 4832, 4837, 4841, 4843, 4963, 4967, 4990, 5008, 5134, 5144, 5278, 5283)

5029. BEAUVERD, G. *Tératologie du Primula vulgaris* Huds. [Teratology of *Primula vulgaris*.] Bull. Soc. Bot. Genève 13: 8. 1921.—Two specimens were found with abnormal calyx and green corolla.—W. H. Emig.

5030. BOBILIOFF, W. *Onderzoekingen over het ontstaan van latexvaten en latex bij Hevea brasiliensis.* [The origin of latex vessels and latex in *Hevea brasiliensis*.] Arch. Rubbercult. 3: 43-65. 1919.—Latex formation was studied in plants of all ages from the young seedling to the mature tree. In young cotyledons the latex vessels were observed to develop by the absorption of the cross walls of a row of cells, and also by the growth and branching of some of the cells. Latex formation takes place as soon as the vessels develop. The latex-vessels can be traced directly back to the meristematic tissue. Latex may form in one part of a plant independently of the remainder of the plant. Caoutchouc formation takes place within the latex vessel itself.—C. D. La Rue.

5031. BOWMAN, H. H. M. *Histological variations in Rhizophora mangle.* Rept. Michigan Acad. Sci. 22: 129-134. Pl. 9-12. 1920 [1921].—Tannin is very abundant in all parts of the mangrove plant, especially in the hypodermal leaf cells. These leaf tannin cells are larger in plants growing in more concentrated salt water and there is often an extra layer of hypodermal water-storage cells. The cells of the "transfusion tissue" (so-called by Warming) are thin walled, turgid, and filled with mucilage and are without the thickenings on the walls reported by Warming. In nearly all parts of the plant are stone cells or idioblasts. These are mostly H-shaped or even stellate, with the lumen nearly filled by the thickened, lignified wall. The anthers are of the plurilocular type. The pericycle is a dense ring of sclerenchymatic tissue, making the wood exceedingly tough.—Ernst A. Bessey.

5032. BOWMAN, H. H. M. *The development and activation of hibernacula.* Papers Michigan Acad. Sci. 1: 61-73. Pl. 26-29. 1923.—A study of the factors governing the production of hibernacula in *Spirodela polyrrhiza* (L.) Schleid., *Lemna trisulca* L., *Ceratophyllum demersum* L., *Cabomba caroliniana* A. Gray, and *Myriophyllum spicatum* L. At different times various species of *Utricularia* were also used. The hibernacula of *Lemna* and *Spirodela* are small fronds, heavily charged with starch, which sink to the bottom. Those of the other species are short shoots with smaller crowded leaves, and short internodes, the tissues also being filled with starch. These hibernacula developed in November in aquaria where the temperature remained constant, apparently as a response to the reduced illumination. The activation of the hibernacula is also described.—Ernest A. Bessey.

5033. BROWN, ELIZABETH DOROTHY WUIST. *Apogamy in Phegopteris polypodioides.* Bull. Torrey Bot. Club 50: 17-34. Fig. 1-20. 1923.—Cultures of spores from 2 sources were grown from unmodified and modified Prantl's and Knop's solutions. The filamentous stage was variable in length and could be induced by reversion by unfavorable cultural conditions. Male prothallia were most numerous in modified solutions, female in the unmodified. Both monoecious and dioecious prothallia occurred in all cultures. A large number of apogamous growths are described and the conditions under which such occurred are discussed. It is pointed out that physiological study of fern gametophytes is of importance in shedding light on the expression of various sexual phenomena.—P. A. Munz.

5034. COOK, O. F. **Diversity of internode individuals.** Jour. Heredity 13: 323-328. 4 fig. 1923.—The successive internodes of the same vegetative shoot represent biological equivalents. Therefore, by a comparison of such internodes or even by comparing the halves of the same leaf or other symmetrical organ the problem can be studied of whether biological processes are carried on with mechanical exactness, or whether normal diversity is to be expected. The fact that homologous parts of the same plant are often as different as species, genera, or families does not support the theory that paths of development are followed exactly. In spite of cytological studies very little is known of the nature of the inherited characters, the results that are produced being the only basis of judgment of the nature of the reproductive processes.—R. C. Cook.

5035. ETTER, AUSTIN. **Polyembryony developed under experimental conditions in certain polypodiaceous ferns.** Bull. Torrey Bot. Club 50: 95-107. Pl. 4, fig. 1-6. 1923.—Polyembryony in *Matteuccia Struthiopteris*, *Onoclea sensibilis*, *Dryopteris mollis*, and *Pteris longifolia* was shown to occur occasionally in ordinary cultures and under experimental conditions. Division of prothallia often resulted in regeneration by each part and in subsequent sporophyte formation. The conclusion is made that, when the gametophyte is of sufficient vigor, 1 to several sporophytes may be nourished and brought to independent existence.—P. A. Munz.

5036. LEPESCHKIN, W. **Recherches sur les organes du bord des jeunes feuilles. (Contribution au problème des organes inutiles des plantes.)** [Researches on the marginal organs of young leaves; a contribution to the problem of useless organs of plants.] Bull. Soc. Bot. Genève 13: 226-235. 1921.—It is not possible to state the causes for the change of form in marginal organs of leaves. The cause for the changes is supposed to lie in the residue of a mass of hereditary units.—W. H. Emig.

5037. PILGER, R. **Ueber Verzweigung und Blütenstandbildung bei den Holzgewächsen.** [On branching and the formation of the inflorescence in woody plants.] Bibliotheca Bot. 90. 1-37. 36 fig. 1922.—The growth of woody plants, even in the tropics, is periodic. The portion of the twig which grows between one rest period and another the author (following Volkens) terms a "schub." In the north, or in dry regions, the schub extends from winter bud to winter bud. In the tropics, it is often difficult to determine the limits of the schub, as it is marked only by rest periods. The schub is more commonly unbranched at the north, more commonly branched in the tropics. The branching is termed 'prolepsis.' The branches of the schub may behave differently, some maturing at once, others developing later. The branched tropical schub is primitive. The panicle is the primitive type of inflorescence and represents a portion of a branched schub in which the leaves have been reduced. Its origin is seen in *Chamaecyparis*. The single flowered inflorescence is reduced from the primitive paniculate type. The Ranales do not usually show a primitive type of inflorescence. Inflorescences borne on old and on new shoots represent a specialization of schubs. Those on new shoots are terminal on the vegetative schub. Those on old wood are entirely separate naked schubs. The separation of flower shoots and vegetative shoots is discussed at length. The following special plants are described fully to illustrate the points made: *Corylus*, *Alnus*, *Betula*, *Acer*, *Cornus*, *Forsythia*, and *Nerium*.—K. M. Wiegand.

5038. SAHNI, B. **Modern Psilotaceae and archaic terrestrial plants.** Nature 111: 84. 1923.—One or more cauline xylem strands devoid of protoxylem are normally present in the pith of *Tmesipteris Vieillardii* Dang., an erect terrestrial form said to be endemic in New Caledonia. This may be regarded as a stage in the disintegration of a once continuous and solid cylinder of cauline xylem. Medullary xylem was recorded in *Tmesipteris* by Bertrand in 1885 and by Dangeard in 1890-91.—O. A. Stevens.

5039. WOODCOCK, E. F., and R. DEZEEUW. **The anatomy of the haustorial roots of Comandra.** Rept. Michigan Acad. Sci. 22: 189-192. Pl. 15. 1920 [1921].—A brief description, with

drawing, depicts the anatomy of the haustorial roots of *Comandra pallida* attacking the roots of apple. Material was collected in the state of Washington. The penetration of the haustorium is effected by pressure and the solvent action of a secreted enzyme. A clasping portion of the haustorial root can be distinguished from the absorbing part.—*Ernst A. Bessey.*

5040. DEZEEUW, RICHARD. The value of double infiltration in botanical microtechnique. *Papers Mich. Acad. Sci.* 1: 83-84. 1923.—A method is described for infiltrating material with celloidin and subsequently with paraffin, which makes possible the cutting of thinner sections than by the use of celloidin alone, while retaining the advantages of the celloidin method.—*Ernst A. Bessey.*

MORPHOLOGY AND TAXONOMY OF ALGAE

E. N. TRANSEAU, *Editor*

L. H. TIFFANY, *Assistant Editor*

(See in this issue Entries 4774, 4865, 4989, 5050)

MORPHOLOGY AND TAXONOMY OF BRYOPHYTES

ALEXANDER W. EVANS, *Editor*

(See also in this issue Entries 4774, 4849, 4989)

5041. ANDREWS, F. M. Abnormal elaters of *Porella platyphylla*. *Bull. Torrey Bot. Club* 50: 85-87. *Pl. 3.* 1923.—Elaters of variously branched and other abnormal types are described and figured from material collected in Indiana.—*P. A. Munz.*

5042. CAMPBELL, DOUGLAS HOUGHTON. An interesting liverwort. *Science* 57: 384-385. 1923.—Specimens of the Asiatic *Monoselenium tenerum* Griffith have recently been found in a nursery at Oakland, California. This species, based on Indian specimens in 1849, was not again reported until 1910, when Goebel published a new account of it, his material having appeared on earth brought from Canton. The Californian plants were undoubtedly introduced with nursery stock from China or Japan, where the species may not be rare. *Monoselenium* is related to *Dumortiera*.—*C. J. Lyon.*

5043. DISMIER, G. Trois muscinées nouvelles pour la région parisienne: *Platygyrium repens* Br. eur., *Liochlaena lanceolata* Nees et *Jamesoniella autumnalis* (De Cand.) Steph. [Three bryophytes new to the Parisian region: *Platygyrium repens*, *Liochlaena lanceolata* and *Jamesoniella autumnalis*.] *Bull. Soc. Bot. France* 66: 313-316. 1919.—The author, on the basis of his own collections, reports *Platygyrium repens* from near Ferté-Milon (Aisne), *Liochlaena lanceolata* from near Boissy-Saint-Léger (Seine-et-Oise), and *Jamesoniella autumnalis* from the same locality. The 1st and 3rd represent additions to the flora of the district around Paris, while the 2nd is a great rarity. Under each species the distribution in France is discussed, and the *Platygyrium* is accompanied by descriptive notes.—*A. W. Evans.*

5044. DOUIN, CH. Les erreurs en hépaticologie. [Mistakes in hepaticology.] *Compt. Rend. Assoc. Franç. Avanc. Sci.* 43 [Rouen]: 610-613. 1922.—Three common mistakes made by students of the Marchantiales are discussed. The 1st is the assumption of a group of apical cells in the thalli of certain genera; in the author's opinion there is never more than 1 apical cell. The 2nd is the supposed distinction between a "true" dichotomy of the thallus, derived from a group of apical cells, and a "false" dichotomy, derived from a single apical cell. The 3rd is the supposed distinction between "composite" and "simple" sexual receptacles.—*A. W. Evans.*

5045. LEE, WILLIAM A. Irish *Sphagna*. *Irish Nat.* 31: 18-23. 1922.—The author reviews the work done on the peat mosses of Ireland and catalogues the species according to the Warnstorffian system, the distribution being indicated by "vice counties." The list includes 31 species, 62 varieties, and 56 forms and subforms.—*A. W. Evans.*

5046. LEE, WILLIAM A. *Irish Sphagna*. *Irish Nat.* 33 [i.e., 32]: 28-29. 1923.—This is a supplement to an earlier list bearing the same title (see preceding entry). The author lists 10 species, 21 varieties, and 21 forms and subforms of *Sphagnum*, mostly from the counties of Dublin and Wicklow. The records represent "vice-comital" additions and include 3 varieties and 11 forms and subforms not found in the earlier list.—A. W. Evans.

5047. ZODDA, G. *Brevi notizie sulle briofite dell' isola di Rodi*. [Notes on the bryophytes of the island of Rhodes.] *Bull. Soc. Bot. Ital.* 1921: 38, 39. 1921.—A collection of bryophytes made by the author in 1919 in the vicinity of the city of Rhodes and on Mt. Smith yielded 18 species, 13 of which were new to the island. The known bryophytic flora of Rhodes now includes 49 mosses and 7 hepatics.—A. W. Evans.

5048. ZODDA, G. *Cenni sulle briofite forlivese*. [Notes on the bryophytes of Forlì and vicinity.] *Bull. Soc. Bot. Ital.* 1921: 49-52. 1921.—A report is given on a collection of bryophytes made by P. Zangheri in the vicinity of Forlì, Italy. The list of species includes 55 mosses and 11 hepatics and of these, 16 mosses and all the hepatics are new to the district.—A. W. Evans.

MORPHOLOGY AND TAXONOMY OF FUNGI, LICHENS, BACTERIA, AND MYXOMYCETES

H. M. FITZPATRICK, *Editor*

DONALD S. WELCH, *Assistant Editor*

(See also in this issue Entries 4774, 4794, 4816, 4847, 5116, 5117, 5119, 5123, 5124, 5125, 5127, 5128, 5218, 5229, 5231, 5233, 5234, 5235, 5239, 5243, 5253, 5254)

FUNGI

5049. BULLER, A. H. REGINALD. *Rea's British Basidiomyceteae*. [Rev. of: REA, CARLETON. *British Basidiomycetae: A handbook to the larger British Fungi*. xii + 799 p. (Published under the auspices of the British Mycological Society.) Cambridge University Press: London, 1922 (see Bot. Absts. 12, Entry 1978).] *Nature* 111: 213-214. 1923.—"The volume is indispensable to all students of fungi on both sides of the Atlantic. In accuracy of description the book is an immense advance on anything previously produced in Britain." The dropping of main divisions based upon spore characters has its advantages, but in some groups spore color seems to be of more importance than the other characters, e.g., in *Coprinus*.—O. A. Stevens.

5050. BUSTOS, M. R. ESPINOSA. *Informe del Jefe de la seccion Plantas Cryptogames*. [Report of the section of cryptogamic plants.] *Bol. Mus. Nacion. Santiago* 11: 269-270. 1918/19 [1920].—The author reports collections of *Marasmius*, *Lepiota*, *Psilocybe*, *Peziza*, *Fomes*, *Heterosporium*, *Ustilago*, *Gyromitra*, *Clavaria*, and *Sclerotinia*.—*Heterosporium gracile* was found parasitic on the leaves of *Iris florentina*, *Sclerotium Trifoliorum* parasitic on *Trifolium repens*, and *Ustilago Tritici* (Pers.) Jens. causing the loose smut of wheat.—The algae *Nitella clavata* (Berter) A. Braun, *Chara coronata* Ziz., and *C. fragilis* Desv. were collected, the latter 2 for the 1st time in Chile.—J. A. Faris.

5051. COUPIN, HENRI. *Fungi*. *Album Gén. des Cryptogames* Fasc. 29-35. *Pl.* 182-236. [1922?].—The author completes the treatment of the Sphaeriales, presents the Laboulbeniaceae, and begins the consideration of the fleshy Basidiomycetes. [See also Bot. Absts. 10, Entry 585].—J. R. Schramm.

5052. KAUFFMAN, C. H. **A black rot of squash.** Rept. Michigan Acad. Sci. 22: 201-202. 1920.—Hubbard squashes (*Cucurbita maxima* Duchesne) in storage developed a dry rot in which the invaded tissues turned black and showed an abundance of dark brown mycelium. When grown in pure culture on synthetic sugar agar the mycelium remained sterile and lacked pigment; on corn-meal agar the mycelium became dark and pycnidia developed after 15 days. A healthy squash inoculated with a bit of mycelium from a pure culture developed the characteristic rot in a few days. The fungus is *Diplodina citrullina* Grossb., the pycnidial stage of *Mycosphaerella citrullina* Grossb.—Ernst A. Bessey.

5053. KAUFFMAN, C. H. **Collybia strictipes, developed in the laboratory.** Rept. Michigan Acad. Sci. 22: 203-204. 1920.—The fruiting bodies of the fungus appeared on a mass of wet, partially decayed leaf-mass filled with a whitish web of mycelium, when brought into the laboratory in October and kept wet for 2 months.—Ernst A. Bessey.

5054. KAUFFMAN, C. H. **Mortierella bainieri.** Rept. Michigan Acad. Sci. 22: 195-199. Pl. 16. 1920.—The mold under consideration was collected on forest leaves near Ann Arbor, Michigan. The cultural characters of the species are described in detail.—Ernst A. Bessey.

5055. KAUFFMAN, C. H. **The mycological flora of the higher Rockies of Colorado.** Papers Michigan Acad. Sci. 1: 101-150. Pl. 30-34. 1923.—This paper is an annotated list of the fungi collected by the author and companions near the continental divide in the mountains of Colorado in 1917 and 1920, mostly at elevations of 9000-10,000 feet. The fungi listed were mostly found in the forests. The following new forms are described: *Dasyscypha pulverulentum* (Lib.) Sacc. var. *fruticola* n. var., *Helotium alnicola* n. sp., *H. sulphuratum* (Schum.) Phil. var. *Piceae* n. var., *Hymenoscypha scutula* (Pers.) Phillips var. *Grossulariae* n. var., *Odontotrema minus* Nyl. f. *salicella* n. f., *Strickeria megastega* (E. & E.) n. comb. (*Teichospora megastega* E. & E.), *Boletus tomentosus* n. sp., *Collybia albiflava* (Pk.) Kauff. var. *montana* n. var., *Cortinarius bistreoides* n. sp., *C. citrinellus* n. sp., *C. glaucopodoides* n. sp., *C. griseoluridus* n. sp., *C. metarius* n. sp., *C. nigrocuspidatus* n. sp., *C. pinetorum* (Fr.) n. comb. (*C. argentatus* var. *pinetorum* Fr.), *Marasmius piceina* n. sp., *M. pinastris* n. sp., *Pholiota platyphylla* n. sp., *Stropharia squamosa* var. *subalpina* n. var., *Tricholoma tristiforme* n. sp.—Ernst A. Bessey.

5056. LENDNER, A. **Le Clathrus cancellatus Tourn. nouveau pour la flore mycologique Genevoise.** [Clathrus cancellatus Tourn. new for the mycological flora of Geneva.] Bull. Soc. Bot. Genève. 13: 29-30. 1921.

5057. MARTIN, CHARLES ED. **Une mise au point sur la nomenclature du Boletus aereus Bulliard.** [Certain facts concerning the nomenclature of Boletus aereus Bulliard.] Bull. Soc. Bot. Genève 13: 5-7. 1921.—*Boletus aereus* of the French mycologists is an entirely different species from *B. aereus* of the Central European mycologists. *B. aereus* of Krombholz, considered the type species by all mycologists except the French, is the *B. irideus* of Rostko-vius, which is only a subspecies of *B. edulis*, not a distinct species.—W. H. Emig.

5058. PONCY, R. **Un champignon nouveau pour la Suisse.** [A fungus (*Omphalia candida* Bresadola) new to Switzerland.] Bull. Soc. Bot. Genève 13: 20. 1921.

5059. YASUDA, A. **Notes on fungi (130).** Bot. Mag. Tokyo 37: (34)-(35). 1923. [In Japanese.]—*Polyporus Patouillardii* Rick, *Boletus griseus* Frost, and *Calocera cornea* (Batsch) Fries are discussed.—J. R. Schramm.

5060. YASUDA, A. **Notes on fungi (131).** Bot. Mag. Tokyo 37: (66)-(68). 1923. [In Japanese.]—*Pentophora glebulosa* (Fr.) Bres., *Dothidea puccinioides* (DC.) Fr., and *Trametes protracta* Fries are considered.—J. R. Schramm.

LICHENS

5061. LESDAIN, BOULY DE. *Lichens du Mexique (Etats de Puebla et Michoacan) recueillis par le Frère G. Arsène Brouard. Premier supplément.* [Mexican lichens collected in Puebla and Michoacan by Bro. Arsène Brouard. First supplement.] Brochure, 16 × 22 cm., 23 + 4 unnumbered p., mimeographed. Preface dated Covington, Louisiana, September, 1922.—The 1st 4 pages of this brochure are by Brother BROUARD and detail the circumstances of publication of the early list [see Bot. Absts. 7, Entry 372] of which this is a supplement, the occasion of the issue of the present list, and briefly outline the physiographic characters of the localities where collections were made. The body of the brochure, by Lesdain, lists 116 species, varieties, or forms of lichens and 4 of parasitic Basidiomycetes, with 1 page containing corrections in the earlier article mentioned above. There is full citation of localities and collector's numbers and a considerable body of references to earlier literature. The following novelties are proposed, authority in all cases being Bouly de Lesdain: *Aspercilla mixcoacensis*, *Acarospora Brouardi*, *Allarthonia mexicana*; *Heppia michoacanensis* var. *adnata*, *Endocarpon pallidum* var. *montanum*, *E. pusillum* var. *Arsenii*; *Evernia furfuracea* f. *ceratea* and f. *scobicina*, *Placodium mexicanum* f. *imbricata*, *P. murorum* f. *tectorum*, *Psora nigrorufa* f. *terrena*. *Placodium murorum* var. *radiatum* B. de L. (= *Lecanora* Hué) appears to be a new combination. There is additional descriptive matter or discussion relative to *Heppia Brouardi* B. de L., *H. leptopholis* Nyl., *Placodium murorum* var. *congestum* Flag., *F. saxorum* Flag., *F. bolacinum* Tuck., *F. interfulgens* Tuck., *Buellia tumida* Bagl., *Endocarpon pusillum* var. *minor* B. de L., *Staurothele clopina* Th. Fr., *Collema glaucophthalmum* Nyl., *C. texanum* Tuck., *Leptogium Hildbrandii* Nyl., and *Tromera Resinoe* Krb.—*E. B. Chamberlain.*

5062. MAMELI, EVA. *Contributo alla lichenologia del Forlivese.* [Contribution to the lichenology of Forli.] *Atti Ist. Bot. Univ. Pavia* III, 1: [1-22.] 1923.—About 200 species and varieties are listed, of which 128 are new to Emilia. No new species or names occur.—*J. R. Schramm.*

5063. OLIVIER, H. *Lichens du Chile determines.* [Catalog of the lichens of Chile.] *Bol. Mus. Nacion. Santiago* 11: 271-277. 1918/19 [1920].

BACTERIA

5064. ADAMS, F. O., and H. A. HARDING. *Test of commercial thionins for staining Frost little plates.* [Abstract.] *Absts. Bact.* 7: 23. 1923.—Thionin is found useful not only for staining colonies in plates but also for staining individual cells for microscopic examination.—*D. Reddick.*

5065. ALLEN, P. W. *Description of a method for determining the gelatin liquefying power of bacteria by a fluidity method: A substitution for solid gelatin plates.* [Abstract.] *Absts. Bact.* 7: 4-5. 1923.—The method is described in sufficient detail in the abstract to be duplicated.—*D. Reddick.*

5066. BENGTON, IDA A. *A toxin-producing anaerobe isolated from fly larvae.* [Abstract.] *Absts. Bact.* 7: 17. 1923.—The organism is called *Bacillus botulinus* type C. It resembles the 2 other types in its effect on animals, but the toxin which it produces is not neutralized by the antitoxins of the American strains known as types A and B.—*D. Reddick.*

5067. BENGTON, IDA A. *Classification of anaerobes producing toxins poisonous by mouth.* [Abstract.] *Absts. Bact.* 7: 17. 1923.—Three types of *Bacillus botulinus* are discussed.—*D. Reddick.*

5068. BERGEY, D. H. *Report of the committee on determinative bacteriology.* [Abstract.] *Absts. Bact.* 7: 2. 1923.

5069. BURKE, GEORGINA S. **The differential staining of live and dead spores of *Clostridium botulinum*.** [Abstract.] Absts. Bact. 7: 5. 1923.—Method: stain in steaming carbol-fuchsin, destain with absolute acetone, and counter stain with methylene blue. Living spores are stained only in the outer zone, whereas dead ones are stained throughout.—*D. Reddick*.

5070. BURKE, VICTOR, and MARY DUNNING. **A modified method for staining acid fast organisms and bacterial spores.** [Abstract.] Absts. Bact. 7: 5. 1923.—Technique: place slide in a beaker of steaming carbol-fuchsin for 2-5 minutes; wash in water without drying; decolorise in acetone until faintly pink: counter stain as usual.—For spores the process is as follows: stain in steaming carbol-fuchsin for 1 minute; wash in water without any drying; decolorize with 2-3 changes of acetone, leaving acetone on slide for 2 seconds at each change; counter stain as usual.—*D. Reddick*.

5071. CONN, H. J. **Methods of pure culture study. Report of committee on bacteriological technic.** [Abstract.] Absts. Bact. 7: 1. 1923.

5072. CONN, H. J. **Standardization of bacteriological apparatus. Report of committee on bacteriological technic.** [Abstract.] Absts. Bact. 7: 1. 1923.

5073. CONN, H. J. **Standardization of stains. Report of committee on bacteriological technic.** [Abstract.] Absts. Bact. 7: 1-2. 1923.

5074. DARLING, C. A. **Counting micro-organisms in tomato products.** [Abstract.] Absts. Bact. 7: 10. 1923.

5075. FROST, WILLIAM D., and FRED A. M. BACHMANN. **Hemolytic Streptococci in high grade milks.** [Abstract.] Absts. Bact. 7: 20. 1923.—In 18 per cent of the samples examined the alpha type was found and in 10 per cent the beta type occurred.—*D. Reddick*.

5076. ENLOWS, ELLA M. A. **A sugar-free medium for fermentation studies.** [Abstract.] Absts. Bact. 7: 8-9. 1923.—Procedure and formula are presented.—*D. Reddick*.

5077. EVANS, ALICE C. **A comparison of strains of the alpha type of *Streptococcus* from pathologic and from dairy sources.** [Abstract.] Absts. Bact. 7: 12. 1923.—“No characteristic was found which could distinguish the 2 groups.”—*D. Reddick*.

5078. GRAHAM, ROBERT, and I. B. BOUGHTON. **A spontaneous disease of chickens and ducks associated with a toxic anaerobe.** [Abstract.] Absts. Bact. 7: 29-30. 1923.—The organism, which is described in some detail seems to be *Clostridium botulinum* type C of Bengtson [see Bot. Absts. 12, Entry 5066].—*D. Reddick*.

5079. HAMMER, B. W., and MERLE P. BAKER. **Studies on the *Strep. paracitrovorus* group.** [Abstract.] Absts. Bact. 7: 12-13. 1923.—*Streptococcus paracitrovorus* represents a group of organisms, widely distributed in dairy products, the most striking characteristic of which is the fermentation of citric acid. Certain variations exist but data are not yet available justifying a division into types.—*D. Reddick*.

5080. HULL, THOMAS G., and HUGH CASSIDAY. **Preserved cultures in the Widal test.** [Abstract.] Absts. Bact. 7: 3-4. 1923.

5081. JONES, DAN H., and J. GIBBARD. **Microbiological investigation of sweet clover silage.** [Abstract.] Absts. Bact. 7: 20-21. 1923.—“Bacterial, yeast and mold determinations were made before, during, and after the period of fermentation of 6 lots of sweet clover [*Melilotus alba*?] silage ensiled at different dates from June 1st to July 20th, 1922.”—*D. Reddick*.

5082. KELSER, R. A. The identification of *Bacillus botulinus* and its toxin in culture and in canned foodstuffs by serological methods. Amer. Jour. Public Health 13: 366-376. 1923.—“Culture of *B. botulinus*, either in a pure or contaminated state, can be identified by means of complement-fixation titrations,” the details of which are given.—C. A. Ludwig.

5083. KOSER, STEWART A. *Bacillus Welchii* in bread. [Abstract.] Absts. Bact. 7: 10-11. 1923.—A strain of the organism of a low grade of virulence was found to be the active gas producer in a commercial “salt rising” bread “starter.” The organism was isolated from baked loaves.—D. Reddick.

5084. KOSER, STEWART A. Utilization of organic acid salts by the colon-aerogenes group. [Abstract.] Absts. Bact. 7: 8. 1923.—“It is believed that the salts of the commoner organic acids are entitled to a wider use by bacteriologists than that accorded them at present. Such compounds should form a valuable series of test substances in the differentiation and classification of bacterial groups.”—D. Reddick.

Public Health 13: 384-387. 1923.—This agar is easily prepared, gives higher counts for all milk products than the standard agar, and serves as a means of detecting both acid forming and proteolytic-enzyme forming organisms.—C. A. Ludwig.

PALEOBOTANY AND EVOLUTIONARY HISTORY

EDWARD W. BERRY, *Editor*

(See also in this issue Entries 4851, 5038)

5101. ANONYMOUS. The distribution of life in the southern hemisphere and its bearing on Wegener's hypothesis. Nature 111: 131. 1923.—This is an extract from a recent discussion before the Royal Society of South Africa. "Prof. Compton regards the botanical evidence as completely opposed to Wegener's theory. Dr. DuToit regards the paleobotanical evidence as too fragmentary."—O. A. Stevens.

5102. BERRY, EDWARD W. Miocene plants from southern Mexico. Proc. U. S. Nation. Mus. 62¹⁹: 1-27. Pl. 1-7. 1923.—This article describes 33 species of Miocene plants from the Isthmus of Tehuantepec in southern Mexico. These comprise 2 ferns, 1 monocotyledon, and 30 dicotyledons, all of which are new except species of *Ficus*, *Nectandra*, *Goeppertia*, and *Guetarda*. The facies is that of tropical lowlands and is distinctly South American in affinities. Following are the new species: *Gymnogramme Wadiei*, *Acrostichum mexicanum*, *Coussapoa veracruziana*, *Anona saraviana*, *Moquillea mexicana*, *Connarus carmenensis*, *Anacardites lanceolatus*, *Liquidambar incerta*, *Inga miocenica*, *Dioclea* (?) *mexicana*, *Leguminosites mexicanus*, *L. oaxacensis*, *Fagara Wadiei*, *Drypetes elliptica*, *Cedrela miocenica*, *Simaruba veracruziana*, *Gouania miocenica*, *Nectandra tehuntepecensis*, *Mespilodaphne palomarensis*, *Myrcia saraviana*, *Lecythydophyllum couratarioides*, *Melastomites angustus*, *M. obovatus*, *Apocynophyllum mexicanum*, *Allamanda carmenensis*, *Crescentia cucurbitinoides*, *Bignonioides orbicularis*, and *Rondeletia* (?) sp.—E. W. Berry.

5103. CUNO, J. B. The mystery of a buried forest. Amer. Forest. 29: 105-106. 1 fig. 1923.—This article concerns the discovery of a prehistoric cypress swamp in Washington, D. C., which geologists claim is the remains of a forest dating back 30,000-100,000 years. The writer believes that the trees were felled by the early settlers of the region and removed for use in building construction elsewhere, since no trunks of trees were found during the excavation.—Chas. H. Otis.

5104. GOTHAN, W. Ein Fund natürlicher Zellulose im Miocän des Niederlausitzer Braunkohlenreviers. [The discovery of unaltered cellulose in the Miocene of the Niederlausitz brown coal district.] Zeitschr. Deutsch. Geol. Ges. 74: 159-161. 1922.—The author reports the presence of unaltered cellulose, as determined chemically, in unidentified wood from the Miocene brown coal of Niederlausitz.—E. W. Berry.

5105. GOTHAN, W., und K. NAGALHARD. Kupferschieferpflanzen aus dem niederrheinischen Zechstein. [Copper shale plants from the lower Rhein Zechstein.] Jahrb. Preuss. Geol. Landes. 42¹: 440-460. Pl. 5-7. 1922.—The following species are recorded from the Zechstein of the lower Rhein region and the indicated environmental conditions are discussed. All the plants are new to this horizon in the Permian: *Ulmannia Bronni* Goeppert, *U. frumentaria* (Schlot.) Goeppert, *U. Solmsi* new name, *Voltzia* sp., *Callipteris Martinsi* (Germar) Zeiller, *Sphenopteris Kukukiana*, and *S. Gibbelsi* n. sp.—E. W. Berry.

5106. HOWE, M. A. Two new Lithothamnieae, calcareous Algae, from the lower Miocene of Trinidad, British West Indies. Proc. U. S. Nation. Mus. 62²⁴⁵³: 1-3. Pl. 1-4. 1922.—*Lithothamnium pennyi* and *Lithophyllum trinitense* are discussed as new.—E. W. Berry.

5107. KRYSHTOFOVICH, A. N. Report on the results of studies in Japan 1919-1920. Rec. Geol. Comm. Russian Far East 13. 1-12. 1921.—This is an account in Russian of the author's paleobotanical studies in Japan in the years mentioned.—E. W. Berry.

5108. KRYSHTOFOVICH, A. N. Some Tertiary plants of Possiet Bay, southern Ussuri District, collected by Mr. E. Ahnert. Rev. Geol. Comm. Russian Far East 11. 1-32. Pl. 1-3. 1921.—This is an account in Russian of the Eocene flora from this district in eastern Siberia. None of the species is new, but some are recorded from this region for the 1st time.—E. W. Berry.

5109. KRYSHTOFOVICH, A. N. Tertiary plants from Amagu River, Primorskaya Province, discovered by Mr. A. Kuznetsoff. Rec. Geol. Comm. Russian Far East 15. 1-15. Pl. 1-3. 1921.—This account in Russian records and illustrates 16 species of plants from the Eocene of eastern Siberia.—E. W. Berry.

5110. LAKE, PHILIP. Wegener's hypothesis of continental drift. Nature 111: 226-228. 1923.—The hypothesis is based on the idea that the continental masses are patches of lighter rock moving upon a denser one which forms the floor of the ocean. One of the chief arguments is that the frequencies of heights above sea level and depths below sea level show well marked maxima at 100 and 4700 m. respectively. Wegener concludes that 2 distinct surfaces standing at these altitudes must have been involved in the subsequent movements, and that according to mathematical laws a deformation of a single level would not produce such maxima. G. V. Douglas in a paper to appear in the Geological Magazine shows that the actual frequency curve is consistent with ordinary geological conceptions and does not require the original existence of 2 surfaces.—Wegener imagines that at the close of the Carboniferous period the upper layer formed one continuous patch covering about $\frac{1}{2}$ the globe. The *Glossopteris* flora of India is found also in Australia, the Falkland Islands, the Antarctic continent, and in South America. In Wegener's reconstruction these are brought together. But this flora also is found in Kashmir, northwestern Afghanistan, northeastern Persia, Tonquin, northern Russia and Siberia. These areas are widely separated from the other by Wegener. The writer discusses geological features further, concluding that the 2 sides of the Atlantic could not have been united as was suggested by Wegener.—O. A. Stevens.

5111. NOÉ, A. C. Coal balls. Science 57: 385. 1923.—The writer seeks information concerning deposits of coal balls which, though not previously reported in North American coal seams, are here reported from Illinois, Kentucky and Texas.—C. J. Lyon.

5112. SEWARD, A. C. **A study in contrasts: The present and past distribution of certain ferns.** Jour. Linn. Soc. Bot. 46: 219-240. Pl. 16-19. 1922.—The author discusses the present and past distribution of the fern families Gleicheniaceae, Matonieae, Dipteridinae, Schizaeaceae, and Marattiaceae as understood by him and illustrated by maps.—E. W. Berry.

5113. TORREY, RAY ETHAN. **The comparative anatomy and phylogeny of the Coniferales, Part 3.—Mesozoic and Tertiary coniferous woods.** Mem. Boston Soc. Nat. Hist. 6: 41-106. Pl. 8-15. 1923.—Diagnoses are given of the following lignitic woods: *Dadoxylon* sp., *Voltzi-oxylon documense* n. gen. & sp., *Pitoxylon* sp., *P. scituatensiforme* n. comb., *P. cf. Vateri* Platen, *Pseudotsuga annulata* n. comb., *Podocarpoxylon texense* n. sp., *P. washingtonense* n. sp., *P. McGeei*, *P. dakotense* n. sp., *Sequoioxylon montanense* n. gen. & sp., *S. dakotense* n. sp., *S. laramense* n. sp., *S. Burgessii* n. comb., *Brachyoxylon Woodworthianum* n. sp., *B. raritanense* n. sp., *B. comanchense* n. sp., *Paracupressinoxylon cupressoides* n. comb., *P. trinitense* n. sp., *Metacupressinoxylon cedroides* n. gen. & comb., *Telephragmoxylon brachyphyloides* n. sp., *T. comanchense* n. sp. *Araucarioxylon texense* n. sp.—This is the most extended study of lignitic woods since the description of the Cretaceous conifers of Kreischerville, Staten Island, by Hollick and Jeffrey in 1909. The "nitro-cellulose" method is used, and the photomicrographs (64 in number) show that the lignites are at last amenable to study.—Most of the stems described were collected by the writer himself, and notes are given on the geographic and geologic occurrence of the lignites of the U. S. A.—A histologic key to the lignitic woods of the U. S. A. is given, modified from earlier keys of Goeppert as developed by Stopes and Gothan. Attention is called to the fact that the species of Araucariaceae are becoming numerous, and render some form of classification necessary. Hollick and Jeffrey's *Araucariopityoideae*, *Brachyphyloideae*, and *Araucarioideae* are raised to the rank of tribes; i.e., a great Araucarian facies, especially well attested in the Cretaceous and earlier, spread far to the North, though later to be restricted to the Southern Hemisphere in sharply limited numbers. And side by side with this facies flourished the cosmopolitan pines and their relatives in even greater variety, likewise undergoing restriction in form, in habit, and in number. While on the borders of these 2 dominant forest-making elements were many and striking intermediate types. Of such the most interesting must be the *Brachyoxylon Woodworthianum* from the Cretaceous of Martha's Vineyard, since the earliest formed tracheids are close, to even *Dadoxylon* pitted; while later pitting is more Abietineous, but without bars of Sanio. Despite the Abietineous features the species is so much like an Araucarian that it must be referred to that group.—A new genus held still nearer to *Araucaria* is *Telephragmoxylon*, thus defined: annual rings slight, traumatic resin canals, uniseriate to partly biseriate, wood rays 2-16 cells deep, few to 10 slits or "oculipores" per tracheid field; pitting in young wood uniseriate, in older wood often biseriate, and then alternate contiguous or sometimes in 2 slightly separated rows; wood parenchyma none.—The conclusion reached from these border types is that the Araucarians sprang from the Abietae in early Mesozoic time and have since been undergoing simplification. The stem of this Abietean line is the Triassic *Woodworthia* of Jeffrey with araucaroid wood and short shoots. Reversing the more usual view of the gymnosperm phylum, this also becomes a finding in open court against the tendency of the past few years to belief in a more profound parallelism, with the exact lineal ancestry seldom observed. Consonant with an Abietineo-Araucarian line, and more primitive than any of the present gymnosperms, except the cycads, *Ginkgo* is considered a "living Cordaite," only less emphatically called by Darwin a "living fossil." From the pines (Abietae) later arose the further simplified Cupresseae, and also the Taxodiae or Sequoidae.—Two definitions of handy use in the anatomy of the conifers remain to record. Gothan used the expression "Kreuzungsfeld," Lignier, "aire mitoyenne," and Stopes, "tracheid-field," for the portion of a tracheid subtended by a ray cell. The pits seen in the fields, or along the tracheid surface, have been gradually modified until the old slit or "oculipore" (conventional form of an eye) becomes a round borderless opening, often large, the "oöpore."—G. R. Wieland.

5114. WHITE, D., and T. STADNICHENKO. **Some mother plants of petroleum in the Devonian black shales.** Economic Geol. 18: 238-252. Pl. 5-9. 1923.—The authors describe the alga

Foerstia ohioensis n. sp. and the spore sacs *Protosalvinia ravenna* n. sp. which are very abundant in the black shales and which contain both waxy and resinous compounds, as determined experimentally; and consider them, in conjunction with the waxy-resinous exines of *Sporangites*, as the probable source of petroleum.—*E. W. Berry*.

5115. WINCHESTER, DEAN E. Oil shale of the Rocky Mountain region. U. S. Geol. Surv. Bull. 729. 204 p. 1923.—This comprehensive work contains a list of plants of the Green River formation (middle Eocene) prepared by F. H. KNOWLTON; and notes on the microorganisms of the oil shales by the late C. A. DAVIS, with figures of various algae, pollen, fern annulus, etc.—*E. W. Berry*.

PATHOLOGY

DISEASES CAUSED BY FUNGI

5116. ANONYMOUS. Pins sylvestres attaqués par *Armillaria mellea*. [*Pinus sylvestris* attacked by *Armillaria mellea*.] Bull. Soc. Centrale Forest. Belgique 28: 628-630. 1921.—A Belgian forest owner sent in specimens of 8-year-old *Pinus sylvestris* killed by a fungus. The latter was identified as *Armillaria mellea* and the identifying characteristics are given.—*H. T. Gisborne*.

5117. ANONYMOUS. [Rev. of SCHWARZ, MARIE B. Das Zweigsterben der Ulmen, Trauerweiden, und Pfirsichbäume. (Dying of elms, weeping willows and peach trees.) Thesis, University of Utrecht, 73 p., 7 pl., 15 fig. 1922]. Rev. Applied Mycol. 2: 92-94. 1923.—In the case of die-back of elms, cultures from fragments of discolored wood taken from the interior of larger limbs constantly yielded a Graphium-like fungus which gave positive results from artificial inoculation. The author describes this fungus as *Graphium Ulmi* n. sp.—Detailed description is given of the "bark scorch" disease of *Salix alba* var. *vitellina pendula* S. upon which the fungus *Fusicladium saliciperdu* was predominant. Other fungi were also present and a Phoma which gave positive results from inoculation tests is named *Phoma intricans* n. sp. Dying of the shoots in autumn after defoliation was found due to the wound parasite *Discella carbonacea* as shown by infection trials.—Several fungi are concerned in the die-back of peach shoots common in Holland, but only *Monilia cinerea* is a true parasite. However, the author believes *Botrytis cinerea* to be responsible for the dying back of peach shoots, especially in greenhouses. Three strains of *Cytospora Prunorum* Sacc. & Syd. were also isolated and 2 of them gave infection after artificial inoculation. The 3rd, however, sometimes infected weeping willow and is considered a different physiological strain from the other 2.—*Frederick V. Rand*.

5118. ALLYN, O. M. Reducing corn root-rot by careful hand selection of seed. Jour. Amer. Soc. Agron. 15: 73-76. 1923.—Hand selection, even the 1st year, materially reduces the corn-root disease.—*F. M. Schertz*.

5119. BEACH, W. S. A crown rot of rhubarb caused by *Phytophthora cactorum*. Pennsylvania Agric. Exp. Sta. Bull. 174. 28 p., 25 fig. 1922.—Part I contains facts of general interest concerning this disease, characterized by a brown necrosis of roots, crown, and base of petioles. Outer leaves usually wilt first and this may extend to all leaves and result in their death. Sometimes the disease affects only 1 or 2 buds on the crown, the rest of the plant remaining healthy unless wet weather intervenes. The rapid progress of the disease and the discoloration of the buds serve to distinguish this disease from minor crown troubles. The severest losses occur in new plantings from crowns taken from infested fields. The loss in old fields is not

great from year to year unless long periods of warm, wet, and cloudy weather occur during July and August. New fields should be started only from crowns taken from healthy fields or from seedlings grown under disease-free conditions. Spraying with 8-8-100 Bordeaux mixture was started after the close of the pulling season in 1921 and clearly indicated that it restricted the spread of the disease during the remainder of the summer. The spray does not kill the parasite already established in the crowns. Roguing as early in the season as the diseased hills can be detected appears to be an important control measure. It is also recommended that in setting new fields with roots from old fields the roots be disinfected with HgCl_2 1:1000, or formaldehyde 1:240 for 30 minutes.—Part II is concerned with the more technical phases of the problem. The crown rot caused by *Phytophthora cactorum* is similar to "foot rot," caused by *P. parasitica* var. *Rhei* as described by Godfrey, and an undescribed *Phytophthora* "root rot" of rhubarb in southern Illinois. The crown rot here described appears to be more northern in distribution and the fungus causing it has an optimum temperature requirement of 25°C. *in vitro*. *P. parasitica* var. *Rhei* has an optimum temperature requirement of about 30°C. and the Illinois *Phytophthora* sp. reacts to temperature ranges in about the same manner. Both parasites appear to be more southern in their distribution. Pathogenic proof of *P. cactorum* from rhubarb, *P. parasitica* var. *Rhei* from rhubarb, *P. sp.* from rhubarb in Illinois, and *P. cactorum* from apple was established upon rhubarb by inoculating seedlings at various seasons with bits of test tube culture material. *P. cactorum* from rhubarb infects uninjured leaves and petioles under favorable conditions but infection of the crown and roots appears dependent upon wounds. Such wounds are afforded by the pulling of the stalks. *P. parasitica* var. *Rhei* appears able to infect more readily in the absence of wounds, as does the *Phytophthora* from Illinois. *P. cactorum* from apple infects rhubarb through wounds but with less readiness than any of the other organisms, indicating that this strain is not so readily adapted to parasitism on this host. All tissues of rhubarb exhibiting symptoms of crown rot are invaded by the mycelium. In the early stages of infection the mycelium is intercellular with lateral haustoria piercing the adjacent cells. In later stages the mycelium not infrequently develops within the cells. Generally the hyphal strands lie parallel with the longitudinal axes of the cells. However, in the region of the medullary rays the hyphae develop radially and by following these "rays" the fungus appears to be able to penetrate more deeply into the tissues of the root than is the case in petioles, where the development is more rapid in a longitudinal direction and the medullary rays are absent. Oospores of *P. cactorum* from rhubarb develop abundantly *in vitro* but have been observed only once each in petioles and crowns. Zoosporangia are developed abundantly during moist weather upon the surface of petiole spots, emerging in fascicles from the stomata. Tabulated effects of temperature and media upon the 3 species of *Phytophthora* from rhubarb together with measurements of oospores and conidia are included. The conidia of *P. cactorum* from rhubarb may germinate either by zoospores or by producing germ tubes directly. A bibliography is appended.—C. R. Orton.

5120. ELLIOTT, JOHN A. Cotton-wilt, a seed-borne disease. Jour. Agric. Res. 23: 387-393. Pl. 1-2. 1923.—Experimental data by plate culture methods and subsequent inoculation tests to prove pathogenicity show that *Fusarium vasinfectum* of cotton is at times carried within the seed coat.—Spores of the organism on the surface of seed may retain vitality for at least 5 months.—D. Reddick.

5121. ERIKSSON, JAKOB. Beizversuche mit Uspulun und Supersolfo gegen den Steinbrand des Weizens. [The treatment of bunt smut of wheat with uspulun and supersolfo.] Zeitschr. Pflanzenkrankh. 32: 289-293. 1 fig. 1922.—Uspulun is a dirty grey powder manufactured and sold by Friedr. Bayer and Co., Leverkusen, near Cologne. The principal constituent is "Chlorphenolquecksilber," to which a coloring agent is added to prevent mistaking treated grain for untreated.—Supersolfo is a thick, heavy, dark fluid manufactured by the San Paolo gas works of Rome, a by-product obtained in the purification of gas after Bruttini's method. The principal constituent is sulphide of lime.—The experimental plots were 1 square m. in area, the control plot in the center and $\frac{1}{2}$ m. from the others.—Fifty gm. of wheat arti-

ficially "sooted" with spores were used on each plot. The grain was immersed in aqueous solutions (uspulun, 2.5 gm. to 1 l., supersulfo, 10 cc. to 1 l.) for 1 hour, occasionally stirred, the liquid drained off, and the grain dried.—The plots were sown Sept. 12, harvested Aug. 19 following. Results, so far as number and weight are concerned, are given in a table from which it is seen that the control gave 83.8 per cent, supersulfo 22.6 per cent, and uspulun 0.5 per cent of diseased plants. Uspulun proved most effective, being for all practical purposes an absolute fungicide.—It is, however, highly important to observe the superiority of supersulfo over uspulun as far as the yield increase is concerned. Both treatments gave increased yields, indicating their fertilizing value, supersulfo acting the more favorably of the 2 in this respect.—*H. T. Güssow.*

5122. HURD, ANNIE MAY. Hydrogen-ion concentration and varietal resistance of wheat to stemrust and other diseases. Jour. Agric. Res. 23: 373-386. 1923.—The varieties of wheat resistant to stemrust (*Puccinia graminis tritici* Pers.) employed in the test were: Kanred, Pentad, Khapli, Kota, Mindum, and Iumillo; susceptible varieties: Turkey, Kharkov, Little Club, Preston, Arnautka.—There is no significant difference in the H-ion concentration of juices expressed from resistant and from susceptible varieties. Greater differences are found in a single variety when subjected to differing environmental conditions. The pH value of expressed juice from plants harvested at 1 o'clock in the afternoon is 0.1 higher than from similar plants harvested 4 hours earlier. Juice from plants grown in limed soil has a lower H-ion concentration than that from plants grown in unlimed soil. Plants of unhealthy appearance show abnormally high acidity of expressed juice while plants affected with *Erysiphe graminis* are more acid than healthy ones and, perhaps, for the same reason. Geographic source of seed does not affect the H-ion concentration of the juice of plants.—A compilation of data from various sources shows that there is no correlation between the H-ion concentration of the expressed juices of these varieties of wheat and their resistance or susceptibility to diseases caused by the following organisms: *Puccinia graminis Tritici*, *P. triticea*, *P. glumarum Tritici*, *Tilletia Tritici*, *Urocystis Tritici*, *Gibberella Saubinetii*, *Erysiphe graminis*, and *Tylenchus Tritici*.—*D. Reddick.*

5123. KASAI, MIKIO. Kurze Mitteilung über den auf der Binse parasitisch lebenden Pilz *Cercosporina juncicola* sp. n. [Note on *Cercosporina juncicola* sp. n. parasitic on *Juncus effusus* var. *decipiens*.] Japanese Jour. Bot. 1: 105-110. 1923.—A stem spot disease of *Juncus* has been known for nearly 20 years in Bingo Province, western Japan; but its cause remained unknown until the author proved as a result of 2 years of study that it is due to *Cercosporina juncicola* Hori & Kasai sp. n. The fungus usually attacks half-grown plants just below the middle of the stem; the spots, which are very small and brownish at first, later enlarge and become sunken. These spots are variable in size and shape, and may be elliptical, circular, or without definite form. A detailed description of the fungus is given. Preventive measures have not yet been worked out, but the planter is urged to set out sound stock only and in doubtful cases to disinfect the stalks but not the roots with Bordeaux mixture. [See also following entry].—*Lillian C. Cash.*

5124. KASAI, MIKIO. Über den auf der Binse parasitisch lebenden Pilz *Cercosporina juncicola* sp. n. [*Cercosporina juncicola* parasitic on *Juncus*.] Ber. Ohara Inst. Landw. Forsch. 2: 225-232. Pl. 10-12. 1922.—The author describes a disease of *Juncus effusus*, L. var. *decipiens* Buch., a plant which in Japan is used in the mat industry. The fungus attacks half-grown plants causing gray spots which become very conspicuous after the stems are dry. The presence of the fungus on stems materially lessens their value for making mats. On the basis of morphology the author designates the fungus as a new species. Certain recommendations are made for field sanitation and disease control. [See also preceding entry].—*Margaret Buwens.*

5125. NISIKADO, Y., and C. MIYAKE. Studies on the helminthosporiose of the rice-plant. Ber. Ohara Inst. Landw. Forsch. 2: 133-195. Pl. 3-9. 1922.—This disease, which is serious and widely distributed in Japan, is caused by *Helminthosporium Oryzae* Breda de Haan.

It attacks all parts of the rice plant in all stages of development, and is characterized by brownish leaf-spots and a velvet-like blackening of the culms and glumes. Cultures of the fungus were isolated from different parts of the plant and were grown in rice agar and other culture media, the writers observing particularly the mode of anchorage of the germ tube, the formation of the appressoria, the penetration of the host epidermis, and the effect of the advancing mycelium on the host cells. Penetration may take place either through open stomata or by breaking through the epidermal cells by means of appressoria. Infection hyphae are formed at the tips of the germ tubes. The minimum temperature for the germination of conidia is 2°C. and the maximum 41°C.; the optimum for both germination and mycelial growth is 25-30°C.—Extensive experiments were also conducted to test the germicidal effect of various chemicals on the conidia, mercuric chloride, silver nitrate, copper sulphate, calcium hypochloride, formaldehyde, and phenol proving highly effective. Disinfection of seed with one of these is suggested as a means of control. The taxonomy of the fungus is discussed and a bibliography is given.—*Margoret Buwens.*

5126. REMY, TH., and J. VASTERS. Untersuchungen über die Wirkung von Chlorphenol-Quecksilber, Sublimat und einigen anderen Pflanzenschutz- und Desinfektionsmitteln. [Studies on the action of mercury-chlorphenol, sublimate, and several other substances used for plant protection and disinfection.] Landw. Jahrb. 58: 379-480. Fig. 21-25, 37 tables. 1923.—A detailed study is made of chlorphenol-mercury compound and other disinfectants, including formaldehyde, mercuric chloride, and copper sulphate, for seed treatment against rust and smut spores and against other fungus diseases. A 0.5:1000 concentration of chlorphenol-mercury was sufficient against a moderate infection of wheat with rust, but in the case of strong infection a concentration of 1.5-2.0:1000 was required. Mere moistening of seed with this solution was insufficient for protection. A 0.5:1000 solution proved very efficient against *Fusarium*. The action of the disinfectant against *Gloeosporium lindemuthianum* and *Ascochyta Pisi* proved of doubtful value. The disinfectant compares favorably with formaldehyde, mercuric chloride, and copper sulphate in its influence on seed germination.—*S. A. Waksman.*

DISEASES CAUSED BY BACTERIA

5127. JOHNSON, JAMES. A bacterial leafspot of tobacco. Jour. Agric. Res. 23: 481-493. Pl. 1-4. 1923.—Leaves of tobacco [*Nicotiana tabacum*] of any age may be affected but lesions occur more commonly on the lower ones. The lesions are circular to oblong and vary from 1 mm. to 1 cm. in diameter except through coalescence. The young lesions usually are surrounded by a chlorotic halo.—The bacterial diseases wildfire and angular leafspot have been studied in comparison but "Wisconsin bacterial leafspot" is found to be different. The causal organism is named *Bacterium melleum* n. sp. Its morphological and cultural characters are described in detail, and its group number, according to the system formerly recommended by the American Society of Bacteriologists, is given as 221.3333633.—Infection has been secured artificially only through needle punctures and it is concluded from this and from cultural studies that the organism is not a vigorous parasite but is rather one requiring special conditions for natural infection. High humidity and possibly fairly high temperature are required for infection but these requirements in themselves are not sufficient to insure infection.—Test plats treated with barnyard manure showed 45 per cent diseased plants as compared with 10 per cent on chemically manured plats, thus indicating a predisposing factor that affects occurrence and prevalence.—*D. Reddick.*

5128. KENDALL, ARTHUR ISAAC. Bacterial parasitism, bacterial pathogenism, and resistance to bacterial infection. Jour. Infect. Diseases 32: 341-354. 1923.—Ehrlich's humoral theory and Metchnikoff's cellular theory of immunity are discussed. The differences between the 2 theories are indicated and their relationships respectively to pathogenic and parasitic organisms are pointed out. The author compares the life cycles of these 2 groups of organisms with respect to their host, man.—*R. L. Starkey.*

DISEASES CAUSED BY ANIMAL PARASITES (INSECTS, NEMAS, PROTOZOANS, ETC.)

5129. FERRIÈRE, CH[ARLES]. *Entomologie économique. Les problèmes modernes de la lutte contre les insectes et leur application en Suisse.* [Economic entomology. Modern problems of insect control and their application in Switzerland.] 36 p. Ernest Bircher: Berne, 1922.—This paper includes a discussion of agricultural, horticultural, forest, veterinary and medical, industrial and commercial entomology; entomology and the public economy; and entomology in Switzerland.—A bibliography of 2 pages is appended.—*Frederick V. Rand.*

5130. JORDAN, K. H. C. *Die tierischen Schädlinge des Gemüse-, Obst- und Blumengartens und ihre Bekämpfung. Ein Lehrbuch für alle Gartenfreunde.* [The animal enemies of the vegetable, orchard, and flower garden. A handbook for all garden lovers.] xii + 266 p., 88 fig. Oskar Leiner: Leipzig, 1922.—This is a popular handbook discussing, under host groups and specific hosts, the animal parasites of plants.—*Frederick V. Rand.*

5131. NIESCHULZ, OTTO. *Unsere bisherigen Kenntnisse von der Flagellatenkrankheit der Pflanzen.* [Our present knowledge of the flagellate disease of plants.] *Zeitschr. Pflanzenkrankh.* 32: 102-108. 3 fig. 1922.—This recapitulation of present knowledge of flagellates causing plant disease deals mainly with those found in the latex of Euphorbiaceae. Useful literature references are appended.—*H. T. Güssow.*

INFECTIOUS CHLOROSES (MOSAIC AND PEACH YELLOWS GROUPS, ETC.)

5132. DOOLITTLE, S. P., and M. N. WALKER. *Cross-inoculation studies with cucurbit mosaic.* *Science* 57: 477. 1923.—In addition to nearly all members of the Cucurbitaceae, the following species have been proved susceptible to this disease: *Martynia louisiana*, *Capiscum annuum* (pepper), *Asclepias syriaca*, *Phytolacca decandra*, *Amaranthus retroflexus*, *Physalis* sp., potato, and tobacco.—*C. J. Lyon.*

5133. GAGET, J. *La dégénérescence des pommes de terre.* [Degeneration of the potato.] *Jour. Agric. Pratique* 35: 316-318. 1921.—The author writes of the connection of aphids with diseases of degeneration such as leaf roll and mosaic and of the difficulty of aphid elimination, and notes the presence of eggs on such diseased tubers, which carry insects through the winter. He asks for a remedy in which seed tubers may be immersed to kill aphid eggs.—*J. P. Kelly.*

DISEASES OF UNKNOWN CAUSE

5134. HINTIKKA, T. J. *Die "Wisa"—Krankheit der Birken in Finnland.* [The "Wisa" disease of birches in Finland.] *Zeitschr. Pflanzenkrankh.* 32: 193-210. 1922.—"Wisa" wood obtained from "Wisa" birches is a wood of abnormally wavy or undulating grain similar to what is known in America as birds' eye wood, or resembling structures such as are found in burls, burl being perhaps the most suitable interpretation of the term "Wisa." Such wood is used in cabinet making.—The author has investigated claims that this abnormality is brought about by fungi, and is of the opinion that the phenomenon is not of parasitic origin, but due to external, climatic, or soil conditions. The changes in structure are said to be caused by an internal gummosis, in which neither cell walls nor contents are dissolved.—*H. T. Güssow.*

5135. KEUCHENIUS, P. E. *Kringrot, een nieuwe Ziekte van Hevea.* [Ringrot, a new disease of Hevea.] *Arch. Rubbercult.* 4: 495-496. 1920.—The disease is common in Sumatra and affects only the outer portion of the bark, which in late stages of the disease dries up and scales off in concentric rings. The cause of the disease is unknown. It may be cured by scraping away the diseased bark, but trees sometimes recover without treatment.—*C. D. LaRue.*

GENERAL AND MISCELLANEOUS PATHOLOGICAL LITERATURE

5136. ANONYMOUS. [Rev. of: NICOLLE, M., et J. MAGRON. *Les maladies parasitaires des plantes (infestation-infection)*. [Parasitic diseases of plants.] 199 p. Masson et Cie: Paris, 1922 (see Bot. Absts. 11, entry 4544).] *Nature* 111: 77. 1923.—This book is prepared chiefly for the medical profession and deals with insect as well as fungus infection. No illustrations are given.—O. A. Stevens.

5137. BERTHELOT, ALBERT, et OSSART. *Sur la pureté des tyrosines commerciales*. [The purity of commercial tyrosins.] *Bull. Soc. Chim. Biol.* 3: 247. 1921.—Examination of 6 samples of commercial tyrosin showed that 2 samples gave a strong biuret reaction and contained large amounts of cystine; a 3rd contained sufficient Ba to completely prevent the development of *Bacillus aminophilus*; and a 4th was merely the crude residue remaining from the manufacture of pancreatic peptone, containing only 20 per cent tyrosin. Only 2 were pure tyrosin (99.7 per cent). The authors emphasize the necessity for chemical and biological examination of commercial tyrosins which are to be employed in bacteriological work.—Joseph S. Caldwell.

5138. BRITTON, W. E., and G. P. CLINTON. *Spray calendar*. Connecticut [New Haven] Agric. Exp. Sta. Bull. 244. 183-226. 1923.—Formulae for 14 insecticidal and 12 fungicidal preparations are given.—A catalogue of the common cultivated plants gives a brief description of the insects and fungi that injure the plant together with the methods of combating the injury. Lists of manufacturers and dealers in spraying machines, insecticides and fungicides are given.—Henry Dorsey.

5139. CARBONE, DOMENICO. *Studi sulle reazioni immunitarie delle piante*. 1. *Introduzione*. [Immune reactions in plants. Introduction.] *Boll. Ist. Sieroterap. Milanese* 2: 261-265. 1922.—It is doubtful whether in green plants a condition of immunity is developed following infection; different investigators have obtained contradictory results. It is still more doubtful whether green plants are capable of opposing to the action of microorganisms proteins with immunizing reactions comparable to those of animals. It is possible that actions of this nature may be simulated or masked by non-specific reactions.—Lillian C. Cash.

5140. CARBONE, DOMENICO, e ITALO CORTESE VIGLIANO. *Studi sulle reazioni immunitarie delle piante*. 2. *Sulle presenza nelle piante di sostanze agglutinanti, precipitanti, emolizzanti ed antiemolitiche*. [The presence in plants of agglutinating, precipitating, hemolytic and antihemolytic substances.] *Boll. Ist. Sieroterap. Milanese* 2: 267-274. 1922.—Some plant saps have been studied to determine their ability to agglutinate microorganisms, and the following have given positive results for some microorganisms: *Armillaria mellea*, lemon fruit, onion bulb, root of *Stachys* and of carrot, cabbage leaves, spinach, celery, goat's-beard, and cladodes of *Opuntia*. The lemon fruit, cladodes of *Opuntia*, celery leaves, and onion bulbs caused a precipitate in horse serum. *Armillaria mellea* was found to possess a hemolytic action on red blood corpuscles of sheep. Lemon fruit, leaves of endive, spinach, chicory, cladodes of *Opuntia*, roots of *Stachys*, and potato tubers had an antihemolytic action. Lemon fruit, leaves of endive, spinach, chicory, cabbage, egg-plant, cauliflower, potato tubers, and onion bulbs agglutinated the red blood corpuscles of sheep.—The degree of agglutinating action differed in the same plant for different bacterial species. Probably there are agglutinating principles filterable through paper but not through clay filters.—The hemolyzing principle of *Armillaria mellea* and the hemagglutinating and antihemolytic principles of potato are not affected by boiling, the latter is active at 37°C. but not at 13-15°C. The hemagglutinating principle of endive is filterable through a clay filter, the antihemolytic principle is not; both can be filtered through paper.—The above described reactions can all be simulated or masked in some plants; but it is always possible and even easy to select plants and antigens in which the reciprocal action is such that the tests are free from the causes of error, which up to the present have vitiated the results of experiments on the immunizing reactions of plants.—These tests were made upon bulbs and young spring shoots. The authors propose to repeat the work using mature plants.—Lillian C. Cash.

5141. EWING, JAMES. *Neoplastic diseases. A treatise on tumors.* 1054 p., 514 fig. W. B. Saunders: Philadelphia & London, 1922.

5142. KONING, M. DE. *Boschbescherming. De leer der ziekten en beschadigen onzer Nederlandsche bosschen.* [Forest protection. Diseases and injuries in Dutch forests.] xiv + 567 p., 385 fig. (5 unnumbered). W. H. Thieme & Cie: Zutphen, 1922.—After a discussion of the question: "What is forest protection?," the author gives a review of the history of plant pathology, laws relative to plant pathology, etc., in the Netherlands, with special reference to forest protection.—The book may be divided into 4 principal parts, treating the followingsubjects: (1) troubles caused by weather conditions, as cold, heat, precipitation, wind, storm, and lightning, each of which is treated and illustrated in detail; (2) troubles caused by environment, e.g., conditions of soil, air, and light; (3) troubles caused by plants, e. g., weeds, algae, and fungi. The latter are treated in considerable detail. In each case the common and scientific names of the fungus are given, followed by a clear semipopular description, with a discussion of control; (4) troubles caused by animals, the latter being divided according to the usual classification. Each animal and the damage it causes are described; likewise, means of control and prevention. The insects are treated extensively. The last 2 chapters discuss the injuries caused by man and by unknown causes.—An index concludes the book.—*Peter J. Klaphaak.*

5143. SCHMIDT, E. W. *Ueber die Voraussetzungen zu einer erfolgreichen Bekämpfung von Pflanzenkrankheiten.* [The requirements for a successful control of plant diseases.] *Zeitschr. Pflanzenkrankh.* 32:293-303. 1922.—The author concludes his discussion of prophylaxis and therapy of disease with the following essential points: (1) the use of really suitable chemical substances, and, if possible, specifics against the respective diseases; (2) intensive treatment with sufficient quantities of the efficient composition of the specific used; (3) use at the most opportune period, i. e., (a) under suitable weather conditions (b) (as far as this refers to the respective causal agents) at the correct biological moment.—*H. J. Güssow.*

5144. WELLS, B. W. *Fundamental classification of galls.* *Science* 57: 469-470. 1923.—The author objects to Cook's statements [see *Bot. Absts.* 12, Entry 3452] as to the classification of galls made by Küster. The latter did not classify galls on the basis of the presence or absence of cell differentiation.—*C. J. Lyon.*

PHARMACEUTICAL BOTANY AND PHARMACOGNOSY

HEBER W. YOUNGKEN, *Editor*

E. N. GATHERCOAL, *Assistant Editor*

(See also in this issue Entries 4768, 4771, 4802, 5190)

5145. BALLARD, C. W. *Histology of Cocillana and substitute barks.* *Jour. Amer. Pharm. Assoc.* 11: 781-787. Fig. 1-4. 1922.—Macroscopical and microscopical descriptions are given of 4 samples of Cocillana: (1) the genuine Cocillana, *Guarea Rusbyi*; (2) substitute Cocillana, *G. Bangii*; (3) substitute Cocillana, *Guarea* sp.; (4) substitute Cocillana, *Nectandra* sp. The descriptions are supplemented with drawings of their respective transverse sections and powdered samples. *Guarea Bangii* resembles true Cocillana more closely than the other 2 substitutes, but differs from it sufficiently to render its identification simple. The other 2 substitutes differ greatly from the genuine Cocillana in appearance and physical characters.—*Anton Hogstad, Jr.*

5146. BLACK, O. F., J. W. KELLY, and W. W. STOCKBERGER. *A chemical examination of Venezuelan jaborandi.* *Amer. Jour. Pharm.* 95: 4-7. 1923.—The authors report 0.04 per cent of alkaloid in the leaves of Venezuelan jaborandi which responds to tests for pilocarpine. This plant, which is locally known as "borrachera" on account of the intoxicating effect of

its leaves upon animals, was provisionally named by Ernst in 1883 *Pilocarpus heterophyllus* A. Gray, a species discovered about 1857 by Wright in Cuba. The plant grows in dry hot localities in the vicinity of Barquisimeto.—*Anton Hodstad, Jr.*

5147. BOURQUELOT, EM. *Les principes actifs de quelques plantes employées en médecine populaire; leur recherche par la méthode biochimique.* [The active principles of certain plants employed in popular medicine; their study by biochemical methods.] Bull. Soc. Chim. Biol. 3: 71-84. 1921.—In this posthumous paper the author describes his method of detection and isolation from plant material used in popular medicine of glucosides hydrolyzable by emulsin and summarizes previously published results of its use. *Sambucus nigra* is employed in popular medicine, the bark as a diuretic and purgative and the infusion of the flowers in the treatment of angina and pulmonary catarrh. All parts contain a cyanogenetic glucoside, sambunigrin, hydrolyzed by emulsin to glucose, benzaldehyde, and hydrocyanic acid. Leaves and bark contain large amounts of potassium nitrate, which explains their diuretic properties. Leaves of *Prunus Laurocerasus* contain prulaurasin, an isomer of sambunigrin. Bark and shoots of *P. padus* contain a second isomer, glucoprunasin or amygdonitrile-glucoside. *Plantago major*, *P. media*, and *P. lanceolata* were recommended by Galen as a cure for dysentery and the crushed leaves are popularly used as poultices for bee and wasp stings. The leaves contain aucubin, as do the seed of *Aucuba japonica*, which is hydrolyzed by emulsin to glucose and aucubigenine and which is without physiological effect. The leaves of *Tarus baccata*, reported to be poisonous, contain taxicatin, hydrolyzed by emulsin to glucose and a phenol. Its physiological effects have not been investigated. *Verbena officinalis*, formerly regarded as an universal panacea and still employed as a cataplasm for contusions and in pleurisy, contains verbenalin, hydrolyzed by emulsin to glucose and a phenol which oxidizes to a yellowish brown color. It is without physiological effect. *Olea europaea* contains in stems, leaves, and fruit an amorphous bitter glucoside, oleuropein, which progressively decreases in amount as the fruits mature and is entirely removed by the treatment given them in preparing them for food. Leaves and young fruits have been used in lieu of quinine as an astringent tonic and in intermittent fevers. *Erythraea Centaurium* has a place in almost all European pharmacopoeias, the flowering shoots having long been employed as a tonic and febrifuge. The glucoside present is erytaurin; its physiological effects have not been studied. *Menyanthes trifoliata*, popularly used as a tonic, febrifuge, antiscorbutic, emmenagogue, and vermifuge, contains menyanthin, isolated by Kromayer, and meliatin, neither of which has been studied as to physiological effects. *Hepatica triloba* contains hepatrilobin. *Scabiosa succisa*, employed as a sudorific, detergent, depurative, and as a wash in leprosy and skin diseases, contains scabiosin. Other glucosides isolated in the same laboratory from plants which are not used in medicine are jasmiflorin from *Jasminum nudiflorum*, bakankosin from *Strychnos* seed, arbutin from many varieties of pear, and loroglossin from *Loroglossum hircinum* and other indigenous orchids. In Bourquelot's laboratory 281 species have been examined for the presence of glucosides, with positive results in 205; from 56 of these the glucoside has been isolated. Among plants popularly employed in medicine and included in many pharmacopoeias and which are known to contain glucosides not yet isolated and studied are *Vincetoxicum officinale*, *Sambucus Ebulus*, employed in gout and rheumatism. *Lonicera periclymenum*, used in coughs, *Ajuga Chamaepitys*, an aperient and vulnerary, *Teucrium montanum*, used in insect stings, *Anthyllis vulneraria* and *Melilotus officinalis*, employed as resolutive, *Ononis spinosa*, diuretic, *Aquilegia vulgaris*, antiscorbutic, *Helleborus foetidus*, vermifuge, *Ranunculus bulbosus* and *R. repens*, as external caustics, *Asperula odorata*, *Veronica chamaedrys*, and *V. officinalis*, as tonics and vulneraries, and *Scrophularia nodosa*, as a resolute.—*Joseph S. Caldwell.*

5148. BOURQUELOT, EM., et M. BRIDEL. *Sur un nouveau glucoside hydrolysable par l'émulsi-ne; la scabiosine.* [On scabiosine, a new glucoside hydrolyzable by emulsin.] Bull. Soc. Chim. Biol. 2: 119-124. 1920.—*Scabiosa Succisa* (Dipsaceae) is widely employed in popular medicine in France in lung and skin diseases and especially in itch. The root contains a laevorotatory glucoside (named scabiosin) which is hydrolyzed by emulsin or by dilute sulphuric acid to glucose and an unidentified yellowish water-soluble body.—*Joseph S. Caldwell.*

5149. CHEN, K. K. **Phytochemical notes. No. 91. Cassia oils from leaves and twigs.** Jour. Amer. Pharm. Assoc. 12: 294-296. Pl. 1. 1923.—Three bales of leaves and 2 of twigs of *Cinnamomum cassia* Blume, imported from China, were subjected to distillation and cohobation. The 288 pounds of leaves yielded 658.7 gm. (0.52 per cent) of oil with a density of about 1.054 at 22°C. The 174 pounds of twigs yielded 715.5 gm. of oil (0.9 per cent) with a density of about 1.047.—Anton Hogstad, Jr.

5150. COUCH, JAMES F. **The toxic constituent of greasewood (*Sarcobatus vermiculatus*).** Amer. Jour. Pharm. 94: 631-641. 1922.—Chemical examination revealed large amounts of sodium and potassium oxalates, these being responsible for cases of range poisoning. Toxic alkaloids, glucosides, saponins, hydrocyanic acid or its compounds were not found. The material examined was collected near Salina, Utah.—Anton Hogstad, Jr.

5151. DOWZARD, EDWIN. **Note on the toxicity of castor seed.** Jour. Amer. Pharm. Assoc. 12: 116-117. 1923.—In experiments with guinea pigs the author finds the toxicity to be about 0.179 gm. per kgm. of guinea pig. In the same proportions about 12.2 g. of castor seed would prove fatal to a man weighing 150 pounds.—Anton Hogstad, Jr.

5152. GERLACH. **Zur Lupinenentbitterung. [On removing the bitter principle from lupines.]** Mitteil. Deutsch. Landw. Ges. 38: 220. 1923.—This note gives the loss of protein resulting from 2 methods of treating lupine seed to remove the bitter principle. When first treated with cold water the loss of crude protein was 28.2 per cent; when treated with boiling water, 18.2 per cent.—A. J. Pieters.

5153. GORIS, A. **Sur les constituants des essences de primevère. [The constituents of *Primula* essence.]** Bull. Soc. Chim. Biol. 1: 163-170. 1919.—The roots of *Primula officinalis* Jacq. contain 2 glucosides, primeverin and primulaverin, the composition and structural formulae of which have been determined. The essence of *Primula* obtained by distillation of the roots consists of a solid methyl ester of β -methoxyresorcylic acid derived from primeverin and a liquid methyl ester of metamethoxysalicylic acid derived from primulaverin. The glucosides are not split by emulsin, invertin, or yeast extract, but are hydrolyzed by an enzyme contained in the sepals of this and other species of *Primula*, and which may be identical with betulase and gaultherase since it also hydrolyzes the glucosides of *Monotropa*, *Betula*, and *Gaultheria*. Hydrolysis of primeverin and primulaverin by the enzyme yields a new disaccharide, primeverose, made up of 1 molecule each of glucose and xylose.—Joseph S. Caldwell.

5154. HART, FANCHON. **The histology of Vilca bark.** Jour. Amer. Pharm. Assoc. 11: 906-909. Fig. 1-3. 1922.—The author presents a gross and a histological description of the bark of *Piptadenia macrocarpa* from South America with drawings of the cellular elements and contents. The bark contains a large percentage of tannin, calcium oxalate, and resin. It has been used for tanning and for the fermentation of cane juice. Rusby encountered the trees on the central slopes of the eastern Bolivian Andes at an elevation of 3000-5000 feet. The usual height of the tree is 40-80 feet, and the trunk diameter 1-2 feet. It is instantly recognized by its conspicuous warty bark.—Anton Hogstad, Jr.

5155. HUERRE, R. **Action des hydracides sur l'essence de *Juniperus oxycedrus*. Chlorhydrate, bromhydrate, iodhydrate de cadinine. [Action of hydracids on the essence of *Juniperus oxycedrus*. Hydrochloride, hydrobromide and hydriodide of cadinine.]** Bull. Soc. Chim. Biol. 2: 239-246. 1920.—The essence obtained by distillation of the wood with water, when treated with gaseous HCl, HBr, or HI in the usual way, yields hydrochloride, hydrobromide, or hydriodide of l-cadinine identical with those obtained from the officinal oil of cade. The amount of l-cadinine present in the essence is between 21 and 30.6 per cent.—Joseph S. Caldwell.

5156. MASUCCI, PETER, and GEORGE A. SLOTHOWER. **Some physical and chemical properties of Neorobin.** Jour. Amer. Pharm. Assoc. 12: 335-338. 1923.—Neorobin, a derivative of

chrysarobin made by dissolving chrysarobin in glacial acetic acid and subsequently reducing with metallic tin, was found to be 50 per cent more active than chrysarobin, using the reduction of ammoniacal silver nitrate as a criterion of reducing power. Therefore it should be at least 50 per cent more active therapeutically. Neorobin may be differentiated from chrysarobin by dissolving in acetone, the former producing a golden yellow, the latter a dark red solution. Neorobin was found to be neither a tin compound nor a complex acetate.—*Anton Hogstad, Jr.*

5157. MUNESADA, T. Über den Farbstoff der Frucht von *Gardenia florida* L. (Gelbschote). [The pigment in the fruit of *Gardenia florida*.] Ber. Ohara Inst. Landw. Forsch. 2: 219-223. 1922.—From a study of the physical and chemical properties of the substance, the author believes it to be crocin.—*Margaret Buwens.*

5158. RIPERT, JEAN. Sur la variation et le rôle des alcaloides de la belladonna. [On the variation and rôle of belladonna alkaloids.] 152 p., 20 pl. Oberthür: Rennes, 1922.

5159. RUSBY, H. H. Some interesting medicinal plants of Bolivia. Jour. Amer. Pharm. Assoc. 11: 775-781. 1922.—The introduction, dealing with the history of coto and para coto barks, is followed by the author's findings concerning these barks on his recent trip to South America. Several barks were collected; "Coto Piquante" or "Coto Fino" appears to be the genuine coto, which the author has named with some slight admission of doubt *Nectandra coto*, and the spurious one *Ocotea pseudo-coto* [see Bot. Absts. 12, Entry 2215]. The real para coto was not found. O. E. WHITE submits with the article an account of the discovery of these trees.—The 2nd part deals with Cocillana or Guapi bark and its substitutes, the history of which is reviewed. Four specimens are considered: (1) Guapi or Cocillana "A," the original and genuine article, *Guarea Rusbyi*; (2) Guapi or Cocillana "B," the spurious article that has occurred in commerce, *Guarea Bangii*, a new species [see Bot. Absts. 12, Entry 2215]; (3) Guapi or Cocillana "C," also spurious, pertaining to a large tree of the laurel family, probably a species of *Nectandra*; (4) Guapi or Cocillana "D" also spurious, and pertaining to an undetermined species of *Guarea*.—*Anton Hogstad, Jr.*

5160. SCHEPPEGRELL, WILLIAM. Hayfever and asthma. 274. p., 1 colored pl., 107. fig. Les & Febiger: Philadelphia, 1922.—Hayfever is caused by the pollen of certain common anemophilous plants. Among the common hayfever plants of the eastern and southern U. S. A. may be mentioned *Ambrosia elatior*, *A. trifida*, *A. psilostachya*, *Xanthium americanum*, *Salsola pestifer*, various oaks, *Juglans nigra*, *Salix*, the Gramineae, etc. From the Pacific and Rocky Mountain States, the Artemisias (*A. heterophylla*, *A. tridentata*, etc.) give the most severe reactions. Contrary to an old belief *Solidago*, although its pollen gives a positive reaction, is not a cause of hayfever since it is not wind-borne. To establish the responsibility of a plant for hayfever, botanical and biological tests are required. Among the subjects considered are the history and prevalence of hayfever, the forms and chemical composition of pollen, principal hayfever plants in the U. S. A., common plants not responsible for hayfever, anatomy and physiology of the nose, diagnostic tests of hayfever, hayfever seasons, atmospheric conditions, etiology, classification of many hayfever plants into 4 great groups (Ambrosiaceae, Gramineae, Chenopodiaceae, and the Artemisia group), a list of the plants tested for hayfever reactions at the laboratory of the American Hayfever Prevention Association, with results, prevention of hayfever, treatment, immunization, and hayfever resorts.—*H. W. Youngken.*

5161. SCHWARZ, L. J. A brief review of the crude drugs entered at the port of New York during the part year. Jour. Amer. Pharm. Assoc. 12: 200-204. 1923.—This report from the Pharmacognosy Laboratory in the New York Station of the U. S. Bureau of Chemistry reviews the examination of approximately 3,500 shipments of crude drugs. Detention action was recommended on 210 shipments. Contrary to the common belief that the importations were of unusually poor grade, there was an improvement in the quality of crude drugs imported during the past few years. Individual shipments are discussed.—*Anton Hogstad, Jr.*

5162. SEIL, HARVEY A. **Composition of *Nectandra coto* Rusby sp. nov. Preliminary report.** Jour. Amer. Pharm. Assoc. 11: 904-906. 1922.—The sample was collected by Rusby in South America. The cotoin separated and purified melted at 127-128°C. (uncorrected); gave a brown-black coloration with ferric chloride; and, dissolved in glacial acetic acid to which a few drops of concentrated nitric acid are added, gave a blood-red color. Therefore *Nectandra Coto* is a true coto. Two new alkaloids were found, parostemine, a non-phenolic alkaloid, and parosteminine, a phenolic alkaloid, both names being derived from *Parostema*, the sub-genus of *Nectandra* to which coto belongs. Ether extract 24.83 per cent; volatile oil 1.89 per cent; and ash 1.67 per cent.—*Anton Hogstad, Jr.*

5163. STOCKBERGER, W. W. **Status of drug-plant growing in the United States in 1921.** Jour. Amer. Pharm. Assoc. 12: 120-122. 1923.—The year 1921 brought to a close the cultivation of many medicinal plants in America, which had had considerable success during the war years. A sharp decline was met in the case of *Cannabis*, although a small amount (some 25 acres) was under cultivation during this time. Cultivation of sage almost reached the vanishing point because the home-grown material did not fall within the limits for total and acid-insoluble ash. The exported crop of ginseng was valued at \$974,097, representing about 157,351 pounds of both wild and cultivated roots. Twenty-six educational institutions maintained drug gardens, one of them devoting considerable study to poisonous plants, another to the biochemistry of the mints.—*Anton Hogstad, Jr.*

5164. WHERRY, EDGAR T., and GEORGE L. KEENAN. **Occurrence and forms of calcium oxalate crystals in official crude drugs.** Jour. Amer. Pharm. Assoc. 12: 301-318. Fig. 1-2. 1923.—The authors seek to (1) ascertain whether the crystals in every case possess the optical properties of ordinary (monohydrate) calcium oxalate; (2) identify any having different properties and to work out the crystallographic orientation of each type of calcium oxalate crystal represented. The technical crystallographic data have been reviewed by WHERRY, E. T., Jour. Washington [D.C.] Acad. Sci. 12: 196-200. 1922.—Various forms are reported besides monohydrate calcium oxalate, viz., tetragonal calcium oxalate, monohydrate magnesium oxalate, and potassium hydrogen oxalate. In a few drugs, e.g., *agaricus*, *belladonna*, *myristica*, crystals with properties unlike those of any thus far described were observed; the nature of these has not been determined.—The powdered samples were examined by the immersion method, the liquid used consisting of monobromnaphthalene to which a very little monochloronaphthalene was added, the mixture having a refractive index of 1.650.—*Anton Hogstad, Jr.*

5165. WIRTH, ELMER H. **Pharmacognosy, today and tomorrow.** Editorial. Jour. Amer. Pharm. Assoc. 12: 196-197. 1923.—The author emphasizes that the pharmacognostic field is being rapidly invaded by the chemist through microchemistry, which should rightly belong to the pharmacognocist, and sounds the warning that if pharmacognosy is to be preserved more attention will have to be given to the chemistry of drugs.—*Anton Hogstad, Jr.*

5166. YOUNGKEN, H. W. **A review of the literature in pharmaceutical botany and pharmacognosy for 1921-1922. (August 1, 1921-August 1, 1922).** Jour. Amer. Pharm. Assoc. 12: 122-129. 1923.—The literature is divided into 7 sections: morphology, drug cultivation, micro-analytic and microchemic methods, drug adulteration and substitution, plant chemistry, ash determination, and history. References are made to some 200 articles.—*Anton Hogstad, Jr.*

(See also in this issue Entries 4734, 4735, 4745, 4748, 4765, 4808, 4813, 4814, 4815, 4823, 4827, 4836, 4843, 4857, 4954, 5008, 5026, 5030, 5032, 5033, 5039, 5065, 5076, 5083, 5084, 5086, 5087, 5100, 5122, 5126, 5128, 5137, 5139, 5147, 5148, 5152, 5153, 5155, 5157, 5164, 5258, 5260, 5265, 5267, 5269, 5270)

GENERAL

5167. CZAPEK, FRIEDRICH. *Biochemie der Pflanzen*. [Biochemistry of plants.] 2nd. ed. Vol. 2, *xii* + 541 p. 1920; Vol. 3, *ix* + 852 p. 1921. Gustav Fisher: Jena.—The first volume of the revised edition of this elaborate work was published in 1913, and contained a treatment of the special and general biochemistry of carbohydrates, fats, and fat-like substances, together with an account of the metabolism of these groups of constituents. Subsequent to the close of the war revision proceeded to the completion indicated, in 1920 and 1921. In revising volume 2 of the old edition the immense accumulation of new material necessitated an additional volume. The material in the present edition is distributed as follows: Volume 2 contains the account of proteins and protein metabolism in all groups of plants, this treatment occupying 321 pages. The remainder of the volume is devoted to the mineral constituents of plant organs and products (205 pages). Volume 3 is subdivided into 3 major parts devoted especially to biochemistry of dissimilation. The 1st is devoted to respiration phenomena, the 2nd to nitrogen-containing excrete products and by-products of metabolism, and the 3rd to the metabolism of nitrogen-free cyclic compounds. It will be seen that the topics just mentioned are relatively more completely elaborated than any other aspect of the work, although an immense amount of new material is incorporated under practically every section. The work is distinctively encyclopedic, though unfortunately conditions arising from the war have obviously made it impossible for the author to incorporate the results of a considerable amount of work done especially in England and America.—*B. M. Duggar*.

5168. FITTING, H. *Aufgaben und Ziele einer vergleichenden Physiologie auf geographischer Grundlage*. [Problems and aims of comparative physiology based on geography.] Address on becoming Rector of the University at Bonn on the Rhine, Germany. 42 p. Gustav Fischer: Jena, 1922.—The title of this address does not indicate what is especially emphasized, namely the knowledge on the part of the physiologist of what formerly was called physical geography, and that "typical" plants do not exist, but that, instead, each individual, or at least individual species, represents the resultant of inherited substance acted upon by environment. While the address resembles an essay in ecology, Fitting's physiological training and experience cause him to point out both the limitations of laboratory physiology and the inadequacy of climatology, soil science, and the other components of ecology, except as the painstaking student may determine the constituents of the actual immediate surroundings of the individual plant. Physiological analysis both of the individual plant and of the space which it occupies leads Fitting to discard the theory of bog-xerophytism, and to recognize that current explanatory hypotheses regarding salt plants, lime plants, and other special plants lack the support of experimental investigation. He commends American studies, particularly Cannon's, of the root systems of desert plants. He reports his own and the researches of others on the moisture content of the various layers of desert soils, and on the concentration of cell-sap, and shows that the concentration of the latter is ample to account for the absorption of water by desert plants. He asserts that cell-sap concentration, which is not always due to salt concentration, is invariably more or less proportional to the degree of dryness of the soil.—*George J. Peirce*.

5169. MOLISCH, HANS. *Mikrochemie der Pflanze*. [Microchemistry of plants.] 3rd ed., 438 p., 135 fig. Gustav Fisher: Jena, 1923.—The revised edition of this work is not signalized by any significant departures, but as contrasted with the 1st edition particularly there is a more extensive treatment of pigments of chromatophores, especially chlorophyll. Much of the more recent work on carotinoids is not included. In the group of anthocyanins the new data considered are almost exclusively German. Subsidiary recent work on chromogens is included in a few paragraphs. Otherwise, one notes few changes except in details of technique and in the inclusion of a few additional glucosides and alkaloids.—*B. M. Duggar*.

5170. WEISS, O. *Grundriss der Physiologie. Zweiter Teil. Biophysik*. [Outline of physiology. Part II, biophysics.] 454 p., 170 fig. Georg Thieme: Leipzig, 1919.—The first part of this work, by Carl Oppenheimer, was concerned with biochemistry [see Bot. Absts. 12, Entry 2721]. In the present volume, after a preliminary chapter of very general nature, the following topics are discussed: physiology of the nerves, movement, production of electricity, luminescence, special physiology of movement, physiology of the central nervous system, physiology of the sense organs, and a brief chapter on temperature and heat production in the body. Plant material is not discussed except incidentally.—*Grace E. Howard*.

DIFFUSION, PHYSICO-CHEMICAL PHENOMENA

5171. BIRCHUMSHAW, LOUIS LEIGHTON. The transition from the colloidal to the crystalloidal state. Solutions of potassium oleate. *Jour. Chem. Soc. [London]* 123: 91-97. 3 fig. 1923.—Although potassium oleate forms a colloidal solution in water, in alcohol it gives a non-associated and non-dissociated solution. A study was made of the behavior of potassium oleate in mixtures of alcohol and water, the density, viscosity, and surface tension being measured in a complete series from pure alcohol to pure water. Heretofore it has been assumed that the transition from colloid to crystalloid takes place gradually. "The experimental results suggest that there are 3 stages in the breaking down of the colloidal aggregate."—*F. E. Denny*.

5172. BROOKS, S. C. Conductivity as a measure of vitality and death. *Jour. Gen. Physiol.* 5: 365-381. Fig. 1. 1923.—The conductance of *Laminaria*, *Saccharomyces*, *Bacillus coli* and *B. butyricus*, *Chlorella*, and of red blood cells has been studied by the electrolytic method of the author and that of Osterhout. Both methods show that conductance of living tissue is closely proportionate to, and determined by, that of the surrounding fluid with which it is apparently in equilibrium. A quantity is defined which is independent of the conductivity of the fluid bathing the tissue. This is called the "net conductance."—*O. L. Inman*.

5173. HERBST, HEINRICH. Über die Adsorption durch Kohlenstoff. [On the adsorption by carbon.] *Biochem. Zeitschr.* 115: 204-219. 1921.—The writer draws the conclusion from his work that in order to know the adsorptive value of any carbon one should know 4 characteristics of it, namely, the purity, as the activity increases with increase in purity; the porosity, upon which the rate of adsorption depends; the ultraporosity loss, dependent upon the size of molecules being adsorbed, to which loss the apparent activity is related; and graphitization, by which is meant that when amorphous carbon is heated to 1200°C. it changes to graphite and its adsorbing power is greatly reduced. In explanation it may be said that the writer speaks of the "true" activity of a carbon as the activity shown in the adsorption of gases of small molecules as N₂, H₂, and CO₂; the "apparent" activity as that shown with larger molecules, and the difference between them he calls the ultraporosity loss. This loss increases as the size of the adsorbed molecules increases. By ultraporosity he means the spaces between the molecules of the adsorbent. If large molecules are being adsorbed the surfaces between the ultimate carbon molecules are not being utilized and the adsorbing surface is reduced with a consequent reduction.—*F. G. Gustafson*.

5174. KELLER, RUDOLF. Dielektrizitätskonstanten biochemischer Stoffe. [Dielectric constants of biochemical substances.] *Biochem. Zeitschr.* 115: 134-158. 1921.—The author presents arguments in favor of his view that the behavior of most substances of biochemical importance is determined by their dielectric constants, which in turn determine the sign of their charges against water or other biochemical substances. Ionic reactions among molecules of small dimensions and among aggregates of such molecules may be important, but the author considers that disparity in size precludes ionic reactions between molecules of substances such as proteins among themselves or with typical crystalloids; the theory of H-ion concentrations is particularly attacked as being entirely unfounded and misleading. Isoelectric points are stated to be governed by surface potential differences which follow Coehn's Law. The chemical nature of dyes is supposed to have little effect on their staining reactions, which are determined by dielectrically produced charges.—On the basis of the author's theory, movement of water in tissues should be from "anodic" towards "cathodic" regions: secreting organs, e.g., sweat glands, stomach epithelium, kidney glomeruli, and plant leaves are anodic, the exceptions being pancreas and salivary glands, yielding alkaline fluids; while absorbing organs are cathodic, e.g., intestinal epithelium, convoluted tubules of the kidney, roots. Fats do not behave in the intestine as predicted.—Dielectric constants of 18 substances including carbohydrates, proteins, lipoids, dyes, serum, etc., are given, but are shown not to furnish conclusive evidence as to the reactions of these substances in living matter.—*S. C. Brooks.*

WATER RELATIONS

5175. BOBILIOFF, W. Onderzoekingen over de transpiratie van *Hevea brasiliensis*. [The transpiration of *Hevea brasiliensis*.] *Arch. Rubbercult.* 4: 498-531. 1920.—Many hydathodes which give off water at night are present on the lower side of the leaves of *Hevea*. Light is the chief factor influencing transpiration and there is almost no transpiration at night. Temperature has more effect on transpiration at low temperatures than at higher ones. The effect of humidity on transpiration is slight. In direct sunlight, rapid transpiration takes place even in a very humid atmosphere. Wind is a factor of great importance. When leaves are wet some water may be absorbed by them. Leaves which become dry after having been wet show a pronounced increase in transpiration rate. The stomata open in light and close in darkness. Transpiration is one of the chief factors influencing yield of latex.—*C. D. LaRue.*

5176. BOSE, J. C. The physiology of the ascent of sap. 277 p., 98 fig. Longmans, Green and Co.: London. 1923.—The object of this work is an attempt to formulate upon experimental evidence a comprehensive theory for the ascent of sap. Various present-day theories are given and each one shown to be lacking in some important detail.—Several appliances of great sensitiveness are described for the purpose of making measurements of the change in the rate of the ascent of sap caused by some physiological variation. For example, responsive movements induced by the ascent of sap are recorded by an apparatus in which the indicating leaf is attached by a thread to a magnifying lever made of fine glass fiber. The lever itself is mounted on jewel bearings. Interesting methods are given for the determination of transpiration rates.—These investigations lead the author to conclude that the ascent of sap is due to the pulsatory activity of definite layers of cells in all parts of the body of the plant, the exact positions of which have been located in 3 regions, namely, the absorbing root, the conducting stem, and the excreting leaf.—*Grace E. Howard.*

5177. HARLAN, HARRY V., and MERRETT N. POPE. Water content of barley kernels during growth and maturation. *Jour. Agric. Res.* 23: 333-360. 1923.—A complete daily record of dry weight and percentage of water in individual kernels of barley [*Hordeum*], varieties Jet and Baku, from flowering to maturity is presented in graphs, tables, and frequency tables.—Immediately following flowering, the kernels show almost identical water content for any 1 day and almost identical daily increase in water content for many days. The range is from about 80 per cent to about 42 per cent. When the latter stage is reached no further deposition of starch occurs and the kernels dry very rapidly.—In Jet, a black pigment develops as deposition of starch ceases so that the progress of ripening is evident.—*D. Reddick.*

5178. POOL, RAYMOND J. *Loftfield on stomata*. [Rev. of: LOFTFIELD, J. V. G. *The behavior of stomata*. Carnegie Inst. Washington Publ. 314. 104 p., 16 pl., 54 fig. 1921 (see Bot. Absts. 11, Entry 1903).] *Science* 57: 418-420. 1923.

MINERAL NUTRIENTS AND SALT RELATIONS

5179. BAKKE, A. L., and L. W. ERDMAN. *A comparative study of sand and solution cultures of Marquis wheat*. *Amer. Jour. Bot.* 10: 18-31. 1 fig. 1923.—A comparison is made of the growth of Marquis wheat in sand cultures and in water cultures, when supplied with Solution III of the National Research Council series; and a determination of the best proportion of the salts KNO_3 , $\text{Ca}(\text{H}_2\text{PO}_4)$, and MgSO_4 . Shive's solution IR_5C_2 was used as a control. The total absorption, the growth of roots and tops, and the change in the H-ion concentration of the media after a $3\frac{1}{2}$ -day period of plant growth therein were recorded. The solutions giving the highest yield in sand were found to be quite different in their salt proportions from those giving the highest yield in water culture. The highest yield in both cases was markedly superior to Shive's R_5C_2 solution. The highest amount of absorption and the maximum green and dry weight of tops occurred in water culture, but the greatest root development in sand. In general, those cultures having the greatest transpiration for the entire growth period also showed the greatest dry weight of tops and of roots. The reaction of the medium in which the plants were grown changed from an average acidity of pH 3.75 before growing the cultures to one of pH 5.94 (for water cultures) and of pH 6.66 (for sand cultures), after growing the plants for one $3\frac{1}{2}$ -day period. No correlation could be shown between the total yield of cultures and their corresponding H-ion concentrations.—E. W. Sinnott.

5180. CANALS, E. *De l'action des sulfate de magnésium sur le développement de la racine et de la tige*. [Action of magnesium sulphate on development of stem and root.] *Bull. Soc. Chim. Biol* 2: 138-139. 1920.—Peas, lupines, beans, and corn were germinated in distilled water and transferred to Detmer's solution in which calcium had been replaced by varying amounts of MgSO_4 . As the amount of magnesium was increased, injury to the root appeared but was accompanied by stimulation of stem growth. This stimulation increased until the amount of magnesium present was 2-5 times that at which injury to roots appeared. In the higher concentrations geotropism was reversed and the roots turned upward out of the solution or grew horizontally along its surface. The addition of calcium enabled the roots to endure about twice as much magnesium without discoverable injury and there was a corresponding increase in the concentration at which maximum stimulatory effect upon tops was observed.—Joseph S. Caldwell.

5181. DAVIS, A. R., D. R. HOAGLAND, and C. B. LIPMAN. *The feeding power of plants*. *Science* 57: 299-301. 1923.—In answer to the theory set forth by Truog in 1922 [see Bot. Absts. 12, Entry 1424] and in previous publications the authors point out several objections. Truog assumed that specific absorbing powers of root cells cause differences between plants, but he failed to take into account the effect of the differences in extent of root system and in the amount and intensity of CO_2 excretion by the roots. Objections are raised to the application of the law of mass action to the absorption of ions of nutritive substances such as potassium. Many studies have shown that the ions are not precipitated in the cell, leaving a low concentration in the cell sap, as would be required if the law of mass action is to affect the case. Neither can the changes in pH of the cell sap be regarded as any controlling influence, since most studies show the pH to vary only within a very narrow range.—C. J. Lyon.

5182. IRWIN, MARIAN. *The behavior of chlorides in the cell sap of Nitella*. *Jour. Gen. Physiol.* 5: 427-428. 1923.—A method is described for determining the chloride content in less than a drop of the cell sap of *Nitella*. The sap shows a concentration of chloride of 0.128 M and the accumulation can be followed during the growth of the cell. The chloride concentration in the cell sap does not increase when the cell is placed for 2 days in solutions (at pH 6.2) containing chloride up to 0.128 M. The exosmosis of chloride from injured cells can be followed quantitatively.—O. L. Inman.

5183. LICHTIN, AARON. **The iron content of lettuce.** Amer. Jour. Pharm. 95: 154-159. Pl. 1. 1923.—The per cent of iron in 5 samples of lettuce is reported as follows: Big Boston, 0.00272; Iceberg, 0.00189; Cos or Romaine, 0.00033; Grand Rapids, 0.00301; May King, 0.00326; the average being 0.00213 per cent. With a salad portion of about 25 gm., one consumes about 0.5 mgm. of iron.—Anton Hogstad, Jr.

5184. McHARGUE, J. S. **Iron and manganese content of certain species of seeds.** Jour. Agric. Res. 23: 395-399. 1923.—The average percentage of iron and manganese found in seeds, each average representing samples of several varieties, is as follows: wheat, iron 0.0039, manganese, 0.0047; oats, Fe 0.0050, Mn 0.0049; garden pea, Fe 0.0096, Mn 0.0012; garden bean, Fe 0.0103, Mn 0.0018; soy-beans, Fe 0.0074, Mn 0.0028; clovers, Fe 0.0156, Mn 0.0039; grasses, Fe 0.0107, Mn 0.0111.—D. Reddick.

PHOTOSYNTHESIS

5185. BALY, EDWARD CHARLES CYRIL, ISIDOR MORRIS HEILBRON, and HAROLD JACOB STERN. **Photocatalysis. Part III. The photosynthesis of naturally occurring nitrogen compounds from carbon dioxide and ammonia.** Jour. Chem. Soc. [London] 123: 185-197. Fig. 1-6. 1923.—Aqueous solutions of ammonia saturated with carbon dioxide were exposed to light from a quartz-mercury lamp. After short exposure-periods methylamine and nitric acid in the form of nitrate were found. The results were checked by comparison with the reagents protected from light. This photosynthesis was represented as having taken place "in 2 stages; 1st, the photosynthesis of formaldehyde by the action of light on the carbonic acid, $\text{H}_2\text{CO}_3 = \text{HCOH} + \text{O}_2$ and 2nd, the interaction of the activated formaldehyde and ammonia, $\text{NH}_2 + \text{HCOH} = \text{CH}_3\text{NH}_2 + \text{O}$." The oxygen set free in these 2 reactions oxidized some of the ammonia to nitric acid. After longer periods of exposure pyridine and piperidine were found. These reactions took place under the influence of ultra-violet light and were prevented by the interposition of a plate-glass screen; but they were found to proceed photocatalytically under the influence of visible light when ammoniacal solutions of cupric carbonate saturated with carbon dioxide were used. When stronger solutions of ammonia and formaldehyde were exposed to ultra-violet light for periods of 6-10 days, positive tests for the alkaloid coniine were obtained. Emphasis is laid on the total absence of alpha-amino acids and of all reducing sugars among the products of these reactions; but high excess of formaldehyde resulted in the formation of reducing sugars.—F. E. Denny.

5186. BAUDISCH, OSKAR. **On the formation of organic compounds from inorganic by the influence of light.** Science 57: 451-456. 1923.—This work was begun with the observation of the reduction of nitrates to nitrites, which takes place in leaves only in the light. Iron is necessary in the leaves and seems to act as a catalyst. Laboratory experiments proved that iron could so act to reduce nitrites to ammonia in the presence of grape sugar but did not attack nitrates. Ferrous salts were found to reduce nitrates in the presence of oxygen and in direct ratio to the amount of oxygen present. An iron peroxide with magnetic properties is supposed to be formed. While such reductions are taking place, there is formed potassium nitrosyl, $\text{K}(\text{NO})$, which reacts in the light with formaldehyde to make form-hydroxamic acid and formaldoxime. There are indications that bacteria form these compounds by the energy of iron peroxide and thus make nitrates available for protein building. Baly, who has extended the experiments in this field, goes so far as to say that formhydroxamic acid is the first step in the synthesis of nitrogen compounds in plants. The author refuses to make such a statement and is of the opinion that the secret of protein formation by plants will not be solved for a long time.—C. J. Lyon.

5187. F., H. B. **The Lourenço Marques Meeting of the South African Association.** Nature 111: 162-164. 1923.—This article includes abstracts of several papers. The presidential address to Section C by D. THODAY dealt with "carbon assimilation." Colorations of weed plants were discussed, their pale green color being attributed to the fact that the intensity of the light renders these colors sufficient.—O. A. Stevens.

METABOLISM (GENERAL)

5188. BRIDEL, MARC. Sur la présence simultanée du gentianose et du saccharose dans les espèces du genre *Gentiana*. [Simultaneous presence of gentianose and saccharose in species of the genus *Gentiana*.] Bull. Soc. Chim. Biol. 2: 37-41. 1920.—Bourquelot and Hérissé showed in 1900 that fresh roots of *Gentiana lutea* contain saccharose and the trisaccharide gentianose, and Bridel in 1913 found the same condition in *G. asclepiadea* and *G. punctata*. He now presents the results of a study of *G. cruciata* and *G. purpurea*. Both these species contain saccharose as well as gentianose, both sugars having been prepared in crystalline form. Gentianose preponderates during the period of active growth, but diminishes toward winter with a concurrent increase in saccharose. The author suggests that the seasonal variations in relative amounts of the 2 sugars is due to reversible action of gentiobiase. It is suggested that a similar reversibility of melibiase may be responsible for the presence of raffinose in sugar beet, sugar cane, and *Taxus baccata*.—Joseph S. Caldwell.

5189. BRIDEL, MARC, et R. ARNOLD. Sur l'application aux végétaux du procédé biochimique de recherche du glucose. [The application to plants of the biochemical method of estimating dextrose.] Bull. Soc. Chim. Biol. 3: 297-306. 1921.—Using a tested and refined method for estimating dextrose in mixture with other sugars (first described by Bourquelot and Bridel [see Bot. Absts. 8, Entry 263], which consists in the conversion of 69 per cent of the dextrose present into the readily crystallizable *b*-methylglucoside by the addition of a solution of emulsin in 50 per cent methyl alcohol. After work with the sugars of strawberries and raisins, which demonstrated the applicability of the method to mixtures containing much dextrose and only small amounts of soluble non-sugars, they apply the method to the dry leaves of *Eucalyptus globulus*, which contain little dextrose and large amounts of non-sugars. The method adopted is as follows: the material, dry or fresh, is extracted with boiling alcohol, diluted to predetermined volume with distilled water, and cleared with lead subacetate. After freeing from lead the solution is evaporated under reduced pressure at 50°C. and extracted with boiling acetic ether to remove fatty and resinous matter, alkaloids, and glucosides. The residue is then repeatedly shaken up with boiling 95 per cent alcohol to extract all sugars, the alcoholic extracts are combined, distilled to dryness in presence of calcium carbonate, and the residue dissolved in cold 50 per cent methyl alcohol and filtered. The reducing sugars are determined in an aliquot, and 1 gm. emulsin per 200 cc. is added to the remainder, which last is kept at 20-25°C. with daily shaking. After 10 days a determination of reducing sugars is made, and if any diminution in reducing power has occurred the determination is repeated at intervals until the results become constant. Whether equilibrium has been attained may then be determined by filtering off the emulsin, adding a fresh quantity, and continuing the sugar determinations, by testing the emulsin to determine whether it has lost its activity, or by adding a known amount of dextrose to the solution and ascertaining whether further synthesis occurs. The absolute proof of the presence of dextrose in the original material is the isolation of *b*-methylglucoside in crystalline form from the products of the reaction. This is accomplished by evaporating the solution to dryness and extracting repeatedly with boiling acetic ether, distilling off the ether, dissolving in water, filtering through charcoal, evaporating under reduced pressure, and taking up the residue in equal parts of boiling 95 per cent alcohol and anhydrous acetic ether, from which the methylglucoside crystallizes out on cooling.—Joseph S. Caldwell.

5190. BRIDEL, MARC, et MARIE BRAECKE. Rhinanthine et aucubine. La rhinanthine est de l'aucubine impure. [Rhinanthine and aucubine. Rhinanthine is impure aucubine.] Compt. Rend. Acad. Sci. Paris 175: 640-643. 1922.—It is found that rhinanthine is not a pure chemical compound but is a mixture of aucubine and saccharose in variable proportions. The study is based on seed of *Rhinanthus Crista-Galli*.—C. H. Farr.

5191. BOURQUELOT, EM., et MARC BRIDEL. Application de la méthode biochimique de recherche du glucose à l'étude des produits de l'hydrolyse fermentaire de l'inuline. [Application of the biochemical method for identification of glucose to the study of the products of enzy-

mic hydrolysis of inulin.] Bull. Soc. Chim. Biol 3: 217-225. 1921.—Various workers have reported the presence of saccharose or dextrose in the products of acid hydrolysis of inulin, thus failing to substantiate the earlier work of Bourquelot, who obtained only fructose by hydrolysis of inulin from *Atractylis gummifera* with inulase from *Aspergillus niger*. The authors examined the products of hydrolysis for the presence of dextrose by a method developed by themselves [see Bot. Absts. 6, Entry 2002]. When emulsin is added to mixtures of dextrose and levulose in 70 per cent methyl alcohol and the reaction allowed to proceed to equilibrium, 82.6 per cent of the dextrose is converted into *b*-methylglucoside, irrespective of the relative amounts of dextrose and levulose present. The authors hydrolyzed inulin from *Atractylis* and dahlia with inulase and treated the products of hydrolysis with emulsin in methyl alcohol for 60-80 days. The reducing power of the solution was unaltered and the optical rotation at the end of the treatment was that of pure levulose. That emulsin was not prevented from acting upon any dextrose present by the conditions of the experiments was proved by the fact that 82.6 per cent of added dextrose was converted into methylglucoside. Hence, there is no dextrose in the inulin molecule.—*Joseph S. Caldwell.*

5192. BOURQUELOT, EM., et MARC BRIDEL. **Obtention biochimique de sucre de canne à partir du gentianeose.** [Obtaining saccharose from gentianose.] Bull. Soc. Chim. Biol. 2: 160-165. 1920.—The complete hydrolysis of gentianose by enzymes involves 2 stages, invertin splits it to levulose and gentiobiase, the latter being then hydrolyzed by gentiobiase to 2 molecules of dextrose. Saccharose has never been isolated from the products of hydrolysis, hence it has been supposed that gentiobiase could not split gentianose into saccharose and glucose. The authors show that when the enzymes are allowed to act for prolonged periods and the dextrose found is removed by converting it into methylglucoside, saccharose can be isolated from the products of hydrolysis. It is considered to be formed by the action of gentiobiase upon gentianose, but that this action is very much slower than that upon gentiobiase; and it is retarded by the presence of dextrose. This situation is analogous to that seen in the action of invertin on mixtures of saccharose and gentianose, in which gentianose is very slowly split.—*Joseph S. Caldwell.*

5193. DELAUNEY, P. **La loroglossine, glucoside du Loroglossum hircinum Rich.; sa presence dans diverses espèces d'orchidées indigènes.** [Presence of loroglossin in several indigenous orchids.] Bull. Soc. Chim. Biol. 3: 238-246. 1921.—The author examined *Orchis simia* Lam., *O. bifolia* L., *Cephalanthera grandiflora* Babingt., *Ophrys aranifera* Huds., and *O. apifera* Huds., for the presence of loroglossin, the glucoside isolated by Bourquelot and Bridel from *Loroglossum hircinum* Rich. [see Bot. Absts. 3, Entry 2839]. He found in each of these species a glucoside identical in melting point, optical rotation, yield of dextrose on hydrolysis with acid or emulsin, and other characters with loroglossin.—*Joseph S. Caldwell.*

5194. JONESCO, ST. **Recherches sur le rôle des anthocyanes.** [The rôle of the anthocyanins.] Ann. Sci. Nat. Bot. 4: 301-403. 1922.—A review of the literature is given in which special attention is paid to: (1) distribution of anthocyanins, (2) chemical properties, (3) chemical nature, (4) chemical relations of the anthocyanins with the flavones and flavonols, (5) the origin of anthocyanins, (6) chemical processes in the formation of the anthocyanins, (7) the influence of various internal and external factors on the formation of the anthocyanins, and (8) the rôle of the anthocyanins.—In the 1st part of the work, young plants of buckwheat (*Sarrasin argenté*) and Bordeaux wheat were used; in the 2nd, red leaves of *Ampelopsis hedera-cea* and dahlia flowers. Small, completely etiolated plants were placed in the light, where they very quickly became colored. The amounts of glycosides and flavones in the etiolated plants, also in those exposed to the light, were determined. Finally, determinations of reducing and non-reducing sugars, starch, and cellulose in all the plants experimented with were made.—The amount of glucosides, flavones, and anthocyanins was decreased in the etiolated plants, in proportion to the length of time they were kept in the dark. The reducing and non-reducing sugars and starch were less in the red plants than in the etiolated plants. During the decrease of glucosides, flavones, and anthocyanins a large amount of free phenol compounds were found

to be produced. The same diminution of glucosides, flavones, and anthocyanins in the etiolated dahlia and *Ampelopsis* material was obtained.—The anthocyanins should not be considered as waste products, but as products necessary in the life cycle of the plant.—*Grace E. Howard.*

5195. KENDALL, A. I. **Carbohydrate identification by bacterial procedures. Studies in bacterial metabolism, LXVII.** Jour. Infect. Diseases 32: 362-368. 1923.—The bacteria studied differed in ability to decompose carbohydrates. On this basis it is suggested that a collection of carefully standardized microbes be utilized as reagents to identify water-soluble carbohydrates.—*R. L. Starkey.*

5196. KENDALL, A. I., and S. YOSHIDA. **The estimation of small amounts of carbohydrates by bacterial procedures. Studies in bacterial metabolism, LXVI.** Jour. Infect. Diseases 32: 355-361. 1923.—The selective utilization of carbohydrates by bacteria suggests a procedure for determining the presence and abundance of some carbohydrates when they occur mixed with other compounds. The authors were able to determine amounts of levulose as small as 0.001 per cent in peptone medium by measuring the reaction changes effected by *B. coli*. The more sugar initially present in the medium, the greater was the resulting increase in acidity.—*R. L. Starkey.*

5197. KENDALL, A. I., and S. YOSHIDA. **The measurement of carbohydrate mixtures by bacterial procedures. Studies in bacterial metabolism, LXVIII.** Jour. Infect. Diseases 32: 369-376. 1923.—Cultures of *B. proteus*, *B. mesentericus*, and *B. coli* differed with regard to decomposition of numerous carbohydrates. This characteristic was made use of in determining the presence and amounts of lactose and glucose in prepared solution mixtures of these 2 carbohydrates.—*R. L. Starkey.*

5198. KENDALL, A. I., R. BLY, and R. C. HANER. **Carbohydrate configuration and bacterial utilization. Studies in bacterial metabolism, LXIX.** Jour. Infect. Diseases 32: 377-383. 1923.—A series of sugar derivatives were prepared from *d*-glucose, mannose, and galactose differing merely in the character of the terminal groups. All of numerous organisms studied decomposed glucose. The other carbohydrates and their derivatives were decomposed by organisms and not by others. The common enol formation was not found to be an absolute prerequisite to fermentation. Most staphylococci were unable to ferment any except the aldose-ketose sugars. It was concluded that the influence of the terminal group in hexose sugars and derivatives on microbial utilization had received some support.—*R. L. Starkey.*

5199. LEPESCHKIN, W. **Étude sur les réactions chimiques pendant le gonflement de l'amidon dans l'eau chaude. (Contribution au problème des coefficients de température extrêmement grands.)** [Studies on the chemical reactions during the swelling of starch in hot water. (The problem of high temperature coefficients).] Bull. Soc. Bot. Genève 13: 40-65. 1 pl., 1 fig. 1921.—The formation of starch jelly cannot be considered as a particular case of swelling of starch in water. Only the swelling of starch in cold water is a phenomenon purely physical and completely reversible. The swelling of starch in hot water involves 2 processes: (1) a chemical reaction between the polysaccharides of starch and water leading to the formation of hydrates at the expense of the anhydrides; (2) a swelling in water of the products thus formed. The absorption of water by these hydrate compounds is 10 times greater than that observed for starch in cold water, and the absorption of water by starch operates in the same manner in cold and hot water.—All acids except H_2SO_4 accelerate the chemical reaction between the polysaccharides of starch and water. In all cases the acceleration caused by the presence of acids is not proportional to the quantity of H-ions in the liquid. This result confirms the hypothesis that the reaction of special interest in this connection is not one of hydrolysis but rather a chemical union of water with the polysaccharides of starch.—*W. H. Emig.*

5200. ROUGE, E. **Sur les flavones et leur rôle dans la cellule végétale.** [The rôle of flavones in the plant cell.] Bull. Soc. Bot. Genève 13: 18-19. 1921.—Flavones reduce silver nitrate and give all the reactions indicated by Czapek. After the death of the plant, silver nitrate is not reduced by the chloroplasts or by plasma. The flavones in alkaline solution have a great affinity for oxygen and lose their power to reduce silver nitrate. The flavones are important in the process of assimilation in that they absorb oxygen and transport it away from the cell.—W. H. Emig.

5201. WOLFF, J., et B. GESLIN. **Sur quelques propriétés de l'inuline et ses changements d'état physique.** [On certain properties of inulin and its changes of physical state.] Bull. Soc. Chim. Biol. 2: 19-23. 1920.—*Schizosaccharomyces Pombe* formed no alcohol during 7 days growth in a solution containing pure inulin; in a solution containing inulin and saccharose the alcohol formed in the same time was equal to all the saccharose and 10 per cent of the inulin present. Impure preparations containing inulides are partially fermentable. The solubility of inulin in water at different temperatures varies with the method of preparation, that obtained by maceration of roots of dahlia in water and evaporating to dryness being much less soluble than that obtained from water extracts by precipitation with alcohol; but such alcohol precipitates again show lowered solubility when dissolved in water and evaporated to dryness. The phenomenon is reversible and due to a change of physical state, possibly to a difference in degree of hydration. Treatment with a water extract of *Aspergillus niger* prior to precipitation with alcohol gives a still greater increase in solubility, especially at lower temperatures. Inulin from dahlia, no matter by what method prepared, is very much less soluble than inulin from *Cichorium Intybus*.—Joseph S. Caldwell.

METABOLISM (NITROGEN RELATIONS)

5202. BLANCHETIERE, A. **Action du bacille fluorescent liquéfiant de Flüge sur certains amino-acides en milieu chimiquement défini.** [Action of *Bacillus fluorescens liquefaciens* Flüge upon certain amino-acids in a chemically controlled medium.] Bull. Soc. Chim. Biol. 2: 28-36. 1920.—Alanin, leucin, asparagin, phenylalanin, tyrosin, and histidin, singly or in combination, were added in known quantities as sources of nitrogen and carbon for *Bacillus fluorescens liquefaciens*, the medium being otherwise constant in composition. When used singly, histidin, alanin, and asparagin were most readily attacked. When 2 acids, both of which are readily attacked, are employed in mixture, both are used up more rapidly than either would be if used alone, and the presence of one which is readily attacked appears to aid the organism in attacking another which is not used if present alone. The hypothesis is suggested that the unattackable amino acid is deaminized by some of the intermediate metabolic products derived from the attackable acid. Benzoylalanin permitted no growth when used alone. The introduction of the benzoyl radical therefore interferes with the utilization of the acid, as expected from the accepted ideas of the mechanism of bacterial action upon aminoacids. When employed in mixture with alanin there was slight growth without pigment development, but the benzoylalanin was decomposed to some extent, as was shown by recovery of benzoic acid.—Joseph S. Caldwell.

5203. DAVIDSON, JEHIEL, and J. A. LECLERE. **Effect of various inorganic nitrogen compounds applied at different stages of growth on the yield, composition, and quality of wheat.** Jour. Agric. Res. 23: 55-68. 1923.—Inorganic nitrates applied in the early stages of growth, uniformly resulted in highest yields but applications made at the time of heading reduced the amount of "yellow-berry" and increased the protein content of the kernels and straw.—Contrary to previous experience, no relation was found between nitrogen content and weight per bushel of grain.—Various chemicals, not nitrogen carriers, such as chlorides of sodium, calcium, potassium, etc., produced no effect on yield or on quality of grain. The application of nitrogen at the time of heading or at the milk stage depressed the phosphoric-acid content of grain and of straw and depressed the ash and silica content of straw.—D. Reddick.

5204. FALK, I. S., and M. F. CAULFIELD. Some influences of hydrogen ion concentration upon antigenic properties of proteins. [Abstract.] Absts. Bact. 7: 27. 1923.

5205. HUGOUNENQ, L., et GABRIEL FLORENCE. Recherches sur la synthèse des acides amines aromatiques dans la cellule vivante. Premier mémoire. [The synthesis of aromatic acid amines in the living cell. I.] Bull. Soc. Chim. Biol. 2: 13-18. 1920.—*Aspergillus niger* was grown on various modifications of Raulin's solution and tested for the presence of tyrosin and tryptophane by the methods of Adamkiewicz, Herzfeld, and Hopkins and Cole. Hexoses are not necessary for the formation of tryptophane and tyrosin, since substitution of arabinose and xylose for saccharose did not affect the growth of the fungus or decrease the amounts of tyrosin and tryptophane formed. Normal growth and positive reactions for tyrosin and tryptophane were also obtained when glyecoll, leucin, phenylalanin, tyrosin, or tryptophane were used as sources of nitrogen; no growth was obtained when phenylalanin or the hydrochlorides of lysin or histidin were used. Very poor growth was obtained when 1 gm. per l. of phenylglycin or orthonitrophenylpropionic acid was added to Raulin's liquid. There is therefore a wide range in the raw materials from which the fungus is able to synthesize its proteins; the authors propose to investigate the question whether the cells of higher organisms possess equally great synthetic powers.—Joseph S. Caldwell.

5206. HUGOUNENQ, L., et GABRIEL FLORENCE. Recherches sur la synthèse des acides amines aromatiques dans la cellule vivante. Deuxième mémoire. Étude de l'aspergilline. [The synthesis of aromatic acid amines in the living cell. II. Aspergilline.] Bull. Soc. Chim. Biol. 2: 133-136. 1920.—The authors isolated the black pigment of *Aspergillus niger*, which they name aspergilline, by treating the spores with 10 per cent NaOH, neutralizing with H_2SO_4 to precipitate, washing with water, dissolving in NH_4OH , precipitating with acetic acid, washing, and drying, thus obtaining a non-crystalline powder insoluble in water or acid but soluble in alkalis. It contains Fe, S, Zn, and Ca, and the elementary analysis suggests to the authors a likeness to hematogen of eggs. They regard both substances as greatly condensed substance containing all the mineral elements necessary for the development of the new organism. Distillation by Nencki's method set free ammonia, indol, and a compound having the odor of amylamine, while the residue contained small amounts of fatty acids.—Joseph S. Caldwell.

5207. MESTREZAT, W. et MARTHE PAUL JANET. L'azote titratable par la méthode de Kjeldahl. [Estimation of nitrogen by the Kjeldahl method.] Bull. Soc. Chim. Biol. 3: 105-130. 1921.—This is a comprehensive résumé of the literature, discussing various modifications of the original method. Nitrogenous compounds are grouped into 5 classes with respect to the ease with which the nitrogen may be measured by the Kjeldahl method. (1) Very readily determined: aliphatic amines, certain aromatic amines, imines, amides, urcides, the pyrrol nucleus, the pyrimidine nucleus, purine and its derivatives. (2) Possible but difficult to determine, requiring prolonged heating, etc.: guanidine derivatives, indol and skatol nuclei, acridine, the quinoline nucleus, the piperazine nucleus, morphine, brucine. (3) Difficult and giving only doubtful results: certain aromatic amines, quaternary ammonium compounds, azo-, azoxy-, and diazo-derivatives (doubtfully), the tropic nucleus, tyrosin. (4) Direct measurement impossible, but may be made after reduction: nitrates, nitrites, nitro and nitroso derivatives, nitriles, cyanogen derivatives, hydrazines, hydrazones, osazones, azo-, azoxy-, and diazo derivatives. (5) Compounds the nitrogen of which is lost in wet-way determinations: Pyridin and pyrazol and their derivatives. A bibliography of 50 selected titles is appended.—[See also following abstract.].—Joseph S. Caldwell.

5208. MESTREZAT, W., et MARTHE PAUL JANET. Présence dans l'urine d'une reste azoté que ne dose pas la méthode de Kjeldahl. Étude comparée des résultats fournis dans quelques cas par la technique de Kjeldahl-Foerster et la méthode de Dumas. [Presence in urine of a nitrogenous residue not determined by the Kjeldahl method. Comparative results obtained by the Kjeldahl-Foerster and the Dumas methods.] Bull. Soc. Chim. Biol. 3: 88-94. 1921.—The yields by the Dumas method were in all cases 1-9 per cent higher than those by the

Kjeldahl-Forster method. The reasons for the discrepancy are discussed in detail in another paper [see preceding abstract].—*Joseph S. Caldwell.*

5209. THOMAS, P. **Le dosage colorométrique de la tyrosine et l'indice phénolique de protéiques.** [Colorimetric estimation of tyrosin and the phenolic index of proteins.] *Bull. Soc. Chim. Biol.* 3: 197-216. 1921.—The author's earlier work on colorimetric methods of estimating tryptophane [see following abstract] led him to examine the colorimetric methods of estimating tyrosin proposed by Folin and Denis, Denigès, and Morner, and by the use of Milton's reagent. He finds that the results obtained by the Folin and Denis method are affected by the time allowed for the reaction, the presence of tryptophane, various reducing substances, indol and its derivatives, and dioxyphenylalanin, with the result that he pronounces it wholly untrustworthy. The Denigès-Morner reaction is not sufficiently delicate and the color obtained in a mixture of products of protein hydrolysis is difficult to measure colorimetrically, hence work with it was abandoned. The author then endeavored to employ Millon's reagent in such manner as to make the reaction a quantitative test for tyrosin, finding that tryptophane, oxytryptophane, and dioxyphenylalanin gave interfering colorations. Tryptophane may be removed from the products of protein hydrolysis by precipitation with a mercury salt, but such treatment would not remove oxytryptophane or dioxyphenylalanin if present. Nillon's reagent can therefore be employed as a colorimetric method for determining the total content of phenol compounds, or "phenolic index," of a protein, in terms of tyrosin. A standard method of employing it is described and results of a number of determinations upon 9 proteins are given in the form of a table, in which the content of tyrosin as determined by Folin and Denis and by the author using their method is compared with the author's phenolic index and with the tyrosin content found by workers who have made quantitative analyses. Thomas invariably obtains considerably higher results by the use of the Folin-Denis method than do these authors themselves. The phenolic index determinations run roughly parallel but are much lower in such proteins as are rich in tryptophane, and all are very much higher than the amounts obtained by quantitative analyses.—*Joseph S. Caldwell.*

5210. THOMAS, P. **Sur le dosage de l'ammoniaque dans les cultures en présence d'urée.** [The determination of ammonia in cultures in the presence of urea.] *Bull. Soc. Chim. Biol.* 7: 171-175. 1919.—A method for determining small quantities of ammonia in the presence of large amounts of the various nitrogenous products present in a yeast culture is described. Phosphoric acid is eliminated from the solution by adding hydrochloric acid and neutral lead acetate until no further precipitation occurs, after which powdered lead carbonate is added and the solution allowed to stand 15-18 hours. The liquid is then filtered and the filter washed with cold water. Magnesia is added and the distillation is conducted under reduced pressure in a modified Schloesing-Aubin apparatus at 35-40°C. Air enters through a trapflask containing H_2SO_4 and the NH_3 is drawn through a condenser and received into H_2SO_4 and determined by titration. The author claims advantages over the similar method of Nencki and Zaleski in that the apparatus employed is simpler and everywhere obtainable.—*Joseph S. Caldwell.*

METABOLISM (ENZYMES, FERMENTATION)

5211. AMBARD, L. **Fixation de l'amylase par l'amidon cru et l'empois d'amidon.** [Fixation of amylase by raw starch and starch paste.] *Compt. Rend. Soc. Biol.* 83: 1458-1460. 1920.—It has been established by Sorensen, Michaelis and Rona, and others that amylolytic action of amylase is greatest when the medium has a pH of 6.6. It is easy to obtain this reaction with extracts high in amylase content, as saliva or pancreatic juice, but it is difficult to adjust the reaction with such materials as urine or blood, which are low in amylase. The authors find that it is possible to adsorb quantitatively the amylase present in such dilute solutions upon raw commercial rice starch and to remove foreign substances by washing without loss of the enzyme. When added to a starch paste adjusted to pH 6.65, the enzyme is quantitatively transferred to combination with the paste, as is shown by the fact that the enzymic activity is 96-98 per cent of that of check solutions.—Adsorption of amylase by raw starch is apparently specific; it has no power to adsorb invertase. Some experiments with invertase adsorbed upon

animal charcoal show that, contrary to expectation, the charcoal retains invertase quantitatively when washed with 0.1 per cent sugar solution but gives it up almost wholly when the wash water contains no sugar. The phenomenon is much more complex than has heretofore been realized, as the presence of small quantities of sugar is necessary for the fixation of invertase upon carbon.—*Joseph S. Caldwell.*

5212. AMBARD, L. **Fixation de l'amylase sur l'amidon cru et l'empois d'amidon.** [Fixation of amylase by raw starch and starch paste.] *Compt. Rend. Soc. Biol.* 84: 230-232. 1921.—Continuing an earlier note of the same title [see preceding abstract] the author reports further studies of the conditions for the adsorption or fixation of amylase upon raw starch. He substitutes glycogen for starch paste in digestion experiments for the reason that the latter is partially precipitated from saline solution by centrifuging, hence is difficult to separate from the raw starch. Fixation of the enzyme upon raw starch is as complete in an electrolyte-free medium as in saline solution, but when amylase adsorbed upon raw starch is added to a solution of salt-free glycogen not more than 4 per cent of the amylase is set free. If NaCl be added the amylase is quantitatively released. These facts indicate that amylase is a colloid and that it follows the general laws of colloids in forming adsorption compounds, as is also suggested by the readiness with which it is precipitated from solution under certain conditions. The proportions of amylase released from the enzyme-starch complex by identical quantities of glycogen are 98, 90, and 74 per cent when the concentrations of glycogen are 1, 0.1, and 0.01 per cent respectively, hence follow the general laws of adsorption. This fact may furnish an explanation of the observation that when the initial concentration of starch is 1 per cent or more the amount of hydrolysis per unit of time is constant, while it rapidly decreases if the initial concentration is less than 0.1 per cent. If the formation of a combination between enzyme and substrate is a preliminary step in the reaction, the proportion of combined and active enzyme must fall off as the initial concentration of the substance is decreased.—*Joseph S. Caldwell.*

5213. AMBARD, L. **Sur l'amylase. Son dosage. Mechanisme de la digestion amylolytique.** [Amylase, its estimation; mechanism of digestion by amylase.] *Bull. Soc. Chim. Biol.* 3: 51-65. 1921.—Continuing previous studies [see 2 preceding abstracts] the author gives details of the technique for absorbing amylase upon raw starch, shows that the absorption is specific and quantitative, and that reducing substances are not taken up on the starch. The paper is principally concerned with the conditions for release or "defixation" of the enzyme from combination with starch. Preparations repeatedly washed with 2 per cent solutions of levulose, saccharose, glycerol, maltose, inulin, gum arabic, or mastic in 0.3 per cent saline solution showed no defixation, but preparations washed with ferric hydroxide and aluminum hydroxide showed reduction to 63.5 and 70.4 per cent respectively of normal activity. The author assumes that Fe and Al enter into combination with the enzyme-starch complex, thus "immobilizing" the enzyme. Glycogen is to be preferred to starch paste for defixation because of its greater stability; the presence of a neutral salt, such as NaCl, is absolutely necessary for defixation. The reaction of the medium is important and should be pH 6.6. At pH 5.0 and 8.04 the activity of the enzyme is only 60 per cent of the normal, although the destruction of the enzyme at these points is only about 2.5 per cent. The author finds no evidence that the fixation of amylose upon glycogen is retarded by the accumulation of maltose, since the presence of maltose in the solution with glycogen does not affect the defixation of amylose from raw starch. The rate of hydrolysis is determined by the number of enzyme substrate groups in combination, by the temperature and reaction of the medium, and by the accumulation of products of the reaction.—*Joseph S. Caldwell.*

5214. AMBARD, L., E. PELBOIS, et M. BRICKA. **Similitude de l'hydrolyse du sucre par les acides et de l'hydrolyse de l'amidon par l'amylase.**—Etude de certaines réactions monomoléculaires. [Similarity of the hydrolysis of saccharose by acids and the hydrolysis of starch by amylase; a study of the mechanism of certain monomolecular reactions.] *Bull. Soc. Chim. Biol.* 2: 42-63. 1 fig. 1920.—The authors advance the thesis that the rôle played by neutral salts in the hydrolysis of starch by amylase is qualitatively and quantitatively identical with

that which they play in the hydrolysis of saccharose by acids, and that the so-called "activation" of the enzyme by salts is in reality an effect exerted upon the substrate. The argument rests upon experimental data showing that the amount of sugar produced per unit of time when starch paste containing known amounts of NaCl is acted upon by salivary amylase which has been dialyzed until free of salts, is directly proportional to the amount of amylase employed, but is not materially affected by a considerable variation in the amount of NaCl present. The mechanism of the action of neutral salts upon the substrate is not explained, and the widely accepted hypothesis that they accelerate enzymic activity through increasing the colloidal dispersion of the enzyme is not mentioned.—*Joseph S. Caldwell.*

5215. BRIDEL, M., et R. ARNOLD. Sur l'emploi de divers agents de précipitation dans la préparation de l'émulsion des amandes. [The use of various precipitating agents in preparing emulsin from almonds.] Bull. Soc. Chim. Biol. 2: 216-222. 1920.—Three preparations made from sweet almonds are compared as regards enzymic activity. Preparations were made (1) by precipitating an aqueous extract with 2 volumes 95 per cent ethyl alcohol, which was allowed to act 48 hours; (2) by using 2 volumes methyl alcohol, allowed to act 31 hours; (3) by using 2 volumes of acetone, allowed to act 28 hours. When washed with ether and dried, the comparative yields for the 3 were as 16:15:21. The 3 preparations were tested as to both hydrolytic and synthetic activity of *b*-glucosidase, *b*-galactosidase, lactase, gentiobiase, cellobiase, and invertin. The hydrolytic activity of *b*-glucosidase, tested on amygdalin, salicin, *b*-benzylglucoside, and *b*-methylglucoside, was identical for the 3 preparations, as was the synthesis of *b*-methylglucoside from glucose in methyl alcohol. Activity of the galactosidase was tested upon *b*-ethylgalactoside, and was greatest in the ethyl alcohol preparation, least in the acetone preparation; the 3 preparations held the same order as regards synthetic activity. There were only insignificant differences in the activity of lactase, gentiobiase, and cellobiase in the 3 preparations, but the invertin of the methyl alcohol preparation was most rapid in action. Emulsin may be prepared in any of these ways but prolonged contact with the precipitating agent should be avoided.—*Joseph S. Caldwell.*

5216. COLIN, H. Action de la sucrase sur les satellites de l'inuline. [Action of sucrase on the sugars accompanying inuline.] Bull. Soc. Chim. Biol. 2: 157-159. 1920.—The expressed sap of common varieties of *Helianthus tuberosus* becomes strongly dextrorotatory during winter despite the presence of various laevorotatory polyoses which accompany inulin. Hydrolysis of saccharose alone could not account for the change. Addition of sucrase to the expressed sap brings about hydrolysis occurring in 2 stages, in which the changes in optical rotation and in reducing power do not run parallel, indicating that more than 1 sugar is being acted upon. Pseudo-inulin, inulinin and helianthenin, which accompany inulin, are readily prepared by reason of their differing solubility in alcohol. In the pure state they are not attacked by sucrase. Synanthrin, which is difficult to separate from saccharose, is hydrolyzed concurrently with saccharose; whether this is due to the action of sucrase or to that of a specific synanthrin-splitting enzyme which is associated with sucrase is to be further investigated.—*Joseph S. Caldwell.*

5217. COLIN, H. Quelques corollaires des lois de l'hydrolyse diastatique. [Certain corollaries of the laws of enzymic hydrolysis.] Bull. Soc. Chim. Biol. 3: 263-272. 1921.—When a quantity of saccharose is acted upon by invertin under constant conditions, the amount of inversion per unit of time is a constant until a point is reached at which the alteration in ratio of concentration between sugar and enzyme begins to affect the rate. Whether the curve is a true logarithmic one depends upon the initial ratio between enzyme and substrate. The mathematical laws applying to the process hold for all enzymic hydrolyses in which a single reaction occurs under definite conditions, but not for such complex reactions as the conversion of starch by diastase. The author shows how the laws of hydrolysis may be applied to the determination of the degree of purity of various sugars, as raffinose, synanthrin, and gentianose, to the measurement of the quantity of enzyme, and to the determination of molecular weights of sugars.—*Joseph S. Caldwell.*

5218. EMOTO, YOSHIKADZU. Ueber die Enzyme einiger Saprolegnien. [Enzymes of some Saprolegnias.] Bot. Mag. Tokyo 37: (13)-(29). Pl. 1. 1923. (In Japanese.)—In *Saprolegnia Tokugawana* n. sp., which is described in detail, positive reactions were obtained for the following intra-cellular enzymes: amylase, inulinase, pectinase, cellulase, raffinase, invertase, lactase, maltase, emulsin, salicase, and proteolytic enzymes (acid, neutral, alkaline). Glycolase (Glykolyse), lipase, urease, tyrosinase, oxydase, peroxydase, and catalase were not found. In a species of *Achlya* lacking oogonia the results were identical except that glycolase (Glykolyse) was present.—Of intra-cellular enzymes in the *Saprolegnia*, amylase, inulinase, raffinase, invertase, lactase, maltase, emulsin, salicase, glycolase (Glykolyse), proteolytic enzymes (acid, neutral, alkaline), peroxydase, and catalase were present and pectinase, cellulase, lipase, urease, tyrosinase, and oxydase absent. In the *Achlya*, amylase, inulinase, cellulase, invertase, lactase, maltase, emulsin, salicase, proteolytic enzymes (acid, neutral, alkaline), peroxydase, and catalase were present and pectinase, glycolase (Glykolyse), lipase, urease, tyrosinase, and oxydase absent.—From Author's German abstract.

5219. HARVEY, ELLERY H. Efficiency of some common anti-ferments. Amer. Jour. Pharm. 94: 797-801. 1922; 95: 105-108. 1923.—The author records the effect of some 18 anti-ferments, including mercuric chloride, potassium cyanide, sodium hypochlorite, ultra-violet rays, sodium arsenate, hydrogen peroxide, methyl salicylate, furfural, formaldehyde, copper sulphate, etc., on invertase of yeast in sucrose solutions. The method for measuring the retarding action is given. The author suggests that the ultra-violet radiation, used as a bactericide, might further be employed as an anti-ferment, since no toxic residue is left in the treated material. In most cases the action of the anti-ferment was one of gradual retardation rather than an immediate cessation of activity. Many commonly used materials were noted to have a low percentage of activity.—Part II. The action of an additional list of anti-ferments on yeast is reported, which includes several volatile oils from spices, nitro-benzol, oxalic acid, saccharin, sodium fluoride, etc. The use of volatile oils, within the limits set by the taste, is an aid in the preservation of such food products as catsup, tomato sauce, etc. Saccharin exerts but a mild anti-ferment action. The yeast activity was found to be but slightly inhibited by dilute salt solutions. Dilute mineral acid hydrolysis of sucrose solutions produced a curve having the characteristics of enzyme-inverted sugar solutions.—Anton Hogstad, Jr.

5220. JOFFE, JACOB S. Homogeneous catalysts in the oxidation of sulfur by *Thiobacillus thiooxidans*. [Abstract.] Absts. Bact. 7: 8. 1923.—The activities of the organism, resulting in the production of sulphuric acid as high as 2 N, are increased by the presence of several catalysts, particularly by nickel, uranium, caesium, and zinc. The presence of 10 ppm. of salts of these metals in the medium with an excess of sulphur resulted in an increase of from 20 to 40 per cent oxidation of sulphur in 30 days.—D. Reddick.

5221. MELDOLESI, GINO. Die Wirkung von Druck auf die Geschwindigkeit der Fermenthydrolysen durch Pepsin, Trypsin und Diastase. [The effect of pressure on the rate of hydrolysis by pepsin, trypsin, and diastase.] Biochem. Zeitschr. 115: 85-95. 1921.—The writer finds that the action of pepsin and trypsin upon blood albumin is influenced by pressure. The pressure over 1 atmosphere was produced by CO₂ or N₂. The reaction was most rapid at a pressure of 5 atmospheres, less at 10 atmospheres, but more than at 1 atmosphere pressure. The difference in rate was most noticeable during the first 2 hours of the experiments. The hydrolysis of arrow-root starch by diastase was also studied; pressure influenced the reaction in the same way as it affected the reaction of pepsin and trypsin. The reactions are illustrated by graphs.—F. G. Gustafson.

5222. MICHAELIS, L. Weitere Beiträge zur Theorie der Invertasewirkung. [Further contribution to the theory of invertase action.] Biochem. Zeitschr. 115: 269-281. 1921.—In colloidal solutions the reaction is usually proportional to the surface and not to the concentration of the dissolved substance. This is not the case with invertase, for here the active

mass of the enzyme, whether free or adsorbed on ferric hydroxide or carbon, is always proportional to the concentration. This fact entitles one to apply the mass law to the inversion of cane sugar. The effectiveness of the invertase adsorbed by the ferric hydroxide does not depend upon the ability of the cane sugar to dissolve it from the hydroxide, because the adsorbed invertase hydrolyses the sugar before it is dissolved from the hydroxide. Other disaccharides are able to dissolve the invertase from the ferric hydroxide without themselves being acted upon by the enzyme.—*F. G. Gustafson.*

5223. NEUBERG, CARL, und JULIUS HIRSCH. Über ein Kohlenstoffketten knüpfendes Ferment (Carboligase). [Carboligase, a carbon chain-synthesizing enzyme.] *Biochem. Zeitschr.* 115: 282–310. 1921.—The experimental work is divided into 3 parts. In the 1st the reaction between cane sugar and benzaldehyde in the presence of yeast is discussed. The 2nd part deals with the reactions characteristic of the substance formed from sugar and benzaldehyde. The empirical formula is given as $C_6H_{10}O_2$ with the probable structural formula $C_6H_5 \cdot CO \cdot CHOH \cdot CH_3$. The 3rd part deals with the enzyme nature of the substance found in yeast which brings about the reaction between benzaldehyde and acetaldehyde, derived freshly from the destruction of sugar. Carboligase, as the enzyme is called, facilitates the construction of carbohydrates, while carboxylase aids in their destruction.—*F. G. Gustafson.*

5225. SOPPELAND, LULU C., and MAX LEVINE. On some factors influencing proteolysis in dairy wastes. [Abstract.] *Absts. Bact.* 7: 19. 1923.—An adequate supply of air and a neutral or slightly alkaline reaction are favorable for proteolysis.—*D. Reddick.*

METABOLISM (RESPIRATION, AERATION)

5226. MAQUENNE, L., et E. DEMOUSSY. Observations sur la résistance des végétaux à l'asphyxie. [Observations on the resistance of plants to asphyxiation.] *Bull. Soc. Chim. Biol.* 3: 273–278. 1921.—Failure of germination in seeds submerged in water is shown to be due to the low O_2 content of the water; when provision was made for aerating water constantly circulated through a tube containing the seeds, normal germination and development of the young plants occurred. Older plants when completely immersed die very quickly because of the slow diffusion of air through water.—The darkening of many leaves on dying is due to oxidation, and does not occur in the absence of air. In the leaves of *Aucuba* darkening on dying occurs even in vacuo and is due to the splitting of the glucoside aucubin by emulsin. It therefore serves as a check upon the condition of the cells. Floated on water, the leaves remain green for 2 months, when submerged 4–5 mm. in water they brown in 3–4 days by reason of lack of O_2 . In leaves which discolor as a result of oxidation no change of color occurs while submerged, but they very rapidly become brown when again brought into the air. When leaves of this type are spread flat against a surface beneath water which is aerated, those which have the lower surface toward the water discolor very quickly, those with the upper surface very much more slowly, showing that O_2 enters at a rate directly proportional to the number of stomata. In strong sunshine submerged leaves live for very long periods, since the light decomposes the CO_2 given off in respiration thus constantly renewing the O_2 supply. Sealed into a dry tube exhausted of air, leaves of *Aucuba* placed in the dark remain living 2 or 3 days by means of intracellular respiration. Placed in light they remain alive more than 2 months by reason of the establishment of a cycle in which the respired CO_2 is decomposed to yield O_2 ; this the colorless leaves found on weak branches are wholly unable to do.—*Joseph S. Caldwell.*

5227. RAY, GEORGE B. Comparative studies on respiration. XXIV. The effects of chloroform on the respiration of dead and of living tissue. *Jour. Gen. Physiol.* 5: 469–475. *Fig. 1–4.* 1923.—By use of H_2O_2 and $Fe_2(SO_4)_3$, powdered dead *Ulva* and chloroform gave results comparable to those obtained by action of chloroform upon living tissue. The effect

of chloroform upon a mixture of H_2O_2 and $\text{Fe}_2(\text{SO}_4)_3$ depends upon the concentration of the iron. If the concentration is low there is an increase in the production of CO_2 , followed by a decrease. If the concentration is high the rate appears to decrease from the start.—O. L. Inman.

5228. ROUGE, E. **Le réveil de la terre (réponse aux deux récentes communications de M. Auguste Lumière, Lyon).** [The awakening of the earth (a reply to 2 recent communications of August Lumière).] Bull. Soc. Bot. Genève 13: 13-16. 1921.—August Lumière says that the cause of seasonal rhythm and the awakening of the earth are independent of variations in temperature. Experiments with germinating seeds indicate that Lumière's theory of the rôle of atmospheric O_2 and chemical changes in the soil does not explain the cause for renewed growth in the spring.—W. H. Emig.

5229. WAKSMAN, SELMAN A., and ROBERT L. STARKEY. **On the growth and respiration of sulphur-oxidizing bacteria.** Jour. Gen. Physiol. 5: 285-310. Fig. 1-6. 1923.—*Sulfomonas thiooxidans* is shown to be a sulphur-oxidizing bacterium. It oxidizes elementary sulphur to sulphuric acid and sodium thiosulphate to sulphate. The organism derives its carbon from the CO_2 of the air. Sulphates do not exert any injurious effect upon sulphur oxidation by *Sulfomonas thiooxidans* but nitrates exert a distinctly injurious action both on the growth and respiration of the organism. Dextrose below 5 per cent shows no deleterious effects. The oxidation of sulfur takes place normally at 0.25 molar acid, but that concentration may be greatly increased without bad effect. Using a respirometer like that of Meyerhof the respiration of growing cultures was studied.—O. L. Inman.

5230. WAKSMAN, SELMAN A., and ROBERT L. STARKEY. **Energy transformations by micro-organisms.** [Abstract.] Absts. Bact. 7: 7. 1923.—*Thiobacillus thiooxidans* obtains its energy from the oxidation of elementary sulphur, thiosulphate, and sulphides, and its carbon from CO_2 of the air. For every part of carbon assimilated about 32 parts of sulphur are oxidized; 6.7 per cent of energy made available in the oxidation is used for the assimilation of carbon.—D. Reddick.

ORGANISM AS A WHOLE

5231. EDWARDS, S. F. **A note on the longevity of some cultures of *B. radiculicola*.** [Abstract.] Absts. Bact. 7: 9. 1923.—*Bacillus radiculicola* from red clover [*Trifolium pratense*] was kept alive and virulent in a sealed test-tube for 16 years. Similar cultures from white clover [*T. repens*] and from alfalfa [*Medicago sativa*] were kept for 10 years.—D. Reddick.

5232. HASTINGS, E. G. **A comparison between the resistance to an unfavorable environment of organisms that have grown in native habitats and the same kind grown in artificial culture.** [Abstract.] Absts. Bact. 7: 6. 1923.

5233. LENDNER, A. **Culture expérimentale de *Spinellus macrocarpus*.** [Experimental culture of *Spinellus macrocarpus*.] Bull. Soc. Bot. Genève 13: 8-9. 1921.—*Spinellus macrocarpus*, a parasitic fungus on *Mycena epipterigia*, was grown on an infusion of *Tricholoma terreum*.—W. H. Emig.

5234. SHERMAN, J. M., and W. R. ALBUS. **The function of "lag" in bacterial cultures.** [Abstract.] Absts. Bact. 7: 7. 1923.—"Instead of viewing the latent period as an expression of injury received by the organism in its previous environment, we feel that a more satisfactory explanation would be to consider it as a biological rejuvenescence."—From Author's Abstract.

5235. YOUNG, C. C., and M. GREENFIELD. **Observations on the viability of the Bacterium coli group under natural and artificial conditions.** Amer. Jour. Public Health 13: 270-273. 1923.

5236. TROTTER, H. **Height growth of seedlings.** *Indian Forester* 48: 640-644. *Pl.* 19. 1922.—Monthly height determinations of selected seedlings 1 year old were made at Dehra Dun. Tables and a chart are given showing the growth in inches by months for *Shorea robusta*, *Cedrela Toona*, *Acacia catechu*, *Dalbergia sissoo*, *Bombax malabriculum*, and *Terminalia tomentosa*. The growth curves for some of the species follow closely the form of the precipitation curve.—*E. N. Munns.*

MOVEMENTS OF GROWTH AND TURGOR CHANGES

5237. NEWCOMBE, F. C. **Response of sensitive stigmas to unusual stimuli.** Rept. Michigan Acad. Sci. 22: 145-146. 1920.—When wheat flour is placed upon the stigmas and the latter are touched gently, they close in the species studied and remain closed in *Tecoma radicans* L. Juss. and *Catalpa speciosa* Warder, but reopen in *Mimulus glabratus* HBK. var. *Jamesii* (T. & G.) Gray. If pollen is used in the place of the wheat flour the stigmas remain closed in all 3 and if emery powder is used the stigmas of all 3 reopen in 10-30 minutes. Immersion of the pistil with open stigma lobes in water does not cause closing. A drop of water placed on the stigmas in the act of closing causes a reversal of movement. Immersion in alcohol or hot water causes very prompt closing. A weak electric current causes prompt closing with subsequent reopening. Cutting through the style within 2 mm. of the stigmas causes no closing, but pinching or pressing the style, even 10 mm. away from the stigmas, causes the latter to close. Probably the closing is due to extrusion of water from a turgid tissue.—*Ernst A. Bessey.*

5238. SNOW, R. **The conduction of excitation in Mimosa.** *Nature* 111: 237. 1923.—The writer reviews briefly the work of Ricca and others which seems to show that conduction is by dissolved substances in the water stream. Dutrochet used *Mimosa Spegazzinii* in which it is possible to remove easily the tissues outside the cambium. In that species, basipetal conduction takes place with difficulty, but in *M. pudica* it takes place easily and rapidly. Such conduction may not be dependent upon the water current only, and further work is desirable.—*O. A. Stevens.*

GERMINATION, RENEWAL OF ACTIVITY

5239. BURKE, GEORGINA S. **Dormancy in spores of Clostridium botulinum.** [Abstract.] Absts. Bact. 7: 11. 1923.—Spores on nutrient agar remained dormant for 92 days and in broth for 144 days.—*D. Reddick.*

5240. PETRY, E. J. **Germination and growth of Ceanothus americanus as affected by heated soils.** Rept. Michigan Acad. Sci. 22: 135-143. *Pl.* 13-14. 1920.—For seeds treated in various ways, viz., scarified, acid-etched, or untreated, and using 3 types of soils sterilized at various steam pressures, it was determined that for certain types of soil, toxic substances are liberated by the heating which reduce or even prevent germination, while other soils are not thus affected. The effect of such soils upon the further growth of the seedlings was also followed.—*Ernst A. Bessey.*

TEMPERATURE RELATIONS

5241. ESTY, J. RUSSELL. **The heat resistance of B. botulinus spores.** [Abstract.] Absts. Bact. 7: 6. 1923.—In all, 112 strains of *Bacillus botulinus* were tested. Heat resistance at 105°C. varies from 3 to 75 minutes. Maximum resistance is 330 minutes at 100, 33 at 110, 11 at 115, and 4 at 120°C.—*D. Reddick.*

5242. MCALPINE, JAMES G. **The influence of autoclave sterilization on carbohydrates in culture media.** [Abstract.] Absts. Bact. 7: 5. 1923.—Sucrose is relatively stable when heated in a neutral buffered medium for 15 minutes at an extra pressure of 15 pounds while maltose and lactose undergo partial hydrolysis.—*D. Reddick.*

RADIANT ENERGY RELATIONS

5243. COONS, G. H., and EZRA LEVIN. The relation of light to pycnidium formation in the Sphaeropsidales. Rept. Michigan Acad. Sci. 22: 209-213. Fig. 1. 1920.—Thirty-two species of Sphaeropsidales, isolated mainly by the junior author, and grown from single spores, were cultivated in diffuse daylight, in the dark, and under electric light, under similar conditions of ventilation and temperature, each fungus being grown on 3 media,—cornmeal agar, oatmeal agar, and prune-juice agar. Sixteen of the species produced pycnidia only in the illuminated cultures, 16 produced pycnidia in both light and darkness, while 2 of those in the diffuse daylight actually reduced the number of pycnidia. The results showed no close relation as between light influence and the generic affinities of the species.—*Ernst A. Bessey.*

5244. REINLE, HANS. Über die Wirkung der Becquerel- und Röntgenstrahlen sowie des ultravioletten Lichtes auf die Peroxydase und Methylenblau-Formalin-Reduktase-Reaktion der Kuhmilch. [On the effects of Becquerel and Roentgen rays and of ultraviolet light on the peroxidase and methyleneblue-formalin-reductase reaction of cow's milk.] Biochem. Zeitschr. 115: 1-21. 1921.—The writer found that the Becquerel and the Roentgen rays had no effect upon the activity of the peroxidase and the aldehyde reductase of milk. The Becquerel rays were obtained from $RaCl_2$. It was found that the 1st hour's exposure of the milk to ultraviolet light had no effect upon either the peroxidase or reductase activity, but further exposure was somewhat harmful.—*F. G. Gustafson.*

5245. SEMMENS, ELIZABETH SIDNEY. Effect of moonlight on the germination of seeds. Nature 111: 49-50. 1923.—Increased velocity of germination has been found, and it is suggested that this effect is upon the diastase and is due to the plane-polarization of the moon light at certain periods. Experiments on various starches in polarized light seem to confirm this explanation.—*O. A. Stevens.*

TOXIC AGENTS

5246. BERTRAND, GABRIEL, et M. MOKRAGNATZ. Sur la présence du cobalt et du nickel chez les végétaux. [The presence of cobalt and nickel in plants.] Compt. Rend. Acad. Sci. Paris 175: 458-460. 1922.—Results of these studies are positive for nickel in all plants studied, and positive for cobalt only in carrot and oats. The plants studied are: roots of carrot, bulbs of onion, tubers of potato, leaves of spinach, leaves of lettuce, leafy shoot of cress, fruit of tomato, pericarp of apricot, seed and shells of beans, seed of lentils, seed of buckwheat, seed and bran of wheat, corn, rice, and the chanterelle fungus.—*C. H. Farr.*

5247. EATON, SYLVIA M., and HARPER F. ZOLLER. Some studies on the bactericidal action of sodium hypochlorite in cow's milk. [Abstract.] Absts. Bact. 7: 21-22. 1923.

5248. FALTA, W., und M. RICHTER-QUITTNER. Über die sogenannte oligodynamische Wirkung von Schwermetallen und Schwermetallsalzen. [Investigation on the so-called oligodynamic action of heavy metals and their salts.] Biochem. Zeitschr. 115: 39-41. 1921.—The heavy metals Cu, Hg, Ag, Pb, Sn, Zn, Al, Fe, Mg, and Pt were investigated, their effectiveness decreasing in the order named. The metals were placed in water in glass tubes for 8 days, after which the water was poured out and the tubes rinsed several times with distilled water and then filled with the solution to be employed. The authors studied the effect of these metals on: (1) easily oxidizable substances, such as guaiac, benzidine, resorcin, and potassium permanganate; (2) color substances like methylene blue, indigo blue, and malachite green leucobase; (3) coagulation of protein solutions; and (4) hydrolysis of starch to sugar. From these studies they concluded that the reactions are of the nature of catalysis. The ions are the active constituents; these are adsorbed by the glass tube and later pass into the solution giving a very dilute solution of the metal in question.—*F. G. Gustafson.*

5249. LEVINE, MAX and JOHN C. WELDIN. **Germicidal efficiency of a boric acid canning compound.** [Abstract.] Absts. Bact. 7: 5-6. 1923.—The compound consists of about 95 per cent boric acid and 5 per cent sodium chloride. It has little germicidal value at the concentration recommended.—D. Reddick.

5250. WILSON, H. F., and W. A. HADFIELD. **The effect of sodium hypochlorite upon the spores of American foul brood.** Science 57: 334. 1923.—Experiments show that the spores of *Bacillus larvae* are destroyed by special solutions of sodium hypochlorite and such solutions can be used to disinfect hives and combs. The bees are not poisoned by eating the chemical.—C. J. Lyon.

5251. YOUNG, H. C., and C. W. BENNETT. **Studies in parasitism. I. Toxic substances produced by fungi.** Rept. Michigan Acad. Sci. 22: 205-208. 1920.—The paper presents a study of the toxic principle produced by a virulent strain of *Fusarium oxysporum* Schl. The fungus was grown in Richards solution at pH 5, using 300 cc. for each culture in a 500 cc. Ehrlenmeyer flask. After 10 days the fungus had produced a heavy mat. Initially, and every 3rd day thereafter, the solution was removed from a culture, the pH determined and the filtrate, diluted with an equal amount of distilled H₂O placed in vials into which were placed the cut ends of freshly cut stems of potato (*Solanum tuberosum*), tomato (*Lycopersicum esculentum*) and celery (*Apium graveolens*). The check, cut potato stem placed in pure H₂O, wilted after 48 hours. The potato stem in the *Fusarium* culture medium wilted in 8 hours in the case of a culture 40 days old and in 42 hours for the 10-day-old culture. For the tomato the corresponding times were 8 and 24 hours, respectively, but for the 20- and 24-day-old cultures the time required was 36 hours. The celery wilted in 8 hours for the 20-day-old culture, 24 hours for the 24-day-old culture, and 12 hours for the 40-day-old culture. The pH of the culture solution changed toward the acid side until it reached 3.8 on the 10th day, then turned toward the alkaline side, reaching 5.2 the 24th day, and 7.4 the 40th day. The potato wilted more rapidly the older the culture, but the tomato and celery responded to the wilting least when the pH of the culture solution approached that of the plant juices, 4.8-5.6. An alkaloid was extracted from the culture fluid which when redissolved caused wilting, but much less rapidly. On the other hand, the alcoholic precipitate of the filtrate on being redissolved caused rapid wilting.—Ernst A. Bessey.

5252. ZOLLER, HARPER F., and SYLVIA M. EATON. **The phenol coefficient and relative disinfecting power of sodium hypochlorite.** [Abstract.] Absts. Bact. 7: 6-7. 1923.—The phenol coefficient ranges from 42.8 for *Bacillus tuberculosis* to 330. for *Proteus vulgaris*.—D. Reddick.

5263. HASKELL, S. B. Methods of distribution of phosphorus fertilizers. Jour. Amer. Soc. Agron. 15: 141-152. 1923.—Superphosphate, carrying a low percentage of water-soluble substances, applied alone is comparatively safe in any reasonable application, almost without regard to the method of application. When superphosphate comes in contact with the seed it is much safer than a complete mixed fertilizer. The retarding effect of fertilizers on germination varies with the crop, the soil, and with moisture conditions. Under humid conditions a local application of fertilizer may be more beneficial and economical than broadcast distribution. On drier western [U. S. A.] soils, as the benefit from localized application becomes relatively less, the danger of overstimulation of the crop becomes relatively greater.—*F. M. Schertz*.

5264. HORNER, W. W. Rainfall and run-off studies in St. Louis. Sprinkling experiments at Washington University. Municipal and County Engineering 63: 176-180. 1922.—Beds experimented with are $\frac{1}{16}$ acre in area; measured quantities of water are applied by hose and sprinklers at various rates and the run-off information obtained by accurately measuring the water collected from the experimental area in sub-drains. The experiments, part of

which have been completed, are being conducted on the Washington University campus for (1) typical soil conditions on the campus; (2) bare soil and sod covering; (3) surface slopes of 10, 5, and 0.08 per cent. It was found that the relation between total rainfall and run-off for each experiment could be represented with a fair degree of accuracy by a straight line. From this line 2 factors developed, (1) the intercept of the line on the rainfall axis gives the amount of water in cubic feet necessary to produce a normal surface film, and (2) the slope of the line indicates the rate of absorption (and possibly evaporation) during the run. The figures for volume required to produce a surface film and volume lost by absorption were divided by the amount of water applied and the results taken to represent the percentage of rainfall required for the surface film and percentage lost through absorption; and they checked almost perfectly against experimental run-off figures.—*A. E. Gorman.*

5265. JOFFE, JACOB S. **Acid phosphate manufacture by a biological process.** [Abstract.] *Absts. Bact.* 7: 19. 1923.—If suitable conditions are supplied it is possible to secure acid phosphate in 18 weeks by means of the sulphur-oxidation process.—*D. Reddick.*

5266. LOVEJOY, P. S. **The effect of forest fires upon the soil of the northern lake states.** *Rept. Michigan Acad. Sci.* 22: 9-20. 1920.—Arguments and evidence are submitted controverting the statements of some investigators that forest fires are beneficial, or at least not harmful to the soil.—*Ernst A. Bessey.*

5267. OSUGI, S. **On the catalytic action of soils.** *Ber. Ohara Inst. Landw. Forsch.* 2: 197-218. 1922.—The catalytic action of soil, or the power of soil to decompose H_2O_2 with the liberation of O_2 , was found to vary with the physical condition of the soil particles. Any treatment which increases the quantity of colloidal substances in the soil lessens catalysis, while peptinization of the soil particles speeds up the reaction. An alkaline reaction accelerates catalysis, and an acid reaction retards it to some extent. This is due partly to change in the physical state of the soil particles and partly to the reaction itself. Experiments conducted to determine the effect of the chemical nature of soil on its catalytic activity has led the writer to believe that humus, manganese, and iron may be the main constituents which give the soil catalytic power, although he could not obtain any quantitative relation between soil activity and soil-content of these constituents. The effect of bacteria on soil catalysis is slight, but that of enzymes is very marked.—*Margaret Buvens.*

5268. POWERS, W. L. **Progress of sulphur investigations with Oregon soils.** *Jour. Amer. Soc. Agron.* 15: 158-160. 1923.—A review of the sulphur investigations at the Oregon Experiment Station is given.—*F. M. Schertz.*

5269. SCHREINER, OSWALD. **Organic phosphorus in soils.** *Jour. Amer. Soc. Agron.* 15: 117-124. 1923.—Proof is offered of the existence of organic phosphorus in soils by the isolation of at least 1 definite organic compound containing it, namely, nucleic acid. Lecithins, phytins, nucleic acids, nucleo-proteins, and other complex compounds contain phosphorus in an organic form. The decomposition of nucleo-proteins and nucleic acids is discussed and it is pointed out that nucleic acid has a decided growth-promoting property not equalled by that of the usual inorganic nitrates or phosphates.—*F. M. Schertz.*

5270. SHERWIN, M. E. **The effect of fertilizers on germination and seedling growth.** *Jour. Amer. Soc. Agron.* 15: 66-73. 1923.—Fertilizers generally inhibit germination. The inhibition is greater when the fertilizer is in direct contact with the seed than when it is mixed with the soil, and is generally proportional to the quantity of fertilizer used. It is greater with the more soluble mineral fertilizers than with the less soluble mineral or organic materials. Apparently the inhibiting action is not due to a direct effect of the fertilizers upon the viability of the seed, but to a retarding influence upon the osmotic absorption of water from the soil by the seed, in the case of the soluble mineral fertilizers. The presence of organic fertilizers stimulates the growth of fungi, which are injurious to the root system of

young seedlings. Borax in amounts as small as 3.5 pounds per acre exerts a marked inhibiting effect upon root growth.—*F. M. Schertz.*

5271. TRUOG, E. **Determining the phosphorus needs of soils.** Jour. Amer. Soc. Agron. 15: 110-117. 1923.—A less expensive and more rapid method is needed for determining the phosphorus requirement of soils in regions like Wisconsin, because of the great natural variation in the soils. A tentative table gives the minimum percentages of phosphorus deemed adequate for general farming in Wisconsin under different soil conditions.—*F. M. Schertz.*

5272. WAKSMAN, SELMAN A. **Methods in soil microbiology.** [Abstract.] Absts. Bact. 7: 18-19. 1923.

5273. WIEDMER, F. **Peat as a fertilizer ingredient.** Jour. Amer. Peat Soc. 16: 52-54. 1923.—Peat is useful as a base for fertilizers on account of its high absorbency and its deodorizing properties. Some peat contains "available" nitrogen, but this must be determined for each kind of peat.—*G. B. Rigg.*

5289. ARBUCKLE, H. B., and O. J. THIES, JR. Variation of protein content of corn. Jour. Elisha Mitchell Sci. Soc. 38: 84-87. 1922.—Grain resulting from West Virginia-grown seed planted at Davidson, North Carolina, showed a marked reduction in protein. A modification of the Kjeldahl method was employed in determining the nitrogen content. There is about 1 month's difference in season between the 2 localities.—*W. C. Coker*.

5290. BAILEY, L. H. (Editor.) *Cyclopaedia of farm crops: a popular survey of crops and crop-making methods in the United States and Canada.* 669 p., 25 pl. 907 fig. The Macmillan Co.: New York and London, 1922.—Part I, of 7 chapters, covers structures and physiology, insects and diseases, breeding, plant introduction, crop management and weeds, growing under cover, seeding, planting and yields. Part II, of 2 chapters, covers preserved products, juices, and liquors. Part III covers North American field crops. Each chapter is subdivided into several parts and each is treated by a well known specialist. [See also Bot. Absts. 12, Entry 5360.]—*P. L. Ricker.*

5291. BARKER, EUGENE E. *Como seleccionar y cuidar la semilla de maiz para la proxima siembra.* [Selection and care of seed corn for the next crop.] *Rev. Agric. Puerto Rico* 64: 9-19. 6 fig. 1921.—Methods of selecting and storing seed corn under Porto Rican conditions, so as to improve the crop in yield and quality, are discussed.—*John A. Stevenson.*

5292. BARTLETT, H. *Farmers' experiment plots. Winter green fodder experiments, 1922. Western district.* *Agric. Gaz. New South Wales* 34: 251-254. 1923.—Due to the increase of certain wheat diseases crop rotation to include forage crops has become of increasing importance. Experiments undertaken cooperatively with 8 farmers in the production of forage crops, are described. Production is given in amounts of stock carried.—*L. R. Waldron.*

5293. BEAUVERIE, J. *Influence de la hauteur d'eau météorique pendant que la "période critique" du blé sur le rendement.* [The influence of the amount of rainfall during the "critical period" on the yield of wheat.] *Compt. Rend. Acad. Sci. Paris* 176: 707-709. 1923.—Azzi has called the stage of development during which the plant most needs water, the "critical period." For wheat this has been found to be the 30 days preceding and during the time of heading. A comparison has been made of the yield of wheat in the Department of Puy-de-Dôme for 21 years, 1901-1922, and the rainfall records for this region. The 2 graphs are shown and their rather close correspondence discussed. The rainfall varied from 70 to 160 mm.—*C. H. Farr.*

5294. BERKNER. *Der Einfluss der Jahreswitterung auf Höhe und Güte der Erträge unserer Feldfrüchte.* [The influence of the annual weather conditions on the size and quality of the yield of our field crops.] *Illus. Landw. Zeitg.* 42: 267-269, 276-277. 1922.—The effect of weather conditions on the yield and quality of the various crops, including optimum weather conditions for high yield and high quality, are discussed. It is maintained that by the selection of varieties adapted to local conditions of soil and climate, yields can be greatly increased both in size and in quality.—*John W. Roberts.*

5295. BLAKELY, W. F. *Weeds of New South Wales.* *Agric. Gaz. New South Wales* 34: 286-291. 3 fig. 1923.—*Euphorbia prostrata*, *E. thymifolia*, and *E. Preslii*, weeds introduced into Australia, are figured and described and methods of eradication are discussed.—*L. R. Waldron.*

5296. BLAKELY, W. F. *Weeds of New South Wales.* *Agric. Gaz. New South Wales* 34: 332-336. 2 fig. 1923.—Blessed thistle (*Cnicus benedictus*) and small-fruited devil's claw (*Martynia diandra*) are figured and described and methods of eradication and control are discussed. Neither plant is at all common.—*L. R. Waldron.*

5297. BRAMBILA, ALEJANDRO. *Establecimiento de semilleros de tabaco en terrenos esterilizados.* [Establishment of tobacco seed beds in sterilized soils.] *Rev. Agric. [Mexico]* 7: 305-307. 7 fig. 1922.—Methods of sterilizing tobacco seed beds with steam in order to prevent damping off are described.—*John A. Stevenson.*

5298. BRUNE, F. *Ueber vergleichende Kartoffelsortenversuche auf verschiedenen Bodenarten in den Jahren 1920 und 1921.* [Comparative experiments with potato varieties on different soil types.] *Illus. Landw. Zeitg.* 42: 259-260. 1922.—The experiments were con-

ducted with 26 potato varieties on high moor, low moor, sand, and marsh soils. The results show yield of tubers, comparative rating of the varieties based on the yield, and also the starch content of each variety.—*J. C. Dunegan*.

5299. CABRERA, PABLO MORALES. *Henequen y piño*. [Henequen and pineapple.] *Rev. Agric. Puerto Rico* 9²: 39-42. 1922.—The author gives a brief account of the uses and methods of preparing the fibers of *Agave* and of *Ananas*. The possibilities of growing the 2 plants for their fiber in Porto Rico are discussed.—*John A. Stevenson*.

5300. CALVINO, MARIO. *La caña Uba del Natal*. [The Uba cane of Natal.] *Rev. Agric. Puerto Rico* 7¹: 17-26. 1921.—The results of chemical tests of the sugar cane variety Uba or Kavangire at the Cuban experiment station in comparison with other standard varieties are given.—*John A. Stevenson*.

5301. CAUTHEN, F. F., AND J. T. WILLIAMSON. *Time of applying nitrate of soda to corn*. Alabama Agric. Exp. Sta. Bull. 210. 17-32. 1920.—Before the advent of the boll weevil, 100 pounds of nitrate of soda per acre to corn plants 2½ feet high gave an average increase of 7.5 bushels. When in addition an equal amount was added just before time to tassle, there was an increased production, and a still greater one when 240 pounds were applied.—More recent experiments indicate that 100 pounds of nitrate of soda when corn plants are 2½ feet high give the greatest increase of seed corn per acre.—*Wright A. Gardner*.

5302. CHARDÓN, CARLOS E. *El "Coque"*. [Nutgrass.] *Rev. Agric. Puerto Rico* 9²: 45-46. 2 fig. 1922.—A description is given of the plant known as coqui or nutgrass (*Cyperus rotundus*), widely distributed as a weed in Porto Rico, particularly in sugar cane fields where it harbors a new species of leafhopper (*Carolinia*) recently demonstrated to be a carrier of the mosaic disease.—*John A. Stevenson*.

5303. CHRISTIANSEN, EDV. *Dyrkningsforsøg med Sorter og Stammer af Havegulerødder og Rødbeder*. 1919-1921. [Experiments with varieties of garden carrots and beets 1919-1921.] *Tidsskr. Planteavl* 29: 117-142. 1923.—This is a report of government experiment station results.—*Albert A. Hansen*.

5304. COLON, E. D. *Trabajos de investigacion durante el año fiscal de 1919-1920*. [Investigational work during the fiscal year 1919-20.] *Rev. Agric. Puerto Rico* 6³: 7-14. 1921.—The director reviews the work of the Insular Experiment Station. Particular attention was given to sugar cane varieties in connection with studies of the mosaic disease. A start was made in the improvement of rice, corn, and tobacco varieties. Fertilizer tests with pineapples were carried on.—*John A. Stevenson*.

5305. CROSS, W. E. *Ensayos de cultivo de caña con caupi en las trochas*. [Experiments in cane cultivation with cowpeas interplanted.] *Rev. Indust. y Agric. Tucuman* 12: 99-102. 1 fig. 1922.—Experiments have been carried on for 4 years to test the effect of interplanting legumes (cowpeas) on yield of sugar, using the variety P.O.J. 213. The cowpeas were planted as soon as moisture conditions permitted after the ratooning cane had been cultivated for the first time. Check plots adjoined those in which the cowpeas were planted. The results indicated that not only was there no increase in the legume plots but that there was a decrease in yields as compared with the check plots, with evidence of actual injury to the cane.—*John A. Stevenson*.

5306. CROSS, W. E. *Ensayos sobre el cultivo de la caña sin quemar la maloja*. [Experiments in cane cultivation without burning the trash.] *Rev. Indust. y Agric. Tucuman* 12: 103-110. 1922.—It is customary in Tucuman to burn the trash after cutting the cane crop, while in some other cane growing countries it is left on the field. There are reasons to support both methods. Burning the trash makes cultivation easier and is said to cause the cane to

germinate more rapidly for the ratoon crops. Burning may also destroy fungi and insects. In Louisiana it prevents deterioration of the cane over winter. On the other hand the trash has a high fertilizing value if left on the ground and helps to hold moisture. Experimental work on this problem was started in 1916 using the variety P.O.J. 213. In one plot the trash was burned and in another dragged into the alternate rows. It was found that the idea that cane starts to germinate more quickly when the trash is burned is true only when the trash is left lying on the cane itself. The burned over plot yielded at the rate of 4,060 kgm. of sugar per hectare, the unburned plot 4,115 kgm. The yields in the one experiment were therefore practically the same but observations and tests demonstrated that the soil had been benefited greatly by non-burning of trash, a condition that would become evident with succeeding crops.—*John A. Stevenson.*

5307. CROSS, W. E. Ensayos sobre métodos de plantar la caña. I. Método Reynosa. [Experiments in cane-planting methods. I. The Reynosa method.] Rev. Indust. y Agric. Tucuman 12: 65-70. 1 fig. 1921.—A uniform plot was divided into 2 parts, 1 being planted to sugar cane by the Reynosa method, the other by the ordinary Tucuman furrow system. The Reynosa system used in Java consists of wide furrows (50-60 cm.) in which 2 lines of cane cuttings are planted, 1 on each side. The 2 plots were given uniform cultivation throughout 3 seasons. At cutting time each year the weight of cane produced was taken and determinations of sucrose and purity were made. The yields per hectare both in cane and on the basis of sugar content were practically the same but observations and tests demonstrated that the soil had been benefited greatly by non-burning of trash, a condition that would become evident with succeeding crops.—*John A. Stevenson.*

5308. CROSS, W. E. Ensayos sobre métodos de plantar la caña. II Método de plantar en hoyos. [Experiments in methods of cane planting. The method of planting in holes.] Rev. Indust. y Agric. Tucuman 12: 93-98. 2 fig. 1922.—The hole-method of planting sugar cane, in use in Barbados, Porto Rico, Mauritius, and other cane growing countries, was tested in Tucuman in comparison with the furrow system commonly used. The holes were made square 35 cm. across and 1.7 m. from center to center. The furrows were 1.8 m. apart, the distance usually employed. The variety P.O.J. 36 was used in planting both plots, 3 cuttings being placed in each hole. The usual cultivation for each type of planting was given throughout the season. The plot planted by the hole-method yielded at the rate of 2,248 kgm. of sugar per hectare, the furrow plot at the rate of 5,614 kgm. The 1st ratoon crop gave 6,294 kgm. for the hole plot and 5,804 for the furrow plot. The 2nd ratoon crop yielded 4,490 kgm. for the former and 3,996 kgm. for the latter, or 492 kgm. of sugar in favor of the hole-method of planting taking the totals for 3 years. These results are not considered conclusive and the experiment is being continued.—*John A. Stevenson.*

5309. CROSS, W. E. Estudios con variedades de cañas importadas. [Studies with imported cane varieties.] Rev. Indust. y Agric. Tucuman 12: 72-92. 6 fig. 1921.—Besides studies of Tucuman seedlings, experimental work has been carried on with many imported cane varieties, some of which are of promise under Tucuman conditions. P.O.J. 105 (Egyptian amber) has been grown experimentally for 3 years and found to be a high yielder but with little resistance to freezing. Tabular comparison is made between it and other varieties grown on a field scale as to sucrose, glucose, and purity of the juice. D1135, highly thought of in Queensland and Hawaii, has been of sufficient promise to warrant extended tests over 3 seasons. Yon Tan San of several Japanese varieties tested, was resistant to disease and freezing but was low in sugar content. Rose Bamboo proved to be the same as the Criolla or native white cane, which has no resistance to freezing or disease. A number of other varieties from Brazil, Barbados, and Peru and some of unknown origin were also grown in the experimental plots, and several were of sufficient promise to warrant further trials.—*John A. Stevenson.*

5310. CROSS, W. E. Frecuencia de cortar las cañas forrajeras. [Frequency of cutting forage canes.] Rev. Indust. y Agric. Tucuman 12: 70-72. 1921.—The variety Kavangire, grown because immune to mosaic disease, has proved satisfactory for forage but not for sugar.

The question arose as to whether it could be cut more often than once a year without causing the stools to deteriorate or lowering the total annual yield. Three year's tests have demonstrated that while total yield is somewhat reduced by more frequent cuttings, the reduction is negligible. There was no diminution of vigor in the stools of cane cut twice a year.—*John A. Stevenson.*

5311. CROSS, W. E. *Las cañas tucumanas en la cosecha del año 1921.* [The 1921 harvest of Tucuman canes.] *Rev. Indust. y Agric. Tucuman* 12: 58-62. 1921.—This is a progress report of the work at the Tucuman station with seedling sugar canes. Observations on the resistance of seedlings to freezing were made, and comparative chemical tests, including Brix, sucrose, glucose, and purity, obtained both before and after the freezing weather. The 1918 seedlings were grown as 2nd ratoons and those of 1919 as 1st ratoons. New plantings were also made and the resulting cane tested in the usual manner. Results are given in tabular form.—*John A. Stevenson.*

5312. CROSS, W. E. *Los ensayos con abonos para la caña de azucar.* [Fertilizer experiments with sugar cane.] *Rev. Indust. y Agric. Tucuman* 12: 45-57. 1921.—Fertilizer experiments have been conducted at the Tucuman station for over 11 years. During 1911-14 native varieties were employed and the results were so contradictory as to be valueless, due, it is now known, to the mosaic disease, which forced the practical abandonment of the native types in favor of the Javan canes. Experiments in 1916-18 indicated that phosphates and potash did not increase yields under Tucuman conditions. Manure tests started in previous years with Zwinga and native varieties gave increased yields for the former, while mosaic vitiated results with the latter. Ammonium sulphate was applied to 4 plots, 2 limed and 2 unlimed. The variety P.O.J. 36 gave increased yields but with a lower sugar content—a gain for the Colonas since they sell cane by weight. P.O.J. 213, also commonly grown, gave results tending in the same direction but less definite. On the whole, the author concludes, fertilizing is of doubtful value.—*John A. Stevenson.*

5313. DECHAMPAGNE, A. *Profondeur du sol pour blé.* [Depth of soil for wheat.] *Nat. Canadien* 49: 55-57. 1922.—In an old number of *Pèlerin*, Paris, it is recorded that roots of wheat will descend 50 cm. into proper soil. By the breaking up of sub-soils production over extensive regions has been increased.—*A. H. MacKay.*

5314. DERLITZKI und WEBER. *Mitteilungen aus dem Forschungsinstitut für Landarbeit Pommriß (Sachsen).* [Communications from the research institute for farm labor, Pommriß (Saxony).] *Illus. Landw. Zeitg.* 42: 235. 1922.—On the basis of experiments it is recommended that in soils which have a tendency to form a crust and to dry out quickly, seed should be planted $2\frac{1}{2}$ cm. deep rather than nearer the surface. In the absence of rain, seed planted at this depth germinates quickly and the young plants are soon visible. If rain follows the seeding, the resulting crust can be broken by harrowing, thus permitting the young plants to appear above the surface.—*John W. Roberts.*

5315. EASTERBY, H. T. *Bureau of sugar experiment stations. Annual report of the directors.* III Extract. *Australian Sugar Jour.* 15: 89-93. 1923.—The work at the Bundaberg station is detailed. Fertilizers, methods of culture, and the use of first, second and third ratoon cane for plants were tested. The third ratoons produced good cane crops.—*C. Rumbold.*

5316. FAWCETT, G. L. *Description de dos interesantes variedades de caña.* [Description of 2 interesting cane varieties.] *Rev. Indust. y Agric. Tucuman* 12: 156-160. 2 fig. 1922.—Technical descriptions are given of 2 varieties: P.O.J. 2727, a seedling recently introduced from Java and proving satisfactory under Tucuman conditions; and Chola, a soft native variety with high sugar content which has been grown only in gardens or small native plantings—it cannot be considered for use on plantation scale because of its non-resistance to mosaic and other diseases.—*John A. Stevenson.*

5317. FAWCETT, G. L. El efecto de las heladas sobre las yemas de la caña. [Effect of freezes on buds of cane.] Rev. Indust. y Agric. Tucuman 12: 32-39. 1921.—Freezing weather blackens sugar cane buds. If the temperatures are not too low, varying numbers of frozen buds will sprout. Experiments were conducted with the varieties P.O.J. 36, P.O.J. 213, D1135, and Kavangire planted at various intervals after the freezing weather. The 1st and last gave 50-75 per cent germination when planted immediately, but only 2-14 per cent when planted a month later. The other varieties failed entirely. Buds on the lower parts of the stalks proved more resistant to freezing than those higher up and were found to have a lower water content.—*John A. Stevenson.*

5318. FAWCETT, G. L. Notas sobre la clasificación de la caña morada criolla. [Notes on the classification of the native Morada cane.] Rev. Indust. y Agric. Tucuman 12: 125-127. 1 fig. 1922.—The author states that the native Morada cane of Tucuman is the same as the variety Bandjermazim hitam of Java and not Black Cheribon as claimed by Jeswiet. Variations in the bud characters of the 2 varieties are presented in support of this statement. The native striped cane (Rayada) is a mutation from the Morada and is the same as the Striped Preanger of Java. The white variation known as White Cristalina or Rose Bamboo is the same as the White Preanger of Java.—*John A. Stevenson.*

5319. FINGERLING. Die Gewinnung von Eiweiss im Inlande. [Domestic production of protein.] Mitteil. Deutsch. Landw. Ges. 38: 362-366. 1923.—In an address before the German Agricultural Society the speaker emphasized the possibility of increasing grass yields and also the percentage of protein by heavy applications of nitrogenous fertilizers and cutting the grass while very young. He had been able to increase the percentage of protein from 12 per cent in common meadow hay to 20 or 23 per cent. In order to save and utilize this high grade young grass the use of electrically equipped silos is advocated.—*A. J. Pieters.*

5320. FRUWIRTH, C. Die Saatenanerkennung. [Seed certifying.] 2nd ed., 152 p., 79 illus. Paul Parey: Berlin, 1922.—Part I is a general discussion and concerns: purpose and development of seed certifying; steps involved in, and leading to, certification; inspection requirements (general, in the field, determining the ancestry, in the harvesting and farm storage, in the warehouse); time for inspection; plot tests; seed certifying and strain certifying; conditional or unconditional certifying; inspector's equipment and qualifications.—Part II discusses the following crops with general remarks concerning the special problems, foreign field and weed seeds present, and diseases: winter wheat; winter rye; summer barley; summer oats; corn; upright legumes; procumbent legumes; potato; beet; turnip; carrot; cabbage; rape; poppy; flax; red clover; white clover; alfalfa; esparsette; grasses; miscellaneous vegetables (cucumber, melons, tomato, radish, celery, onion, etc.); orchard and forest trees; and vines.—*W. B. Lydenberg.*

5321. GEERTS, J. M. De factoren die het product bepalen. Zesde bydrage: Het product van E. K. 28. [The factors which determine the yield. Sixth contribution. The yield of E. K. 28.] Mededeel. Proefsta. Java Suikerindust. 1922: 351-389. 1922.—Sugar cane variety E. K. 28 has come into general cultivation only since 1916-1917. It has been shown to be superior in most cases to 100 P.O.J. It must be planted quite early. It yields better and lodges less on old than on new soils, and is drought resistant.—Many tables are given regarding growth and field and weather conditions influencing yields. The results from different plantations are discussed separately.—*Peter J. Klaphaak.*

5322. GEERTS, J. M. De factoren die het product bepalen. Zevende bydrage: Het product van 90 F. [The factors which determine the yield. Seventh contribution: The product of 90 F.] Mededeel. Proefsta. Java Suikerindust. 1922: 465-485. 1922.—The new sugar-cane variety, 90 F., at first very promising, is planted less and less because of its susceptibility to lodging. Under favorable conditions it produces well but lodges badly resulting in a decreased sugar content. The product is strongly influenced by the amount of lodging. The

variety is but little resistant to drought, much more sensitive than E. K. 2, E. K. 28, 247 B. It stools abundantly and has therefore been planted recently mainly on poor soils, where it lodges very little and gives a comparatively good product.—*Peter J. Klaphaak.*

5323. GEERTS, J. M. De factoren die het product bepalen. Achtste bydrage: Het product van Tjepiring 24. Negende bydrage: De varieteiten onderling vergeleken. [The factors which determine the yield. Eighth contribution: The product of Tjepiring 24. Ninth contribution: The varieties compared with one another.] Mededeel. Proefsta. Java Suikerindust. 1922: 487-531. 1922.—The sugar cane named Tjepiring 24 is very successful locally, especially in East Java (Sidoardjo). The leaves are stiff, the variety showing external signs of drought damage much later than others. Growing slowly it lodges but little on rich soils, where other varieties lodge severely. It has a long growing period and produces a good yield of sugar. Immunity to sereh and mosaic are advantages over susceptible varieties. In the 9th contribution varieties discussed in former articles are compared, the following being mentioned: 100 P.O.J., 247 B., E.K. 2, D.I. 52, Tjepiring 24, 2714 P.O.J., 2725 P.O.J., 1499 P.O.J., E.K. 28. Tables compare varieties under different conditions of weather, soil, yields, etc. 100 P.O.J. is generally replaced by E.K. 28 on the drier soils and by D.I. 52 on the moist soils. 247 B. is mainly replaced by Tjepiring 24 on rich soils (moist soils), but also by D.I. 52, E.K. 28, E.K. 2, and during recent years by 2714 P.O.J. Newer varieties have been gaining in popularity.—*Peter J. Klaphaak.*

5324. GIROLA, CARLOS D. Abrojo grande. [Giant cocklebur.] Bol. Ministerio Agric. Nacion [Argentina] 15: 1 col. pl. between pages 168-169. 1920.—The botanical characteristics, injury caused, and control of *Xanthium strumarium* are given.—*John A. Stevenson.*

5325. GIROLA, CARLOS D. Destrucción de las plantas invasoras perjudiciales, vivaces y anuales. [The destruction of annual and perennial injurious plants.] Bol. Ministerio Agric. Nacion [Argentina] 25: 165-169. 1920.—Methods for controlling or destroying weeds are given.—*John A. Stevenson.*

5326. GIROLA, CARLOS D. El cultivo de la avena en la Republica Argentina y el concurso de avenas de 1920-1921 organizado por el Museo Agrícola de la Sociedad Rural de Argentina. [Cultivation of oats in Argentina and the 1920-21 oats "show" organized by the Agricultural Museum of the Rural Society of Argentina.] Bol. Ministerio Agric. Nacion [Argentina] 27: 262-273. 4 fig. 1922.—Oats are extensively grown in Argentina, either for export or for green feed, 1,295,000 hectares having been planted in 1917-18, for the most part in Buenos Aires and neighboring provinces. Very little has been done to improve the varieties used; in fact, improved imported varieties have become mixed within a few years with the native types and so lost. The average yield is 1,000 kgm. per hectare.—*John A. Stevenson.*

5327. GIROLA, CARLOS D. Ray-grass oriolla. [Native ray grass.] Bol. Ministerio Agric. Nacion [Argentina] 26: 488-489. 1 col. pl. 1921.—The botanical characters, uses, and cultivation of *Lolium brasilianum* Nees are given.—*John A. Stevenson.*

5328. GIROLA, CARLOS D. Sorgho de Alepo. [Johnson grass.] Bol. Ministerio Agric. Nacion [Argentina] 27: 232-235. 1 col. pl. 1922.—The manner of spread of this serious weed pest is discussed and control measures are outlined.—*John A. Stevenson.*

5329. GRANEL, JOAQUIN. Cultivo del centeno. [Rye cultivation.] Rev. Soc. Rural Córdoba [Argentina] 21: 6214-6225. 1922.—Popular.—*John A. Stevenson.*

5330. GUARDIOLA, JORGE. Cultivo del ajonjolí. [Sesame culture.] Rev. Agric. [Mexico] 7: 327-332. 2 fig. 1922.—The author recommends increased plantings of *Sesamum indicum* in Mexico. Cultural directions are given, including varietal descriptions, preparation of land, seeding, cultivation, harvesting, and yields to be expected.—*John A. Stevenson.*

5331. HANSEN, JOSEF. Forsøg med Afvanding, Mergling of Kalkning, Jordlaegning og Godskning paa Højmoser ved Askov. [Experiments with the application of marl, lime, liquid manure and other manures on peat soils at Askov.] Tidsskr. Planteavl 29: 1-26. 1923.—Experiments are reported with virgin peat soils about 15 feet deep. In open ditch experiments the yield of cereals and legumes was best with a distance of 11.3 m. between ditches and least when the ditches were 22.6 m. apart. The yield of grass crops for hay was best when the ditches were 22.6 m. apart and about 20 per cent less when ditches were 5.7 m. apart. The application of 36,000 kgm. of carbonate of lime as ground chalk or clay marl per hectare gave best yield of rye, oats, and vetch, while 18,000 kgm. gave best yields of barley and oats and fair yields of legumes, oats and grass; 36,000 kgm. of lime reduced the yield of grain 10-15 per cent and reduced grass hay yields 15-20 per cent. On permanent grassland bogs with a 5 cm. layer of sand, lime and marl produced equally good results, but when a 2.5 cm. sand layer was used, marl gave an 8 per cent greater yield than lime. Where no layer of soil was laid, marl gave 33 per cent higher yields than lime. From 20 to 30 per cent increased yields of cereals and grasses were secured from nitrogen fertilizers applied to high peat bogs. Similar results were secured with Chile saltpeter, ammonium sulphate, and liquid manure, while calcic nitrogen was not effective.—The Askov Experiment Station is located in the heather and bog region of western Jutland, a region formerly considered of little value. As a result of drainage and the use of fertilizers, the region is now highly productive.—*Albert A. Hansen.*

5332. HARREVELD, J. VAN. De samenstelling van dan aanplant 1921-1922. [The planting of 1921-1922.] Mededeel. Proefsta. Java Suikerindust. 1922: 391-412. 1922.—This paper includes 8 tables giving varieties planted, amount of bouws planted for each variety, and totals for the varieties and for the plantations. The number of bouws in bibitgardens in the plains and amount of imported mountainbibit are likewise given.—*Peter J. Klapaak.*

5333. HARREVELD, J. VAN. Statistiek van de verbreiding en de productie der rietsoorten in Oogst 1921. [Statistics regarding sugarcane varieties from 1921 crop.] Mededeel. Proefsta. Java Suikerindust. 1922: 533-612. 1922.—The paper consists of tables of statistical data obtained from 172 plantations. The varieties planted and percentages of the entire cane production for Java are given as follows: E.K. 28, 38½; 247 B., 21¼; D. I. 52, 14¼; 100 P.O.J., 6½; E.K. 2, 6½; 90 F., 3; S.W. 3, 2¼; Tjepiring 24, ¼; other varieties, 6½.—*Peter J. Klapaak.*

5334. HARRISON, L. S. Graze off the paddymelons. Agric. Gaz. New South Wales 34: 285. 1923.—A suggestion is made in regard to eradication of *Cucumis Myriocarpus*.—*L. R. Waldron.*

5335. HELM, C. A., AND L. J. STADLER. Productive methods for oats in Missouri. Missouri Agric. Exp. Sta. Circ. 105. 16 p., illus. 1922.—A brief popular discussion of oats varieties and culture for Missouri is presented.—*L. J. Stadler.*

5336. HELM, C. A., AND L. J. STADLER. Productive methods for wheat in Missouri. Missouri Agric. Exp. Sta. Bull. 188. 40 p., 8 fig. 1921.—Varieties and culture of wheat are discussed on the basis of station and outlying experiments since 1905.—*L. J. Stadler.*

5337. HENDERSON, G. S. Report of the Imperial agriculturist. Sci. Rept. Agric. Res. Inst. Pusa 1921-22: 68-78. 2 pl. 1922.—The report summarizes operations on the Pusa farm; field experiment work; trials of farm machinery; milk production; and the work of selection of the cross-bred dairy herd.—*Winfield Dudgeon.*

5338. HEUSER, OTTO. Versuche über die Standweite der Zuckerrüben. [Experiments in spacing sugar beet plants.] Illus. Landw. Zeitg. 43: 85. 1923.—The results of experiments on different soil types are reported.—*John W. Roberts.*

5339. HEUSER, OTTO. Zur Technik des Zuckerrübenbaues. [On the technique of sugar-beet culture.] Illus. Landw. Zeitg. 42: 411-413. 1922.—This is a popular article on the growing of sugar-beets.—*John W. Roberts.*

5340. HOLMGAARD, J. Bestemmelse af Kornprøvers Sortsrenhed ved Undersøgelse i Laboratoriet. [Determination in the laboratory of varietal purity of grain samples.] Nordisk Jordbrugsforskning 1922: 361-364. 1 col. pl. 1922.—At the state seed testing station it is possible to recognize 2-rowed and 6-rowed barley seeds and the common *erectum* and *nutans* varieties. Wheat and rye varieties can be determined in few cases only in the laboratory. In oats the color varies widely with growth and storage conditions, and determination of varieties in the laboratory is hardly possible. Only "Lyngby Hede Havre" may be determined after germination by the color of the first leaf,—grey-violet in light and violet in the dark.—*Ernst Gram.*

5341. HOWARD, A., AND G. L. C. HOWARD. Report of the Imperial economic botanists. Sci. Rept. Agric. Res. Inst. Pusa 1920-21: 8-20. 2 pl. 1921.—An attempt to solve the problem of production and distribution of improved varieties of wheat among small cultivators has been made in the United Provinces by cooperating with interested estate holders, certain government agencies, and cooperative movements. The number of private seed farms has increased rapidly. Pusa 4, a stiff straw variety of wheat, has yielded 40 $\frac{3}{4}$ maunds (about 1500 kgm.) per acre under estate conditions. Quick maturing wheats are a necessity in the Plains wheat area; if planted while the ground is too warm in the autumn, white ants destroy the seedlings, and varieties that mature too late in the spring are injured by the advent of the hot dry season. Work is in progress to develop desirable bearded varieties.—Testing and distributing improved varieties of tobacco, *Hibiscus cannabinus*, *H. sabdariffa*, *Cicer arietinum*, *Linum usitatissimum*, and *Carthamus tinctorius* have been carried on. The commercial value of the oil from *Carthamus tinctorius* seed is under investigation.—The deleterious action of grass growing under fruit trees, and the problem of soil aeration are being studied. During the monsoon *Medicago sativa* (lucerne) usually dies from wilt due to poor aeration of the roots, as a result of consolidation of the surface soil. It can be kept healthy by growing on flat raised beds about 1 m. broad, with irrigation trenches between.—*Winfield Dudgeon.*

5342. HOWARD, A., AND G. L. C. HOWARD. Report of the Imperial economic botanists. Sci. Rept. Agric. Res. Inst. Pusa 1921-22: 9-23. 1922.—Over 1,000,000 acres of Pusa wheats are now grown in the United Provinces and the Punjab. Pusa No. 4 and No. 12 wheats show good milling qualities. Bearded wheats developed to resist wild animals and birds give slightly higher yields than Pusa No. 12.—Development and distribution of improved varieties of tobacco, *Hibiscus cannabinus*, *Linum usitatissimum*, *Carthamus tinctorius*, and *Cicer arietinum* have continued, and work is begun on Indian barleys.—Work on soil aeration continues. The cotton plant is very sensitive to poor aeration, and has been found useful for experimental work. To investigate the action of grass on fruit trees, an orchard of 8 locally grown fruit trees was set out in 1914-16. It was divided into 3 parts: 1 under clean cultivation; 1 under complete grass; and 1 under grass, with aerating trenches filled with broken bricks. "The amount of carbon dioxide (in the soil atmosphere) was greatest in the grassed plot, least in the cultivated, and intermediate in the trenched plot. During the rains, the proportion of carbon dioxide rose considerably, particularly in the plots under grass." Root development in *Andropogon sorghum*, *Cajanus indicus*, and *Crotalaria juncea* is being studied in relation to agricultural practice. *Medicago sativa* (lucerne) grown on raised beds with irrigation trenches between does not die out during the monsoon; a crop sown October 20, 1921, has given 8 cuts up to July 11, 1922, yielding at the rate of 70,000 pounds green weight per acre. Lucerne does not set seed readily at Pusa.—Lathyrism, a disease "supposed to be due to long continued consumption of the seed of *Lathyrus sativus*," is being studied. No traces of alkaloid were found in the seed, but alkaloids were found in the seed of *Vicia sativa* a common weed of *Lathyrus* fields. Pollination, unit species, and relation of root development to disease resistance are also being studied in *Lathyrus*.—*Winfield Dudgeon.*

5343. HYSLOP, G. R. **Field peas.** Oregon Agric. Exp. Sta. Circ. 34. 2 p. 1923.—This crop does best in a cool season. Applications of land-plaster and sulphur give good results. Where garden peas or vetch have preceded field peas inoculation is not necessary. Where they are a new crop it is best to inoculate the seed. Early planting is desirable.—Standard varieties for high altitudes and dry-land districts are Kaiser, Bangalia, and Carlton. For that section west of the Cascade Mountains good varieties are White Canadian, Blue Prussian, and Arthur. Seeding should be at the rate of 90–120 pounds per acre. When planted with grain 90 pounds of peas should be used to $1\frac{1}{4}$ – $1\frac{1}{2}$ bushels of grain. Under dry-farm conditions peas are planted in double rows about 3 feet apart.—C. E. Owens.

5344. JACK, H. W., AND W. N. SANDS. **Cotton experiments in Malaya.** Malayan Agric. Jour 10: 248–258. 1922.—As a result of experiments during 2 seasons with several varieties of Egyptian and Sea Island Cotton it is shown that long staple cotton of good average quality can be grown in Malaya with a fair degree of success, as compared with the average of other countries, provided that its cultivation and the time of its sowing are given adequate attention and that pest control is systematized. The cotton-stainer (*Dysdercus cingulatus*) feeds on the seeds of other cultivated plants besides cotton, including Kapok, Roselle, and Hibiscus, and these would have to be destroyed or the pests on them controlled in cotton-growing localities. In the authors' opinion the eastern and northern states of the Peninsula offer the best prospects on account of their more defined wet and dry seasons and their lighter soils.—R. E. Holttum.

5345. JACOBSEN, L. P. **Forsøg med forskellig Afvanding og Sandbelægning paa Høgmose.** 1912–1921. [Experiments with ditching and drainage on peat soil. 1912–1921.] Tidsskr. Planteavl 29: 29–55. 1923.—Results of experiments on the influence of the distance between drainage ditches on yields are reported. The necessity of using layers of sand on soil is explained.—Albert A. Hansen.

5346. JOHNSEN, J. **Jordbundens Indflydelse paa Rødbedernes Stamme-Egenskaber.** [The influence of soil on the strain characteristics of red beets.] Gartner-Tidende [Copenhagen] 39: 151. 1923.—In 1922, 2 strains of red beets, grown for 2 generations on different soil types, were grown for comparison. The seed of one originated from a good, rich soil where the plants developed well, while the other came from a lighter soil where the growth was irregular and the form of the roots inferior. Bad form and color was finally less prominent in the 2nd, though it had more beets with broadly seated leaves and a higher leaf percentage. It is suggested that where beets were grown on poor soil the poor qualities have been apparent to a larger extent and therefore they have been discarded in sorting.—Ernst Gram.

5347. JONES, ROY C. **Oats and vetch versus corn or sunflowers for silage.** Oregon Agric. Exp. Sta. Bull. 194. 20 p., 2 fig. 1922.—As measured by milk yield there is little difference in feeding value of the 3 kinds of silage. Over a series of years sunflower has yielded the largest tonnage, with oats and vetch 2nd, and corn 3rd. During certain favorable seasons, oats-and-vetch gave the highest tonnage. Oats-and-vetch have certain advantages, however, among which are: (1) yield more on heavier, poorly drained soils; (2) fill silo in early summer and keep it from drying out and collapsing; (3) placed in silo in spring and used during summer allows double use of silo, as it can be filled again in fall with corn or sunflowers; (4) require no cultivation; (5) vetch benefits the soil.—C. E. Owens.

5348. KNIERIENE, W. VON. **Die starke Stickstoffdüngung der Wiesen als Mittel zur Gewinnung eiweissreichen Futters.** [Heavy application of nitrogenous fertilizers to meadows for securing protein-rich fodder.] Mitteil. Deutsch. Landw. Ges. 38: 384–386. 1923.—Sections of a meadow were fertilized with urea, others with minerals and urea, or with minerals alone; some were left unfertilized. The yields from those receiving complete fertilizers were much greater than from the others and the protein content of the hay was also higher.—A. J. Pieters.

5349. KORFF, ADOLPH. Ueber Queckenvertilgung. [Concerning the extermination of quack grass (*Agropyron repens*).] Illus. Landw. Zeitg. 43: 109. 1923.—The planting of crops which shade the ground most is particularly recommended as a means of extermination.—*John W. Roberts*.

5350. KUIJPER, J. Bibit voor orienteerende varieteiten proeven. [Bibit (cuttings) for varietal experiments.] Arch. Suikerindust. Nederland. Indie 30: 855-867. 1922.—New sugar cane varieties obtainable by planters after December, 1922, for testing under field conditions are listed as follows: 2801 P. O. J. (= 2722×2764 , = $[2364 \times \text{EK } 28] \times [\text{K} \times \text{EK } 2]$); 2802 P. O. J. (= $2364 \times \text{Tjoek. } 154$); 2803 P. O. J. (= 2703×2713 , = $[2354 \times \text{EK } 28] \times [2364 \times 2571]$); 2804 P. O. J. (= 2721×2751 , = $[2364 \times \text{EK } 28] \times [2364 \times 920]$); 2805 P. O. J. (= $2725 \times 247 \text{ B}$, = $[2364 \times \text{EK } 28] \times 347 \text{ B}$); 2806 P. O. J. (= $1547 \times 247 \text{ B}$, = $[213 \times 369] \times 247 \text{ B}$) These varieties are only a few years old and require thorough testing. All are practically immune to sereh and yellow-stripe disease; only 2806 occasionally shows a few stripe-disease plants.—Gumming disease has not yet been observed among them.—*Peter J. Klaphaak*.

5351. LARSEN, J. C. Dyrkningsforsög med Havresorter. 1915-1920. [Experiments with oats. 1915-1920.] Tidsskr. Planteavl 29: 56-94. 1923.—Yields of white, grey, and heather oats on newly reclaimed peat soil are compared with yields on other types of soils in other regions.—*Albert A. Hansen*.

5352. LARSEN, L. J. Kartoffelavl i aeldre Tid og nu. [Potato growing in former days and now.] Jydsk Landbrug 5: 242-244. 1923.—Thirty years ago the potato crop in central Jutland was 4-5 tons per hectare. The potatoes were grown after fallow, manured slightly, cultivated poorly, and not kept free of weeds. At present 25-30 loads barnyard manure, 200 kgm. 18 per cent superphosphate, 150 kgm. potassium salt, and 150 kgm. Norway saltpeter are applied, the potatoes are cultivated, kept free from weeds, and healthy seed potatoes used. In 1922 the average output of 12 fields of the variety Richters Imperator was 34 tons per hectare, and the average of 17 fields of Up-to-Date 35 tons per hectare.—*Ernst Gram*.

5353. LINDHARD, E. Dyrkningsforsög med Sukkerroestammer. 1922. [Experiments with sugar beets. 1922.] Tidsskr. Planteavl 29: 95-115. 1923.—The experiments give results of trials at the Government experiment stations of Danish strains of sugar beets supplied by Danish seed firms; the yields are compared with those of strains supplied by Swedish and German sugar factories. In general, the majority of the Danish strains yield slightly more root with a slightly smaller percentage of sugar than the so-called standard strains.—*Albert A. Hansen*.

5354. MCCALL, J. STEWART. A handbook on cotton and tobacco cultivation in Nyasaland. A guide to prospective settlers. 85 p. Government Printer: Zomba, Nyasaland, 1920.—Cotton cultivation. P. 1-62. Designed for prospective settlers, information is given concerning the environmental needs of cotton, establishing a cotton farm, varieties and selection, cultural and field methods, harvesting and marketing practices, pests and their control, and cotton legislation.—*H. M. Steece*. Tobacco cultivation. p. 64-78. This part contains a brief discussion of history of tobacco culture in Nyasaland, climate of the region, soils used for tobacco, management of seed beds, transplanting, field management, harvesting and curing. The Virginia or flue-cured type of leaf is produced. Exports for fiscal year ending March 31, 1920, were 4,340,000 pounds. Tobacco soils vary from light sandy loams to stiff red clays and are poor in nitrogen, normal to slightly deficient in phosphoric acid and rich in potash. The most profitable yield of tobacco is 450-550 pounds per acre. The best quality is obtained from virgin or grass land. Only a limited supply of wood is available for curing tobacco and attention to re-afforestation will be necessary to place the tobacco industry on a permanent footing. [See also Bot. Absts. 12, Entry 5288.].—*W. W. Garner*.

5355. MASSEY, ENRIQUE MOLINA. Depósitos para conservación de papas. [Potato storage.] Bol. Ministerio Agric. Nacion [Argentina] 27: 274-279. 4 fig. 1922.—The construction of varying types of storage buildings and pits for potatoes is described.—*John A. Stevenson.*

5356. MILLIGAN, S., AND W. H. HARRISON. Report of the Director. Sci. Rept. Agric. Res. Inst. Pusa 1921-22: 1-8. 1922.—The report gives a brief summary of the scientific work of the sections of chemistry, botany, animal nutrition, bacteriology, mycology, entomology, and agriculture, and of the Imperial Dairy Expert and the Sugar Bureau.—*Winfield Dudgeon.*

5357. PACZKA, ALEJANDRO. El cultivo del tabaco en Tlapacoyan. [Tobacco culture in Tlapacoyan.] Rev. Agric. [Mexico] 6: 617-623. 6 fig. 1922.—Popular.—*John A. Stevenson.*

5358. PETZKE, EGÓN. La Fourcroya gigantea una planta textil. [Fourcroya gigantea, a fiber plant.] Bol. Ministerio Agric. Nacion [Argentina] 26: 403-407. 1921.—A botanical description of the plant is given. Methods of cultivation, harvesting, and preparation of the fiber are discussed with particular attention to the last point since considerable difficulty has been experienced in producing fiber in Argentina.—*John A. Stevenson.*

5359. REYNOLDS, MARK H., AND A. N. SHEPHERD. Farmers' experiment plots. Wheat and oat experiments, 1922. Agric. Gaz. New South Wales 34: 229-237. 2 fig. 1923.—Experiments were conducted upon a number of private farms. Wheat varieties Bomen, Waratah, and Warren scored high yields for the northwest district. Yields were not increased by the use of phosphates. Very little disease was in evidence.—*L. R. Waldron.*

5360. RUSSELL, E. J. A great American agricultural cyclopaedia. [Rev. of: BAILEY, L. H. (editor). Cyclopaedia of farm crops: a popular survey of crops and crop-making methods in the United States and Canada. xvi + 699 p., 25 pl., 907 fig. The Macmillan Co.: New York and London, 1922 (see Bot. Absts. 12, Entry 5290).] Nature 111: 140-141. 1923.

5361. RUSSELL, JOHN. Rothamsted and agricultural science. Nature 111: 465-470. 2 fig. 1923.—The remarkable development of British agriculture between 1843 and 1870 would have been impossible without artificial manures. On the heavy soil at Rothamsted a liberal use of phosphates gives best results, but potash is less effective. On the lighter soil of Woburn, potash is more effective and phosphates in a less degree. Experiments with artificial farmyard manure are being tried. Extensive studies of the bacteria, algae, fungi, and protozoa of the soil have been made. The application of statistical methods to the study of the factors and results is beginning to give results. Figure 2 shows the predictable variation in wheat yields on 5 Broadbalk fields. Weather and soil deterioration figure most prominently on the fields without potash and with no manure. A part of the weather effect, from about $\frac{1}{2}$ in field with barnyard manure, to about $\frac{1}{2}$ on that without potash, can be predicted from the rainfall.—*O. A. Stevens.*

5362. SAGAWÉ, D. Raubbau und Ertragswert der Landgüter in den Kriegsjahren. [Exploitation and yield of agricultural estates during the war years.] Landw. Jahrb. 58: 618-644. 1923.—A detailed study of the value of farm yields in Germany during 1913-1919 is reported.—*S. A. Waksman.*

5363. SAYER, WYNNE. Report of the Secretary, Sugar Bureau (India). Sci. Rept. Agric. Res. Inst. Pusa 1920-21: 85-90. 1921.—The Bureau has collected and disseminated information, given technical advice in sugar production, and conducted experimental work in the development of desirable varieties of cane.—*Winfield Dudgeon.*

5364. SCHLUMBERGER, O. Kartoffelkonservierung und Kartoffelbeizung. [The conserving of potatoes in storage and the treatment of potatoes with fungicides.] Illus. Landw. Zeitg. 42: 372-373. 1922.—Some of the literature on the subject is compiled.—*John W. Roberts.*

5365. SCHULTZ, E. F. *La grama elephante*. [Elephant grass.] Rev. Indust. y Agric. Tucuman 12: 39-45. 4 fig. 1921.—*Pennisetum purpureum*, a forage plant native of Africa which has given excellent results in some parts of the world, has been under trial in Tucuman. The seed germinates poorly and a stand can more readily be obtained from cuttings. The rainfall in Tucuman during the time the grass has been under trial has been above normal so that it has not been possible to ascertain its drought-resistant possibilities. The grass was eaten readily by stock and was not injured by trampling or close grazing. Because of its thick stems the grass is not suited for hay but it is thought that with proper handling it may make a good quality silage.—*John A. Stevenson*.

5366. SCHURIG, A. *Der Anbau des Hanfes*. [The culture of hemp.] Illus. Landw. Zeitg. 42: 387-388. 1922.—This popular article on the culture of hemp includes the choice of soils, varieties, fertilizers, manner and time of seeding and harvesting, and preparation of the soil for seeding.—*John W. Roberts*.

5367. SHEPHERD, A. N. *Crop rotation on the Murrumbidgee irrigation areas*. Agric. Gaz. New South Wales 34: 249-250. 1923.—A 3-year rotation designed principally for dairy-men is suggested as follows: green fodder, such as oats and vetches, the field to be grazed later; sorghum and vetches; and maize sown with cowpeas. Three fields are to be used.—*L. R. Waldron*.

5368. SÖRENSEN, HAKON. *Dyrkningsforsog med Sorter og Stammer af lave Marvaerter, 1919-1921*. [Experiments with varieties of peas, 1919-1921.] Tidsskr. Planteavl 28: 807-833. 1922.—The following varieties of peas were used: American Wonder, London Wonder, Record, Wonder of Witham, Coopers Market, Carter's Daisy, and Strategem.—*Albert A. Hansen*.

5369. TERRELL, GEORGE B. *Fifteenth annual report of the Commissioner of Agriculture of Texas*. 1-47. 1922.—In this report are incorporated the reports of: J. M. DEL CURTO, division of plant pathology and seeds; E. L. SCHOSTAG, division of orchard and nursery inspection; R. E. YANTIS, division of statistics; J. M. BURKETT, division of edible nuts; R. E. McDONALD, division of entomology; and E. W. COLE, bureau of markets. Statements regarding the divisions are added.—*Mary R. Burr*.

5370. THATCHER, L. E. *The status of the soybean crop in Ohio*. Monthly Bull. Ohio Agric. Exp. Sta. 8: 59-64. 1923.—The data presented are based on information gained from questionnaires sent to 300 soybean growers in the state. It is thought that at the present rate of increase the next decade will see soybeans rivaling oats for a place as the major crop in the State. Ito San is the most popular variety followed closely by Midwest. Manchu, Medium Green, Wilson, and Elton are also grown. Suggestions are given as to the relative merits of each variety for serving the needs of the Ohio farmers; also brief discussions are devoted to dates of seeding, methods, rate and manner of seeding and harvesting. A list of 61 varieties with protein and oil content is appended.—*R. C. Thomas*.

5371. TONNELIER, CARLOS R. *Instrucciones practicas para la cosecha de trigo, lino, cebada, centena, avena, y maiz*. [Practical instructions for harvesting wheat, flax, barley, rye, oats, and corn.] Bol. Ministerio Agric. Nacion [Argentina] 26: 408-426. 1921.—Popular.—*John A. Stevenson*.

5372. VALENTINE, MAX. *Tobacco for Victorians*. Seed beds for bright tobacco. Jour. Dept. Agric. Victoria 19: 722-726. 1921.—Recommendations are made regarding selection of sites for seed beds, most suitable soil, methods of preparing and sterilizing the soil, sowing the seed, covering the beds, and care of the seedlings. Because of uncertainty as to seasonal conditions several beds should be planted in different locations and on different dates, thus providing for varying soil-drainage and temperature requirements. Only freshly cleared land is used. The best soil is a deep, friable, light sandy loam. To destroy weed seeds, fungi, and soil insects the soil is sterilized by surface burning or by steaming. After seeding, a frame 6 inches high is placed around the bed and covered with cheese cloth.—*W. W. Garner*.

5373. VALLEJO, CARLOS. El cultivo de papas en los Estados Unidos. [Potato culture in the United States.] Bol. Ministerio Agric. Nacion [Argentina] 27: 280-307. 27 fig. 1922.—The cultivation of potatoes in the U. S. A., including cultivation, varieties, harvesting, storing and yields is discussed.—*John A. Stevenson.*

5374. VUILLET, F. La culture du coton égyptien dans l'Arizona. Rapport de mission aux États-Unis. [The culture of Egyptian cotton in Arizona. Report of the mission to the United States.] 84 p., 16 illus. Émile LaRose: Paris, 1922.—The report begins with the history of the introduction into the U. S. A. of Egyptian cotton, stating how a cooperative association was formed for its culture under irrigation, thus assuring the necessary water for irrigation and the drainage of the valley land. Roosevelt Reservoir, Granite Reef Dam, and Joint Head are described. Insect injury is noted together with methods of control. Tables show the annual production in the Salt River Valley and sale price of the cotton. In 1914 an association was formed known as the Arizona Pima Cotton Growers. The report closes with a commercial classification of the Pima variety.—*Grace M. Weston.*

5375. WARTH, F. J. Report of the Imperial Agricultural Chemist. Sci. Rept. Agric. Res. Inst. Pusa 1920-21: 21-27. 1922.—Methods of nitrogen determination have been tested. In investigations of enzyme content and action in sugar cane it is found that windrowing the cane under proper conditions increases the output of sugar. The ratio of oxygen to CO₂ in the soils has been determined and shows striking differences between the grassed and cultivated plots. The ratio for the latter was found to vary between 86 and 60, whilst in the grassed plots the corresponding figures were 63.6 and 8.3. Soils of the Institute farm have been examined and correlated as far as possible with crop production.—*Winfield Dudgeon.*

5376. WEBER, C. A. Der jährliche Saatgutbedarf Deutschlands zur Anlage und Verbesserung des landwirtschaftlich nutzbaren dauernden Grünlandes. [The annual seed requirements of Germany for laying down and improving agriculturally valuable grass lands.] Mitteil. Deutsch. Landw. Ges. 38: 272-274. 1923.—The author has made an estimate of these seed requirements for the more important meadow and pasture grasses and legumes, and presents the figures in a table and discusses their significance.—*A. J. Pieters.*

5377. WEIDNER. Die Entwicklung des Flachsbaues in Bayern. [The development of flax culture in Bavaria.] Illus. Landw. Zeitg. 42: 252-253. 1922.—This is an historical sketch of flax culture in Bavaria with statistical tables showing its development.—*John W. Roberts.*

5378. WEISS, F. Die Stickstoffdüngung der Luzerne und anderer Schmetterlingsblütler. [Nitrogen fertilization for alfalfa and other legumes.] Illus. Landw. Zeitg. 43: 117-118. 1923.—Experiments are reported which show beneficial results from the moderate use of nitrogenous fertilizers.—*John W. Roberts.*

5379. WIGGLESWORTH, A. The new era in flax. Jour. Textile Inst. 14: 109-117. 1923.—Since linen manufacture was introduced into Ireland by the Huguenots over 3 centuries ago, there had been, until 1914, a steady expansion in the volume of linen manufactured, and a corresponding increase in flax fiber. Russia became the chief source of supply. The exports of flax from Russia increased from 167,000 cwt. in 1749 to 4,379,000 cwt. in 1907. The production in Russia decreased from 1907 to 1914, due partly to decreased acreage, but more to decreasing yield per acre. In 1880 the average yield of flax fiber in Russia was about 400 pounds per acre, and just before the war it had fallen to about 270. Since the war the flax position in Russia has become still worse, and an early return to pre-war conditions seems impossible. An important new field for fiber flax production has been established at elevations of 7,000-9,000 feet in Kenya Colony, with 20,000 acres yielding flax fiber that has been thoroughly tested by the Belfast College of Technology and proved to be superior to Russian flax. Kenya is the first province in the world to appoint officially qualified flax officers to inspect and grade flax. The Linen Research Association of Belfast, Ireland, has conducted important studies on the physi-

cal properties of plant fibers, and has developed a strain of flax yielding 28 per cent more fiber than ordinary commercial fiber flax. The U. S. A. Department of Agriculture has also developed by plant breeding since 1909, the variety "Saginaw" which is more vigorous, more uniform, and in many characters superior to commercial fiber flax. Improvements are being made in machinery for harvesting, thrashing, and scutching flax. A better market must be developed for flax fiber, and to do this it is suggested that more high grade and well finished linen fabrics be produced commanding high prices and yielding a return for higher priced flax fiber.—*L. H. Dewey.*

5330. ZEQUEIRA, LUIS CUEVAS. La selección de la semilla en el cultivo del maíz. [Seed selection in the cultivation of corn.] *Rev. Agric. Puerto Rico* 64: 9-10. 1921.—The author emphasizes the importance of all possible care in seed selection in corn cultivation.—*John A. Stevenson.*

5331. ZEQUEIRA, LUIS CUEVAS. La selección de la semilla en el cultivo del maíz. La caja germinadora. [Seed selection in corn culture. The germinating box.] *Rev. Agric. Puerto Rico* 67: 17-19. 1921.—An apparatus for testing the germinating power of seed corn is described.—*John A. Stevenson.*

5332. ANONYMOUS. Current topics and events. *Nature* 111: 508. 1923.—Reference is made to Botanical Abstracts and the suggestion to publish Biological Abstracts in its stead. The writer agrees with Cockerell's preference for an analytical index such as the Zoological Record; but in view of the difficulties the latter publication has had, the feasibility seems doubtful.—*O. A. Stevens.*

5333. ANONYMOUS. Imperial College of Science and Technology. *Nature* 111: 295-296. 2 fig. 1923.—This is a general account of the history and work of the Department of Botany (Plant Technology) of the College, with exterior and interior views of its new building in London.—*O. A. Stevens.*

5334. ANONYMOUS. Prof. Dr. Kamiel Vermoesen. *Natuurw. Tijdschr.* 4: 248. 1922.—Kamiel Vermoesen died December 17, 1922. He was plant physiologist at the University of Louvain, and a specialist on the flora of the Congo. In relation to modern views of crystallography, he studied pollen grains of different groups of plants, investigations which were unfinished at his death.—*J. C. Th. Uphof.*

5335. ANONYMOUS. Professor Emile Perrot. *Amer. Druggist and Pharm. Rec.* 70: 22-23. 3 fig. 1922.—This is a brief account of the achievements of this versatile worker as student, professor of materia medica, and investigator of medicinal and economic plants of Europe and Africa.—*C. M. Sterling.*

5336. ANONYMOUS. Une religieuse naturaliste,—Feu Soeur Marie-de-Sainte-Amélie. [A nun naturalist—the late Sister Marie-de-Sainte-Amélie.] *Nat. Canadien* 48: 265-267. 1922.—The Rev. Sister belonged to the Convent of the Holy Cross of Saint-Laurent, near Montreal, and died Feb. 17, aged 71 years. Her herbarium, which won prizes at both Montreal and Chicago, contained 1,800 plants mounted and scientifically classified in 20 volumes. From 1890 to 1922 she had charge of the "Annales" and the "Bulletin" of the Museum at Saint-Laurent.—*A. H. MacKay.*

5387. ANONYMOUS. [Rev. of: DAWSON, W. H. (editor). *The Yearbook of the Universities of the Empire, 1923*. Published for the Universities Bureau of the British Empire. xii + 692 p. G. Bell and Sons: London, 1923.] *Nature* 111: 459. 1923.

5388. ANONYMOUS. *A yearbook of the learned world*. [Rev. of: *Index Generalis: Annuaire général des universités, grandes écoles, académies, archives, bibliothèques, instituts scientifiques, jardins botaniques et zoologiques, musées, observatoires, sociétés savantes*. (General index of universities, scientific institutes, museums, learned societies, etc.) Published under the direction of R. DE MONTESSUS. 2111 p. Gauthier-Villars et Cie: Paris, 1923 (see Bot. Absts. 11, Entry 2239).] *Nature* 111: 425-426. 1923.—The reviewer regards the execution of the work as excellent, but finds a considerable number of omissions and errors in entries relating to the British Empire. He suggests that the editor might better have used the Yearbook issued by the Universities Bureau as a basis instead of depending upon the replies to his questionnaires received from the different institutions.—O. A. Stevens.

5389. ANONYMOUS. *Scientific societies in the British Isles*. [Rev. of: *The year book of the scientific and learned societies of Great Britain and Ireland: a record of the work done in science, literature, and art during the session 1921-22 by numerous societies and government institutions*. 39th annual issue. vii + 374 p. C. Griffin and Co.: London, 1922 (see Bot. Absts. 12, Entry 2285).] *Nature* 111: 389. 1922.

5390. BULLOCK, SAMUEL DILMAN. *La granja Norteamericana y algunos aspectos de la vida rural*. [The North American farm and some aspects of country life.] Rev. *Facultad Agron. y Veterinaria Univ. Nacion. Buenos Aires* 4: 14-23. 1922.—This begins with a historical sketch of the farming industry in the U. S. A. as affected by colonial conditions and by later government policy in the distribution of public lands. Both influences tended to produce numerous independent farms of comparatively small area. Statistics of rural population, crops, and stock are given for the state of Wisconsin, and there is an account of agricultural organizations and of educational facilities and government aid available for the farmer.—C. A. Weatherby.

5391. CHEVALIER, A. *Octave Lignier, 1855-1916*. 19 p., 1 pl. Paris, 1920.—This is an account of the life of M. Lignier, professor of botany at the University of Caen, of his work as a teacher, and of his researches in the anatomy of plants, paleobotany, and evolutionary morphology.—C. A. Weatherby.

5392. CHRISTENSEN, C. *Otto Friederich Müller, specielt som Botaniker*. [Otto Friedrich Müller, especially as a botanist.] *Nat. Verden* 6: 49-68. *Portrait*. 1922.

5393. COCKERELL, T. D. A. *Sir Isaac Bayley Balfour*. *Nature* 111: 150. 1923.—*Prismula Rusbyi* Greene and *P. Ellisiae* Cockerell, occupying different mountain ranges in New Mexico, are so similar in appearance that a German writer pronounced them identical. The writer procured seed of *P. Ellisiae* for Prof. Balfour, who grew the plants at Edinburgh and demonstrated that the 2 species were distinct.—O. A. Stevens.

5394. COLON, E. D. *Breve reseña del desenvolvimiento de la agricultura en Puerto Rico*. [Brief résumé of the development of agriculture in Porto Rico.] *Rev. Agric. Puerto Rico* 8²: 49-53. 1922.—The author presents an outline of the various stages through which the agriculture of the Island has passed from the time of the aboriginal inhabitants to the end of the Spanish regime.—John A. Stevenson.

5395. COLON, E. D. *Instituciones relacionadas con la agricultura*. [Agricultural institutions.] *Rev. Agric. Puerto Rico* 9⁶: 7-11. 1922.—Agricultural experiment stations were founded by the Spanish government at Rio Piedras and Mayaguez, Porto Rico, in 1880 and continued until 1897. An outline of the experimental work carried on by these stations, covering all of the principal crops, is given.—John A. Stevenson.

5396. COLON, E. D. *Introducción de especies extranjeras*. [Introduction of exotic species.] *Rev. Agric. Puerto Rico* 9: 20-23. 1922.—The dates when the various economic plants were first brought to Porto Rico, together with the name of the importer, are given.—*John A. Stevenson*.

5397. DAVY DE VIRVILLE, A. D. *Gaston Bonnier*. *Nat. Canadien* 49: 222-223. 1923.—A biographical sketch is presented of the great botanist of France who died Dec. 30, 1922.—*A. H. MacKay*.

5398. DRUDE, OSCAR. *Bernhard Schorler*. *Sitzungsber u. Abhandl. Naturwiss. Ges. "Isis"* 1920-21: xiv-xvii. 1922.—An account is given of the botanical activities of Bernhard Schorler, who died Apr. 1, 1920. He was an ardent student of the vascular plants of Saxony and also of the cryptogams, his interests being both floristic and ecological. In 1905 he undertook a revision and expansion of Otto Wünsche's *Sächsische Excursionsflora*, the new work appearing under the title, *Die Pflanzen Sachsens*. The 11th edition of this publication, which is perhaps his most important contribution to botany, appeared in 1919.—*A. W. Evans*.

5399. DUDGEON, WINFIELD. *The Madras meeting of the Indian Botanical Society*. *Jour. Indian Bot.* 3: 22-25. 1922.—This is a brief account of the first scientific meeting of the Society at Madras in January, 1922. The program of 34 papers is given.—*Winfield Dudgeon*.

5400. [FYSON, P. F.] *Editorial*. *Jour. Indian Bot.* 3: 29. 1922.—The Journal of Indian Botany, started privately by P. F. Fyson and financed by T. R. D. Bell, late Chief Conservator of Forests, Bombay, has become the property and official organ of the Indian Botanical Society.—*Winfield Dudgeon*.

5401. [FYSON, P. F.] *Editorial note*. *Jour. Indian Bot. Soc.* 3⁶: 2nd cover page. 1923.—"The Journal of Indian Botany . . . will henceforth be styled the Journal of the Indian Botanical Society."—*Winfield Dudgeon*.

5402. HASUND, S. *Havren i Sagatids-Jordbruget*. [Oats in the agriculture of the saga age.] *Nordisk Jordbrugsforskning* 1922: 297-306. 1922.—In the sagas and tales from 900 to 1300, oats, now the principal grain in Norway, is not mentioned. But it was cultivated about the years 400 and 800, and very soon after 1300. When oats is not mentioned, as are "barley" and "grain," the reason is sought in (1) a growing of barley and oats in mixture, (2) an admitted computation of oats in units of barley flour.—*Ernst Gram*.

5403. HECKE, G. H. *G. Harold Powell: A tribute*. *Monthly Bull. California Dept. Agric.* 11¹⁰: 1 unnumbered p., 1 pl. 1922.

5404. HECKE, G. H. *John Charles Whitten: A tribute*. *Monthly Bull. California Dept. Agric.* 11¹⁰: 1 unnumbered p., 1 pl. 1922.

5405. KOFOID, CHARLES ATWOOD. *Pasteur and the science of biology*. *Sci. Monthly* 16: 658-662. 1923.—This is an appreciation of Pasteur and his work.—*L. Pace*.

5406. LANGE, A. *Nogle omdannede Plantenavne*. [Some transformed plant names.] *Nat. Verden* 6: 424-430. 1922.—Latin names have often been transformed into common names of somewhat similar sound, but frequently of quite different meaning. For example, *Semen foeni graeci* has passed through *Foenum graek*, *Freum graek*, *Fillegraek*, *Tillegraek*, *Tillegraf* to become "Telegraph seeds." *Levisticum* has in German many vulgar names composed of *Liebe*, *Laub*, *Lauf* and *Stock*, *Stickel*. The same thing has happened in Danish; the author lists 60 transformations of *Levisticum*.—*Ernst Gram*.

5407. LYMAN, G. R. Report of the fourteenth annual meeting of the American Phytopathological Society. *Phytopathology* 13: 188-198. 1923.—The report includes a general report of the sessions of the Society held in the buildings of the Massachusetts Institute of Technology, Cambridge, Massachusetts, Dec. 27-30, 1923; the report of the Treasurer for 1922; the report of the Editor-in-Chief of Phytopathology; report of the retiring representative on the Board of Control of Botanical Abstracts; action of the Society on the Union of American Biological Societies; a report of the Advisory Board; reports of various committees; report of a discussion of the proposed Tropical Institute of Phytopathology; and reports of other miscellaneous business.—*B. B. Higgins*.

5408. OYE, PAUL VAN. De oekonomische beteeknis der natuurwetenschappelijke onderzoekingen in Nederlandsch-Indie. [The economic significance of biological research in the Dutch East Indies.] *Natuurw. Tijdschr.* 4: 197-208. 1922.—The Dutch East Indies have been in possession of the Netherlands for 300 years. In early times no official attention was paid to biological subjects. Persons interested in them (e.g., medical men employed by rich private individuals) worked independently and usually with small means. But they gathered plant and animal material and contributed considerably to form a foundation for the study of the natural sciences. In this way originated Ambonsche Rariteitskamer, Hortus Malabaricus, and many other important works. Now experts regard the Dutch East Indies as an example of a colony well organized for biological and agricultural work. Mention is made of the botanical garden at Buitenzorg and of the Department of Agriculture of Java with its numerous branches, a system closely connected with the name of Melchior Treub.—*J. C. Th. Uphof*.

5409. PRAEGER, R. LLOYD. Henry William Lett. *Irish Nat.* 30: 41-43. 1921.—This Irish botanist was noted chiefly for his work among the bryophytes.—*W. E. Praeger*.

5410. RUSSELL, E. J., AND A. HENDERSON SMITH. Discovery of the use of phosphates as fertilizers. *Nature* 111: 116-117. 1923.—The idea of utilizing raw mineral phosphates as fertilizer is usually supposed to date from 1840. In May, 1837, however, an unnamed writer in the *Farmers' Magazine* (2d series) proposed making "fictitious bone dust by impregnating lime with phosphoric acid" and another (same date) stated that phosphate of lime, if available to the farmer, would be invaluable and that there were entire mountains of it in Spain.—*O. A. Stevens*.

5411. TIDESTROM, IVAR. The floral alphabet of the Celts. *Torreyia* 23: 41-49. 1 fig. 1923.—The names of the letters in the Celtic alphabet are all plant names. For example, A in Gaelic is *ailm*, which is also the word for "elm." These names are compared with their cognates in English, Anglo-Saxon, Old Norse, and Swedish.—*J. C. Nelson*.

5412. CLUTE, WILLARD N. Botany for beginners-VI. *Amer. Bot.* 29: 53-57. 1923.

5413. CLUTE, WILLARD N. Plant names and their meanings-XV. *Scrophulariaceae*. *Amer. Bot.* 29: 60-67. 1923.

5414. DUDGEON, WINFIELD. [Rev. of: MOLISCH, HANS. *Mikrochemie der Pflanze*. [Microchemistry of plants.] 2nd ed., 434 p., 135 fig. Gustav Fischer: Jena, 1921 (see Bot. Absts. 12, Entry 5169).] *Jour. Indian Bot.* 3: 119. 1922.

5415. F[YSON], P. F. [Rev. of: FRITSCH, F. E., AND E. J. SALISBURY. *Botany for students of medicine and pharmacy*. 346 p., 163 fig. G. Bell and Sons: London, 1921.] *Jour. Indian Bot.* 3: 123-124. 1922. [See also *Bot. Absts.* 12, Entry 1009.]

5416. F[YSON], P. F. [Rev. of: JIVANNA RAO, P. S. *Lessons in water plants*. *Jour. Madras Agric. Students Union* 10: 20 p. 1922.] *Jour. Indian Bot.* 3: 121. 1922.

5417. F[YSON], P. F. [Rev. of: RANGACHARI, K. *Manual of elementary botany for India*. 2nd ed., 518 p., 471 fig. Government Press: Madras, 1921 (see *Bot. Absts.* 11, Entry 3454).] *Jour. Indian Bot.* 3: 124. 1922.

5418. F[YSON], P. F. [Rev. of: TANSLEY, A. G. *The elements of plant biology*. George Allen & Unwin: London, [1922] (see *Bot. Absts.* 12, Entry 3809).] *Jour. Indian Bot.* 3: 183-184. 1923.

5419. HUXLEY, JULIAN S. *Biology in schools*. *School Sci. Rev.* [London] 4: 5-11. 1922.—The function of biology in school curricula is shown. Interest in animals is more easily aroused than in plants, the main link between the inorganic and organic. Evolution is most easily taught in connection with organisms, especially the idea of direction in evolution. This leads to the relation of mind to matter, and shows that increased mental power is of immense importance in biological evolution.—*Elsie Hammond*.

5420. STRASBURGER, E., und MAX KOERNICKE. *Das botanische Practicum*. 7th ed., 883 p., 260 fig. (3 col.) Gustav Fischer: Jena, 1923.—In comparison with the 6th edition of 1921 this well known work is increased by 10 pages and 13 figures. Numerous changes have been made in the text. The chapter on *Saprolegnia* has been extended. More attention is given to the red algae. Citations of literature have been considerably increased. Register IV, p. 711-842, presenting a compact consideration of reagents, stains, etc., is printed on another color of paper to facilitate consultation.—*J. C. Th. Uphof*.

CYTOLOGY

GILBERT M. SMITH, *Editor*

(See also in this issue Entries 5598, 5624, 5629, 5635, 5742, 5764, 5768, 5809, 5922, 5952, 5954)

5421. ARGAUD, R. *Sur la présence intra-nucléolaire du centrosomé*. [On the existence of an intra-nucleolar centrosome.] *Compt. Rend. Acad. Sci. Paris* 174: 1078-1080. 2 fig. 1922.—This peculiar condition is found in certain cells of man.—*C. H. Farr*.

5422. BECQUEREL, PAUL. *Observations sur la nécrobiose du protoplasme végétal avec l'aide d'un nouveau réactif vital*. [Observations on the necrobiosis of vegetable protoplasm with the aid of a new intravital reagent.] *Compt. Rend. Acad. Sci. Paris* 176: 601-603. 1923.—The basic aniline dyes are used as intravital stains. They are absorbed by the vacuole, but do not enter the cytoplasm and nucleus while the cell is alive. Necrobiosis is the name given to the change of protoplasm from the living to the dead condition. Scale leaves of bulbs of *Allium cepa* were treated with a mixture of 2 parts of methylene blue with 1 part of Bismarck brown and one part of neutral red and remained alive in this solution for as long as 24 hours. During this time the plasma membrane is green, the protoplasm a pale yellow, the vacuoles a rose brown, and the spheric microsomes a translucent green. The parietal cytoplasm is readily seen to circulate. It is thus apparent that the methylene blue does not stain the cell while it is alive. However, when death occurs the nucleus becomes green with a tint of brown and the 2 nucleoli become blue. The cytoplasm takes on a greenish blue tint, and the vacuole seems to disappear. Observations with the microscope and ultramicroscope indicate that necrobiosis is always accompanied by an irreversible colloidal transformation of the funda-

mental substance of the cytoplasm and nucleoplasm. This is a change from a homogeneous gel to a heterogeneous granular gel more or less vacuolate and reticular. This is perhaps due to a change in the nature of the electrical charges of the molecules of the cytoplasm which are negative in life and positive in death. This is indicated by the fact that they absorb in the latter state the negative molecules of methylene blue.—*C. H. Farr.*

5423. CAROTHERS, E. ELEANOR. *The cell mechanism.* [Rev. of: SHARP, LESTER W. *Introduction to cytology.* McGraw-Hill Book Co.: New York, 1921.] *Jour. Heredity* 12: 351-353. 1921.—That cytology is "one of the most actively developing biological sciences is indicated by the appearance in little more than a year of three new textbooks on the subject, two from England and the American one which is the subject of this review." The reviewer considers Sharp's book "well planned and modern in its view-point," naming its bibliographies, efficient index, and text-figures among other good points. Lack of clearness and accuracy are noted in some places, but the "book seems adapted to meet the needs of several classes of people" and "especially useful since it stresses the views of the botanists and makes their results more readily accessible." [See also *Bot. Absts.* 11, Entries 230, 2476, 3448; 12, Entry 5428.]—*Oliver Olson.*

5424. CHESHIRE, FREDERICK J. *The early history of the polariscope, and the polarizing microscope.* [Presidential address, Royal Microscopical Society, London, read January 17, 1923.] *Jour. Roy. Microsc. Soc. London* 1923: 1-8. 8 fig. 1923.—The paper refers briefly to the use of the polarizing microscope in the examination of biological material.—*R. E. Cleland.*

5425. CONN, H. J., S. I. KORNHAUSER, THOMAS MALLORY, F. G. NOVY, AND L. W. SHARP. *American eosins.* *Science* 56: 689-690. 1922.—This brief report of the Commission on Standardization of Biological Stains explains the differences in chemical composition of the several eosins on the market. As compared with the Grüber eosins, the American samples tested proved to be better in almost every case.—*C. J. Lyon.*

5426. DANGEARD, PIERRE. *Le vacuome dans les graines de pollen des Gymnospermes.* [The vacuome of the pollen grains of gymnosperms.] *Compt. Rend. Acad. Sci. Paris* 176: 915-917. Fig. 1-5. 1923.—A study is reported of the development and germination of the pollen grains of *Taxus baccata*, *Cephalotaxus Fortunei*, and some of the Cupressineae by means of intravital stains.—*C. H. Farr.*

5427. DENHAM, H. J. *A micrometric slide rule.* *Jour. Roy. Microsc. Soc. London* 1923: 57-61. 2 fig. 1923.—A simple device is described by which large numbers of microscopical measurements at different magnifications can be quickly made.—*R. E. Cleland.*

5428. DUDGEON, WINFIELD. [Rev. of: SHARP, LESTER W. *An introduction to cytology.* xiii + 452 p., 159 fig. McGraw-Hill Book Co.: New York and London, 1921.] *Jour. Indian Bot.* 3: 119. 1922. [See also *Bot. Absts.* 11, Entries 230, 2476, 3448; 12, Entry 5423.]

5429. FARR, CLIFFORD H. *Quadripartition by furrowing in Sisyrinchium.* *Bull. Torrey Bot. Club* 49: 51-61. Pl. 2. 1922.—A summary is given of recent work done on quadripartition of pollen-mother-cells in various dicotyledons. In *Sisyrinchium Bushii* Bicknell much the same manner of quadripartition was found.—*P. A. Munz.*

5430. GELEI, J. *Weitere Studien über die Oogenese des Dendrocoelum lacteum. III. Die Konjugationsfrage der Chromosomen in der Literatur und meine Befunde.* [Further studies on oogenesis in Dendrocoelum lacteum. III. The question of chromosome conjugation in the literature and my investigations.] *Arch. Zellf.* 16: 299-370. 1 fig. 1922.—The author continues his studies upon *Dendrocoelum lacteum* with a discussion of the subject of chromosome conjugation. He first reviews the terminology adopted previously by him:

presynopsis referring to the early heterotypic prophase before synapsis or syneesis; syndesis including the remaining stages up to the first metaphase, in turn subdivided into eusyndesis (diplotene, strepsinema), and chalasthosyndesis (diakinesis). The results of his studies are fully discussed, with their bearing upon the work of other authors. The first oocyte division is the reduction division. This is preceded by a distinct resting stage. In early prophase the chromosomes become distinct as long threads, which are clearly single in structure. No evidence is found of parallelism or an approximation of threads during this stage, or of a split in the chromosomes during the previous telophase. Following early prophase, the ends of the threads become associated closely at one side of the nucleus, forming more or less radiating loops—the “bouquet” (Schleifenbukett). The number of loops is greater than the haploid of chromosomes. The threads are distinctly and regularly beaded. The conjugation of chromosomes follows. There is no question but that this is a longitudinal fusion of whole chromosomes. Conjugation is brought about by the fusion of the leptotene loops of the “bouquet” in pairs, fusion beginning at the “pole” end, where the thread ends approximated, and proceeding to the distal end of the loops. The conjugated or diplotene thread is thicker than the leptotene. Conjugation is an intimate fusion of threads, not merely an approximation. “By longitudinal conjugation of chromosomes we mean the fusion, beginning at the end, of two homologous chromosomes, one descended from the male, the other from the female parent, in such a way that the qualitatively equal parts of the conjugants always fuse. * * * it makes possible not only the reduction in number of the chromosomes, but also the mixing of their contents, and their reconstruction.” Early in the conjugation period, crossing over may take place.—In the more purely theoretical part of the paper the question is asked as to whether there is any sex difference between the chromosomes of the 2 sexes, and the author concludes that there is none. If 2 sperms or 2 eggs could be made to fuse and develop, an entirely normal individual would be produced. The phylogenetic history of chromosome conjugation is discussed. Cell fusion is a necessary forerunner of chromosome conjugation, which in turn is essential to chromosome reduction. In evolution, therefore, the original cells were haploid and these in time began to fuse. Chromosome conjugation followed, at first in an end to end fashion, and finally longitudinally, and the reduction in number of chromosomes appeared last of all. A discussion of the meaning of the “bouquet” follows, the conclusion being that this arrangement is for the purpose of bringing together the homologous chromosomes in such a way that they can conjugate. A good bibliography follows.—*Ralph E. Cleland.*

5431. GILLIS, J. Is het mogelijk dat een enkelvoudige zetmeelkorrel twee “navels” zou bezitten? [Can a simple starch grain possess two “navels”?] *Natuurw. Tijdschr.* 4: 162-166. 5 fig. 1922.—In studying the optical properties of the starch grain in polarized light, the starch layers are compared with concentric spheres of which the navel, or “nucleus,” is the geometrical center. According to Reychler the concentric layers are formed in circles round the longest axis, consequently are conaxial. The writer states the starch grain contains either 1 navel or that there are at the ends of the axis “polar points.” The simple starch grains are entirely surrounded by the substance of the starch, in which form the concentric or excentric layers, and contains but 1 “nucleus.”—*J. C. Th. Uphof.*

5432. HERRERA, A. L. Sur l'imitation des plasmodies et des structures chromatiques avec le silicate de sodium noirci par le noir l'ivoire et des gouttes d'alcool en diffusion. [On the imitation of plasmodia and chromatic structures by diffusing drops of alcohol through sodium silicate blackened with ivory back.] *Compt. Rend. Acad. Sci. Paris* 176: 1011-1012. 1923.—By this means it is possible to imitate plasmodia, cells, nuclei, and chromatin structures. Plasmodia show a movement of short duration, also a tendency to contract. Nuclei with chromosomes may be simulated by using the alkaline silicate. The structures undergo a sort of karyolyse.—*C. H. Farr.*

5433. HOBGEN, LANCELOT. The problem of synapsis. *Jour. Roy. Microsc. Soc. London* 1920: 269-276. 1920.—There is no justification for the assumption that there is any difference between the paternal and maternal moieties contributed to the zygote in relation to the

specific and generic characters of the organism, or between the role of cytoplasm and nucleus in the same regard. The claim that chondriosomes transmit "non-mendelian" characters is ill founded. It is necessary, in connection with the chromosome theory of character transmission, to demonstrate that the "reduction" segregates chromosome pairs into maternal and paternal components, and further that the chromosomes of one generation correspond to those of another. The continuity, numerical constancy, morphological constancy and behavior in hybrids indicate the correctness of these assumptions. The behavior of the accessory chromosome also bears on this point. The parasynaptic and telosynaptic views bear on the mechanism of synapsis, but the latter view has scant direct observational evidence. The study of individual chromosomes and the re-study of reported telosynaptic cases have often tended to favor the parasynaptic view. The situations in plants and animals have been confused. Among the questions that arise are: (1) is there evidence that the chromatin elements conjugate? (2) are such elements really chromosomes? (3) are these subsequently disjoined? "It will thus be seen that while the chromosome hypothesis has proved a great incentive to research—particularly in the problem of sex—its major premise, the reality of synapsis, is in no way firmly established; further knowledge of the relation of chromosomes to the organization of the resting nuclei and a specialized study of individual heterotype chromosomes constitute, therefore, two of the most imperative needs of cytological theory today."—*Wm. Randolph Taylor.*

5434. LOEWENTHAL, HANS. Die Oogenese von *Tubifex tubifex* (Müll.). (Zur Kritik der "Kernverschmelzung" Oschmanns.) [Oogenesis in *Tubifex tubifex*. In criticism of the "nuclear fusions" of Oschmann] Arch. Zellf. 16: 231-237. Pl. 14. 1922.—The author discusses a paper of Oschmann (1914) in which the latter describes in *Tubifex bavaricus* a process by which the egg is formed through a fusion of many oocytes and their nuclei. Such a process would compel a revision of our ideas concerning the constancy of chromosome number and individuality. Oschmann states (1919) that there are here "no cell organs, neither chromosomes, nucleolus, centrospheres, centrosomes, centrioles, etc., nor nucleus and cytoplasm." The author shows that in *T. tubifex*, while the central oocytes, which act in a nourishing capacity, degenerate, and their nuclei fuse, the peripheral oocytes of the complex do not fuse, but give rise individually to eggs. The results given in this paper therefore tend to discredit the cytological ideas of Oschmann above mentioned.—*Ralph E. Cleland.*

5435. LUNDEGÅRDH, HENRIK. Zelle und Cytoplasma. [Cell and cytoplasm.] In: *Handbuch der Pflanzenanatomie*. Edited by K. LINSBAUER. I Abt., 1 Teil: Cytologie, Band 1. xii + 402 p., 195 fig. Borntraeger: Berlin, 1922.—This is a comprehensive review of our knowledge of the plant cell as regards its general features and its behavior in the formation of tissues, together with a detailed discussion of cytoplasm and cytoplasmic structures other than plastids, which are to be treated in a separate volume of the series.—The contents of the work may be briefly indicated as follows: The introduction consists of an account of the historical development of cytology and plant anatomy. The 1st principal section, The Cell, comprises 11 chapters dealing with the following main topics: nomenclature; the morphological organization of the cell (including brief mention of the nucleus and its division, treated fully in the volume by Tischler [see Bot. Absts. 12, Entry 5448]; symmetry, size and form of the cell; protoplasmic connections and cell fusions; the role of the cell in tissue formation and the possible causes underlying this process; types of cell aggregates; tissues and tissue systems; the physical and chemical organization of the cell, including a discussion of theories of elementary structure. In the 2nd section, The Cytoplasm, there are 10 chapters dealing with nomenclature and methods, the form of the cytoplasmic body, the structure of cytoplasm, consistency and degeneration phenomena, alloplasmatic structures (chiefly the achromatic figure), cytosomes (chondriosomes), the Hautschicht, vacuoles, cilia, and cytoplasmic movement.—The book has a very extensive bibliography, and is supplied with author and subject indexes.—*L. W. Sharp.*

5436. MARKOVITS, EMMERICH. Zytologische Veränderungen von *Paramaecium* nach Bestrahlung mit Mesothorium. [Cytological changes effected in *Paramaecium* through treatment with mesothorium (radium bromide).] Arch. Zellf. 16: 238-248. Fig. 1-2, A-D. 1922.—The author subjected individuals of pure lines of *Paramaecium caudatum* to the emanations from 10 mgm. of radium bromide, the alpha rays being eliminated and the beta and gamma rays being allowed to act. This resulted in a decrease in size and a generally increased rate of division in animals having recently undergone endomixis, but resulted in the death of those approaching or undergoing this reorganization. Cytological examination showed the division of the macronucleus to be unusually early, as well as abnormal in other ways, but the micronucleus remained seemingly unaffected.—Ralph E. Cleland.

5437. MIRANDE, MARCEL. Sur les organites élaborateurs particuliers (stérinoplastes) de l'épidermis des écailles de bulbes de lis blanc. [On the special elaborating organs, the sterinoplasts, in the epidermis of the scales of the bulbs of the white lily.] Compt. Rend. Acad. Sci. Paris 176: 327-330. Fig. 1-21. 1923.—More or less spherical structures, composed of a central body surrounded by an outer layer or mantel, are found in these cells. They may give rise to a number of lobes, called calculs, which may have a crystalline structure. By boiling, the whole mass may become crystalline. Examination by means of intravital stains, boiling, and various chemicals shows that they are both protein and lipid in composition.—C. H. Farr.

5438. MIRANDE, MARCEL. Sur la nature protéolipoidique des stérinoplastes du lis blanc. [On the proteolipoidic nature of the sterinoplasts of the white lily.] Compt. Rend. Acad. Sci. Paris 176: 596-598. 1923.—The central body of the sterinoplast is found to be of lipid composition. The covering is composed of an external layer of protein, an internal thicker layer of alternating concentric striae of protein and lipid substances; next to the central body is a thin pellicule of proteolipoid material.—C. H. Farr.

5439. MIRANDE, MARCEL. Sur la nature de la sécrétion des stérinoplastes du lis blanc. [On the nature of the secretion of the sterinoplasts of the white lily.] Compt. Rend. Acad. Sci. Paris 176: 769-771. 1923.—The chemical nature of the central body of the sterinoplast is further studied. It is now found to be composed of the lipid, phytosterine. Various reactions of this substance, especially with heat, are discussed.—C. H. Farr.

5440. NIERENSTEIN, M. Tinctorial chemistry and histology. [Rev. of: BECHER, SIEGFRIED. Untersuchungen über Echtfärbung der Zellkerne mit künstlichen Beizenfarbstoffen und die Theorie des histologischen Färbeprozesses mit gelösten Lacken. (Investigations on nuclear stains and the theory of staining.) xx+318 p. Gebrüder Borntraeger: Berlin, 1921.] Nature 110: 33. 1922.—The book is "certainly the best of its kind so far published."—O. A. Stevens.

5441. NOEL, R. Sur des phénomènes de condensation de corps gras à la surface des mitochondries. [On the phenomenon of the condensation of fat bodies on the surface of mitochondria.] Compt. Rend. Acad. Sci. Paris 174: 572-573. 1922.—The material used was the liver of the white mouse. Figures are given in addition to the description, and there is an attempt to explain the phenomenon on the basis of colloids.—C. H. Farr.

5442. OVEREEM, CASPER VAN. Über Formen mit abweichender Chromosomenzahl bei *Oenothera*. [Forms with varying chromosome numbers in *Oenothera*.] Beih. Bot. Centralbl. 1 Abt. 39: 1-80. Pl. 1-15. 1922.—A bibliography of 564 citations on the *Oenothera biennis* group, classified as to anatomy, cytology, systematic botany, etc., is given.—The relation between habit and chromosome number is discussed in triploid, lata, gigas, and forms developed from crosses. A particular form always has a definite number of chromosomes.—The origin of new elementary species in this genus is recognized in *O. bienniformis* and *O. de Vriesii*.—L. Pace.

5443. PUYMALY, A. DE. Nouveau mode de division cellulaire chez les Conjuguées unicellulaires (Desmidiacées sensu lat.). [A new mode of cell division in the desmids.] Compt. Rend. Acad. Sci. Paris 176: 186-188. 1923.—A study was made of cell division in *Cylindrocystis crassa*, which has a mucilaginous envelope like that of *Gloeocapsa*. The daughter cells are included in the sheath of the mother cell, and the axes of the daughter cells are perpendicular to each other. In a clear equatorial zone the new transverse partition appears in the form of an annular diaphragm, the orifice of which gradually closes. The alga thus seems to have a primitive type of cell division.—C. H. Farr.

5444. RAPPEPORT, TH. Ueber die somatische Mitose des Menschen. [Somatic mitoses in man.] Arch. Zellf. 16: 371-382. Pl. 18, 2 fig. 1922.—The author reviews the literature and gives a table of the chromosome numbers obtained by the various investigators. A full account of the technique follows. The pleura, peritoneum, and amion were used on account of their flatness and the fact that they could be spread out thinly and studied without sectioning. The prophase and metaphase stages are described and figured. It was not possible to determine the chromosome number with absolute certainty, but it is unquestionably between 40 and 42 in somatic nuclei. Whether or not the number differs in the 2 sexes was not determined.—Ralph E. Cleland.

5445. SANDS, HAROLD C. Perigenesis. Science 56: 517-518. 1922.—A study of the division figures in *Tradescantia virginica* L., by the use of special methods of vital staining, shows that the chromosome structure is that of an achromatic cylinder with the chromatin imbedded in the form of chromomeres. There is no longitudinal splitting in vegetative or reduction divisions. Detailed publication is promised.—C. J. Lyon.

5446. SUGIYAMA, TAKESI. Studies of the structure and the nuclear division in a Japanese species of *Opalina*, *O. japonica* nov. sp. Jour. Coll. Agric. Imp. Univ. Tokyo 6: 361-390. Pl. 40-42, fig. 1. 1920.—This parasitic protozoan of *Rana* and *Bufo* is multinucleate and with the nuclei lacking a centrosome and a nucleole. The nuclei have 2 kinds of chromatin. The "vegetative" chromatin is comparable to the macronucleus of the higher Ciliata and the "generative" chromatin to the micronucleus. The nucleus is, therefore, considered to be in an undifferentiated primitive condition.—G. M. Smith.

5447. TAYLOR, W. R. Organization of heterotypic chromosomes. Science 56: 635. 1922.—This brief note on the behavior of the heterotypic chromosomes of *Gasteria* "tends to demonstrate a very great precision in the chromomere constitution of the meiotic chromosomes."—C. J. Lyon.

5448. TISCHLER, GEORG. Allgemeine Pflanzenkaryologie. [General plant karyology.] In: Handbuch der Pflanzenanatomie. Edited by K. LINSBAUER. I Abt., 1 Teil: Cytologie, Band 2. xiv + 899 p., 406 fig. Borntraeger: Berlin, 1921-1922.—This is an exhaustive review of present knowledge of the plant nucleus. It is copiously illustrated and fully supplied with references to the literature listed in a bibliography of nearly 5,000 titles. The contents are indexed under authors, subjects, and plant classes and families. Following is a brief outline of the topics treated in the 11 chapters: (1) the resting nucleus and its external morphology; (2) the chemical organization of the resting nucleus; (3) the morphological structure of the resting nucleus; (4) the resting nucleus as a component of the living cell. Here are discussed: interchange between nucleus and cytoplasm; the relation of the nucleus to plastids, centrosomes, and blepharoplasts; movements of the nucleus and their physiological significance; the relation of the resting nucleus to cell division; multinucleate cells. (5) Typical nuclear division. This includes accounts of promitosis and mitosis in lower organisms, somatic mitosis in higher plants, the mechanism of mitosis, and the connection of mitosis with cell division. (6) Allotypic nuclear division. Chromosome reduction in plants is treated very fully. (7) Irregular mitoses and amitosis; (8) nuclear fusion. This deals chiefly with sexual fusion in the various plant groups, but includes also an account of vegetative fusions. (9) The chromo-

somes and their significance for investigations of race and inheritance. The number, size, form and arrangement of chromosomes, and the relation of their behavior to Mendelism and mutation, are fully treated. A list of all known chromosome numbers in plants, originally published by the author in 1915, has been brought up to date and included in this chapter, with references to all of the original papers. (10) Degeneration and resorption of the nucleus; (11) the question of the enucleate condition of certain organisms.—*L. W. Sharp.*

5449. WINGE, Ö. A peculiar mode of inheritance and its cytological explanation. *Compt. Rend. Trav. Lab. Carlsberg* 14¹⁷: 1-10. 1 pl. 1922.—In the fish *Lebistes reticulatus* there are several races of males with distinct color patterns, whereas all females are similar. Male offspring from a cross always have the identical color patterns of the male parent; back crosses between male F_1 and the female parent again yield male offspring similar to the male parent. Back cross F_1 females with unmarked males yields only unspotted males.—A condensed account is given of spermatogenesis to the production of spermatozoa and their discharge, and of oogenesis through the primary oocyte. The number of chromosomes is the same in both sexes, being 23 in the haploid phase. This is conceived to be a combination of 22 autosomes plus an X or a Y sex chromosome. The presence of Y determines the male sex, and secondary sexual characters carried by this body dominate the allelomorphs of the autosomes.—*F. Weiss.*

5450. WYLIE, ROBERT B. A note on the sperms of *Vallisneria*. *Science* 56: 422-423. 1922.—In order to fix the sperms and ovules of *Vallisneria spiralis* it was necessary to squeeze the ovary contents out into water, which dissolved the mucilage about the ovules. Pieces of ice in this water cooled the ovary contents and slowed down the growth and cyclosis so that the fixing fluid could act on sperms in all situations through to the completion of fertilization.—The sperms travel down the pollen tube as male cells. The one that fuses with the egg flattens itself against the egg membrane. When the membrane is ruptured, the nucleus not only moves to the egg nucleus but there seems to be some mingling of cytoplasm.—*C. J. Lyon.*

ECOLOGY AND PLANT GEOGRAPHY

GENERAL, FACTORS, MEASUREMENTS

5451. ANONYMOUS. Flora of New Zealand. [Rev. of: COCKAYNE, L. The vegetation of New Zealand. In: ENGLER, A., UND O. DRUDE. Die Vegetation der Erde. Sammlung pflanzengeographischer Monographien. XIV. xxiii + 364 p., 65 pl., 2 maps. W. Engleman: Leipzig, 1921.] *Nature* 111: 457-458. 1923.—The reviewer notes that the meteorological maps are quite deficient as to names and orographical details, the work being remarkably well accomplished otherwise.—*O. A. Stevens.*

5452. BIXBY, WILLARD G. Where may the northern pecan be expected to bear? *Amer. Nut Jour.* 17: 78. 1922.—Pecans require about 150 "pecan growing heat units" (calculated by totaling the average monthly temperatures above 50°F. in 1 year). They do well even with 105 heat units.—*E. L. Overholser.*

5453. BOYE-PETERSEN, J. Om Lysets Indflydelse paa Algernes Fordeling i Havet og deres Farver. [On the influence of light on the distribution and colors of marine algae.] *Nat. Verden* 7: 116-125. 1922.—A S. Ørsted outlined in 1844 the distribution of algae at different depths and sought the explanation in the changing colors of light transmitted through varying layers of water. In spite of further research the cause of this relation has not been determined. Engelmann may be right in his theory of the influence of different colors of light, but other factors, such as the light intensity, may also be of importance.—*Ernst Gram.*

5454. BRAUN-BLANQUET, J., et J. PAVILLARD. *Vocabulaire de sociologie végétale*. [Vocabulary of plant sociology.] 16 p. Montpellier, 1922.—This is an attempt to give in French with German equivalents a vocabulary of the accepted phytosociological terms used by the French and Swiss workers in this field. Among those used to denote the analytic characters of the species of plant communities are: abundance (l'abondance, Abundanz), the relative number of individuals; dominance (la dominance, Deckungsgrad, Arealprozent), the extent of surface occupied; distribution (la fréquence, Verteilungsart), the manner in which individuals are distributed in the population; sociability (la sociabilité, Geselligkeit), the disposition of individuals in the interior of an association; prosperity (la vitalité, Gedeihen), the completeness with which a species completes its cycle of development in a given population; periodicity (la périodicité), the seasonal duration; and dynamic behavior or genetic coefficient (comportement dynamique, bedingende Verhalten), the part played by the species in the development of the community. Different degrees of the various qualities are indicated numerically or, in the case of the last, by a set of conventional signs. The chief terms to denote synthetic characters are: constancy (la constance, Gesellschaftsstetigkeit), depending upon the number of sample areas of the association in which the species occurs; and fidelity or exclusiveness (la fidélité, Gesellschaftstreue), the degree to which the species is confined to the association. Five degrees of these 2 qualities are recognized. Other terms which have been more widely used and more commonly understood are also included. [See also Bot. Absts. 12, Entry 2999.]-*Geo. D. Fuller.*

5455. DASTUR, R. H., and W. T. SAXTON. *The oecology of some plant communities in the savannah formation*. Jour. Indian Bot. 3: 34-51. 2 pl. 1922.—This study was made on an undisturbed area about 90 × 800 m. near Ahmedabad (India), 23° 2' N. Lat., 73° 39' E. Long. Beginning at one end, Area I is dominated by *Cassia auriculata*, with less *Zizyphus rotundifolia*, *Cenchrus biflorus*, and *Indigofera enneaphylla*; Area II is dominated by *Cassia auriculata*; Areas III and IV by *Saccharum Munja*, dominance being more marked in Area IV. Many other plants are present in smaller amounts.—In the attempt to determine the cause of this floristic variation in what appeared to be a uniform habitat, 4 lines of investigation were carried out: (1) Detailed analysis of the vegetation of the 4 areas. Tables are given of the percentage of each species in the areas. (2) Soil analyses. The soil is almost pure sand, with little humus. No significant chemical differences in the 4 areas was found. According to moisture content, the areas are arranged II (highest), I, III, IV (lowest), and this order is maintained at all seasons. Mechanical analysis by passing the soil through sieves of 30, 60, and 90 meshes to the inch proved inadequate, so a thoroughly mixed sample of the 90-mesh screenings from each area was spread evenly on a glass slide and microphotographed. The particles of various sizes in unit areas of the photographs were counted, and the percentage weight of each size calculated. The order of the areas on the basis of percentage weight of soil particles less than 0.15 mm. in diameter also is II, I, III, IV, and the conclusion is that water holding capacity of the soil, determined mainly by particles 0.15-0.05 mm. in diameter, is the principal cause of the floristic differences. (3) Physiological anatomy of some of the more important plants. Details are given of leaf and root structure of 7 plants. No satisfactory correlation could be found between anatomical features and distribution. (4) Study of root systems of dominant plants. Long straight unbranched tap roots predominate. They penetrate from about 1.4 m. in small plants like *Boerhaavia* and *Lepidagathis* to 5.5 m. or more in old plants of *Crotalaria Burhia*.—*Winfield Dudgeon.*

5456. DODDS, CLIFFORD. *Further observations on the water hyacinth*. Monthly Bull. California Dept. Agric. 11: 759-760. 1922.—*Eichornia crassipes* Solms has proved an extremely dangerous and troublesome pest in southern U. S. A. and in the irrigated districts of northern Sinaloa, Mexico. It chokes streams and canals and fills in water holes. It has appeared near Centerville, Fresno, and should be exterminated before it gains too strong a foothold.—*E. L. Overholser.*

5457. EVANS, JOHN W. *A Peruvian desert*. [Rev. of: BOSWORTH, T. O. *Geology of the Tertiary and Quaternary periods in the north-west of Peru*. With an account of the paleontology by H. WOODS, T. W. VAUGHAN, J. A. CUSHMAN, and others. *xxii* + 434 p. MacMillan Co.: London, 1922.] *Nature* 111: 527-529. 2 fig. 1923.—This book is regarded as a classic of the desert. Figure 2 shows a cactus, "Rabo de Leon," growing among quartzite blocks.—O. A. Stevens.

5458. FISHER, R. A. *Paradoxical rainfall data*. *Nature* 111: 465. 1923.—A table is given showing the monthly distribution in $\frac{1}{4}$ -inch intervals over a period of 70 years at Rothamstead. The variability is so great that the mean values give little indication as to which month should be expected to be wet or dry.—O. A. Stevens.

5459. HAVERMANS, AUG. *Plaatselijke en kruidkunde*. [Local zoology and botany.] *Natuurwetenschap. Tijdschr.* 4: 234-241. 1922.—The writer confirms the statement of Caballera that *Chara foetida* makes water uninhabitable for mosquitoes of the genera *Culex* and *Anopheles*. Probably the plant secretes a toxin which is harmful to these insect larvae.—J. C. Th. Uphof.

5460. MARTIN, G. W. *Food of the oyster*. *Bot. Gaz.* 75: 143-169. Fig. 1-9. 1923.—Of the 3 sources of nutrition for oysters, small living organisms, organic detritus, and dissolved organic matter, the author treats only of the first 2. In the case of the Barnegat Bay (New Jersey) oysters studied, he finds diatoms to be less important than the nanoplankton. Of the latter, small flagellates and Peridineae are especially prominent. There obtains, however, an extreme variability in kind and amount of the food used from time to time due to changes in the available supply. Organisms washed to oyster beds from brackish ponds are important food elements. The author confirms, with reservations, the method of using the color and consistency of the gastric crystalline style as an indicator of the kind and amount of food taken. He finds some evidence to prove the rejection by the oyster of finely ground particles of the marsh grass *Spartina glabra* var. *pilosa*. It was found that the mucous discharges from the mouth region containing rejected living organisms tend to cling to the shell. Fecal matter is also added to the gelatinous content so that, as the writer puts it, "the oyster not only plants a garden but also fertilizes it." He was definitely able to show that the shell accumulations increased much more rapidly on the shells of living oysters than on shells which were filled with cement.—B. W. Wells.

5461. PAVILLARD, J. *Cinq ans de phytosociology*. [Five years of phytosociology.] 30 p. Montpellier, 1922.—The origin of this branch of ecological science is seen in a publication by Harper in 1917; among those who have contributed to its advance Rübel, Tansley, Braun-Blanquet, and du Rietz are mentioned. It places emphasis on the study of the structure of plant communities and the inter-relations of their members. Attention is focused upon the vegetation and not upon the habitat. The developmental or dynamic principle is recognized as the essential one in the interpretation of plant communities and the association is the fundamental unit comparable to the species in taxonomy. Associations are to be recognized and characterized by the exclusiveness or affiliation (fidélité) of the species composing them and designated according to the dominance of the species.—In discussing the grouping of associations Pavillard thinks that a natural system may be evolved based upon the "sociological progression" of Braun-Blanquet but the time has not come, apparently, for the formulation of such a classification. As the highest unit in such a classification he recognizes the "element" as employed by Braun-Blanquet, that is, the autochthonous and permanent vegetation of a phytogeographical region. The formation, he holds, is not a unit of vegetation superior to the association but a plant community, of any size whatever, characterized by a homogeneous physiognomy, or in other words, the formation is the growth-form (ground-form) of the association.—Geo. D. Fuller.

5462. SAXTON, W. T. **Mixed formations in time: a new concept in oecology.** Jour. Indian Bot. 3: 30-33. 1 *diagr.* 1922.—The author concludes that European and American classifications of plant communities cannot be applied to the vegetation of peninsular India, at least not in ways hitherto attempted. It is customary to think of any given stable area as occupied by 1 formation only, although displaying different aspects and floristic composition at different times. Europe and America have no habitat which even approximately corresponds to the Indian monsoon habitat, with its succeeding 8 months of drought. During the year a given area is subjected to 2 or even 3 such widely differing sets of conditions as to practically amount to distinct habitats: (1) during the monsoon both soil and air are almost saturated with water for about 3 months, when comparatively delicate mesophytic plants flourish; (2) if subsoil drainage is imperfect, toward the end of this period the soil becomes completely water logged and swamp conditions arise; (3) at the end of the monsoon both soil and air gradually become dry, culminating in about 7 months of intense drought, when markedly xerophytic plants are met with. Such an area "may be supposed to be xerophytic bushland in the months of April and May, equally to be a meadow with scattered bushes in July and August, and possibly also to be a marsh in September and October." This is not "succession" in the usual sense. It is suggested that the area cannot be regarded as occupied by "a single unit ('formation') of vegetation, but rather that two (or even three) entirely different plant communities regularly alternate with one another, though each persists to some extent through the dominant phases of the other, thus giving rise to the idea of 'Mixed formations in time.'"—*Winfield Dudgeon.*

APPLIED ECOLOGY

5463. DE SELLEM, GEO. B. **Inspectors corner.** The Western Honey Bee 10: 16-19; 47-50; 79-82; 111-113; 143-145; 207-209; 239-241; 267-268; 299-301; 332-336; 365-371. 1922.—In this department the bee inspectors of California report briefly each month as to the condition of the honey plants in the different counties of the state.—*J. H. Lovell.*

5464. SANDS, W. N. **The agricultural possibilities of Cameron's Highlands, Pahang.** Malayan Agric. Jour. 10: 269-280. 1922.—In the northwest of Pahang at an altitude of about 5,000 feet is a considerable area of open valley land now explored for the first time since its discovery by Cameron in 1885. Probably at least 2,000 acres could be used for the cultivation of *Cinchona* and tea, and other possible crops are suggested; some account is also given of the vegetation, soil, and climate. The Lubok Tamang district lies on the route to Cameron's Highlands at a mean altitude of 3,500 feet; about 500 acres suitable for tea and market garden crops are here available.—*R. E. Holtum.*

FLORISTICS

5465. ANONYMOUS. **The flora of an Indian island.** [Rev. of: ANNANDALE, N. *Introduction to the study of the fauna of an island in the Chilka Lake.* Mem. Asiatic Soc. Bengal 7: No. 4.] Nature 111: 378. 1923.

5466. F[YSON], P. F. [Rev. of: WILLIS, J. C. *Age and area, a study in geographical distribution and origin of species.* 251 p., University Press: Cambridge, 1922.] Jour. Indian Bot. 3: 182-183. 1923. [See also Bot. Absts. 12, Entry 4851.]

5467. HARPER, ROLAND M. **Some recent extensions of the known range of *Pinus palustris*.** Torreya 23: 49-51. 1923.—The range of the long-leaf pine has been extended in northwestern Alabama to Walker and Fayette counties, and in Mississippi to Newton County.—*J. C. Nelson.*

5468. KASHYAP, SHIV RAM. **Notes on some foreign plants which have recently established themselves about Lahore.** Jour. Indian Bot. 3: 68-71. 1922.—The indigenous vegetation about Lahore (India) approaches that of a desert. Nineteen plants are recorded as recently established. A few have washed down to the plains from the Himalayas, but most have come from abroad, mainly from America.—*Winfield Dudgeon.*

5469. NYGAARD, J. N. Botaniske Resultater. [Botanical results.] In: KOCH, L. Resultaterne af Jubilæumsexpeditionen Nord om Gronland 1921. [The results of the jubilee expedition north of Greenland 1921.] Nat. Verden 7: 74-76. 1923.—In this preliminary report of an expedition from Inglefield Gulf round Pearyland the author mentions his collections from Washington Land and Inglefield Land, of about 4,000 specimens, fossils and marine algae included. In Inglefield Land 2 localities gave each more than 100 species of higher plants, while Washington Land with its dry limestone has a very poor vegetation. Special mention is made of the distribution of *Salix herbacea* and *Hesperis Palasii*, and the occurrence of several species of *Taraxacum*.—Ernst Gram.

5470. PHILLIPS, R. A. Distribution of *Brachypodium pinnatum* in Ireland. Irish Nat. 29: 75. 1920.—This grass was first recorded from Ireland in 1898. Now several new localities are given; "wherever it grows it is the dominant species, driving all other plants before it with its strong creeping stem."—W. E. Praeger.

5471. STAGER, ROB. Beitrag zur Verbreitungsbiologie der Claviceps-Sklerotien. [Contribution to the biology of the dissemination of the *Claviceps sclerotia*.] Centralbl. Bakt. II Abt. 56: 329-339. Fig. 1-2. 1922.—The author points out some of the adaptations of *Claviceps sclerotia* to insure distribution. The sclerotia of the aquatic grasses have air chambers and consequently float. Those of the land grasses the seeds of which are provided with a pappus have somewhat reduced their specific weight; those of the grasses the caryopses of which are provided with awns or similar structures and depend on attachment for distribution have in no way lowered their specific weight.—Anthony Berg.

VEGETATION

5472. ANONYMOUS. Un bocage sur un bloc de pierre. [A grove on a block of stone.] Nat. Canadien 48: 173-177. 1 fig. 1921.—At "Pointe-aux Alouettes" between the confluence of the Saguenay and St. Lawrence is a block of rock with earth on it some 12 feet square carrying 3 birch and 2 Indian pear trees about 30 feet high the roots of which run into the earth beneath, as is well shown in the figure.—A. H. MacKay.

5473. ASHE, W. W. Forest types of the Appalachians and White Mountains. Jour. Elisha Mitchell Sci. Soc. 37: 183-198. 1922.—This paper treats specifically only the forest types of the Appalachian region. Those of the White Mountains are to appear in a later paper. More than 50 distinct forest types occur in the 2 regions. While the type is essentially permanent, oscillations and modifications occur by direct self-replacement under cover, by alternation, and by succession. For example, the chestnut type may with increase in peaty accumulation and greater acidity, become favorable for invasion by laurel. The types are separated by composition, by marked difference in height of dominant trees, and by the volume of wood. The sharpest transitions are due to differences in direction of slope and in abundance or scarcity of lime. In the Alleghanies, where stratification of rock is prevalent, the types are usually in horizontal zones along slopes and along ridges. For the Canadian life zone of the Appalachians 9 forest types are mentioned; for the transition zones 38 types; for the Carolinian area 9 types. The physiographic areas, with their associated forest types, are also tabulated. An appendix containing notes and references to literature is added.—W. C. Coker.

5474. BERTSCH, KARL. Pflanzengeographische Untersuchungen aus Oberschwaben. [Studies on the plant geography of Upper Swabia.] Jahresh. Ver. Vaterländ. Naturk. Württemberg 74: 69-172. 20 fig. 1918.—The 1st part discusses the numerous bogs of the region from the standpoint of floristics, ecology, physiography, and geology. The distribution of the characteristic bog plants of Swabia is given in great detail, including: *Vaccinium oxycoccus*, *Andromeda polifolia*, *Eriophorum vaginatum*, *Scheuchzeria palustris*, *Carex limosa*, *Melampyrum paludosum*, *Carex pauciflora*, *Trichophorum caespitosum*, *Lycopodium inundatum*, and *Malaxis paludosa*. Species from the bog-margins, treated in the same way, are: *Vaccinium uliginosum*, *V. vitis idaea*, *Carex cladorrhiza*, *C. helonastes*, *Lonicera caerulea*, *Viola palustris*,

and *Lysimachia thrysiflora*. In many cases the distribution is shown by means of maps, and the structure of certain bogs by diagrammatic plans and sections. The sedges considered in the 2nd part are *Carex alba* and *C. pilosa*, and evidence is cited to show that they entered Swabia shortly after the Ice Age. The carnivorous plants discussed in the 3rd part include 3 species of *Drosera* (with 2 hybrids), 6 of *Utricularia* (with 1 hybrid,) and 2 of *Pinguicula*.—A. W. Evans.

5475. BRICK, C. Die Erhaltung von Mooren. [The preservation of peat bogs.] Verhandl. Naturw. Ver. Hamburg. 25: xvii-xx. 1917 [1918].—The structure and development of the various types of bog are described; also the draining and utilization of many bogs in Germany during the war. A plea is made for the preservation of some of the more characteristic and beautiful bogs as natural monuments.—A. W. Evans.

5476. BRUNS, F. Botanische Wanderungen in Nordpersien. [Botanical journeys in northern Persia.] Verhandl. Naturw. Ver. Hamburg. 25: xxvi. 1917 [1918].—The author, who visited Persia in 1909 and 1910, contrasts the vegetation of the southern coast of the Caspian Sea, the rainy provinces of Gilan and Masanderan, the mountainous region of the Elbur, and the xerophytic plateau to the southward.—A. W. Evans.

5477. ENGEL, THEODOR. Ein botanisches "Naturwunder." [A botanical "natural wonder."] Jahresh. Ver. Vaterländ. Naturk. Württemberg 74: 275-277. 1 fig. 1918.—The author describes and figures a pollarded willow (*Salix alba*) in the crown of which a mountain ash (*Sorbus acuparia*) 2-3 m. high has established itself. The tree is growing in the vicinity of Eisingen, Germany. Attention is called also to the occurrence of the snowball and other woody plants in similar situations.—A. W. Evans.

5478. HARPER, ROLAND M. A botanical bonanza in Tuscaloosa County, Alabama. Jour. Elisha Mitchell Sci. Soc. 37: 153-160. 1 pl. 1922.—The area studied includes the bluffs, cliffs, and ravines along the Warrior River, a short distance above Tuscaloosa, which is on the fall line. A remarkable assemblage is listed and discussed and the author compares the locality favorably with the celebrated bluffs of the Apalachicola in Florida. A number of the species find their southern limits here, and 1 (*Croomia pauciflora*) its northern limit. Among the most interesting plants found were: *Quercus Muhlenbergii*, *Q. montana*, *Acer leucoderme*, *Cladrastis lutea*, *Croton alabamensis*, *Neviusia alabamensis*, *Hypericum aureum*, *Heuchera macrorrhiza*, *Dryopteris marginalis*, *Sedum Nevii*, *Viola canadensis*, *Asplenium Trichomanes*, *Dodecatheon Hugerii*, *Washingtonia longistylis*. The soil is strongly basic, containing 3.95 per cent of K_2O , though only 6.42 per cent of CaO . It is suggested that many supposed calciphiles are really potash-loving plants.—W. C. Coker.

5479. UPHOF, J. C. TH. Vegetationsbilder aus Kalifornien. [Vegetation pictures from California.] Vegetationsbilder 14: 1-24. Pl. 37-42. 1922.—A short description of the geography, topography, and climatic conditions of California is given together with the flora of the Sierra Nevada, the coastal region, the large valleys, the deserts, and the San Bernardino Mountains. The plates illustrate *Yucca* deserts, *Sarcodes sanguinea* in the Yosemite Valley, *Yucca* and *Ephedra* in the Mohave desert, *Eschscholtzia californica*, and *Neowashingtonia filifera* in Palm Canyon.—J. C. Th. Uphof.

STRUCTURE AND BEHAVIOR, SYMBIOSIS

5480. BERTSCH, KARL. Kalklebende Pflanzen in Oberschwaben. [Calciphilous plants of Upper Swabia.] Jahresh. Ver. Vaterländ. Naturk. Württemberg 78: 55-67. 1 map. 1922.—The author describes and indicates on the map the more important calciferous areas in Upper Swabia and gives an account of their geological history. He lists the plants under 3 categories: (1) those confined to calciferous habitats (33 species); (2) those strongly preferring such habitats and not found elsewhere in Upper Swabia (15 species); (3) those preferring calciferous habitats

but not absolutely confined to them (29 species). He then gives a detailed list of the calciferous areas and enumerates under each the calciphilous plants occurring there.—*A. W. Evans.*

5481. DASTUR, R. H. Vegetative reproduction by root runners in two species of *Clerodendron*. Jour. Indian Bot. 3: 143-147. 2 fig. 1923.—Healthy *C. infortunatum* L. and *C. fragrans* R. Br. plants propagate profusely from root runners growing about 10 cm. below the soil surface. The new plants are separated by progressive death of the old runners.—*Winfield Dudgeon.*

5482. GLÜCK, H. Systematische Zusammenstellung der Standortsformen von Wasser- und Sumpfgewächsen. [Systematic summary of the growth-forms of water and swamp plants.] Beih. Bot. Centralbl. II Abt. 39: 289-398. 1923.—One pteridophyte family, Marsiliaceae, 12 families of monocotyledons, and 24 families of dicotyledons, including about 130 species, are described. The size of plant, leaf, etc., is described for each habitat, —water, land, submerged, floating, etc.—*L. Pace.*

5483. IYENGAR, M. O. TIRUNARAYANA. On the biology of the flowers of *Monochoria*. Jour. Indian Bot. Soc. 3: 170-173. 4 pl. 1923.—*Monochoria hastaeifolia* Presl. and *M. vaginalis* L., both common in India, show floral dimorphism related to cross pollination. The single fertile stamen bends either to the right or left, while the style bends in the opposite direction. Flowers of both types occur in the same inflorescence, but the flowers opening on any one day in an inflorescence usually are of the same type. Pollination is mainly by bees. Bagging experiments show that if cross pollination fails, self pollination can take place.—*Winfield Dudgeon.*

5484. SEIFRIZ, WILLIAM. Observations on the cases of gregarious flowering in plants. Amer. Jour. Bot. 10: 93-112. 1 pl. 1923.—The author discusses drought as a factor in causing gregarious flowering in several species of bamboo and in the talipot palm, bringing together data from Jamaica, India, Ceylon, Java, and other regions in the tropics. He concludes that drought is not an important factor, although the remarkable flowering of talipot palms, 2 species of bamboo, and *Bauhinia anguina* at the same time in Ceylon during 1918 suggests the action of some environmental cause of which we are ignorant. Many of the bamboos have a long but very regular sexual cycle, at the close of which all individuals flower and die. Neither depletion of nourishment nor injury seems to be the cause of this cycle. The gregarious flowering of the orchid *Dendrobium crumenatum*, which is clearly caused by environmental factors, is described. The author briefly discusses the causes and origin of sexual periodicity and other growth rhythms.—*E. W. Sinnott.*

FOREST BOTANY AND FORESTRY

W. N. SPARHAWK, *Editor*

(See also in this issue Entries 5473, 5849, 6027, 6084, 6095, 6109)

5485. ANONYMOUS. Annual return of statistics relating to forest administration in British India for the year 1920-21. 29 p. Calcutta, 1922.—This is the customary set of tables for all the British India states, covering the work of the Forest Department. The total area of forests is 250,473 square miles, or 23.1 per cent of total area of the provinces. The percentage of forest varies from 1.4 in Baluchistan to 64.3 in Burma and 70.2 in the Andamans. Artificially marked boundaries total 151,192 miles and forest settlements total 5,146 square miles. The forest survey maps now cover 88,511 square miles, 1,420 having been covered during the year. Working plans cover 59,584 square miles, or 23.8 per cent of forest area. Expenditures on communications and buildings totaled Rs. 33,55,747, in pursuance of the policy of developing the forest property. Forest offences totaled 83,300, the lowest number during the past 5 years. Fire protection was attempted on 44.2 per cent of area of reserves, and 5.6 per cent

of the attempted area burned over, the highest for 5 years, although the number of fires, 4,391, was well below the average. Practically $\frac{2}{3}$ of the forest was open to all grazing animals for the entire year, and 12,159,000 head of stock were carried. The area of plantations increased by 1,600 acres to a total of 169,175 acres, of which 104,108 acres are taungyas. The outturn of timber and fuel was 298,654,000 cubic feet, the lowest for 5 years, while minor produce was of about average value at Rs. 1,36,00,627. The average cut per square mile was 1,192 cubic feet. About 15 per cent of timber and 8 per cent of fuel was removed by Government agency. Total revenue for the year is estimated at Rs. 5,41,00,000 and expenditures at Rs. 3,62,00,000. Fifty years ago the corresponding figures were Rs. 56,30,000 and Rs. 39,33,000, indicating the great growth both in scale of operations and in returns.—*S. B. Show.*

5486. ANONYMOUS. *Bosques*. [Forests.] *Agric. Mexicano y Hogar* 39: 67-74. 1923.—A plea is made for the conservation of existing Mexican forests and for reforestation of the extensive denuded areas.—*John A. Stevenson.*

5487. ANONYMOUS. *Commerce d'importation et d'exportation des bois en 1920*. [Imports and exports of wood during 1920.] *Bull. Soc. Centrale Forest. Belgique* 29: 628-636. 1922.—Although the years 1919 and 1920 marked such a peak of timber cutting that a special law was passed to stop the devastation, the Belgian timber imports for 1920 amounted to nearly half a billion francs in value. Tables compare imports and exports in 1913 and 1920, by classes of materials and by countries. Sweden has become the leading source of supply for Belgium, while France has become the leading purchaser.—*H. T. Gisborne.*

5488. ANONYMOUS. *Conseil superieur des forêts*. [Superior forest council.] *Bull. Soc. Centrale Forest. Belgique* 29: 638-641, 680-688. 1922.—Accounts of the meetings of the Council on June 21, 1922 are given.—*H. T. Gisborne.*

5489. ANONYMOUS. *Conseil superieur des forêts*. *Exploitation abusive des forêts particuliers*. *Interdiction*. *Reglementation*. [Superior council of forests. Devastation of private forests. Control. Regulation.] *Bull. Soc. Centrale Forest. Belgique* 28: 611-620. 1921.—Discussion and conclusions by the members of the council concerning the new law for controlling timber cutting on private holdings are reported. This concludes the discussion which has been published in previous numbers of this journal [see Bot. Absts. 11, Entry 3675; 12, Entry 3042].—*H. T. Gisborne.*

5490. ANONYMOUS. *Experiences en pepinieres*. [Nursery experiments.] *Bull. Soc. Centrale Forest. Belgique* 29: 574-582. 1922.—Some results are given of experiments with the seed of *Pinus silvestris*, *Robinia pseudacacia*, and *Ulmus* sp. No indicative results were obtained by various methods of soaking the pine seed. No definite results have yet been obtained showing the effect of the vigor of the parent, although many old foresters believe that the stunted, or vigorous, condition of the parent is transmitted to the seedling. No definite results were obtained from experiments to determine the influence of age of the parent (15, 20, and 25-year-old parents were utilized).—*H. T. Gisborne.*

5491. ANONYMOUS. *Experiences en pepinieres*. [Nursery experiments.] *Bull. Soc. Centrale Forest. Belgique* 29: 612-620. 1922.—Results are given of experiments in sowing seed of ash, hornbeam, linden, and cherry gathered from the tree at different dates in the fall. Some "general observations on the sowing of green seeds" are made, and the production of stump shoots, or sprouts, from maple is discussed.—*H. T. Gisborne.*

5492. ANONYMOUS. *Loi portant nouvelle prorogation de la loi du 28 janvier 1921*. [Law again prolonging the law of January 28, 1921.] *Bull. Soc. Centrale Forest. Belgique* 29: 601-602. 1922.—The law of Jan. 28, 1921, authorizing the Government to oppose excessive exploitation of certain woods and forests in private ownership is prolonged in effect until December 31, 1923.—*H. T. Gisborne.*

5493. ANONYMOUS. *Loi portant prorogation de la loi du 28 janvier 1921, autorisant provisoirement le Gouvernement à s'opposer à l'exploitation excessive de certains bois et de certaines forêts.* [Law continuing the action of the law of January 28, 1921, authorizing the Government to oppose excessive exploitation in certain woods and forests.] Bull. Soc. Centrale Forest. Belgique 28: 610-611, 655-666. 1921.

5494. ANONYMOUS. *Marche du bois.* [The lumber market.] Bull. Soc. Centrale Forest. Belgique 29: 688-691. 1922.—October and November, 1922, stumpage prices are given for various species and localities, according to size of trees. One oak tree of 260 cm. circumference and containing about 5 cubic m. brought the maximum price of 350 francs per cubic m. Scotch pine and spruce brought about 50 francs per cubic m.—*H. T. Gisborne.*

5495. ANONYMOUS. *Personnalité civile de la Société.* [Organization of the Society.] Bull. Soc. Centrale Forest. Belgique 29: 676-679. 1922.—An account is given of a proposed change in the organization of the Belgian Forestry Society.—*H. T. Gisborne.*

5496. ANONYMOUS. *Progress report of forest research work in India for the year 1920-21, including the administration report of the Forest Research Institute, Dehra Dun. 1-84.* 1922.—The report covers the period July 1, 1920-March 31, 1921. Progress is being made in enlarging the Institute at Dehra Dun. Thirty-four plots were remeasured during the year by the Central Institute. Study of development of established sal reproduction continues to be an important project, and the work is being enlarged to include other valuable species. Artificial regeneration experiments with many species are under way. The work under charge of the various provincial silviculturists shows a wide range of experiments in both natural and artificial regeneration. Burning as an aid in establishing sal reproduction is being tested. Particular attention is being given to the evergreen forests of Assam where the valuable species are in the minority. Cutting and burning of the inferior species, and occasionally clearing and planting, offer best promise of success. In Madras work is under way on the difficult problem of establishing reproduction during the summer heat. In all provinces attention is being given to the remeasurement of permanent plots. In Burma much work in artificial regeneration of teak is under way. Under the heading of Forest Botany the work in group and strip regeneration of sal is described. Experiments indicate that a similar system will prove best for teak. A large amount of work in forest products is being undertaken, dealing with wood technology, testing, preservation, seasoning, minor products, paper, etc. Under Forest Zoology it is noted that relation between rainfall and prevalence of the sal borer is established. A systematic compilation of food plants of important insects is under way. Under Forest Chemistry the work deals with gums, oils, and oleo-resins. Better facilities are needed for publication of results. The administrative report for the Central Institute shows an expenditure for the 9 months of Rs. 2,71,996 compared to Rs. 2,16,270 for the entire preceding year.—*S. B. Show.*

5497. ANONYMOUS. *Protection des oiseaux insectivores.* [Protection of insectivorous birds.] Bull. Soc. Centrale Forest. Belgique 28: 650-655. 1921.—The text is given of a new law applying to the protection of 24 insect-eating birds.—*H. T. Gisborne.*

5498. ANONYMOUS. *Report on the forest administration of the Bombay Presidency (including Sind) for the year 1919-20. 131 p.* Bombay, 1921.—This is the usual administrative report covering all phases of the work of the Forest Department. The area is now 14,947 square miles, 24 less than the preceding year. Working plans continue in arrears, due to shortage of staff, and new plans are needed on 2,640 square miles and revision of old plans on 4,845. New roads to the amount of 181 miles were constructed, and Rs. 1,69,960 were spent on housing. The total of forest offences declined from 22,812 to 19,303, of which 2,271 were injury by fire. Fire protection was attempted on 11,195 square miles and was successful on 94.9 per cent, at an average cost of Rs. 5.9 per square mile. Incendiarism is the principal cause of fires. A total of 2,186,000 head of stock used the forests, compared to 2,674,150 the

previous year, the decrease being due to famine. Seed was generally satisfactory. The total area of plantations is now 39,352 acres, an increase of 4,220 acres. Cultural operations were carried out on 7,362 acres in the Northern Circle and on smaller areas elsewhere. The minor products are being used to an increasing extent. The total outturn of major produce was 1,179,000 cubic feet less than the previous year, due to the ending of the war, and lowered prices. The Government sawmill showed a profit. Thinning on 314 coupes realized a profit of about Rs. 9,000. Departmental exploitation produced 1,737,000 cubic feet of timber out of a total of 5,714,000, and 6,773,000 out of 39,040,000 cubic feet of fuel. The net revenue was Rs. 28,92,626, or Rs. 8,22,915 less than the preceding year. Considerable research work was done, largely in artificial regeneration. The increase in wages and shortage of labor due to the influenza epidemic greatly hampered operations. Capital investment in communications and improvements is evidently necessary both to increase the area worked and the revenue. The usual detailed tabular summaries of work are included.—*S. B. Show.*

5499. ANONYMOUS. **Report of the forest administration in the Bombay Presidency (including Sind) for the year 1920-21.** 130 p. Bombay, 1922.—The report is made to correspond with the fiscal year and covers a period of 9 months. The area of forests decreased by 17 square miles to a total of 14,929 square miles. Working plans are in force on 7,841 square miles, but revisions are needed on 4,614 square miles, and new plans for 2,177. Work is still hampered by lack of personnel. New construction was much less than the preceding year, only 59 compared to 181 miles of road having been built. Forest offences increased from 19,303 to 20,050, fire offences showing the largest increase. Fire protection was unsatisfactory, a total of 1,131 square miles or 10.6 per cent of total attempted area having burned over, due to the dry season and the hostility of the natives. One fire covered a distance of 15 miles and burned 60,000 acres in 24 hours. It is suggested that early burning is the only remedy for such occurrences. Animals grazed increased about 200,000 to a total of 2,338,500. In most of the forests the weather was unfavorable and seed and natural regeneration were poor. The usual cultural operations were carried out on cutting areas, such as weeding of seedlings, sowing of teak, and thinnings. Clear fellings were used in the Thana forests; elsewhere improvement fellings and unregulated cutting were the principal systems of management. Difficulties of labor and transport were serious and the total amount of timber cut was 4,803,000 cubic feet compared with 5,714,000 the previous year, while the figures for fuel are 35,108,000 and 39,041,000 cubic feet. Departmental exploitation accounted for about 25 per cent of the timber and 12 per cent of the fuel. Heavy capital investment is necessary to insure transportation facilities, since contractors and local transport are not dependable. Minor products such as sandal, paper pulp, resin, and tannin, were extracted from the forests to a value of Rs. 11,29,496. Financially, the year shows a decrease in net revenue of Rs. 11,86,460 from the previous year. Personnel is still inadequate for handling the work, and difficult season, famine, and political agitation made the year a particularly difficult one. The most serious trouble is the hostility of the people in many places.—*S. B. Show.*

5500. ANONYMOUS. **Service des aménagements. Année 1921.** [Forest management, year 1921.] Bull. Soc. Centrale Forest. Belgique 29: 586-588. 1922.—Eight tables are given showing the results accomplished in: (1) management plans revised; (2) extent of reserved areas; (3) conversion of ruined woods into coniferous and mixed forests; (4) conversion of coppice with standards into high forest; (5) conversion of simple coppice into coppice with standards and into high forest; (6) lengthening the rotation of coppice under standards; (7) lengthening the rotation of simple coppice; (8) reducing the period of return in broad-leaved forests.—*H. T. Gisborne.*

5501. ANONYMOUS. **The forest formations of Western Australia: No. 1, the karri forest.** Australian Forest. Jour. 6: 52-54. 1923.—The karri (*Eucalyptus diversicolor*) forests endemic to the extreme south and southwest of Western Australia are briefly discussed.—*C. F. Korstian.*

5502. ALLEN, E. T. **America's transition from old forests to new.** Amer. Forest. 29: 67-71, 106. 5 fig. 1923.—Every forested country generally passes through 3 well-defined stages of economic development: (1) the wholly inconsiderate exploitation period, from which the U. S. A. has emerged; (2) the period, which the U. S. A. has entered, of alarm, conservation, and tentative experimentation with actual reconstruction methods; and (3) the final inevitable settling down into such fairly adequate forest production as comparative land values warrant, with the burden and benefit divided between public and private agencies according to their facilities and needs. To be continued.—*Chas. H. Otis.*

5503. ANDERSON, C. R. **Harvesting Christmas trees by topping.** Amer. Forest. 28: 731. 2 fig. 1922.

5504. BAKER, O. E. **Land utilization in the United States.** Geographical aspects of the problem. Geog. Rev. 13: 1-26. 1923.—This paper discusses in detail the present use of land, particularly for agriculture, the possibility of increasing the area of agricultural land and the yield per acre, and the present trend in land utilization and in agricultural production. At present no potential agricultural land is unutilized that does not involve unprofitable expense for reclamation or clearing. Considerable areas are not reverting to forest or pasture. Only about 40 per cent of the land area can ever be used for crops, and while the population is increasing rapidly the area of cultivated land is increasing but slowly. About 50 million acres of cutover lands can be turned into agricultural use, but at a high expense for clearing; and, moreover, most of this can be used more profitably for forest than for crops. It is stated that by ceasing to export agricultural products, by reclaiming all reclaimable land, and by increasing yields per acre, a population of 275 million could be provided for. Change in consumption from the present meat diet to one more completely vegetable in character would also solve the problem of an increased population. The present trend is toward a gradual increase in area of improved farm land with decrease of labor applied, and increased use of machinery and fertilizer. There is also an apparent trend toward more intensive use of the best lands, and use of poorer lands for grazing only. Increased importation of agricultural products probably will help to solve the problem.—*S. B. Shaw.*

5505. BALON, A. **Excursion forestière en 1920, seconde journée.** [Second day of the 1920 forester's excursion.] Bull. Soc. Centrale Forest. Belgique 28: 635-648. 1921.—The area of 4,248 hectares of the Hertogenwald is described as to its timber, management, soil, climate, altitude, topography, roads, game, improvements, exploitation, and nurseries.—*H. T. Gisborne.*

5506. BARBOUR, T., and W. S. BROOKS. **The Sapo Mountains and the Sambu Valley: a biological reconnaissance in southeastern Panama.** Geog. Rev. 13: 211-222. 1923.—Forests of the region are discussed in connection with the human and animal life.—*S. B. Shaw.*

5507. BEESON, C. F. C. **Damage to timber by insects.** Indian Forest Rec. 9⁵: 227-239. 1922.—In connection with seasoning of woods from Indian forest trees, it is pointed out that defects in manufactured forest products may have been due to damage to the tree prior to manufacture. Measures of seasoning adopted for one locality can not be applied to others because of the presence or absence locally of borers, while the season of felling or girdling influences materially the liability of a species to damage. Green conversion or removal of the bark from logs will permit damage from borers. The insect species which damage the wood are listed with a description of the damage caused; in many cases the woods involved are given.—*E. N. Munns.*

5508. B[IOLE]Y, H. **Eclaircie "par le haut" et éclaircie jardinatoire.** [Thinning "from above" and selective thinning.] Jour. Forest. Suisse 72: 181-186. 1921.—In certain forestry circles of Romanic Switzerland both terms are used indiscriminately to denote the same operation, thus causing confusion. Biolley objects to the misuse of terms and proceeds to

show that although the 2 methods of thinning may be analogous or even coincide at times, they necessarily differ in aim and subsequent progression. The method of thinning from above or the French method, as set forth and practised by Boppe, is compared point for point with the method of selective thinning, as defined by Gurnaud. The comparison is thus summarized: (1) thinning from above consists in the removal of competing trees (i.e., by liberation in a lateral direction) and tends to establish a shelterwood forest; (2) selective thinning consists in the removal of intermediate trees (i.e., by liberation in a lateral and downward direction) and tends to establish a selection forest. Biolley cites the results obtained by 2 foresters working under identical conditions and having apparently the same aim. Due to a difference in application of 4 successive thinnings one stand corresponds to a thinning from above and the other to a selective thinning.—*G. Kempff.*

5509. BILLEY, H. *Réponse à Monsieur P. de Coulon.* [Reply to P. de Coulon.] Jour. Forest. Suisse 73: 49–52. 1922.—Biolley fails to see the exact point of de Coulon's criticism [see Bot. Absts. 12, Entry 5524] and therefore his reply is of a general nature. He proceeds to prove that he champions freedom of practice and individuality of the forester's art. The Méthode du Contrôle, the forest, and the best practice are to be considered hypothetical; consequently any method used must demonstrate its usefulness *a posteriori*. Although the method has proved successful in a practice extending over 30 years, Biolley states that it is not a panacea. It can be employed only in forests with special conditions, much depending upon the will and ability of the managing forester; it is a constant guide, not a hindrance, to a definite, unhampered practice. Several reasons are given why an ocular estimate, only, of the progress in a stand is misleading, concluding that the method is submitted in good faith as a successful experiment, although search for a more efficient method continues.—*G. Kempff.*

5510. BILLEY, H. *Une expérience de communisme sûr la forêt.* [An experiment in forest communism.] Jour. Forest. Suisse 73: 61–65, 83–85. 1922.—The author turns to the history of communism in the forests of the canton of Neuchâtel, dating from the earliest colonization to the end of the 18th century. Under this social system the forests were considered "free for all," without restriction and without thought of their exhaustion. Late in the 14th century parties obtained leases of parts of the forest for their exclusive and unrestricted use. This custom extended until the communes in the canton became alarmed and restored the forests to "unrestricted free use." The misuse of forests continued until the first forest reserve of 30 hectares was set aside in 1567. This precedent was followed by other communes and thus the "absolute free use," handed down from generation to generation, was slowly broken down.—Through the efforts of the commune of Couvet, the entire canton decided in 1765 to abolish "unrestricted free use" and to encourage natural regeneration, in order to avert a timber famine. This step hastened the creation of forest reserves and their administration in the interest of the general public. Actual progress in the application of the new policy, however, was very slow, due to constant political interference on the one hand, and lack of a technically trained forest personnel on the other. It is pointed out that the present prosperous state of the canton is due to the abolition of forest communism.—*G. Kempff.*

5511. BOMMER, CH. *Les forêts de la region mediterraneene en France.* [Forests of the Mediterranean region in France.] Bull. Soc. Centrale Forest. Belgique 29: 545–556, 665–673. 1922.—A general description is given of the herbaceous and tree associations found in the French Mediterranean region with references to a few particular cases of succession and their controls.—*H. T. Gisborne.*

5512. BRADLEY, J. W. *A plantation of remarkable growth.* Indian Forest. 48: 637–640. Pl. 18. 1922.—To furnish fuel, a plantation of *Albizzia moluccana* was established in 1915, seed being sown 12 × 12 feet and the area interplanted. The average tree was 86 feet in height and had a girth of 2 feet 6½ inches, making 3,000 cubic feet per acre in 7 years. From this plantation 60 pounds of seed were collected and the return from thinnings, etc., amounted to Rs. 1,050, paying for the plantation with the major stand yet untouched.—*E. N. Munns.*

5513 BRADLEY, J. W. **Report on forest administration in the Andamans for the year 1920-21.** ii + 42 p. Calcutta, 1922.—This is the customary annual report of the work of the forest department, but covers only a 9 month period, since the forest and fiscal years are being made to coincide. The area of forests remains at 2,207 square miles, on 708 of which working plans are nominally in force. An attempt was made to substitute wood for coal as fuel, but with indifferent success. Improvements needed for forest purposes, such as roads and trams, were constructed, the total capital investment being Rs. 2,28,000. The area of plantations remains at 2,063 acres, and other cultural operations covered 2,112 acres. The species planted are chiefly teak, padauk, and mangrove. Thinnings were made in the earlier mangrove plantations, established in 1897. Clear cutting with artificial regeneration is now the silvicultural system in force. About 90 per cent of timber was extracted by Governmental agency, the total amount being 729,000 cubic feet. The usual confusion in current and capital expenditures makes a real understanding of the finances difficult. Apparently the Department is more than paying its way. The problem of labor is very difficult, as convict labor is to be abolished and free men are difficult to secure. Development of the forest property is seriously hampered, and a permanent population appears as the only solution. The usual detailed statistical summaries are given.—*S. B. Show.*

5514. BRUNER, E. MURRAY. **Agricultura y silvicultura.** [Agriculture and silviculture.] *Rev. Agric. Puerto Rico* 6^o: 17-21. 1921.—The author emphasizes the importance of reforestation in Porto Rico, which is now largely denuded of forests and dependent upon imports for fuel and other forest products. Half of its area is waste land capable of being reforested.—*John A. Stevenson.*

5515. BRUNER, E. MURRAY. **Ciertos elementos de la situación forestal como factores determinantes, en consideración del presupuesto del servicio forestal de Puerto Rico para los años fiscales 1921-23.** [Certain elements of the forestry situation as determining factors in consideration of the estimates for the fiscal years 1921-23.] *Rev. Agric. Puerto Rico* 6^o: 25-31. 1921.—The author reviews the past and present forestry situation in Porto Rico as a basis for outlining the needs of the forest service of the Island in the coming biennium.—*John A. Stevenson.*

5516. BRUNER, E. MURRAY. **Informe del silvicultor.** [Report of the silviculturist.] *Rev. Agric. Puerto Rico* 6^o: 15-24. 1921.—The deforestation of Porto Rico has been going on for 4 centuries and 50 per cent of the land or over a million acres is now abandoned or affords only scanty pasturage. Such a condition emphasizes the need of forestry work on the Island. The Insular service now has under protection 15,000 cuerdas of mangrove swamp lands along the coast from which the crop is being sold as it becomes available. Other Insular forests are located near Guaynilla, Guanica, Maricao, and on Mona Island, totaling about 25,000 cuerdas. An experiment station has been established at Rio Piedras, including nurseries for tree production. The trees produced here will be used for planting on the Insular forests and along public roads.—*John A. Stevenson.*

5517. BRUNER, E. MURRAY. **Informe sobre la situación de la silvicultura en Puerto Rico.** [Report on the forestry situation in Porto Rico.] *Rev. Agric. Puerto Rico* 8^o: 43-50. 1922.—The author discusses the present forestry situation in Porto Rico and the prospects for future development. Approximately $\frac{1}{2}$ of the area of the Island is unsuited to agriculture and might well be put under forest growth.—*John A. Stevenson.*

5518. BRUNER, E. MURRAY. **La extensión forestal en Puerto Rico una necesidad económica.** [Forest extension in Porto Rico an economic necessity.] *Rev. Agric. Puerto Rico* 9^o: 19-25. 1922.—Porto Rico has been practically denuded of forest growth, making artificial regeneration necessary. The author discusses the effect of forests on climate, soil, and stream flow. Considerable progress has been made by the Insular forest service in establishing nurseries, making planting plans, and in taking under management such remnants of forests as still exist.—*John A. Stevenson.*

5519. BUTLER, O. M. **Henry Ford's forest.** Amer. Forest. 28: 725-731. 7 fig. 1922.—The author visited this forest of about 400,000 acres, located in the upper peninsula of Michigan, and recently acquired by Henry Ford. The most modern methods of lumbering are practiced.—*Chas. H. Otis.*

5520. BUTLER, O. M. **Our forest hunger.** Amer. Forest. 29: 3-13. 12 fig. 1923.—This popular article depicts the ways in which forests and their products enter everyday affairs and activities.—*Chas. H. Otis.*

5521. BUYSSENS, JULES. **Forêt, nature et art.** [Forest, nature and art.] Bull. Soc. Centrale Forest. Belgique 29: 621-625. 1922.—The aesthetic value of a few trees is compared with that of an entire forest.—*H. T. Gisborne.*

5522. C. **La rouille vesiculaire du pin Weymouth.** (*Peridermium Strobi*.) [*Peridermium Strobi* on the Weymouth pine.] Bull. Soc. Centrale Forest. Belgique 28: 600-602. 1921.—*Peridermium Strobi*, which has become serious within the last 20 years in Belgium, threatens greatly to reduce or even to eliminate the growing of Weymouth pine. Five rules, formulated by Badoux, of the forest school at Zurich, are given for the proper handling of the species in order to reduce the danger of *Peridermium* infection.—*H. T. Gisborne.*

5523. C., N. I., et CTE. F. G. D'A. **Le prix des plantes en 1922.** [The price of plants in 1922.] Bull. Soc. Centrale Forest. Belgique 29: 567-574. 1922.—Nurserymen's prices for seedlings in 1922, some of which are given, are characterized as "exorbitant." Planting becomes a luxury available only to those who do not need to make a profit from the investment. These high prices are maintained by agreement or order of the nurserymen's syndicate, and great harm is bound to result.—*H. T. Gisborne.*

5524. COULON, P. DE. **Jardinage cultural ou Méthode du Contrôle.** [Cultural selection or method of control.] Jour. Forest. Suisse 73: 45-49. 1922.—Inventory revisions may be made as desired. The following specific provisions of the working plan are critically reviewed: (a) determination of thinning intervals; (b) establishment of thinning subdivisions; and (c) determination of the initial yield. The Méthode du Contrôle used by Biolley is regarded by de Coulon as of no practical use, except as a demonstration *a posteriori*. Field examinations are stressed as in every way superior to regulation by inventory figures. De Coulon states that his criticism is directed not against Biolley's praiseworthy book "Method of Control in Forest Management," nor against his practical demonstration of the Méthode du Contrôle during the last 30 years in the majority of the forests in the canton of Neuchâtel, but against the impression that cultural operations in selection forests depend upon the universal application of "methodic control." The article closes with an appeal for the preservation of the 300-year-old trees in the forests of the canton, the cutting of which is now threatened in consequence of the rigid application of the Méthode du Contrôle. [See also Bot. Absts. 12, Entry 5509.]-*G. Kempff.*

5525. COX, WM. T. **The fire call of the north woods.** Amer. Forest. 28: 707-711. 4 fig. 1922.—This article pertains particularly to Minnesota. Reasons are given for the increased prevalence of forest fires. The greatest fire hazard came with the demand for drainage ditches, which have helped to dry out the swamps and grass lands. 252,000 acres of land burned over in the summer of 1922.—*Chas. H. Otis.*

5526. DALRYMPLE-HAY, R. **Report of the Forestry Commission [of New South Wales] for the year ended June 30, 1922.** 15 p. Sydney, 1923.—This is the 6th annual report. Plantations of Monterey pine during the year amounted to 1,488 acres, much less than needed since importations of softwoods amounted in value to £1,478,000. On state forests, 33,975 acres were treated for regeneration and 10,920 acres were thinned. Over 204,000 railroad ties were supplied by state forests to the railway department. Forest fires burned 51,500

acres on a protected area of 850,000 acres. An additional 177,696 acres of state forests were proclaimed, bringing the total to 5,371,994. The area of timber reserves is 1,479,792 acres. New working plans were made for 152,324 acres, the total now being 1,027,361 acres. Timber converted amounted to 14,653 M board feet. The total revenue was £217,841 and administrative expenses £64,942. The consumption of native lumber in the State was 356,932 M board feet, and 145,646 M board feet were produced under license. The State was represented at the Australian forestry conference. Investigations of tanning materials and of native species for wood pulp were made.—*S. B. Show.*

5527. DELEVOY, G. Notes sur l'accroissement du hêtre dans la forêt de Soignes. [Notes on the growth of beech in the forest of Soignes.] Bull. Soc. Centrale Forest. Belgique 28: 579-599. 1921.—Beech is the most important broad-leaved forest tree in Belgium. Tables show volume growth; stand density and volume; mean tree measurements by decades up to an age of 120 years for one parcelle, and 160 years for another, with tree diagrams for each case. Growth is then discussed by height, diameter, longitudinal section, basal area, cubic volume, and form. A table of form coefficients is appended.—*H. T. Gisborne.*

5528. DOCHNAHL. Ueber Band und Flechtweiden. [Concerning hoop- and basket-willows.] Illus. Landw. Zeitg. 43: 27. 1923.—This is a discussion of species and varieties of willow suitable for basket-making and for agricultural use in tying and braiding operations.—*John W. Roberts.*

5529. ELLIS, LEON MCINTOSH. New Zealand. State Forest Service. Report for the year ending March 31, 1922. 25 p. Wellington, New Zealand, 1922.—The report covers the 1st full year of operation of the Forest Service. A modern Forests Act became law, and though hampered by lack of technical force, good progress was made. The total area of state forests increased to 7,181,975 acres. The state plantations total 42,000 acres, and extensive areas have been planted by private owners. Fires burned over only 5,200 acres, the result of better protection and a favorable season. The inventory of forest resources is half completed. Expenditures were £107,582, of which £47,371 was for planting work; receipts increased to £30,836 in spite of a slump in the timber market. Great emphasis is being placed on public education in care with fire, tree planting, and the value of the forests. Research work is being undertaken aggressively, though with inadequate personnel. Economics, products, and the silvics and silviculture of important trees and forest types, as well as planting, are all under investigation. Experimental planting of sand dunes has been begun. Timber shortage is already evident in certain districts. Imports of timber continue heavy. Detailed tabulations covering the important features of work are appended.—*S. B. Show.*

5530. FARRINGTON, H. A. Annual progress report on forest administration in the Presidency of Bengal for the year 1919-20. 50 p. Calcutta, 1921.—The area of forests remained at 10,407 square miles, located on the fringes of the Province. Work was adversely affected by shortage of staff. One new working plan covering 27 square miles was put into effect and 4,805 square miles of forest are now under plan. Departures from the plans were necessitated by lack of demand and revision of plans. Good progress was made in housing, but little in construction of roads. The total number of forest offences dropped from 3,694 to 3,269, and convictions were obtained in 94 per cent of the cases. Fire protection was successful on 99.4 per cent of the 400,000 acres on which it was attempted. Sal fungus is under study, but definite conclusions can not be stated. Lantana is spreading rapidly and every effort is being made to eradicate it. Natural reproduction of the more valuable species is unsatisfactory, and present plans provide for artificial regeneration under the taungya system. With the cessation of war demands departmental operations decreased, but the total value of sales was Rs. 16,11,600 as against Rs. 14,69,200 the preceding year. The selection method is in force on 75 per cent of the area under working plan, and improvement fellings on most of the balance. The usual tending and cultural operations were carried out. The net revenue dropped from Rs. 11,21,800 to Rs. 9,47,600. Considerable research work was done, particu-

larly in connection with forest nurseries. A summary of the report by the Secretary to the Government is included, together with the usual detailed summaries of all phases of the year's work.—*S. B. Shaw.*

5531. FRICKE. Gedanken aus dem Walde und anderes. [Forest thoughts.] Zeitschr. Forest.- u. Jagdw. 54: 43-54. 1922.—The agitation in favor of forest management under the continuous selection system has brought the high forest system with area regulation into disfavor. The most important factor determining increased yields under the new system is increased soil fertility through adequate protection; there is no reason why this can not be secured under the older system by cultural work, soil preparation, under-planting, etc. The high forest system is still in its infancy and needs improvement, but is capable of being improved. It is not economically desirable to abandon the system, prior to developing it to its fullest capacity; neither is it desirable not to develop the selection system, since only long-time development of each can furnish final conclusions. The author also discusses 2 problems in mensuration in the use of Schwappach's yield tables and Pressler's formula for calculating accretion.—*J. Roeser.*

5532. GEORGI, C. D. V. Note on Minyak Nyatoh (oil from *Palaquium* sp.). Malayan Agric. Jour. 11: 38. 1923.—Particulars are given of this oil, probably from *Palaquium oblongifolium* Burck.; it is a hard white fat which could be used for edible purposes, soap-making, etc.—*R. E. Holttum.*

5533. GEORGI C. D. V. Notes on Kapayang oil. Malayan Agric. Jour. 11: 39-40. 1923.—Oil from seeds of 2 forest trees locally known as Kapayang was examined. One of these is probably *Hodgsonia heteroclita*, the other not known. Neither has been cultivated and nothing can be reported as to commercial possibilities.—*R. E. Holttum.*

5534. GEORGI C. D. V. Oil from *Sterculia* sp. Malayan Agric. Jour. 10: 259-261. 1922.—Analyses are given of oils from kernel and pulp of seed sent from Brunei, used locally as a source of edible oil. The total oil content is 26 per cent of the dry seed, but until larger quantities are available for investigation it cannot be recommended for any specific purpose.—*R. E. Holttum.*

5535. GERRY, ELOISE. Naval stores: treasures of the living pines. Amer. Forest. 29: 72-77. 8 fig. 1923.

5536. GHOSE, T. P. The calorific value of some Bombay and Burma timbers. Indian Forest. 48: 141. 1922.—The heating values in calories and in B. T. U. calculated on wood dried at 100°C. are given for *Cordia myxa*, *Bauhinia variegata*, *Trema orientalis*, *Ficus tuberculata*, *Butea frondosa*, *Hymenodictyon obovatum*, *Zizyphus xylopyra*, *Polyalthia cerasoides*, *Bruguiera gymnorrhiza*, *Ceriops roxburghiana*, *Cynometra ramiflora*, *Excoecaria agallocha*, *Heritiera minor*, and *Rhizophora mucronata*.—*E. S. Forest Service.—*C. F. Korstian.*

5551. HVASS, J. Den af v. Kalitsch anvendte Skovbehandling, dens Fortrin og Mangler. [The forest management of v. Kalitsch, merits and disadvantages.] *K. Vet. og Landbohøjskoles Aarsskr.* 1923: 165-192. *Fig. 1-8.* 1923.—A movement in German forestry from the old rigid system to more natural forms, where the forester merely helps nature, was studied in the "Dauerwald" of v. Kalitsch, in pine woods on diluvial sand in Anhalt. Since 1884 all clear cutting has been abolished, no litter is sold, and the poorest parts are even furnished with litter from other parts. The cutting was first very conservative tending to form trees with 10-14 m. branchless trunks and pointed crowns 6-7 m. high. When this was accomplished the new growth was allowed to appear in groups which, as the cutting proceeded, united to a remarkably regular cover in 20 years. In the Dauerwald the new growth in the shade of the older trees develops slender stems with thin branches and when the light is let in the crowns develop and the diameter growth speeds up. Objections to the Dauerwald are its lack of order and system, the great responsibility on the administrator, the poor guarantee for the future, the difficult and expensive work, and the great damage when the trees are cut.—*Ernst Gram.*

5552. JACOB, W. R. LEG. Note on Bokain (*Melia azedarach*) plantations on Monabari tea estate. *Indian Forest.* 49: 73-75. 1923.

5553. JACOB, W. R. LEG. Note on Bokain (*Melia azedarach*) plantations on Orang tea estate. *Indian Forest.* 49: 76-78. 1923.

5554. JERRAM, M. R. K. *Cedrela serrata* timber. *Indian Forest.* 48: 501-502. 1922.—The wood is free from white ant depredations and offers excellent possibilities for use in white ant regions. The tree grows in moist localities, propagates readily from seed, and may be grown in dense stands on a 50-year rotation.—*E. N. Munns.*

5555. JERRAM, M. R. K. The effect of fire, shade, and injury on the growth of *Pinus longifolia* seedlings. *Indian Forest.* 48: 644-647. *Pl. 20.* 1922.—Partial shade helped the growth of seedlings, while on the burns the tree made a much better growth than in the forest. Wood ashes apparently help, but the real effect is presumably deeper for the growth of trees in the nursery, fertilized with ashes, does not compare with their natural growth. An insect attacks the tree and after the death of the leader coppice growth forms a ring about the root, apparently changing the type of root growth from a fibrous system to a tap-root.—*E. N. Munns.*

5556. KAUTZ. Die Verjüngung der Buche und Fichte im Harz. [The regeneration of beech (*Fagus sylvatica*) and Norway spruce (*Picea excelsa*) in the Hartz Mountains.] *Zeitschr. Forst.- u. Jagdw.* 54: 93-106. 1922.—The possibilities are discussed of securing natural reproduction under pure beech, pure spruce, and mixed stands with usual cutting methods. Mixed stands of beech and spruce are reproduced easily everywhere; beech in pure stands is easily regenerated when the soil is kept in good condition and free of weeds; and pure spruce stands may be regenerated in part naturally without cost; in part, only with cost; in part, only artificially. Beech regeneration is governed primarily by the degree of preparatory and light fellings, since the density of the overstory must be regulated according to the amount of light needed to induce seed production, to keep down advance reproduction, and to protect and encourage the desired reproduction. Spruce sites are classified according to method of reproduction to be used, and a few cultural rules are given. In any case—whether seeding or planting—extensive clear-cutting in spruce should be avoided.—*J. Roesser.*

5557. KIENITZ. *Ergebnis der Versuchsanpflanzung von Kiefern verschiedener Herkunft in der Oberförsterei Chorin.* [Results of experimental plantations of pines of various origin in the forest district of Chorin.] *Zeitschr. Forst.- u. Jagdw.* 54: 65-93. 1922.—In 1907 Scotch pine (*Pinus silvestris*) seed from Scotland, East Prussia, southern France, Belgium, Bavaria (Rhine Palatinate), Courland, Brandenburg, and eastern Russia (Ural) was sown in the Chorin nursery. In 1908, 4 additional lots from Bulgaria, northern Sweden, and northern and western Hungary were sown. Results after 15 years are believed to be representative and reliable for practical application. Racial characteristics were developed during the first year after sowing, and the growth habit was affected by place of origin more than by any other factor. Results indicate that the southwestern German pine is entirely unadapted in the East, and southern German mountain pines do not thrive in northern Germany; that trees of eastern German origin surpass all other races in form and size; and that Belgian trees which showed the highest survival belong at least to the better races. On the basis of average height \times survival, the different races of the 1907 planting ranked as follows: East Prussia, Belgium, Brandenburg, Courland, Rhine Palatinate, Scotland, eastern Russia, southern France. The last was a distinct failure. Of the 1908 sowing only the trees of northern Sweden showed promise. For the extensive introduction of pines extreme caution should be employed to select only such races as give the greatest assurance of developing good form upon the new site. In general, the local variety should be employed, and the use of seed far from its place of origin should depend upon similarity of site conditions. Since desirable forms are mainly heritable, stands should be so guided by proper selection in thinnings, that at maturity only those stems remain which conform to the object of management. For best results seed should be collected only from older stands, absolutely pure of race. Failures due to improper selection (from stands of poor form or from regions too remote from the place of employment) are very common and have discouraged pine culture in many parts of Europe.

—J. Roesser.

5558. KNUCHEL, H. *Quelques impressions sur le Portugal forestier.* [Impressions of forestry conditions in Portugal.] *Jour. Forest. Suisse* 73: 41-45, 65-68, 85-87. 3 pl., 1 fig. 1922.—A general description of topography and climate is followed by a short description of Portuguese agriculture. Two tables show (1) the percentage of forest area compared with idle land and land to put to other uses, and (2) the distribution of the different forest types. The growing "Society of Tree Culture" plays an important political part. Portugal has an excellent basic forest law, enacted in 1901 and 1903 and enforced by a far sighted and conscientious forest personnel. All receipts of the forests on the public domain may be paid into a special fund to be used exclusively for forestry purposes other than salaries. The forests are classified according to whether their administration by the State is obligatory or optional.—The law of 1901 established a branch of forest management and one of forest research. An amendment in 1911 created a special fund for general forest inspection and the annual recognition of parish-schoolmasters of merit in any branch of forestry. Under the new forest laws great strides have been made by the State in land acquisition, afforestation, reforestation, road construction, and communal cooperation. The communes have themselves accomplished very little.—The distribution of forest species is summarized into the northern and southern groups. The characteristics, management, and utilization of maritime pine, the most important timber species, are briefly related. Other species are mentioned, especially cork oak.—An outline is given of the forestry organization headed by a director general and comprising the 4 offices of management and research, planting, administration, and finance. The extent of state forests including the areas planted in the mountains and along the coast is given.—The park at Bussaco, embracing 102 hectares, is not only of botanical interest to foresters, but also contains the only primeval forest of indigenous trees and shrubs left in Portugal. There are plantations of introduced species of *Abies*, *Picea*, and *Fagus*, a few splendid specimens of *Cupressus lusitanica* 270-300 years old and many of *Sequoia sempervirens*.—The State has been aggressive and successful in the afforestation of dunes and dried up marshes, obtaining good results especially with *Eucalyptus*, *Pinus maritima*, and *P. insignis*. To date, however, the State has not taken energetic steps in reforesting denuded mountain areas.—G. Kempff.

5559. KRAUCH, HERMANN. Nursery and planting methods developed at the Gallinas nursery, Santa Fe National Forest. *Nation. Nurseryman* 31⁶: 125-128. 7 fig. 1923.

5560. LEETE, F. A., ET AL. Report on forest administration in Burma for the year ending June 30, 1920. ii + 202 p. Rangoon, 1922.—This is the usual annual report covering the activities of the Forest Department. A review of the more important phases of the work by the Chief Conservator is a feature. Rapid progress was made in reserving forests. At present only 29,874 square miles, or 20 per cent of the forest area, is reserved; the balance is unclassified. In the future, forests for local purposes as well as for timber will be reserved, a radical departure from past policy. Little was done in preparation of new working plans, though it is known that much is required and most existing plans are out of date. Minor species are not sufficiently recognized in the older plans. Natural reproduction was generally poor. Artificial reproduction has now covered 100,400 acres,—5,896 acres, largely teak, having been added during the year. Forest offences rose from 5,414 to 7,152, with the certainty that not all were reported. It seems probable that teak can be produced in a 60-year rotation by taungya regeneration as large as that grown in 180 years under natural conditions. Fire protection was attempted on 859,600 acres and 70,300 acres burned over during the year. Progress was made in construction of communications, but the province is still backward and exploitation is seriously hampered by lack of roads. The outturn of timber was 100,775,000 cubic feet, largely teak. Demand and prices were good. Minor produce rose in value to 11.26 lakhs and gross revenue was 165.67 lakhs,—36 lakhs more than the previous year. Departmental exploitation was commonly employed as in the past. A provincial research circle was created, and serious efforts were made to study the many forest species in the province. The usual detailed tabular summaries of receipts, expenditures, grazing, fire, exploitation, etc., are included.—*S. B. Show.*

5561. LEETE, F. A., ET AL. Report on forest administration in Burma for the period July 1, 1920, to March 31, 1921. 202 p. Rangoon, 1922.—This is the customary annual report dealing with all phases of the work of the Forest Department. A comprehensive review of important points by the Chief Conservator, and a summary by the Secretary to the Government are features. The reservation of forests for local use proceeded slowly due to both inadequacy of surveys and misguided opposition of the local population. It was found that many working plans are not being followed in practice, and while the need for new and revised plans is great, the tendency to regard all of the older plans as worthless is unfortunate. Greater attention was given to research, a special officer having been appointed, and much new work was undertaken. Taungya plantations, chiefly of teak, amounted to 5,500 acres in the year. This is an important method of regeneration, avoiding many of the difficulties of natural reproduction. An economic survey is proposed to determine the available supply of various timbers. Expenditures on communications and buildings totaled Rs. 2,33,354, and good progress in this work is reported. Breaches of forest rules totaled 6,140 for the 9 months. Fire protection was attempted on 445,870 acres, of which 116,007 acres burned. On the reserved forests 22,808 square miles were closed to grazing and 7,126 were open wholly or in part. The amount of teak cut was 322,660 tons, greater than in the entire preceding year, and 241,290 teak trees were girdled. The increased use of teak is regarded as dangerous because the present supply will decrease until plantations are ready to exploit. The total area of plantations is now 102,425 acres. Revenue and surplus continued to increase, being respectively 168 and 108½ lakhs as compared with 166 and 102½ lakhs the preceding full year. Teak is the backbone of forest revenue, accounting for 129 lakhs. The successful operation of the provincial forest school continued. The usual detailed tabular statements of the operation of the Department are included.—*S. B. Show.*

5562. LITTLEWOOD, A. C. Effect of poisoning sandal seeds on germination. *Indian Forest*. 48: 188-189. 1922.—Experiments on sandal seed show that neither perchloride of mercury nor the red oxide of mercury were effective rodent deterrents as the seed was freely taken. No treated seed germinated, but as no checks were made it is not known whether the seed was affected by the poisons.—*E. N. Munns.*

5563. LOVEJOY, P. S. Michigan's fight for forests. Amer. Forest. 28: 749-753. 4 fig. 1922.

5564. LOVEJOY, P. S. The need for a policy for the cutover lands of Michigan. Rept. Michigan Acad. Sci. 22: 5-7. 1920.

5565. MILWARD, R. C. Annual progress report on forest administration in the Presidency of Bengal for the year 1920-21. 47 p. Calcutta, 1921.—The report covers a 9-months period. The area under administration remained at 10,698 square miles, or 13 per cent of the area of the province. Working plans were revised for 46 square miles of forest. During the year 105 miles of new trails were constructed. Of 424,000 acres on which protection from fire was attempted, only 1.3 per cent burned. It was found necessary to fence plantations in order to prevent damage by wild cattle. Fungi and insects also required constant attention. Natural reproduction of desirable species continued unsatisfactory and much work was done in tending, cultivating, and protecting natural reproduction. Taungya plantations were established on 179 acres. Of the area under working plan 65 per cent has unregulated felling and 17.6 per cent improvement felling. Departmental operations accounted for 4 per cent of the timber and 22 per cent of the minor produce. The amount of sale and extraction was about the same as the previous year. A greater percentage of the expenditures was for capital investment, since it is recognized that greater investment in roads, communications, etc., is necessary if the forests are to be handled at maximum utility and profit. The net income for the period was Rs. 6,71,600, compared to Rs. 9,47,600 for the entire preceding year. A summary of the report by the Secretary to the Government is appended, with detailed tabulations of all phases of the Department's work.—S. B. Shaw.

5566. MÖLLER. Zusätze zur "Betriebsregelung im Dauerwalde." [Addendum to "Management regulation in the continuous forest."] Zeitschr. Forst.- u. Jagdw. 54: 22-25. 1922.—Comments are made on Wendroth's article [see Bot. Absts. 12, Entry 5593]. Better knowledge is necessary of the quantity, increment, and value of the growing stock than is now had. The purpose of management in the continuous forest is to establish a definite, continuous, maximum yield, this to be secured gradually by means described by Wendroth. There is no fixed rotation under this silvicultural system, as the subject of management is not the stand but the individual tree. No thrifty growing trees are removed; if necessary, the growing stock is increased to take care of future needs; and the determination of the yearly cut must assure continuity of use.—J. Roeser.

5567. MOREILLON, M. Les forêts sont-elles vraiment protégées par les oiseaux? [Are the forests really protected by birds?] Jour. Forest. Suisse 73: 81-82. 1922.—Birds are often quite impotent in checking sudden insect invasions and the author believes that they are not of such importance as nearly all who are interested in this question believe. He argues that birds are plentiful wherever they normally find an ample food supply, and *vice versa*. During the invasion in 1921 of *Dasychira pudibunda* into the forests in the vicinity of Count Berlepsch's "Station for Bird Protection," at Seebach, the forested bird sanctuary suffered very little; but if the birds are numerous there it is due to the fact that this forest is surrounded by meadows and fields, and that the "efficient protective organization" contributed to the result in an entirely secondary way.—G. Kempff.

5568. PERRY, W. J. Indian peeling in western yellow pine. Amer. Forest. 29: 38. 1 fig. 1923.—In northern New Mexico the Navajos and other Indians cultivated patches of corn along the lower valleys of the mountain streams. Also, a substitute breadstuff was prepared from the inner bark or cambium of pine trees. The outer bark was peeled with stone hatchets and the inner bark removed, dried, and roughly ground. The peeling was done in early summer. The operation did not seriously injure the trees, as a photograph of a tree three-fourths girdled in 1852 indicates.—Chas. H. Otis.

5569. PINCHOT, GIFFORD. Outlook for forestry in Pennsylvania. Amer. Forest. 29: 19. 1 fig. 1923.

5570. POLLET, J. Le gibier et la forêt. [Game and the forest.] Bull. Soc. Centrale Forest. Belgique 29: 603-612. 1922.—The ways in which abundance of game is favored or hindered through the practice of forestry are described; e.g., the present tendency toward large dense stands of spruce is highly unfavorable to deer; Scotch pine is better than spruce, and mixed stands are still better as they permit the growth of vegetation palatable to deer. By handling certain small areas in such a manner as to favor the various kinds of game the sport and profit of hunting can be maintained.—H. T. Gisborne.

5571. PREUSS, WILHELM. Bäume als Blitzableiter. [Trees as lightning conductors.] Illus. Landw. Zeitg. 42: 254-256. 1922.—Oak, linden, ash, and especially poplar suffer more frequently from lightning than do elm, birch, and beech. The writer gives reasons for believing the relative susceptibility of different genera is not due to differences in chemical content, location, soil, or root systems. Evidence is adduced to show that one species is as likely to be struck by lightning as another but that the trunks and large branches of poplars and oaks are damaged most often because their wood is more easily split. Many beeches are struck without perceptible injury. Smooth barked trees like beech are less easily injured than rough barked oak and poplar. Trees near buildings are not a lightning menace, but may be a protection as lightning conductors. Old, valuable, and favorite trees should be protected with lightning conductors.—John W. Roberts.

5572. R., E. Le prix des bois. [The price of wood.] Bull. Soc. Centrale Forest. Belgique 29: 625-627. 1922.—The price of wood, now high, has not yet reached its peak. Several lots of spruce at Eupen brought an average of 91.50 francs per cubic m. on the stump. Prices varied according to the size of the average tree. Prices are quoted for several other species at Bullange and Eupen.—H. T. Gisborne.

5573. RAU, MADYAR GOPAL, and JOHN LIONEL SIMONSON. Oils and fats from the seeds of Indian forest trees. Parts 1-5. Indian Forest Rec. 9³: 95-109. 1922.—A preliminary account is given of the yields, and chemical and physical properties of a number of new oils and fats extracted from native tree seeds. *Chloroxylon swietenia* seed yield 16 per cent of a non-drying oil of no present economic value. The seed of *Calophyllum wightianum* yields 34 per cent of an oil which is used as an illuminant. Seed from *Mimusops elengi* furnish 16 per cent oil which, unlike that of the African species of the genus, can not be used for culinary purposes. *Shorea robusta* seed yield 16.4 per cent of a fat resembling tallow; the percentage is too low for utilization. *Garcinia cambogia* seed yielded 31 per cent fat, which is edible and of possible economic importance.—E. N. Munns.

5574. REGINSTER, G. Le dessouchement par explosifs. Les essais dans la forêt de Hertogenwald. [Removing stumps by use of explosives. Experiments in the Hertogenwald.] Bull. Soc. Forest. Belgique 29: 582-585. 1922.—Detailed costs are given for an experiment in stumping land by use of explosives. No market was found for the material removed and the costs were deemed excessive.—H. T. Gisborne.

5575. ROBERTSON, W. A. Note on Gurjun or Kanyin. Forest Bull. [Calcutta] 50. 7 p. 1922.—This wood includes 6 species of *Dipterocarpus*, *D. turbinatus* and *D. alatus* being the most important. They occur in the evergreen forests of Assam, Burma, and the Andamans, tending to form pure patches. They are found principally at the lower elevations on dry sites. Trees 120 feet high and 10-15 feet in girth with 60-80 feet of clear length are not uncommon. The properties of the wood are described. It is not durable, but is extensively used for flooring and, when treated, for railway sleepers. A good oleo-resin is yielded. Data on costs of extraction in various localities are given. The present growing stock in Burma is estimated at 6 million tons, of which $\frac{1}{4}$ is of trees 9 feet or over in girth.—S. B. Show.

5576. RODGER, A. **Note on Thingan (*Hopea odorata* Roxb.).** Forest Bull. [Calcutta] 49. 15 p. 1922.—The tree is found in Lower Burma and the Andamans, and has probably 8 varieties. It grows up to 150 feet high and 12 feet in girth with clear logs 40–80 feet in length. It is nowhere abundant. The properties of the wood are described. It is especially valuable for boat building, and in its range is regarded as one of the most valuable native species. The tree yields a resin, which is described in detail. The species reproduces readily, but seed can not be stored. It appears to do well even when growing under adverse conditions.—*S. B. Show.* *

5577. RODGER, A. ***Pinus Merkusii*.** Indian Forest. 48: 502–504. Pl. 13. 1922.—The Merkusi pine is found in the upper valleys dividing Burma and Siam, usually on poor soils where it makes a fair growth. On good soils it is a tree of 36 inches diameter and 100 feet height at 100 years. Fire is very destructive to seedlings and reproduction is usually scanty. A heavy yield of resin is secured.—*E. N. Munns.*

5578. SCHOTTE, GUNNAR. **Redogörelse för Skogsförsöksanstaltens Verksamhet under Fyraårsperioden 1918–1921 Jämte Förslag till Arbetsprogram.** [Report of the Swedish Forest Experiment Station for the 4-year period 1918–1921.] Meddel. Statens Skogsförsöksanst. 19: 1–123. 1922.—The report gives a brief survey of organization, personnel, and expenditures, followed by discussions of the various lines of work. These discussions cover the field from the administrative rather than the technical point of view. The general program for the 4-year period 1922–1926 contemplates investigations under the following heads: (1) forest regeneration; (2) development of stands; (3) diseases and injuries; (4) races of trees and acclimatization of foreign trees in Sweden; (5) forest soils. Summaries of the program are given in German and English.—*G. A. Pearson.*

5579. SCOTT, A. H. **Massachusetts state forest from an old estate.** Amer. Forest. 29: 108–110. 7 fig. 1923.—The Whitney estate in the Berkshire Hills, recently acquired as a part of the state forests of Massachusetts, is described.—*Chas. H. Otis.*

5580. SEAMAN, L. N. **Further report on tests of hammer handles made of Indian woods.** Indian Forest. 48: 543–547. 1922.—More complete data are given on laboratory tests of the static and impact bending of 3 Indian woods. [See also following entry.]—*E. N. Munns.*

5581. SEAMAN, L. N. **The suitability of certain Indian woods for hammer handles.** Indian Forest. 48: 175–181. Pl. 10–11. 1922.—Laboratory tests of the wood of *Terminalia tomentosa*, *Dalbergia sissoo*, and *Olea ferruginea* show that these supposedly inferior woods are suitable for handle stock. [See also preceding entry.]—*E. N. Munns.*

5582. SIMONSON, JOHN LIONEL, and MADYAR GOPAL RAU. **The constituents of some Indian essential oils. Parts 1–7.** Indian Forest Rec. 9³: 111–146. 1922.—The essential oils from the oleoresin of *Pinus khasya* and *P. excelsa*, and the essential oils from *Cedrus deodora*, *Andropogon juarancusa*, and from the seeds of *Zanthoxylum alatum*, *Z. acanthapodium*, and *Z. budrunga* were obtained by distillation and subjected to chemical analysis. The methods employed are described. All of these oils are likely to prove of economic value. The resins from the pines are as good as those from the American *Pinus palustris*.—*E. N. Munns.*

5583. SMITH, HERBERT A. **How the public forests are handled.** U. S. Dept. Agric. Yearbook 1920: 309–329. 10 illus. 1921.—The difficulties, duties, and aims involved in grazing, lumbering, and protection of public forests are presented in popular style.—*C. J. Shirk.*

5584. SMYTHIES, E. A. **Calculation of the yield of a forest by formulae.** Indian Forest. 48: 626. 1922.—The standard formulae for yield fail under Indian conditions because of the species and sizes. A modified formula with a changed basis of volume to take care of both

the timber crop and the "small-wood" is worked out. V in the present case represents the volume of trees of age x and over with the proviso that both measurements and volumes per tree are taken to the same diameter, i.e., to the diameter of a crop or average tree of age x . In the United Provinces this diameter is invariably 8 inches, so that for any species or forest, as soon as the age of an 8 inch crop or average tree is known, the modified formula can be applied. The methods of deriving the formula are given in detail.—*E. N. Munns.*

5585. SMYTHIES, E. A. Distribution of age and diameter classes in a normal selection forest. *Indian Forest*. 49: 66-69. *Pl. 4*. 1923.—The calculation for a stand of sal of second class quality is given, showing the normal distribution of the various diameter classes, and the volume of wood per acre in the different classes.—*E. N. Munns.*

5586. TH., J. La preparation forestiere de la defense nationale. [Forestry preparation for the national defense.] *Bull. Soc. Centrale Forest. Belgique* 29: 673-676. 1922.—The article deals with the role of forests in concealing the movements of troops, hindering the enemies' movements, and supplying needed materials. The restocking of certain areas is pointed out as urgently necessary for military purposes alone. Attention is called to the importance and value of the forest service personnel in time of war.—*H. T. Gisborne.*

5587. TIEMANN, H. D. The Australian bush. *Amer. Forest*. 29: 87-90. 6 fig. 1923.—Australia has less than 5 per cent of forested land and less than 2 per cent of merchantable timber. The predominant tree is *Eucalyptus*, with 283 species. Next in number of species come the wattles, or Acacias, of which there are at least 250. The forests as a whole are very deficient in softwoods. There are 11 indigenous genera of conifers. A most striking feature of the forests is the undergrowth of tree ferns, which are sometimes 25 feet in diameter and often several hundred years old. The mountain ash (*Eucalyptus regnans*) is probably the largest tree in Australia, one 347 feet high being reported in the Dandenong Mountains. A good stand of millable timber runs 30-50 thousand board feet per acre.—*Chas. H. Otis.*

5588. TODD, F. H. Supplementary research report of Assam. *Indian Forest*. 49: 69-73. 1923.—Of 752 square miles of forest surveyed, only 22 were in classes I and II. The balance is of doubtful economic value. Extensive planting is necessary to secure desirable stocking. Firewood timber is almost exhausted in some places. The supply of simul (*Bombax malabaricum*) for tea shooks is sufficient to fulfill the demand indefinitely.—*E. N. Munns.*

5589. TRESCKOW, VON. [Rev. of: HEDLER, WALTER. Deutschlands Forst- und Nutzwirtschaft in und nach dem Weltkrieg. [Germany's forest and timber management during and after the World War.] 119 p. Leipzig, 1921.] *Zeitschr. Forst.- u. Jagdw.* 54: 38-43. 1922.—Hedler was in charge of wood products under the War Department, and is well versed in the theory of forest politics. His book is valuable as a statistical reference. That portion, however, dealing with state control of wood prices, and of cutting and management upon private holdings can not go unchallenged by technical foresters. Hedler's idea regarding state control of forest product prices is impractical. He suggests state control of cutting and the utilization of Germany's forest reserve upon economic grounds, ignoring the fact that the forest reserve is too valuable to be used up during a temporary emergency. Socialization must be avoided, since the success of forest management has been mainly due to uninterrupted private endeavor. Only a little state help (e.g., a strict reforestation control on small holdings) is necessary in order to bring private forests to maximum production.—*J. Roesser.*

5590. TROTTER, H. Development of bamboos from natural seedlings. (*Dendrocalamus strictus*.) *Indian Forest*. 48: 531-536. 1922.—In 11 years natural seedling bamboos formed clumps of exploitable size and required thinning. Largest culms are 40 feet in height and 5.5 inches in girth. The only protection given them was from grazing.—*E. N. Munns.*

5591. VENDELMAN, HENRY. *Le pin de Banks*. [*Pinus banksiana*.] Bull. Soc. Centrale Forest. Belgique 28: 603-606. 1921.—*Pinus banksiana*, which was in great favor for many years in Belgium, is now being severely criticised. The present article is a defense of the species.—*H. T. Gisborne*.

5592. WALLACE, H. C. *Forestry and our land problem*. Amer. Forest. 29: 14-18. 6 fig. 1923.—Some ideas of the Secretary of Agriculture as to what should go into the U. S. A. forestry program are presented.—*Chas. H. Otis*.

5593. WENDROTH. *Betriebsregelung im Dauerwalde*. [Management regulation in the continuous forest.] Zeitschr. Forst.- u. Jagdw. 54: 11-22. 1922.—The author describes and illustrates a plan of regulation based upon the Möller form of continuous management. Its object is to furnish at all times a survey of the growing stock and the increment of the stand and to provide for continuity of management. Regulation is by volume; governed by growing stock and increment; regulation by area in mixed stands can not be considered practicable or even possible. The working plan includes map and description of stand; tally of yearly cut by species, tally of yearly cultural and planting work and costs, and a statement of actual growing stock and increment for certain periods, the increment being calculated for 5 or 10-year periods in advance; and a tabulation of average diameters for calipered stands as an indication of the movements in value increment of the growing stock. Stands above 20 cm. in average diameter are actually calipered for volume; for those between 7 and 20 cm., volumes are computed from Schwappach's 1896 yield tables for pine.—*J. Roeser*.

5594. WILBRAND. *Nutzholzzucht*. [The production of timber.] Zeitschr. Forst.- u. Jagdw. 54: 175-180. 1922.—The author asks whether the present silvicultural systems are in harmony with the demand for maximum quantity and quality production. Long, straight-boled trees are demanded for the production of timber, and these are best secured by permitting trees to grow in pure, undisturbed stands until the completion of their natural height growth. When this age is reached thinnings should remove all material which touches or interferes with the crown development of the desirable timber-producing trees. At the same time an understory, preferably of red beech, should be introduced to secure full utilization of the site. Removals (thinnings or light cuttings) are to be made whenever necessary to keep the main stand absolutely free. This system applies to all the common hardwoods and softwoods and especially to ash and pine. By this method beech, heretofore managed for fuel wood production, is gradually being converted into a valuable timber tree. The important task for foresters is to determine the time when height growth ceases and diameter growth begins, by locating sample trees and securing measurements of merchantable length and total height. These will afford a basis for putting into effect this system of management.—*J. Roeser*.

London 1923: 69-72. 3 fig. 1923.—The presence of extra vacuoles is considered a case of reversion to an ancestral condition, in which there was a linear series of vacuoles.—R. E. Cleland.

5599. BLARINGHEM, L. Héritéité des caractères physiologiques chez les hybrides d'Orges (deuxième génération). [Heredity of the physiological characters in the barley second generation hybrids.] Compt. Rend. Acad. Sci. Paris 175: 230-232. 1922.—Second generation hybrids between *Hordeum nudum* L. and *H. trifurcatum* Schlecht are found to inherit: 1. the awned and hooded characters in the ratio of 2.85:1-(123 hooded :49 awned); 2. The offspring produced both 2 and 6 rowed spikes and intermediates. The 123 hooded plants produced 48 2-rowed, 36 intermediate, and 39 6-rowed plants. The 49 awned plants produced 26 2-rowed, 6 intermediate, and 17 6-rowed plants. 3. The compactness of the spikelets and proliferations is found to be a complex situation which gives a wider "spread" in the 2nd generation than the original parents had. The conclusion reached is that ornamental and superficial characters (such as awns) are transmitted according to Mendel's law, but the physiological characters essential to increased production (such as fertility of the spikelets) are transmitted through a cellular structure which is a mosaic. The author believes that the selection of varieties for increased yield is quite different than the segregation of characters as conceived by the Neo-Mendelians.—J. A. Faris.

5600. BLARINGHEM, L. Nouveaux faits relatifs aux hybrides de blés et d'aegilops. [New facts relative to wheat and aegilops]. Compt. Rend. Acad. Sci. Paris 176: 852-854. 1923.—During the seasons of 1919-1922 crosses were made between varieties of various species of wheat with the object of obtaining information on the fertility in rather wide crosses. Following are the results obtained: *Aegilops* × *Haynaldia villosa* gave no seed and the ovaries were not visibly affected; *Aegilops* × *Secale cereale* resulted in inflated ovaries but no seed was produced; *Aegilops ovata* × *Triticum spelta* gave inflated ovaries but no viable seed; *A. ovata* × *T. vulgare* resulted in 1 viable seed; *A. ovata* × Petanielle de Nice (a *T. vulgare* × *T. durum* hybrid) yielded 4 seeds; *A. ventricosa* × *T. spelta* produced 9 seeds; *A. ventricosa* × a monococcum × durum hybrid gave 13 seeds (all heads produced seed). Percentages of seed set are not given.—J. B. Harrington.

5602. BONNEVIE, KRISTINE. Zur Analyse der Vererbungsfaktoren der Papillarmuster. [Analysis of the genetic factors of "finger prints."] Hereditas 4: 221-230. 5 fig. 1923.—Considerable difficulty has been experienced in attempting to classify the various arrangements of papillary ridges revealed in ordinary finger prints, but fairly satisfactory results are obtained by giving each finger a numerical index determined by the number of ridges between the delta and the centrum and then assigning the individual a designation, his "quantitative value," based on the sum of the indices of all 10 digits. When the index numbers run from 0 to 10 the quantitative values have a possible range of from 0 to 100. An examination of about 200 subjects distributed among several families shows that when the individual quantitative values are plotted the resulting curve does not differ widely from the binomial curve, but a closer analysis shows that each person has his own peculiar "value" around which the values for his individual digits are grouped. Further, the two 0 individuals found were brothers, 2 with indices between 90 and 100 were related, and in other cases family resemblances were noted, particularly in the case of twins. Analysis of these family histories and of 24,518 additional individual records leads to the conclusion that the friction ridge pattern is conditioned by several, perhaps 5, pairs of hereditary factors.—C. H. Danforth.

5603. BRIMHALL, DEAN R. **Family resemblances among American men of science. III. The influence of the nearness of kinship.** Amer. Nat. 57:137-152. 1923.—A study is reported of the relatives of individuals whose performances are of such an order that their life histories become of public interest. The brother of a man of science is twice as likely to be distinguished as the father; he attains eminence 4 times as often as an uncle, and 6 times as often as a cousin. Direct offspring are distinguished 3 times as frequently as nieces and nephews. Paternal and maternal influences have about the same weight in biological and—what might not have been suspected—in social inheritance as well.—*C. H. Danforth.*

5604. CLAUSEN, J. **Stedmoderblomstens Variation.** [The variation of *Viola*.] Nat. Verden 7: 218-236. Fig. 1-5. 1923.—A popular extract is given of the author's paper in Botanisk Tidskr. [see Bot. Absts. 12, Entry 3147.]

5605. CLAUSEN, R. E., and T. H. GOODSPEED. **Inheritance in *Nicotiana Tabacum*. III. The occurrence of two natural periclinal chimeras.** Genetics 8: 97-105. 1 pl. 1923.—The origin of 2 flower color bud variations in F_1 hybrids between varieties of *N. Tabacum* is described. In both cases the seed progeny of the normal and the variant were identical. In 1 case the variant type was propagated by cuttings, and root cuttings from such plants produced the normal type. The authors conclude that in both cases the variant type was a periclinal chimera consisting of an unchanged central cylinder enveloped in a mutated dermatogen.—*R. E. Clausen.*

5606. CORRENS, C. **Alkohol und Zahlenverhältnis der Geschlechter bei einer getrenntgeschlechtigen Pflanze.** [Alcohol and relative number of male and female plants with a dioecious plant.] Naturwissenschaften 10: 1049-1052. 1922.—Treating the pollen of *Melandrium* with alcohol vapor for periods of 40-60 minutes gave 15.92 per cent \pm 1.72 more male plants than female than did the control where the pollen was untreated. In explanation of these results Correns thinks that there is a difference in the resistance of the male over the female determiners in that the latter are more easily injured by the treatment with alcohol.—*Orton L. Clark.*

5607. DAHLBERG, GUNNAR. **Twins and heredity.** Hereditas 4: 27-32. 1923.—Assuming that sex is determined at fertilization and the normal sex ratio is approximately 1:1, the number of twins which are of uniovular origin may be determined for any group of statistically adequate size by subtracting from the total number of pairs a value equal to twice the number of those in which the members are of different sex. This method, first employed by Weinberg, is essentially sound, and when applied in connection with adequate family pedigrees leads to the conclusion that there is an hereditary factor in uniovular as well as in biovular twinning. Weinberg had regarded the inheritance of uniovular twinning as unproved; many authors, not including Davenport, have regarded it as disproved. But an analysis of the previously reported data shows that uniovular twinning is probably more frequent among the relatives of uniovular twins than among other classes.—*C. H. Danforth.*

5608. DILLA, HARRIETTE M. **Control of parenthood in relation to eugenics.** 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 267-271. Williams & Wilkins Co.: Baltimore, 1923.—A discussion is presented largely in the form of questions, of negative and positive eugenics and birth control.—*Orland E. White.*

5610. ELLINGER, TAGE. **The variation and inheritance of milk characters.** Proc. Nation. Acad. Sci. [U. S. A.] 9: 111-116. 1923.—The writer has had the opportunity of studying the records of a large herd of Red Danish and Jersey cattle and their crosses. He finds that the length of the lactation period is almost wholly determined by the time of successful breeding

for the next calf and thus only slightly if at all by innate factors. He reaches the conclusion: "Taking every pro and contra into consideration, it is the conviction of the writer that the first 10-week section (2nd to 11th week) of the first lactation period best displays the genetic variations and therefore at present is the most reliable measure of a cow's milk yielding ability, though not an ideal one." Considerable differences were found between Jerseys and Red Danish in milk production, butterfat percentage (both with respect to average and to the curve of change during the lactation period) and butterfat production. As to inheritance he concludes: "There is no doubt that the mode of inheritance of milk characters falls in that group of inheritance phenomena to which the term blending has been assigned. The treatment of the material fails to disclose the action of any single Mendelian factor. There is no significant difference in the variability of the different genetic groups. The heterozygosity of the parental breeds and the probable complexity of the characters fully account for this."—*Sewall Wright*.

5611. F., E. Comment transformer les carottes blanches en carottes rouges. [How to transform white carrots into red.] Nat. Canadian 49: 58-60. 1922.—An attempt is made to indicate what has been done by cultivation and especially by selection. Reference is made to the work of Vilmorin, Joigneaux, Decaisne, and Labergerie—the last working on *Solanum commersoni*.—A. H. MacKay.

5612. FRIMMEL, F. Notiz über Dominanzverhältnisse bei Fuchsienbastarden. [Note on dominance relations in *Fuchsia* hybrids.] Indukt. Abstamm.- u. Vererb. 24: 279-281. 1920.—The hybrids between *Fuchsia corallina* and Molesworth, a form of the so-called *Fuchsia hybrida* Hort., were compared with the parents and the following resemblances noted: They resembled the *F. corallina* parent in having young shoots and petioles red, the veins of the leaf red on top, and the corolla violet. They resembled Molesworth in having hairy branches with a squarrose habit, veins green beneath, corolla double, and of same length. They were intermediate in 3 characters. The author proposes an unverified hypothesis to account for the veins of the hybrid resembling *F. corallina* in respect to the color of the upper surface and Molesworth in respect to the lower.—L. L. Burlingame.

5613. FRUWIRTH, C. Handbuch der landwirtschaftlichen Pflanzenzüchtung. [Handbook of agricultural plant breeding.] Vol. 5. 2nd ed., x+272 p., 50 illus. Paul Parey: Berlin, 1923.—In this volume the breeding of various plants is treated by different specialists, as follows: Oil palm, coconut, and date, HUBERT WINKLER; rice, J. E. VAN DER STOK, L. KOCH, C. FRUWIRTH; sweet potatoes, E. DE WILDEMAN; sugar cane, peanut, cassava, J. E. VAN DER STOK; citrus, HERBERT J. WEBBER; tea, C. P. COHEN STUART; coffee, J. S. CRAMER, P. C. VAN DER WOLK; cacao, cola, F. W. T. HUNGER; olive, L. TRABUT; castor bean, ORLAND E. WHITE; cotton, GEO. F. FREEMAN; sisal, sorghums, millet, kapok, C. FRUWIRTH; *Hibiscus cannabinus*, H. sabdariifa, sesame, sunn-hemp (*Crotalaria juncea*), jute, (*Corchorus olitorius*), and *Corchorus capsularius*, A. HOWARD; *Cinchona*, C. SPRUIT. Rubber plants are discussed and miscellaneous notes given.—C. V. Piper.

5614. GAINES, E. F. Genetics of bunt resistance in wheat. Jour. Agric. Res. 23: 445-479. 3 pl., 2 fig. 1923.—Crosses of resistant \times resistant, resistant \times susceptible, and susceptible \times susceptible wheats were made and the F_3 generations tested for resistance to bunt (*Tilletia Tritici*) by inoculating the seed with the maximum spore load and planting in the field. The following conclusions were reached: (1) The most susceptible wheats produce about 80 per cent of bunted heads; the 20 per cent of sound heads seem to escape infection by accident. (2) Forty Fold, Red Russian, and Marquis varieties have dilute resistance which reduces the amount of bunt 20-25 per cent. When added together, as in descendants of crosses between them, a concentrated resistance with a value of 30-60 per cent is secured. Marquis wheat has a strong winter-sensitive resistance with a value of 50-60 per cent in spring-sown grain which is ineffective in preventing bunt when the seed is fall sown. (3) Turkey, Florence, and Alaska have differing concentrated resistance which reduces the amount of

bunt 70-75 per cent, compared with the standard susceptible varieties. These concentrated resistances are also cumulative in effect when brought together by crossing, the resulting descendants segregating into immune, very resistant, various stages of dilute resistant, and completely susceptible classes.—*J. A. Faris.*

5617. KAMMERER, PAUL. Breeding experiments on the inheritance of acquired characters. *Nature* 111: 637-640. 1923.—This article refers to *Salamandra*, *Alytes* and *Ciona*.—*O. A. Stevens.*

5618. KIESE, H. Blütenveränderungen an Rosen. [Flower changes in roses.] *Möllers Deutsch. Gärt. Zeitg.* 38: 101. 1923.—A Marechal Niel rose was cut back closely. Strong shoots were developed which in the 1st year produced glaucous (meergrüne) roses. When budded they produced, however, the normal yellow flowers. A strong twig of Perle des Jardins produced apically a flower stalk with stamens only. This was budded and showed reversion to the normal flower. The same sports may occur on certain varieties in different situations, as is the case with Souvenir d'un Ami. The light yellow sport of Franziska Krüger, under the name of Blumenschmidt, originated in the nursery of Kiese in Vieselbach-Erfurt and was also found in a nursery in Baden-Baden.—*J. C. Th. Uphof.*

5619. KIMBALL, SARAH L. The Mayflower pilgrims. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 329-339. Williams & Wilkins Co.: Baltimore, 1923.—A list of the Mayflower Pilgrims and a partial list of Americans eminent in government, law and literature who are descended from the Pilgrims are given in support of the author's thesis that this foundation stock was of great eugenic value and that it has determined the character of national development in the United States.—*L. C. Dunn.*

5620. LA RUE, CARL D. Notes on bud sport of *Hibiscus mutabilis* L. *Papers Michigan Acad. Sci. Arts and Letters* 1: 151-154. 1923.—Cuttings from the double-flowered variety *alba* were grown under the author's supervision. One of these plants produced 1 branch with flowers pink, like those of the double-flowered variety *rosea*. Two plants from cuttings from the "sporting" branch had flowers all pink; these plants and the parent branch grew more slowly than *alba*. Among 161 plants from cuttings from the normal (*alba*) part of the original bush, 1 had pink flowers on 1 branch; another had pink flowers on a sector including about $\frac{1}{3}$ of 1 branch; and a 3rd plant had green leaves on 1 portion, yellow leaves on another portion, and leaves with irregular mottled variegation (green, yellow and yellow-green) on the rest. No crosses were made, because of lack of viable pollen.—*Howard B. Frost.*

5621. LEMBKE, H. Ergebnisse neunjähriger Futterpflanzenzüchtung. [Results of 9 years of forage plant breeding.] *Beitr. Pflanzenzucht* 6: 45-56. 1922.—The author reports on selection work with English, French and Italian rye grass and presents graphs showing the variations in yield for 18 selections over a period of 5 years, 1912-16. Selected plants were first increased vegetatively by dividing each plant into 25 units and setting these out in beds 4 sq. m. in area. Notes were taken on permanence, yield, leaf number, spike form, resistance to rust, and growth progress and the seed harvested from each plot were seeded in beds 20 sq. m. in area for further increase. No crossing was done. Red clover was selected for hardiness, the original selections being a few plants that survived the severe winters of 1911-12. The remarks on red clover selection are of a general nature.—*A. J. Pieters.*

5622. LENZ, FRITZ. Erfahrungen über Erbllichkeit und Entartung an Schmetterlingen. [Experiments upon inheritance and degeneration in butterflies.] Arch. Rass.- u. Ges.-Biol. 15: 249-301. 1 pl. 1922.—Degeneration is defined as due solely to changes in hereditary constitution (idiokinesis) and to selection. Kaup's statement that the hunger blockade and subsequent scarcity of food in Germany have had an extraordinary degenerative effect upon human stock is questioned. Past experience contradicts it. Dwarf races were formerly attributed to defective feeding, but now to the selection of small biotypes better capable of withstanding famine. Pictet's numerous experiments upon caterpillars fed upon different kinds of leaves are criticised. The alleged changes due to food are merely hereditary differences brought to light by inbreeding or by natural selection under crowded conditions of breeding. The author fed the 2 parts of a wild brood of *Lymantria dispar* with willow and with oak (normal food); the former first gave more moths with pure white ground color and prominent black stripes, the latter a larger proportion with yellowish ground color and faint stripes. Progeny of a pair from each lot were fed in 2 groups, 1 on oak, 1 on willow. In neither brood were willow-fed sibs distinguishable from oak-fed, but each strain showed the hereditary peculiarities of its parent strongly emphasized. Numerical averages obtained by classifying the specimens into 3 groups as regards ground color and cross bands support the conclusion that differences in nourishment with oak or willow produce no essential change in coloration. The differences observed at first were due to chance "selection" of biotypes from a heterozygous wild brood.—A numerical study of average wing-length of the oak- and willow-fed broods shows that the German variety thrives better on oak than on willow, var. *japonica* better on willow (foods naturally preferred), but lends no support to Pictet's statements that willow-feeding modifies *L. dispar* toward *japonica* and that each after 1 generation becomes adapted to its new food. Variation depends little on food but much on sorting out of biotypes. The male is not more variable than the female as Pictet claimed; index of variability of the male is 4.0, of female, 4.8.—Feeding caterpillars on Norway spruce (*Picea excelsa*) contrary to Pictet, produced no definite changes in coloration, though it was not eaten readily and growth was checked by it. The 2nd generation fed on spruce did not differ from the 1st, except that the individuals were slightly smaller, due possibly to inbreeding but probably to the cooler summer (1921), which affected likewise oak-fed caterpillars. Spruce-feeding reduced the number of eggs laid from 800-1,000 to a few dozen, due to under nourishment. Death rate was high and breeding difficult, but this is not genuine degeneration. Pictet's claim that the offspring of parents raised on spruce adapted themselves more readily than their parents to the abnormal food (inheritance of an acquired character) is not supported by Lenz' observations; the difficulty in adaptation and mortality was about the same. Hybrid caterpillars of *Smerinthus ocellatus* ♀ (food-plant willow or poplar) × *S. tiliae* ♂ (food-plant linden) were fed in 2 lots, 1 on willow, 1 on linden; more survived on willow than on linden. Two broods studied differed widely in caterpillar color, but the 2 lots of each fed respectively on willow and on linden did not differ from each other. Nor were differences observed in hybrids of *Drepanula curvatula* ♂ and *D. falcatoria* ♀ when the larvae were fed on alder and on birch, the former species normally feeding exclusively on alder.—Lenz confirms Goldschmidt's observations that a German *dispar* ♂ × *japonica* ♀ gives normal ♀♀ and all ♂♂ of a uniform grade of intersexuality. F₂ gave likewise normal females (112) and 99 males, 19 of which were normal, the rest intersexual in various degrees as shown by their checked appearance, 56 slightly, 24 strongly checked (with white) or mainly white, the last being degenerate with crumpled wings, due to the inequality in development of the white female and brownish-gray male areas, and incapable of reproduction. He adopts Goldschmidt's view that these signs of femaleness in the intersexual male are plasmatic effects due to the action of the female-determining (Y) chromosome of the *japonica* mother. But, possibly, sex-determination in the gypsy moth depends upon several (polymeric) sex-linked factors, which in the male may be interchanged between the 2 X chromosomes.—Back-crossing of females from broods in which intersexes occur with males of the "weak" race (*dispar*) increases the proportion of intersexes among the male offspring and also the grade of intersexuality toward femaleness. A large majority of broods that descended in an unbroken female line (and no others) from the original pair produced intersexes, though several gave only normal males

and females. German *dispar* females by intersexual males gave only normal offspring.—The genetic analysis of this case is not perfectly satisfactory to the author, but he does not accept Goldschmidt's hypothesis that genes fluctuate quantitatively. The process of Mendelian segregation would be likely to equalize supposed initial quantitative differences. Polymeric sex-determining genes and their exchange between the 2 X-chromosomes seems more reasonable than "fluctuation." Objections are raised to Goldschmidt's hypothesis that an intersex develops 1 sex until it reaches a "turning-point," when sex-reversal occurs. Mosaic contiguity of parts of unlike sex is due to simultaneous spacial development, not to a temporal succession of 2 antagonistic processes. Analogy, at least, suggests that the crossing of widely different races of men is a contributing cause of those phenomena of degeneration that appears so extensively in our very much mixed population.—*J. H. Gerould.*

5623. LOEB, LEO. **Disease and heredity.** *Sci. Monthly* 16: 574-587. 1923.—From the hereditary standpoint there are 3 classes of diseases: those due to environmental factors, those due to altered constitution of the germ plasm, and those due to cooperation of altered germ plasm and environmental conditions. Several diseases are discussed as to their relation to these classes. The author is not in favor of beginning the weeding out process now; with the present imperfect knowledge it might lead to the destruction of some of the finer qualities and thus emphasize undesirable characteristics.—*L. Pace.*

5624. LOTSY, J. P. **A peculiar eye-color among Malamute-dogs.** *Genetica* 5: 77-78. 1923.—The writer discusses briefly the variation which he observed among some 30 Malamute dogs at a "Polar Animal Show" at a seaside resort near San Francisco. These dogs are said to be the result of interbreeding dog-wolf hybrids. The writer was especially struck by the frequent occurrence of asymmetry in the eyes. In 87 of the dogs, one of the eyes was wholly gray or gray in a sector, the other brown. One dog had both eyes gray. He believes that dog-wolf hybrids would repay careful study.—*Sewall Wright.*

5625. LUNDBORG, H. **Racial structure of the Finns of the northernmost part of Sweden.** *Hereditas* 4: 125-132. 4 fig. 1923.—A study is reported of the racial constitution of Norrbotten, inhabited by 3 stocks,—Nordic, Finnic, and Lappic. Eye color, cephalic index, and facial index are considered. In the case of eye color typical Nordic and Finnic subjects have light eyes while Lappic subjects are dark. By counting the number of brown eyed individuals and adding to this a number equal to 50 per cent of those with mixed eyes (heterozygotes) the proportion of eye color determiners of Lappic origin may be estimated. Treating each of the 3 traits in this way, fairly consistent results are obtained. These investigations, which are still in progress, indicate that the Nordic race is about as strongly represented among the Finnish-speaking inhabitants of Norrbotten as is the Lappic, the 2 together equaling about 60 per cent. This may explain differences which have been noticed between "Finns" of Sweden and those of Finland. Philology would have been of little assistance in such a study.—*C. H. Danforth.*

5626. MANN, MARGARET C. **The occurrence and hereditary behavior of two new dominant mutations in an inbred strain of *Drosophila melanogaster*.** *Jour. Genetics* 8: 27-36. 1923.—In a stock of *Drosophila melanogaster* maintained by a single pair, brother-sister matings, two dominant second chromosome mutants appeared. This could not have occurred if all hereditary variation were the result of recombination or segregation of unchanged genes. Notched wings (N_2) is variable in expression and only appears during the first two days of hatching. The gene for multiplied lateral bristles (*Br*) is at locus 19. Both N_2 and *Br* are compulsory heterozygotes.—*Margaret C. Mann.*

5627. McCORMICK, A. C. **Blight resistance in pear stocks.** *Nation. Nurseryman* 31: 112-114. 1923.—The history is recounted of the introduction of resistant *Pyrus ussuriensis* and *P. calleryana* from China to be used as stocks for grafting native pears. *P. betulaeifolia* is likely to be confused with *P. Calleryana* by seed collectors in China. The former is extremely

susceptible to pear blight. Using these resistant stocks and developing the resistant varieties of *P. communis*, it is estimated trees will be developed which will be 75-90 per cent proof against the disease.—*J. A. Faris*.

5628. OORTWIJN, BOTJES J. *Het verouderen van aardappelsoorten in verband met de vegetatieve voortplanting.* [Age of potato varieties in relation to vegetative reproduction.] *Cultura* 35: 65-66. 1923.—The writer does not agree with Paravicini's statements that the relation of potato diseases to higher susceptibility in old age cannot be demonstrated. A crop of an old variety may possibly give rise to a large percentage of bud variations, which externally can not be easily differentiated from the original mother type. Potato varieties are generally very heterozygous, which may be an advantage as regards formation of bud variations.—*J. C. Th. Uphof*.

5629. RAU, A. S., and J. B. GATENBY. *Notes on the distribution, morphology and cytology of the organ of Bidder.* *Jour. Roy. Microsc. Soc. London* 1923: 19-36. 2 pl. 1923.—Bidder's organ, a structure closely attached to the anterior end of the testes in some toads, is shown by cytological study to be a group of abnormal oocytes. This is interpreted as evidence for a primitive hermaphroditism among the amphibia.—*R. E. Cleland*.

5630. SIEMENS. [German rev. of: MEULENGRACHT. *Über die Erbliehkeitsverhältnisse beim chronischen hereditären hämolytischen Ikterus.* (On the hereditary relation of chronic, hereditary, hemolytic ikterus.) *Deutsch. Arch. Klin. Med.* 136: 33.] *Arch. Rass.- u. Ges.-Biol.* 14: 445. 1923.

5631. SIRKS, M. J. *Die Farbenfaktoren der Samenschale von Phaseolus vulgaris L. und P. multiflorus Willd.* [The color factors in the seedcoat of *Phaseolus vulgaris* and *P. multiflorus*.] *Mededeel. Landouwhoogeschool Wageningen* 23⁴: 1-40. 3 col. pl. 1922.—The following varieties of *P. vulgaris* were used: (1) Witte boonen—white beans without colored navel ring; (2) Citroenboonen—lemon beans, lemon colored without colored navel rings; (3) Wagenaar—directly after harvest lemon colored, with brown ring around the navel, soon becoming gray and finally light yellow-brown; (4) brown beans; (5) Rotjes boonen—rat beans with gray-brown seed color, of which 2 types were distinguished,—a light and a dark colored one; (6) black beans; and (7) Kievitsboonen—plover beans, being constantly red-violet mottled on a yellowish-white background. In a cross of lemon bean \times Wagenaar, the F_1 generation showed entire dominance of the Wagenaar and the F_2 gave a monohybrid ratio. With Wagenaar \times brown bean the F_1 produced the seed color of the brown bean and behaved as monohybrid. Lemon bean \times brown bean in F_2 gave a monohybrid ratio, 3 brown : 1 lemon. In other cases it behaved as a dihybrid and produced brown, Wagenaar, and lemon, but in a ratio other than the expected one, namely, 12:3:1. In lemon bean \times rat bean, the F_1 individuals were red-brown. The F_2 was composed of 8 distinct phenotypical groups: (1a) dark red-brown, (1b) red-brown (resembling F_1); (2a) dark gray-brown, (2b) gray-brown (these 4 groups having brown colored navel ring); (3) gray-brown, uncolored navel ring; (4) yellow bean; (5) Wagenaar type; (6) lemon type. The frequency of above types in artificial and spontaneous crosses was 17:29:4:10:23:12:5:12, a total of 112. By combining groups (1a) with (1b) and (2a) with (2b) it suggests a trihybrid ratio. Brown bean \times rat bean also appeared to be a trihybrid. With lemon bean \times plover bean, the F_1 seeds were red-violet mottled on yellow-brown background. The F_2 gave 8 distinct groups: red-violet on yellow-brown background resembling the F_1 plants; yellow-brown; Wagenaar type; plover type; lemon type; yellow-white mottled; pure white; pure white with brown navel ring. As to subtypes, some distinctions were made as to color shades. They occurred in the above order with the following ratio: 106:39:15:37:17:35:18:2, a total of 269. Brown bean \times plover bean and rat bean \times plover bean behaved as trihybrids. Brown bean \times black bean in F_1 is black and produces in the F_2 black, red-brown, and yellow-brown in the ratio 39:6:3. Plover bean \times black bean was a spontaneous hybrid, with black mottled seed on grayish background. The F_2 produced 53 plants having no white seed. Therefore, it was suggested that the pollen plant was probably

a black-seeded plant. There were 11 phenotypes: black mottled on gray background; bluish mottled on gray background; dark blue-violet mottled with white-yellow background; light blue-violet mottled on light yellow background; gray-brown mottled, here and there violet; red mottled, here and there violet; yellow-brown mottled, here and there violet; black; red-brown; Wagenaar type. On account of the few seed obtained no definite ratio could be determined. With regard to the cross, brown bean \times white bean, the F_1 was black mottled with yellow background. The F_2 gave 9 color types: F_1 type; red-brown mottled on yellow-brown; gray-brown on gray-white; yellow-brown mottled on light yellow background; black; red-brown; gray-brown; yellow-brown; entirely white. The ratio was 97:24:10:17:55:18:33:87, a total of 366. The writer presents in detail the various factors and various possibilities as to formation of various colors. *P. multiflorus* is not as easy to work with as the other species, as it is more easily cross pollinated. Concerning the different color factors of the seedcoat, (1) white is recessive; (2) light mottled is recessive to black mottled; (3) spotted predominates over mottled; (4) black predominates over light mottled, also over white.—*J. C. Th. Uphof.*

5632 SPRENGER, A. M. **Verbetering der vruchtencultuur door middel van selectie.** [Improvement of fruit growing through selection.] *Natuurwetenschapp. Tijdschr.* 4: 223-233. 1922.—A general review is presented of stock selection for various fruit trees. Bud mutations are mentioned of a peach tree forming a nectarine. A bunch of white grapes was formed by a vine which ordinarily bore blue berries. An apple tree, Pomme de Coeur, produced a branch with entirely different fruits. Bud mutations were further observed 3 times on Gold Reinette and once on Landsberger Reinette.—*J. C. Th. Uphof.*

5633. STOUT, A. B. **Alternation of sexes and intermittent production of fruit in the spider flower (*Cleome spinosa*).** *Amer. Jour. Bot.* 10: 57-66. 1 pl., 1 fig. 1923.—One hundred and twenty-eight plants of this species were studied. Development of the sex organs is very various in different flowers on the same plant. Some flowers function only as males, some only as females, and some are completely bisexual. Various intergrades occur between these types, 1 or the other of the sexual organs being partially aborted, but 1 type is never transformed into the other, as so often happens among animals. The variations from one extreme to the other are alternative and cyclic, all the flowers produced at 1 period being male and this period being followed by 1 in which female or bisexual flowers are developed. This results in intermittent production of fruit. The plants studied were all similar, none being exclusively staminate or pistillate. The flowering period is coincident with the period of greatest vegetative activity. The recurring periodic changes in the sex of the flowers are regarded as phenomena of internal regulation closely related to the influences which determine the development of the plant as a whole. Stamens and pistils only are affected, the other floral organs being similar in all the flowers. Conditions in this species favor the view that there is a tendency among higher plants away from hermaphroditism toward dioecism. The author regards the morphological differentiation of sex to be fundamentally an extension of somatic differentiation, and believes that the theory of sex chromosomes fails in its application to plants.—*E. W. Sinnott.*

5634. SUMNER, F. B. **Studies of subspecific hybrids in *Peromyscus*.** *Proc. Nation. Acad. Sci. [U. S. A.]* 9: 47-52. 1923.—Three crosses were made between geographic races yielding 347 F_1 and 296 F_2 individuals; also a study of 17 quantitative characters,—lengths of body, tail, foot, ear, pelvis, femur, skull, indices of asymmetry (sinistro-dextral ratios) in respect to pelvis length, femur length, femur weight, jaw weight; width of tail stripe, depth of pigmentation of foot, percentage of "black," white," and "color" in pelage, ratio of red to green in color readings. Mean values obtained for any character in the hybrids usually lie between the parental values, not usually equidistant, but may agree closely with or lie beyond the parental values. Means of F_1 and F_2 frequently agree, although there is a preponderant tendency for the former to exceed the latter. No evidence was secured for mendelian dominance for any single character. Tendency for increased variability from F_1 to F_2 is no greater for characters in which parent races differ than for characters in which

parent races agree; this appears especially in sinistro-dextral ratios, although these ratios are not hereditary, and it is not due to environmental factors. Coefficients of parent-offspring correlation for all crosses and characters average less than + 0.3. Mean fraternal correlation is fairly large in F_1 and F_2 , slightly greater in the former. Intra-individual correlation coefficients show that most characters associated geographically are not correlated in individuals of 1 subspecies, nor do they show any tendency to be linked in inheritance unless they are correlated in parental stocks. Doubt is expressed as to adequacy of the multiple factor hypothesis. Blending or cytoplasmic inheritance may be considered. No explanation is offered of segregation of non-hereditary characters. Heribert-Nilsson, from work on willows, questions that specific characters blend while varietal ones mendelize. In *Peromyscus* no racial characters obviously mendelize. Comparison is made with Phillips' results from bird crosses. Harrison, from work on moths, has come to postulate more gametic blending in specific than in varietal crossings. Detlefsen's results with *Cavia* may be explained by blending inheritance. It is regarded as dogmatic and premature to universalize principles of mendelian segregation.—*P. W. Whiting.*

5635. THAPAR, G. S. The occurrence and significance of a third contractile vacuole in *Paramecium caudatum* (Ehr.). Jour. Roy. Microsc. Soc. London 1923: 64-68. 1923.—The individuals with 3 vacuoles do not represent a distinct genetic strain. The appearance of a 3rd contractile vacuole is probably due to increasing amounts of soluble crystalloids which must be eliminated. Favorable environmental conditions, making for a high rate of metabolism, coupled with a slowing down in the division rate, due to the old age of the culture, account for this accumulation. The new vacuole is formed at the point where the crystalloids accumulate.—*R. E. Cleland.*

5636. WALKER, E. W. A. Studies in bacterial variability.—On the occurrence and development of dys-agglutinable, eu-agglutinable and hyper-agglutinable forms of certain bacteria. Proc. Roy. Soc. London B 93: 54-68. 1922.—In enteric and dysenteric groups of bacteria dys-agglutinable and hyper-agglutinable forms or phases occur and can be produced experimentally. Both may be obtained from the same eu-agglutinable strain of a bacillus and both may revert or be mutually converted.—*P. B. Sears.*

5637. ZADE. Die Sortenunterscheidung mit Hilfe des biologischen Eiweisddifferenzierungsverfahrens. [Variety separation with the help of biological protein differentiation processes.] Beitr. Pflanzenzucht 5: 170-181. Discussion p. 181-188. 1922.—A physiological test for identifying varieties is described. About 10 gm. of fine meal, made from seeds of wheat, peas, oats, barley, etc., singly or combined, of known varietal purity, are shaken up with a quantity of physiological common salt solution (0.95 per cent) in distilled water. After settling and filtering, the sterilized solution is injected into rabbits, subcutaneously, intravenously, or intraperitoneally, weekly for 8 or 9 weeks. Blood is then taken from ear vein, allowed to settle, and serum tested against original seed solution by "layer," "mixing," or other method. Proper condition is evidenced by a precipitate and animal is bled, and the blood serum tested against seed extracts. By proper thinning, strong precipitate follows only on the use of the homologous solution. By using several varieties in making up this solution used for injection and then omitting the components successively in testing against the blood serum and substituting an unknown variety, its identity is finally established if corresponding to one of the sorts used in the original solution. Blood sera from animals treated singly with solutions made up from a series of varieties can be used in the same way, the unknown variety being identified by the appropriate reaction. Sorts genetically identical or strains of the same variety can not be separated. The reactions are relationship reactions. The method is difficult and expensive on account of the large number of animals required. It is sufficient for purely botanical purposes for distinguishing sorts or species, but is not recommended further. The method needs simplification and refinement.—*C. E. Leighty.*

HORTICULTURE

FRUITS AND GENERAL HORTICULTURE

5638. ANONYMOUS. *Agricultura practica del café*. [Practical coffee culture.] Rev. Agric. Puerto Rico 9³: 29-34. 1922.—The coffee plantations of Porto Rico are in very poor condition due to improper care. The author outlines proper cultural methods including preparation of seed beds, transplanting, and regulation of the shading.—*John A. Stevenson*.

5639. ANONYMOUS. *Commercial English walnut orchard in the East*. Amer. Nut Jour. 17: 61. 1922.

5640. ANONYMOUS. *Testing alfalfa in the [fig] orchard*. Associated Grower 3⁷: 22. 1922.

5641. ALLEN, WILLIAM S. *Desarrollo de las regiones plataneras Tabasco y Chiapas*. [Development of the banana regions in Tabasco and Chiapas. Rev. Agric. [Mexico] 7: 320-325. 4 fig. 1922.—The Gros Michiel variety of banana does well in the southern provinces of Mexico where it is grown for export to the U. S. A. Considerable additional land is available for development. Costs of production are outlined. Yields average 700 bunches per hectare the 1st year and 1,000 thereafter.—*John A. Stevenson*.

5642. BATCHELOR, L. D. *Winter injury to young walnut trees*. 1921-22. Monthly Bull. California Dept. Agric. 11: 445-449. Fig. 163-165. 1922.—Winter injury is said to result from unfavorable soil or climatic conditions, chiefly early fall frosts before the trees are dormant. The author discusses the effect of frost on young and old trees and gives the critical temperatures and the symptoms of injury.—*E. L. Overholser*.

5643. BECKWITH, CHARLES S. *The effect of fertilizer treatments on Savannah cranberry land*. Soil Sci. 12: 183-196. 1921.—The most profitable sources of nitrogen appear to be sodium nitrate and dried blood, 20 pounds of nitrogen from the former source producing as large a crop as 30 from the latter. Ammonium sulphate and calcium cyanamide are unsatisfactory and of doubtful value as nitrogen sources. Cranberry bogs seem very deficient in phosphoric acid and applications of as high as 80 pounds of phosphoric acid per acre produced large crop increases. Acid phosphate and rock phosphate were efficient sources of phosphoric acid, and potassium sulphate and potassium chloride were good sources of potash; 500-800 pounds per acre of a complete fertilizer mixture gives best results on cranberry bogs. Overfertilization causes excessive vine growth and soft berries, and renders vines more susceptible to insect attack.—*Irl T. Scott*.

5644. BEEKHUIS, WILLIAM. *The raisin industry of California*. Associated Grower 3⁷: 20. 1922.—The author gives the history of this industry in California and briefly describes the planting and care of vineyards and the picking and curing of grapes for raisins.—*E. L. Overholser*.

5645. BETZ, C. *Birnen auf Sorbus veredeln nicht empfehlenswert*. [Pear grafting on Sorbus is not to be recommended.] Möllers Deutsch. Gärt. Zeitg. 38: 50-51. 1923.—When pear is grafted on seedlings of *Sorbus aucuparia* the fruits have a flavor of tannic acid and are therefore valueless as table fruit. Fruits of *Sorbus* are used in some parts of Germany in the manufacture of apple cider on account of the tannic acid content.—*J. C. Th. Uphof*.

5646. BIOLETTI, FREDERIC T. **Grafted vines.** Associated Grower 5⁴: 24. 1923.—On grafted vines all shoots but 1 are removed, which is tied to a stake. Suckers and roots from the scion should be removed 2 or 3 times during the summer.—*E. L. Overholser.*

5647. BIOLETTI, FREDERIC T. **Notes on double planting and cordon pruning for muscat vines.** Associated Grower 3⁷: 9. 1922.—Cordon pruning of muscat grapes as opposed to head pruning did not increase the crop of vigorous vines, and decreased the crop of weak vines 27.8 per cent. Changing the planting distance of muscat vines from 6 × 12 to 3 × 12 feet increased the crop 94 per cent at 5 years of age. This increase would probably disappear as the vines became older.—*E. L. Overholser.*

5648. BIOLETTI, FREDERIC T. **Some defects of the Black Monukka grape.** Associated Grower 5¹: 24. 1923.—While useful as a raisin, shipping, or juice grape, it is subject to spring frost injury. When allowed to overbear is poor in quality and does not ship well. Cordon pruning with short spurs remedies this difficulty.—*E. L. Overholser.*

5649. BLOKZEIJL, K. R. F. **Spice trade of Dutch East Indies.** Pharm. Era 55: 243-245. 4 fig. 1922.—The author briefly describes the cultivation and harvesting of *Myristica*, *Macis*, *Caryophyllus*, *Cinnamomum*, and *Capsicum* in the Dutch East Indies.—*C. M. Sterling.*

5650. BLOKZEIJL, K. R. F. **The quinine situation in Java.** Pharm. Era 55: 348. 1922.

5651. BRITTON, J. C. **The pruning of pecan trees.** Amer. Nut Jour. 18: 20. 1923.—No pruning is recommended for 2 or 3 years after planting. Young vigorous trees should be pruned 50 per cent, chiefly by coarse thinning, followed by summer pruning of water sprouts. Trees severely cut back are easier to spray.—*E. L. Overholser.*

5652. CLARK, KARL B. **Weighing bunches of grapes on the vines.** Associated Grower 4²: 8, 23. 1922.—Bunches were weighed by the displacement method and the determination of the specific gravity when the sugar content was 18 per cent and later when it was 23 per cent. The grapes increased 15 per cent in weight between the times of picking for fresh shipment and for raisins.—*E. L. Overholser.*

5653. CONDIT, I. J. **Colonizing caprifig trees.** Associated Grower 4³: 24. 1922.—Caprifig trees may be colonized by hanging baskets containing fertile mammoni figs in the caprifig trees during summer and fall rather than in April.—*E. L. Overholser.*

5654. CONDIT, I. J. **More fig facts and figures.** Associated Grower 4¹: 13, 22-23. 1922.—Kadota figs are being more extensively planted in California at present than any other variety, but are susceptible to red spider. The Cordelia fig, used for caprification in some districts, is worthless for that purpose. The Black San Pedro variety is of no value in the interior valleys. The best caprifig variety is the Stanford; Roeding No. 3 is good, but the Markarian No. 2 is not satisfactory. The author briefly describes the fig smut investigation and fertilizer trials being carried on by the California Experiment Station.—*E. L. Overholser.*

5655. CONDIT, I. J. **The Stanford Smyrna fig.** Associated Grower 4³: 6. 1922.

5656. CONDIT, I. J. **Topworking fig trees.** Associated Grower 5³: 14-15, 23. 1923.—Young fig trees of undesirable varieties may be topworked between April and October by shield budding on 1-3-year-old branches. Older trees may be topworked by cleft grafts early in the season or by bark grafts in April or May. Two-year-old scions are used.—*E. L. Overholser.*

5657. DANIEL, LUCIEN. **Variations des parfums sous l'influence du greffage.** [Variations in perfumes under the influence of grafting.] Compt. Rend. Acad. Sci. Paris 176: 999-1001. 1923.—It is found that volatile products of the epibiot are in certain instances modified

in quantity and quality by the hypobiot used. In *Artemisia absinthium* the taste and odor as well as certain structural characters are different if grafted on other hypobiotics. This difference increases with age, and there is some evidence that it may be transmitted in the seed.—C. H. Farr.

5658. DELAIRE, EUGENE. *Savez-vous comment les Chinois obtiennent des arbres nains?* [How do the Chinese produce dwarf trees?] *Nat. Canadien* 49: 63-64. 1922.—The tree seed is planted in soil in an orange skin, the rootlets coming through the orange rind being clipped off for 2 or 3 years. The mature tree may thus not much exceed a handbreadth.—A. H. MacKay.

5659. DEMAREE, J. B. *Pecan kernel-spot and its relation to insect punctures.* *Amer. Nut Jour.* 17: 66. 1922.—Pecan kernel-spot is caused directly by punctures of a sucking insect, particularly the Southern stink bug, *Nezara viridula*. Substituting velvet beans for cowpeas as a cover crop aids in controlling the pest.—E. L. Overholser.

5660. EARLE, F. S. *La industria del café en Puerto Rico.* [The coffee industry in Porto Rico.] *Rev. Agric. Puerto Rico* 9⁵: 5-6. 1922.—The present ruinous condition of the coffee industry in Porto Rico is due not to economic conditions but to faulty cultural practices, which include too close planting, excessive shading (which favors development of fungous diseases), using shade trees that harbor injurious coffee insects, and careless pruning.—John A. Stevenson.

5661. GIROLA, CARLOS D. *Cultivo de la yerba mate. Torrefaccion y preparacion del producto.* [Cultivation of yerba mate. Curing and preparation of the product.] *Bol. Ministerio Agric. Nacion [Argentina]* 26: 447-488. 26 fig. 1921.—The author discusses at length the picking, curing, and commercial handling of yerba mate (*Ilex paraguariensis* St. Hil.). [See also *Bot. Absts.* 12, Entry 5911.]—John A. Stevenson.

5662. GIROLA, CARLOS D. *Cultivo de la yerba mate. Vegetación, morfología e histología de las hojas.* [Cultivation of yerba mate. Development, morphology, and histology of the leaves.] *Bol. Ministerio Agric. Nacion [Argentina]* 27: 247-261. 7 fig. 1922.—The author describes leaves and flowers of yerba mate (*Ilex paraguariensis*), a plant which may develop into a tree but on plantations is kept down to bush form by pruning. The structure of the various leaf tissues is given in detail, based on the work of Lendner. [See also *Bot. Absts.* 12, Entry 5911.]—John A. Stevenson.

5663. GRAM, H. *Ompodning af Frugttraeer.* [Grafting of old fruit trees.] *Haven* 23: 17-24. Fig. 1-12. 1923.—Directions are given for the different methods of rejuvenating orchards.—Ernst Gram.

5664. GRIST, D. H. *Kapok.* *Malayan Agric. Jour.* 11: 3-27. 1923.—The author reviews the present status of Kapok (*Eriodendron anfractuosum*) and its products. Sections are devoted to its botanical features, uses, buoyancy value in life-jackets, by-products (the seed yields oil and feeding-cake), oil, climate suitable for cultivation, soil, propagation, age of bearing, pests and diseases, harvesting, ginning, pressing and baling, markets and yield. Appendices deal with the organization of the kapok industry, lists of importers of kapok in England, America, and Australia, and a statement of costs and income of 500 acres in 1911.—R. E. Holttum.

5665. HALBERT, H. A. *Will pecans come true to variety when nuts are planted?* *Amer. Nut Jour.* 17: 7, 11. 1922.—Pecan seed reproduce the variety provided pollination has been by the same variety.—E. L. Overholser.

5666. HELGASON, E. *Korte Traek fra Islands Havebrug.* [Short remarks on horticulture in Iceland.] *Haven* 23: 33-36. 1923.

5667. HENRIQUEZ, J. ACOSTA. **Sombra para cafetales.** [Shade for coffee plantations.] *Rev. Agric. Puerto Rico* 8⁵: 19-26. 1922.—Shade for coffee plantations is considered of very great importance in Porto Rico. Bananas are planted for temporary shading until the permanent growth of leguminous trees is ready. The trees most commonly used are Guava and Guama (*Inga* spp.), Moca (*Andira inermis*), and Bucare (*Erythrina* spp.). These trees and the character of the shade given are described. Growing seedlings in nursery beds is recommended instead of the present method of using chance seedlings. Preparation of seed beds is described. Certain shade trees which harbor insect pests and fungous diseases of coffee plants should be eliminated. Pruning and a definite system of renewal, to which no attention is paid at present, must be practised for successful coffee cultivation.—*John A. Stevenson.*

5668. HODGSON, ROBERT W. **Cover crop pointers.** *Monthly Bull. California Dept. Agric.* 12: 48-51. 1923.—Purple vetch, *Vicia atropurpurea* Desf., is promising and will be widely planted in citrus orchards, partially replacing *Melilotus indica* [(L.) All.], due to its more rapid growth.—*E. L. Overholser.*

5669. HOYT, W. B. **Blackberries in south Florida.** *Florida Grower* 27¹³: 4. 1923.—A variety called Australian is described as being suitable for southern Florida. The fruit ripens from May to June, and directly afterward the old twigs are cut and the new growth trained to the wires. Plants may be set at any time of the year if given plenty of moisture, but during dry weather they should be well shaded until thoroughly rooted.—*J. C. Th. Uphof.*

5670. KELLER, H. R. **Results with cover crops.** *Associated Grower* 3⁶: 16. *Fig. 1.* 1922.

5671. LANGE, A. **Vinteren 1921-22 Virkning paa Havplanterne.** [The effect of the winter 1921-22 on garden plants.] *Nat. Verden* 6: 277-280. 1922.

5672. LEGRAND, J. FEDERICO. **Cultivo del alcanfor en Puerto Rico.** [Cultivation of camphor in Porto Rico.] *Rev. Agric. Puerto Rico* 6⁵: 7-10. *1 fig.* 1921.

5673. LEGRAND, J. FEDERICO. **Plantas útiles de Puerto Rico.** [Useful plants of Porto Rico.] *Rev. Agric. Puerto Rico* 6¹: 21-25. 1921.—The author gives the botanical classification, physical and chemical properties, and uses of *Peperomia rotundifolia*, *Amarantus viridis*, *Heliotropium indicum*, and *Heliconia caribea*.—*John A. Stevenson.*

5674. LEGRAND, J. FEDERICO. **Plantas útiles de Puerto Rico. El cacao.** [Useful plants of Porto Rico. Cacao.] *Rev. Agric. Puerto Rico* 6⁷: 7-16. 1921.—The author discusses the botanical characteristics, structure and composition of the seed, cultivation, and uses of cacao.—*John A. Stevenson.*

5675. LEGRAND, J. FEDERICO. **Plantas útiles de Puerto Rico. El café.** [Useful plants of Porto Rico. Coffee.] *Rev. Agric. Puerto Rico* 6⁴: 11-20. *7 fig.* 1921.—Botanical characteristics, chemical and physical properties, culture, uses, and commercial aspects of coffee are given.—*John A. Stevenson.*

5676. LEITCH, MARIÁ, y MARGARITA W. LEITCH. **El aguacate guatemalteco.** [The Guatemalan avocado.] *Rev. Agric. Puerto Rico* 7⁴: 5-34. *18 fig.* 1922.—The author discusses the possibilities of the successful culture in Porto Rico of Guatemalan varieties of avocado, based largely on opinions of horticulturists in the Island and the continental U. S. A.—*John A. Stevenson.*

5677. MACKIE, D. B. **Vacuum fumigation of citrus nursery stock in Ventura County.** *Monthly Bull. California Dept. Agric.* 11: 726-735. *Fig. 172-176.* 1922.

5678. MARI, MATIANO. **La vainilla.** [Vanilla.] *Rev. Agric. Puerto Rico* 9⁵: 29-31. 1922.

5679. MORRIS, ROBERT T. **Paraffin in hot climates.** Amer. Nut Jour. 17: 47. 1922.—To prevent melting of the paraffin covering of grafts, stearic acid is added to the paraffin, and the grafts are whitewashed.—*E. L. Overholser.*

5680. MOSNAT, H. R. **The Lewis hardy black walnut.** Amer. Nut Jour. 18: 60. 1923.—The variety is large, smooth, soft shelled, mild in flavor, and is adapted to many waste acres in the Corn Belt. Half meats can be obtained and find a market. By-products can be made from the husk.—*E. L. Overholser.*

5681. MÜLLER, R. **Stachelbeer-Erfahrungen.** [Gooseberry experiences.] Möllers Deutsch. Gärt. Zeitg. 38: 65-66. 1923.—The largest varieties are not always of commercial advantage. Medium to large fruited varieties with somewhat hairy and thin skins are best commercially. Some markets demand red, others yellow and dark green, varieties. The red are used for marmalade, the dark green for preserving. The prolific varieties with medium sized, thin skinned fruits are most suitable for wine making. They are planted late in October or late in March or early April and the twigs pruned back to 3 buds. Strongly developed 1-year-old twigs are pruned back to 6-8 buds. Distance of planting is 1.7-1.8 m.—*J. C. Th. Uphof.*

5682. OLIVEIRA, ARTURA A. **Métodos practicas para el cultivo de la yerba mate en la territorio de Misiones.** [Practical methods for the cultivation of yerba mate in the Territory of Misiones.] Bol. Ministerio Agric. Nacion [Argentina] 26: 403-407. 1921.—Directions are given for growing *Ilex paraguariensis* St. Hil. from the preparation of the soil and planting to harvesting and curing the leaves.—*John A. Stevenson.*

5683. OVERHOLSER, E. L. **Effects of thinning peaches.** Assoc. Grower 54: 7. 1923.

5684. OVERHOLSER, E. L. **Future outlook for California's new deciduous fruit acreage.** Assoc. Grower 42: 12, 25-27. 1922.

5685. QUAIL, JOHN L. **Pruning peach trees.** Assoc. Grower 51: 40. 1923.—The author cautions against too little pruning and too little thinning of fruit under the "long pruning" system. Care should be taken in training young trees, and only 3 main limbs left.—*E. L. Overholser.*

5686. READ, F. W. **Facts and figures regarding the deciduous fruit industry.** Monthly Bull. California Dept. Agric. 12: 39-43. 1923.

5687. REINHARDT, H. **Stachelbeere Runde Weisse, ein Massenträger.** [Gooseberry Runde Weisse, a prolific producer.] Möllers Deutsch. Gärt. Zeitg. 38: 65. 1 fig. 1923.—The variety was compared with many others. It is very productive, sweet and thin skinned, and is recommended for wine-making and marmalade.—*J. C. Th. Uphof.*

5688. ROLFS, P. H. **Brazilian fruits and the Centennial.** Florida Grower 27¹⁰: 4-5. 4 fig. 1923.—The indigenous jaboticaba, a Myrtaceous fruit little known outside of Brazil, is delicious and refreshing. The dwarf mangoes are of considerable value. The variety Itamaraca weighs 4-8 ounces, is very much flattened longitudinally, and the meat resembles custard. The Carlotta and Augusta mangoes are also grown. The litchi, avocado, and jack fruit are discussed.—*J. C. Th. Uphof.*

5689. SANTA MARIA, MIGUEL. **Cultivo y producción del cocotero en Mexico.** [Culture and production of the coconut in Mexico.] Rev. Agric. [Mexico] 7: 186-188. 4 fig. 1922.—The coconut thrives in a number of the states of Mexico below the parallel of 25°. The average annual yields are 50-100 nuts per tree. Cultural directions are given.—*John A. Stevenson.*

5690. SCHINDLER. *Erdanschüttungen an Baumstämmen.* [Earthing up tree stems.] Möllers Deutsch. Gärt. Zeitg. 38: 67. 1923.—The stem of a wild, 30-year-old, sweet cherry was covered 1 m. with light soil. It produced a new root system in this soil and no damage was observed. The same was observed in a Canada Reinette and a Gravenstein apple in Westerwald.—*J. C. Th. Uphof.*

5691. SCHMIDT, RICHARD. *Budding of vines given large scale test.* Assoc. Grower 4: 11, 22. 1922.—Budding gives promise of replacing grafting as a means of propagating Vinifera grapes on resistant root stocks. The method of budding used is known as the "Yema graft."—*E. L. Overholser.*

5692. SCHMIDT, RICHARD. *New varieties of grapes.* Assoc. Grower 3: 19, 34. 4 fig. 1922.—The Black Monukka grape is early, black, bears heavily but ripens irregularly. It may be shipped or cured for raisins, and is considered promising. The Maraville de Malaga is used as a pollinizer for Ohanez. Its excellent fruit ripens with the Malaga. It does best in the cooler sections on the heavier soils. The Olivette Blanche is excellent in size, shape, and bearing qualities, but lacks flavor. Gros Guillaume is a large blue grape superior to Gros Coleman in flavor and keeping qualities. The clusters, however, fill poorly. The Hunisa bears excellent crops of red berries. The bunches fill well in the Sacramento Valley, but it has proved less satisfactory in the San Joaquin Valley.—*E. L. Overholser.*

5693. SCHMIDT, RICHARD. *Pruning new varieties of grapes.* Assoc. Grower 4: 12. 1922.—The author tentatively recommends that the Black Monukka grape be pruned like the Thompson Seedless, except that canes be cut shorter; and suggests that Maraville de Malaga, Ohanez, and Olivette Blanche be pruned similarly except that fewer canes be left.—*E. L. Overholser.*

5694. SCHULTZ, E. F. *La naranja de verano "Lue Gim Gong."* [The Lue Gim Gong orange.] Rev. Indust. y Agric. Tucuman 12: 121-124. 2 fig. 1922.—The variety, originated in Florida, has been under successful trial at the Tucuman experiment station since 1915. The crop matures late in the fall and the fruit holds its quality well. The Tucuman orange growers can not now compete with those of other sections of Argentina which have cheap water transportation; but the introduction of this late maturing variety will obviate the difficulty.—*John A. Stevenson.*

5695. SCHUSTER, C. E. *The Barcelona filbert.* Amer. Nut Jour. 17: 77. 1922.—The Barcelona filbert, propagated by layering, is the best variety tested at the Oregon Experiment Station. It is self-sterile; Du Chilly has been found the best pollinator, planted in the proportion of 1 to 8. Harvesting and drying costs for filberts are low and it is so far not necessary to spray.—*E. L. Overholser.*

5696. SCHWERIN, FRITZ VON. *Folgen von Erdanschüttungen an Baumstämmen.* [Results of earthing up tree stems.] Möllers Deutsch. Gärt. Zeitg. 38: 49-50. 2 fig. 1923.—Young trees set too deep are often injured, but old ones may be mounded up without damage. Various examples are given. Stems of *Aesculus* 80 years old were banked 2 m. without injury.—*J. C. Th. Uphof.*

5697. SPINOSA, JOSE P. *Apuntes sobre el cultivo del naranjo referidos especialmente al territorio nacional de Misiones.* [Orange culture with special reference to the Territory of Misiones.] Bol. Ministerio Agric. Nacion [Argentina] 27: 3-185. 31 fig. 1922.—The orange was very extensively cultivated by the Jesuits around their missions during the Spanish regime in Argentina but the culture has gradually dropped away. Oranges are raised extensively, however, in the Territory of Misiones and the industry there is capable of much expansion. Climatic and soil conditions are discussed. The sweet orange is the variety most commonly grown and to a lesser extent the sour orange. Other varieties thought to be adapted to grow-

ing in the territory are described. The author gives detailed methods for successful citrus culture from the preparation of the seed bed to harvesting the fruit. Gummosis is the most serious disease encountered and measures for its control are given.—*John A. Stevenson.*

5698. TELLEZ, OLIVERIO. *El nogal-su cultivo, explotacion y plagas.* [Culture, exploitation, and pests of the walnut.] *Rev. Agric. [Mexico]* 7: 181-185. 7 fig. 1922.—All of the economic species of *Juglans* grow well in Mexico and more extensive culture is recommended. Varietal descriptions and cultural directions are given.—*John A. Stevenson.*

5699. WOODFIN, J. C. *Vine culture under glass.* *New Zealand Jour. Agric.* 24: 287-293, 344-349. 1922; 25: 345-351. 1922; 26: 39-43, 172-177. 7 fig. 1923.—The problems in connection with grape growing under glass are discussed under the following headings: situation, description of vine house, size of house, the trellis, the border, planting, distance between plants, descriptive terms used, training the vines, leading vines into house, establishing strong plants, 1st year's training, manuring, ventilation, bearing laterals, routine work, sublaterals, setting and thinning of the berries, the stoning period, the 2nd swelling and coloring, the after ripening period, manuring established vines, watering, black varieties, white varieties, powdery mildew, vine Sclerotinia, grape spot, shanking, scalding, warted leaves, aerial roots, mealy bug, red spider, and thrips.—*N. J. Giddings.*

5700. WOODROOF, J. G. *Variation in seedlings—especially pecans.* *Amer. Nut Jour.* 17: 67. 1922.—At the Georgia Experiment Station the pecan varieties found to produce the best seedlings for propagation purposes were the Bradley, Lee, and Teche.—*E. L. Overholser.*

FLORICULTURE AND ORNAMENTAL HORTICULTURE

5701. BØRGENSEN, F. *Vinterens Indflydelse paa en Del stedsegrønne Buske og Traeer i en Have i Hellebaek.* [The influence of the winter on several evergreens in a Danish garden.] *Gart. Tidende* 38: 337-341. 353-356, 365-366. Fig. 1-10. 1922.—An annotated list is given of a collection of foreign trees and shrubs and their hardiness in the severe winter 1921-22.—*Ernst Gram.*

5702. GOOS UND KOENEMANN. *Die neue Edeldahlien Zukunft, Friede und Fürstin Anna von Donnersmarck.* [The new improved Dahlias Zukunft, Friede, and Fürstin Anna von Donnersmarck.] *Möllers Deutsch. Gärt. Zeitg.* 38: 73. 3 fig. 1923.—Zukunft produces high, free flowers which are red with orange, and yellowish toward the base. The flowerstalk is solid, 40 cm. long. Fürstin Anna von Donnersmarck has light carmin-red flowers, recommended for bouquets. The abundant flowers of Friede are white, with violet toward the center. The flowerstalk is long and solid.—*J. C. Th. Uphof.*

5703. MÜLLER, GUSTAV. *Neue deutsche Edelnelken.* [New German improved carnations.] *Möllers Deutsch. Gärt. Zeitg.* 38: 97. 2 fig. 1923.—Andenken an August Holz has long stems and beautiful, large salmon red flowers. Frigga has pink flowers, 10-12 cm. in diameter. The originator is August Holz.—*J. C. Th. Uphof.*

5704. MÜLLER, GUSTAV. *Riesen-Edeldahlie Goldglanz.* [Giant improved Dahlia Goldglanz.] *Möllers Deutsch. Gärt. Zeitg.* 38: 69. 1 fig. 1923.—The new variety, of the same group as Kalif, produces very large gold-yellow flowers.—*J. C. Th. Uphof.*

5705. STEFFEN, A. *Verschiedene Vergissmeinnichtsorten und ihr Wert für die Erwerbsgärtnerei.* [Several forget-me-not varieties and their value in commercial floriculture.] *Möllers Deutsch. Gärt. Zeitg.* 38: 81-82. 2 fig. 1923.—Several varieties are described, especially Perle von Ronneburg, Oblongata Perfecta, Albion, Hindenburg, Ruth Fischer, Marga Sacher, and Isolde Krotz (novelty 1922). Oblongata Perfecta is especially recommended for bouquets and Marga Sacher for pot growing.—*J. C. Th. Uphof.*

5706. ZÖRNITZ, H. *Neuere Stauden.* [New herbaceous plants.] Möllers, Deutsch. Gärt. Zeitg. 38: 83-84. 1923.—*Primula Helenae* was originated from crosses between *P. acaulis* hybrids \times *P. Juliae*. They are easily propagated by division. *Trollius* Orange König, *Leucanthemum maximum* Ophelia, and *Erica cinerea splendens* are also mentioned. They were originated by George Arends in Ronsdorf.—*J. C. Th. Uphof.*

VEGETABLE CULTURE

5707. ANONYMOUS. *La coliflor.* [Cauliflower.] Rev. Agric. [Mexico] 7: 246-248. 1922.—The culture of cauliflower under Mexican conditions is discussed.—*John A. Stevenson.*

5708. BREMER, A. H. *Om avstand for hvidkaal i forsök.* [Spacing of cabbage in experiments.] Nordisk Jordbrugsforskning 1922: 289-296. 1 *diagr.* 1922.—Cabbage varieties differ in the spread of leaves and resulting space requirements. Crowding of spreading types gives loose heads. For experimental work the space requirements of each variety are determined by a preliminary test.—*Ernst Gram.*

5709. CLAYTON, E. S. *Onion experiments at Dorrigo.* Agric. Gaz. New South Wales 34: 326. 1923.—A complete mineral fertilizer increased the yield nearly 100 per cent and produced a larger percentage of marketable onions than the untreated land.—*L. R. Waldron.*

5710. CORTES, A. SURO. *Breve estudio sobre la siembra de ajos.* [Garlic culture.] Rev. Agric. Puerto Rico 94: 27-29. 1922.—Seed selection, preparation of the soil, sowing the seed, fertilization, cultivation, and harvesting are discussed.—*John A. Stevenson.*

5711. DOMINGUEZ, IGNACIO. *La col.* [Cabbage.] Rev. Agric. [Mexico] 7: 189-192. 12 *fig.* 1922.—Descriptions of varieties recommended for growing under Mexican conditions are given; cultural directions follow.—*John A. Stevenson.*

5712. DOMINGUEZ, IGNACIO. *La pequeña huerta cultivo de las raíces comestibles.* [The cultivation of edible roots in the small garden.] Rev. Agric. [Mexico] 7: 299-302. 2 *fig.* 1922.—Popular.—*John A. Stevenson.*

5713. DOMINGUEZ, IGNACIO. *La zanahoria.* [The carrot.] Rev. Agric. [Mexico] 7: 133-135. 1 *fig.* 1922.—Carrot culture in Mexico is discussed.—*John A. Stevenson.*

5714. GRIFFITH, JEAN P. *La industria vegetal en Puerto Rico.* [The vegetable industry in Porto Rico.] Rev. Agric. Puerto Rico 86: 43-50. 1922.—Due to adverse conditions of climate and soil and presence of diseases and insects, vegetables are not produced in great quantities in Porto Rico. Statistics of production of beans, sweet potatoes, yams, yautias, and onions are given. Some vegetable crops can be grown successfully in the uplands. Onions do well in the northwest of the Island. Experimental work aimed at the production of resistant varieties of tomatoes and some other vegetables is under way.—*John A. Stevenson.*

5715. IBARRA, DAVID S. *El cultivo del melon en el Bajío* [Cultivation of the melon in Bajío.] Rev. Agric. [Mexico] 7: 192-195. 5 *fig.* 1922.—The Rocky Ford melon has been introduced and grown on a considerable scale in parts of Mexico, but has been allowed to hybridize with other types with a resulting deterioration. Melons in this region are commonly cultivated in alternating rows with corn. Recommendations for improving the crop are given.—*John A. Stevenson.*

5716. JOHNSEN, J. *Kan Haveaerter saa tidligt?* [Early sowing of garden peas.] Gart. Tidende 39: 113-114. 1922.—With 30 days difference in time of seeding peas the difference in appearance above ground was 11 days, and in flowering only 5. With one exception, the yield of green peas was higher on the late plantings.—*Ernst Gram.*

5717. LEGRAND, J. FEDERICO. *Plantas utiles de Puerto Rico*. [Useful plants of Porto Rico.] Rev. Agric. Puerto Rico 7²: 5-8. 1921.—The author gives briefly the botanical characteristics of *Chrysophyllum cainito*, *Antigonon leptopus*, and *Cucurbita pepo* with an enumeration of the uses to which they are put in Porto Rico.—*John A. Stevenson*.

5718. LOBNER, MAX. *Die wirtschaftlich wertvollsten Tomaten*. [The most valuable tomatoes economically.] Möllers Deutsch. Gärt. Zeitg. 38: 85-86, 101. 1923.—A description and comparison of the principal tomato varieties is presented. Lukullus Trieb is a resistant, prolific rather late bearer. Schöne von Lothringen is recommended as large and early. Bonner Beste may in the future be of value on account of its earliness. Preys Delicatess, a greenhouse type, is prolific, of compact growth, and has very large fruits. Tuckwood is commonly grown in the Netherlands in glasshouses.—*J. C. Th. Uphof*.

5719. PITT, J. M. *Farmers' experiment plots*. Trials with peas, onions, and other vegetable crops. 1922. Lower north coast. Agric. Gaz. New South Wales 34: 271-280. 3 fig. 1923.—The pea variety Greenfeast of the Wonder type, decidedly outyielded all other varieties, producing 514 bushels per acre. This variety is popular in the market and sells well during glut periods. Ten onion varieties were under trial. The variety Odorless yielded 10.6 tons per acre with the Early Barletta at 7.35 tons standing second. Notes are given on other garden crops.—*L. R. Waldron*.

5720. WEISHAAR, L. J., AND S. S. ROGERS. *Review of the 1922 broccoli season at Colma, California*. Monthly Bull. California Dept. Agric. 11: 442-445. 1922.—The authors discuss the importance of Colma as a broccoli-producing section and give a history of the Colma Vegetable Association.—*E. L. Overholser*.

5721. WEISHAAR, L. J., AND S. S. ROGERS. *Successful marketing of California vegetables*. Monthly Bull. California Dept. Agric. 11: 721-725. 1922.

HORTICULTURE PRODUCTS

5722. ANONYMOUS. *The grapefruit grower becomes a canner*. Florida Grower 27¹²: 3. 1923.—The possibilities of canning grapefruit are presented.—*J. C. Th. Uphof*.

5723. ALLEN, W. J. *How to dry figs*. Agric. Gaz. New South Wales 34: 376. 1923.

5724. BARNARD, L. C. *Peach drying*. Associated Grower 4²: 28-29. 1922.

5725. BERG, E. A. *Putting figs on the American table*. Associated Grower 5¹: 32. 1923.

5726. CRUESS, W. V. *Raisin by-products*. Associated Grower 5⁴: 12, 26. 1923.—A carbonated beverage called Raisinate, a raisin syrup, and several raisin candies have been perfected by the Fruit Products Division of the California Experiment Station.—*E. L. Overholser*.

5727. EATON, B. J. "Whole" rubber or desiccated latex. Malayan Agric. Jour. 10: 288-294. 1922.—Non-caoutchouc constituents of latex provide valuable vulcanization accelerators; these are lost by ordinary coagulation methods. The Hopkinson process for the preparation of "whole" rubber by desiccation of latex (in an apparatus similar to that used for milk desiccation) is described. It is claimed that this rapid process gives a vulcanized rubber of greater tensile strength and uniformity than the ordinary milled rubber. There are practical difficulties to be overcome.—*R. E. Holtum*.

5728. EATON, B. J., AND J. H. DENNETT. *Preliminary and interim report on investigations on the production of alcohol from Nipah palms*. Malayan Agric. Jour. 11: 47-63. 1923.—The actual area at present covered with *Nipa fruticans* in the Federated Malay States is estimated at about 18,000 acres. Experimental tapping was carried out in 3 areas. According to

local custom a preliminary treatment covering 3 months is necessary before tapping commences, but it is hoped this can be reduced. Yields were irregular, but it is considered that with proper treatment $\frac{1}{4}$ – $\frac{1}{2}$ gallon of juice per palm per day can be obtained. Experiments indicate that control of fermentation of the juice is easier than has been reported from the Philippines; natural fermentation is far from complete after 24 hours if glazed vessels are used. The average sugar content of the juice is about 12.5 per cent. No great difficulties are expected in the manufacture of alcohol. The production of high grade sugar is difficult because of (1) inversion of sugar during collection and (2) the presence of persistent organic nitrogenous substances. Some notes on planting methods are appended.—*R. E. Holttum.*

5729. EATON, B. J., AND J. H. DENNETT. The comparative buoyancy of Malaya and Java Kapok. *Malayan Agric. Jour.* 10: 295–300. 1922.—Experiments show that the Malaya samples are only slightly inferior to the Java samples and are well above the Board of Trade standard of buoyancy for life-jackets. More details are necessary as to the conditions under which the standard tests should be carried out.—*R. E. Holttum.*

5730. GEORGI, C. D. V. Cashew nut oil. *Malayan Agric. Jour.* 10: 301–302. 1922.—Kernels of nuts of *Anacardium occidentale* are shown to contain 40–45 per cent of oil, but a high pressure is required for complete extraction; the cake remaining after extraction contains 33.4 per cent of albuminoids.—*R. E. Holttum.*

5731. GEORGI, C. D. V. Kapok oil. *Malayan Agric. Jour.* 10: 284–286. 1922.—Seeds of Kapok (*Eriodendron anfractuosum*) contain 20 per cent of oil which is easy to extract; analyses and properties of the oil are given. It is used to a small extent for edible and soap-making purposes, and will probably be more used when larger supplies are available. After extraction of the oil the cake contains 3.98 per cent of nitrogen and is a valuable feeding stuff.—*R. E. Holttum.*

5732. OVERHOLSER, E. L. Keeping the fig in fresh condition by low temperatures. I. *Associated Grower* 3⁶: 9, 33–34; 3⁷: 13. 1922.—Fresh figs can be stored at 32°F. for short periods only. Freezing at 10 and 26°F. were tested. The methods were: (1) immersion in water or sugar solution in sealed containers and (2) glazing the fruit with ice. Fruit stored at 10°F. kept as late as April 1. Glazing with ice was unsatisfactory. Fruits soften rapidly after removal from storage and are best used for cooking. Those held in 30–50 per cent sugar at 10°F. may be eaten as fresh fruits within 8–10 hours after taken from storage.—*Mary Barrett.*

5733. WEISHAAR, L. J. Net weight or quantity marking requirements for fruit and vegetable containers. *Monthly Bull. California Dept. Agric.* 11: 450–454. 1922.

5734. WIEGAND, ERNEST H. Recirculation driers. *Oregon Agric. Exp. Sta. Circ.* 40. 11 p., 6 fig. 1923.—The main advantages of recirculating the air in prune driers are: (1) saving heat and fuel, (2) adding moisture to the air, (3) decreasing drying time, (4) lowering drying cost, and (5) increasing the quality by lowering the temperature. Detailed instructions are given for building this new type of prune drier, and for remodeling the older types.—*C. E. Owens.*

MORPHOLOGY, ANATOMY AND HISTOLOGY OF VASCULAR PLANTS

E. W. SINNOTT, *Editor*

(See also in this issue Entries 5426, 5442, 5633, 5657, 5662, 5934, 5949, 5950, 5951, 5986, 5987, 6003, 6036, 6066, 6084)

5735. ARBER, AGNES. On the leaf-tip tendrils of certain monocotyledons. *Jour. Indian Bot. Soc.* 3: 159–169. 3 pl. 1923.—The anatomy of leaf-tip tendrils is described and figured for representatives of 5 genera (*Gloriosa*, *Littonia*, *Sandersonia*, *Fritillaria*, and *Polygonatum*)

of Liliaceae, and for *Flagellaria indica* L. Leaf anatomy of all three genera (*Flagellaria*, *Susum*, and *Joinvillea*) of Flagellariaceae is also given. Tendril tips all coil downward in the Liliaceae, and upward in *Flagellaria*. In the liliaceous leaves the numerous bundles, each with its own sheath of sclerotic tissue, gradually coalesce into 3 bundles in the tendril, and finally into 1. In *Gloriosa*, *Littonia*, and *Sandersonia* the 3 bundles are embedded in a single massive sheath of sclerotic tissue. In the *Flagellaria* tendril there are several bundles in a single sheath, but most of the sclerenchyma is in the mesophyll, quite distinct from the vascular bundles. *Susum* leaves show several series of bundles in the sheath and leaf base. The smallest bundles toward the center of the upper surface of the leaf are inversely oriented. *Joinvillea* leaves are plicate, with large epidermal cells at the bases of the grooves. Sheath and leaf base also have more than 1 series of bundles.—On the phyllode theory, the leaves of *Flagellaria* may be interpreted as “consisting of a sheath succeeded by a limb which is a horizontally expanded petiole,” while the tendril represents the “apical part of this flattened petiole.” The liliaceous leaves may be similarly interpreted, or possibly “the limb in these species may be of leaf-sheath nature, in which the tendril may represent either the apex of the leaf-sheath, or the vestigial rudiment of a petiole.” The structure of leaf-tip tendrils seems to be determined “by the inherent anatomical tendencies of the species, rather than by the response to a common physiological need.”—Winfield Dudgeon.

5736. BAILEY, I. W. Notes on neotropical ant-plants. II. *Tachigalia paniculata* Aubl. Bot. Gaz. 75: 27-41. Pl. 1-2, fig. 1-3. 1923.—The leaf of this leguminous plant is characterized by a hollow fusiform petiole or rachis base. More than 30 species of insects were found inhabiting the petiole cavities. Beetles at first cut their way into the cavities and feed upon the wall of amber-colored medullary tissue. Certain coccids are also present and furnish the beetles with a sugary exudate. Ants (*Azteca* or *Pseudomyrma*) eventually drive out the beetles. The stimulation of the ants while biting out tissue to enlarge the cavity induces changes involving a widening of the primary rays and an inhibition of certain thick-walled elements. The ants, it is believed, feed vicariously through the agency of the coccids, using not only the excretions of the latter but also directly consuming the body of the insect. “There is no evidence to indicate that the structural peculiarities of *T. paniculata* are initiated by ants or by gall forming insects, or that they originated as adaptations for attracting a defending army of ants. The relations between the host plant and the beetles and the ants are not those of a mutually beneficial symbiosis but an interesting type of parasitism, in which there is a remarkable parallelism in the behavior of representatives of such widely separated groups of insects as the Hymenoptera and Coleoptera. The nesting and feeding habits of the insects, and their relations to the coccids, are very largely determined by the structure and arrangement of the vegetative tissues during different stages in the development of the petiole and rachis.”—B. W. Wells.

5737. BUGNON, P. Sur le nombre des cotylédons de la Ficaire. [The number of the cotyledons of *Ficaria*.] Compt. Rend. Acad. Sci. Paris 176: 766-769. 1923.—*Ficaria ranunculoides* has sometimes been considered as having no cotyledons; at other times, as having 1 cotyledon; and finally, as having 2 cotyledons. A careful description is here given of the embryo, and the various theories and their bases are discussed. It is concluded that there are 2 foliar organs having the same anatomic connections with the root as the 2 cotyledons of the species of the same family which are obviously dicotyledonous. The most plausible hypothesis seems to be that this species is heterocotyledonous, one cotyledon being better developed than the other.—C. H. Farr.

5738. BURKILL, I. H. Notes on Dipterocarps; No. 9. On the differences in the seedlings between *Balanocarpus maximus* King and *B. Heimii* King. Jour. Malayan Branch Roy. Asiatic Soc. 1: 218-222. Fig. 1-10. 1923.—The seeds and seedlings of *B. maximus* are here described for the 1st time; those of *B. Heimii* were described under the name *B. maximus* (see Bot. Absts. 6, Entry 1896). The cotyledons of *B. maximus* are not markedly dissimilar, as are those of *B. Heimii*; they are packed parallel in the seed, and are of about equal length. The

1st leaves of the seedling are a pair (4 or 5 together in *B. Heimii*) and the youngest plant is purplish. The fruit is not dehiscent in either species, but is ruptured irregularly.—*R. E. Holttum.*

5739. CLUTE, WILLARD N. The flowers of the magnolia. *Amer. Bot.* 29: 45-47. 1923.

5740. DEBBARMAN, P. M. A case of axial proliferation of the flower of *Nymphaea rubra* Roxb. *Jour. Indian Bot.* 3: 66-67. 1 pl. 1922.—The ovary was transformed into a hard hairy mass, and a short stalk bearing a rudimentary flower grew out from the axil of a petal.—*Winfield Dudgeon.*

5741. DEBBARMAN, P. M. Some observations on the anchoring pads of *Gymnopetalum cochinchinensis* Kurz and some other Cucurbitaceous plants. *Jour. Indian Bot.* 3: 52-57. 1 pl. 1922.—Under normal conditions the branching tendrils twine in the usual manner, without pad formation; but when coming into contact with a surface, the tendril tips respond to the contact stimulus and produce 2-5-celled trichomes which wedge into minute crevices and anchor the plant mechanically. There is no evidence of attachment by a mucilaginous secretion. Shade and moisture favor pad formation, and strong light and drought inhibit it. *Trichosanthes palmata* possesses similar anchoring pads.—*Winfield Dudgeon.*

5742. DUDGEON, WINFIELD. [Rev. of: MASCRÈ, M. *Recherches sur le developpement de l'anthère chez les Solanacées.* (Studies in the development of the anther in Solanaceae.) Thèse, Paris. 99 p., 101 fig. 1921.] *Jour. Indian Bot.* 3: 26-27. 1922.

5743. F[YSON], P. F. [Rev. of: ARBER, AGNES. *Leaves of the Farinosae.* *Bot. Gaz.* 74: 80-94. 1922.] *Jour. Indian Bot.* 3: 156. 1923.

5744. F[YSON], P. F. [Rev. of: ARBER, A. *On the development and morphology of the leaves of the palms.* *Proc. Roy. Soc. London, B.* 93: 249-261. 1922.] *Jour. Indian Bot.* 3: 156-157. 1923.

5745. F[YSON], P. F. [Rev. of: ARBER, AGNES. *On the nature of the blade in certain monocotyledonous leaves.* *Ann. Bot.* 36: 320-351. 1922 (see Bot. Absts. 12, Entry 1106).] *Jour. Indian Bot.* 3: 155-156. 1923.

5746. GHOSE, S. L. An example of leaf-enation in *Allium ursinum* L. *New Phytol.* 22: 49-58. Fig. 1-10. 1923.—In an abnormal leaf of *Allium ursinum* "doubling" was found in both the laminar and petiolar regions. Each blade shows one series of bundles, the orientation of which is opposite as is usual in leaf-enations. An example of leaf-enation is also described from *Xanthosoma appendiculatum*. A theoretical discussion is appended.—*I. F. Lewis.*

5747. HALBERG, F. Notes on Indian plant teratology. *Jour. Indian Bot.* 3: 1-9. 6 fig. 1922.—Abnormalities in flowers of *Calycopteris floribunda* Lamk. and *Habenaria grandiflora* Lindl. are described and figured.—*Winfield Dudgeon.*

5748. PFEIFFER, H. Vergleichende Anatomie der Blätter der Lagenocarpus-Arten. [A comparison of the leaf anatomy of the species of Lagenocarpus.] *Beih. Bot. Centrabl.* 2 Abt. 39: 436-445. Pl. 1. 1923.—Small sections of the leaf are sufficient to identify species. It may be possible to group the species in sections on morphological characters.—*L. Pace.*

5749. PROUTY, WILLIAM F. A more phenomenal shoot. *Jour. Elisha Mitchell Sci. Soc.* 37: 15. 1921.—A shoot of 1 season's growth of *Pawlonia tomentosa* was shown that was 21½ feet high, 10 inches thick at base, and had 24 internodes.—*W. C. Coker.*

5750. ROBERTSON, CHARLES. **Flowers and insects. XXIII. Pollination.** Bot. Gaz. 75: 60-74. 1923.—A summary is given of terms and their definitions which are related to pollination conditions. These terms are chiefly those of early authors, such as "adynamandry" of Kölreuter, referring to self-sterility. The author believes that the original flowers are perfect and entomophilous, and that in the evolution of angiosperms probably the most important condition was the diversification of station and habitat.—B. W. Wells.

5751. SAXTON, W. T. **Preliminary note on the life history of Cedrus deodara Loud.** Jour. Indian Bot. 3: 90. 1922.—Pollination occurs about the end of September (in the Himalayas) and fertilization about the end of May, 8 months later. Considerable spongy tissue is formed as the ovule develops. The female gametophyte at fertilization time is composed of exceedingly delicate tissue (more so than in *Pinus*). There are usually 3 archegonia, but occasionally as many as 6. The neck is variable, but is always composed of a considerable number of cells. The proembryo resembles that of *Pinus*, and the embryo is polycotyledonous.—Winfield Dudgeon.

5752. SOAR, ISABEL. **The structure and the function of the endodermis in the leaves of the Abietineae.** New Phytol. 21: 269-292. Fig. 1-12. 1922.—Methods for distinguishing suberin, lignocellulose, and cellulose are given. The material used included *Pinus* spp., *Picea excelsa*, *Pseudotsuga Douglasii*, *Larix europaea*, *Abies pectinata*, *Tsuga canadensis*, and *Pseudolarix Kaempferi*. Detailed study of leaf sections leads to the following conclusions. "The endodermis * * * has been shown to conform to a general plan, suberisation occurring always on the radial walls which are pitted, and on the transverse walls which are unpitted. The suberin is always deposited as a layer on each side of a lignocellulose core. The structure of the tangential walls varies in the different species described. They are often both lignified and suberised, but sometimes they, especially the inner tangential walls, consist of cellulose. Where these walls are suberised pits or breaks in the suberised membrane are present. In young leaves of *Pinus sylvestris* the development of the endodermal walls proceeds as follows: (1) cellulose, (2) lignocellulose, (3) lignocellulose with a surface layer of suberin. Thickening develops first in the radial walls. When the endodermal sheath is incomplete additional protective tissues are often found. Thus the growing leaf base of *Pinus* is protected by sclerotic scales, and the basal region of the leaf in *Picea* and *Abies* by additional layers of lignified hypodermis. The suberisation and lignification of the radial walls renders the endodermis relatively impervious to the passage of water through the walls alone. Thus the transpiration current must flow largely through the endodermal cell, and it is probable that the protoplasm exerts some control over the rate of flow." It is suggested that "the peculiar structure of the endodermis in the leaves of these gymnosperms is one of the factors which serve to retard transpiration."—I. F. Lewis.

5753. WILLIAMS, C. F. **The stems of grape hybrids.** Jour. Elisha Mitchell Sci. Soc. 38: 11-12. 1922.—The pattern of the phloem tissue and the character of the cork cambium were found to be specific in *Vitis vinifera* and *V. rotundifolia*. The F_1 hybrids of these 2 species showed intermediate characters of great variation, especially in regard to cork cambium.—W. C. Coker.

5754. YOCUM, L. EDWIN. **Some phases of structure and development of garden peas and white sweet clover seeds as related to hardness.** Jour. Elisha Mitchell Sci. Soc. 38: 76-83. 2 pl. 1922.—"In sweet clover and garden peas the Malpighian layer of cells begins to thicken very much about a week after fertilization. Thickenings are in ridges leaving crevices between. Sweet clover develops a light line which is more impermeable to water than the outer part of the cell. The pea does not have this region but in some cases has an impermeable cutin. Pectin is deposited in the cells around the micropyle at about the time of fertilization in the garden pea. The outer portion of the Malpighian cells of sweet clover and garden peas is a hemi-cellulose, very likely some form of pentose. The inner portion is cellulose.—The impermeable portion of a hard pea seed is located in the cutinized layer as compared with the light line in sweet clover."—W. C. Coker.

MORPHOLOGY AND TAXONOMY OF ALGAE

E. N. TRANSEAU, *Editor*L. H. TIFFANY, *Assistant Editor*

(See in this issue Entries 5443, 5923, 5954, 6036, 6099)

MORPHOLOGY AND TAXONOMY OF BRYOPHYTES

ALEXANDER W. EVANS, *Editor*

(See also in this issue Entry 6036)

5755. ANONYMOUS. [Note.] *Rev. Bryologique* 50: 16. 1923.—Attention is called to a meeting of the Botanical Society of France held in the Jura during the summer of 1919. Bryologists were represented by Hétier and Hillier, who pointed out a number of interesting mosses and hepatics in the region.—A. W. Evans.

5756. ANDREWS, A. LE ROY. [Rev. of: GYÖRFFY, ISTVÁN. *A Molendoák fajai tagolódása és rokonsága összehasonlító anatómiai és fejlődéstani vizsgálatok alapján.* (Investigations on Molendoa.) *Math. Term. Tud. Ert.* 38: 344-351. 1921 (see Bot. Absts. 12, Entry 5763.) *Bryologist* 25: 108-109. 1922.—The reviewer outlines the general content of the article, commends the author's methods, and expresses the hope that the completed monograph will do much to clarify a little known region of the moss-system.—E. B. Chamberlain.

5757. ARNELL, H. WILH. *Bryum* (Cladodium) *vestmannum* Arnell, nova species. *Bot. Notiser* 1923: 293, 294. 1923.—The species here proposed as new was based on material collected in the province of Västmanland, Sweden, by C. A. Törnlund in 1920. There is included under it a var. *norbergense* Arnell from the same province, described in 1918 as *Bryum inclinatum* var. *norbergense* Arnell (see Bot. Absts. 7, Entry 1079).—A. W. Evans.

5758. BRINKMAN, A. H. List of British Columbia hepatics. *Canadian Field Nat.* 37: 94-96. 1923.—A list of 170 hepatics compiled from various sources is given, no definite localities being mentioned. The list includes 31 species first discovered in British Columbia by the author.—W. H. Emig.

5759. CULMANN, P. Contribution à la flore bryologique du bassin supérieur de l'Alagnon (Cantal). [Contribution to the bryological flora of the upper valley of the Alagnon (Cantal).] *Rev. Bryologique* 50: 9-15. 1923.—The region is in the department of Cantal in Central France, especial attention having been paid to a series of mountain ravines. The rocks of the district are largely volcanic, but gneiss and limestone are present in certain localities, and calciphilous species are found in some of the volcanic habitats. The species reported includes not only those found by the author but also those recorded in earlier works, particularly Héribaud's *Muscinees d'Auvergne*, published in 1899. In the present portion of the paper, which is to be continued, 39 hepatics are listed with full data regarding stations. A few critical remarks are interspersed and, in connection with *Marsupella Sprucei* and *M. ustulata*, the differential characters are discussed at length, the conclusion being reached that these are too vague and inconstant to separate the species.—A. W. Evans.

5760. DIXON, H. N. *Porotrichum angustifolium* in Ireland. *Irish Nat.* 32: 45-47. 1923.—This endemic British moss, originally found in Derbyshire, has been recorded from Ireland, probably from County Antrim.—W. E. Praeger.

5761. FLEISCHER, MAX. Kritische Revision von Carl Müllerschen Laubmoosgattungen. [Critical revision of Carl Müller's genera of mosses.] *Hedwigia* 63: 209-216. 1922.—In the present part the same plan is followed as in the preceding part [see Bot. Absts. 8, Entry 447],

Müller's determinations being given in one column and the author's in another. The following genera as understood by Müller are taken up: *Remyella*, *Lindigia*, *Gyrosine*, *Patellidium*, *Campylodontium*, *Platygyrium*, *Struckia*, *Pylaisia*, *Entodon*, *Pilosium*, *Cyathophorum*, *Cyathophorella*, *Mononeurium*, *Euglossophyllum*, *Hypopterygium*, *Mniadelphus*, *Hepaticina*, *Hookeria*, and *Lepidophyllum*. As in the preceding part several of Müller's species are reduced to synonymy, and many new combinations are made necessary by the transference of species.—A. W. Evans.

5762. GOLA, G. Le epatiche raccolte dal Dott. G. B. De Gaspari nella Terra del Fuoco sud-occidentale. [The hepatics collected by Dr. G. B. De Gaspari in southwestern Tierra del Fuego.] *Nuovo Gior. Bot. Ital.* 29: 162-175. Pl. 1, 2. 1923.—The present report is based on a collection made in the colder parts of Tierra del Fuego, many of the specimens having been found in the vicinity of glaciers and the streams flowing from them. The species in condition to be determined number 74 of which the following 17 are proposed as new and figured: *Anastrophyllum Pampinini*, *Blepharostoma acanthifolium*, *B. Pigafettoanum*, *Cephalozia* (*Cephaloziella*) *magellanica*, *Frullania* (*Diastoloba*) *microcaulis*, *Jamesoniella fuegiensis*, *J. glacialis*, *Lophocolea atra*, *L. Baccarinii*, *Lophozia magellanica*, *Plagiochila De Gasparii*, *P. marginata*, *P. microdonta*, *Riccardia laminaris*, *Schistochila De Gasparii*, *S. spinosissimum*, and *Solenostoma fuegiense*. In addition to these a new variety is described under each of the following species: *Isotachis georgiensis*, *I. subtrifida*, and *Lepicolea Scolopendra*. For *Plagiochila remotidens* Steph. the older name *P. ambigua* De Not. is taken up. Under each of the species listed the usual data regarding stations are given.—A. W. Evans.

5763. GYÖRFFY, ISTVÁN. A Molendoák fajai tagolódása és rokonsága összehasonlító anatómiai és fejlődéstani vizsgálatok alapján. [Investigations on Molendoa.] *Math. Term. Tud. Ert.* 38: 344-351. 1921.—The paper deals with the problematical moss-genus *Molendoa* and is preliminary to a more complete monograph (Versuch einer Monographie der Gattung *Molendoa*), which the author has nearly ready for publication. Ten previously described species are to be recognized, together with 7 new ones, the names of which alone are here given. The 3 European species are connected by rare transitional forms, and the relationship of all the forms of these species is represented graphically by a diagram. The author speaks also of forms appearing somewhat intermediate between *Molendoa* and *Hymenostylium* and thinks that the relationship between these two genera is closer than between *Molendoa* and *Anoetangium*. [See also Bot. Absts. 12, Entry 5756.]-A. Le Roy Andrews.

5764. HAUPT, ARTHUR W. Embryogeny and sporogenesis in *Reboulia hemisphaerica*. *Bot. Gaz.* 71: 446-453. Pl. 33, 11 fig. 1921.—The material was collected at Hamilton and Dakota, Illinois, and at Rome, Indiana. In the development of the sporophyte the epibasal segment gives rise to the capsule and stalk, while the hypobasal segment gives rise to the foot. No octant stage is formed, as in certain other Marchantiaceae, but the epibasal segment usually divides by 2 transverse walls, before vertical walls are laid down, the young sporophyte thus consisting of a row of 4 cells. These results are in essential agreement with those recently reported by Woodburn (see Bot. Absts. 4, Entry 1045). In the later stages the sporogenous tissue is soon delimited from the amphithecum and gives rise directly, after a series of divisions, to spore mother cells and elater primordial cells, which are thus homologous structures. The walls of the sporogenous cells break down into a mucilaginous mass and the protoplasts of the spore mother cells exhibit an amoeboid movement before forming new cell walls. In the tetrad stage the walls become differentiated into intine and exine and an epispore, which finally gives rise to a "tuberculate" spore-surface, is laid down on the outside. In the elaters the development of the 2 spiral bands "is accompanied by a condensation and ultimate disappearance of the protoplasm."—A. W. Evans.

5765. HAUPT, ARTHUR W. Gametophyte and sex organs of *Reboulia hemisphaerica*. *Bot. Gaz.* 71: 61-74. 21 fig. 1921.—The material was collected at Rome, Indiana, by W. J. G. Land. The author recognizes a single species of *Reboulia*, the polymorphic *R. hemi-*

sphaerica. The thallus grows by means of a cuneate apical cell and bears 2-ranked ventral scales without appendages. The primary air spaces originate by centripetal splittings and become subdivided by secondary partitions. The pores opening into the chambers are simple on the vegetative thallus and male receptacle but barrel-shaped on the female receptacle. On the sessile male receptacle the antheridia develop in acropetal succession according to the method characteristic of the Marchantiales. On the stalked female receptacle several growing points are organized, each of which usually gives rise to a single archegonium, more rarely 2. In the development of the archegonium the initial divides by a transverse wall, the outer cell then dividing by 3 vertical walls in the usual way; the neck canal cells number 18-20 at maturity.—A. W. Evans.

5766. HENRY, R. L'abbé Boulay et l'étude des Sphaignes françaises. [Abbé Boulay and the study of the French Sphagna.] Rev. Bryologique 50: 1-4. 1923.—The author quotes passages from Boulay's letters, dating from 1904 and 1905, in which certain species of *Sphagnum* are discussed. These passages bring out the fact that Boulay regarded as non-valid many of the species proposed by Warmstorf and other recent bryologists.—A. W. Evans.

5767. KASHYAP, SHIV RAM. A long-lost liverwort. Jour. Indian Bot. Soc. 3: 181. 1923.—In 1849 Griffith described and figured a curious liverwort from Assam under the name *Mono-selenium tenerum*. Goebel in 1910 described an apparently identical plant from Canton, China. It has now been rediscovered in Manipur, Assam.—Winfield Dudgeon.

5768. KASHYAP, SHIV RAM, and SHIVA KANT PANDE. A contribution to the life-history of *Aneura indica* St. Jour. Indian Bot. Soc. 3: 79-89. Pl. 1-7. 1922.—*Aneura indica*, one of the few Indian species of *Aneura*, is very variable in the shape and structure of the thallus and in the form of the upper epidermal cells. It is strictly dioecious, the development of the sex organs agreeing with the descriptions of Campbell and Clapp. The sporophyte remains enclosed by the calyptra till a late stage. The elaterophore extends to about the middle of the capsule, and the elaters are attached in a spreading manner. A mature sporophyte had a seta 6 mm. long and a cylindrical capsule 2.5 mm. long. The capsule wall is 2-layered, and the cells of both layers possess broad, brown, annular bands. The spores are 20-30 μ in diameter, and the elaters are about 19 μ long, with a single broad spiral band. The chromosome numbers are 6 and 12.—Winfield Dudgeon.

5769. RÖLL, JULIUS. Torfmoose der Niederlausitz. [Peat mosses of the Lower Lausitz.] Hedwigia 64: 19-29. 1922.—The present report is based on 2 collections of *Sphagnum* made by the author in June, 1920, in the Lower Lausitz, a district of southern Prussia just north of Saxony. The prevailing vascular plants of the localities investigated are briefly indicated, and the peat mosses collected are listed in detail, definite stations being given in each case. The lists include 26 distinct species of *Sphagnum*, together with numerous varieties and forms.—A. W. Evans.

5770. THÉRIOT, I. Gyroweisla ou Weisiodon? Rev. Bryologique 50: 4-6. 1923.—Reference is made to a recent paper by Andrews (see Bot. Absts. 12, Entry 4167), in which it is shown that the generic name *Gyroweisla* Schimp., being antedated by *Weisiodon* Schimp., ought to be discarded according to the current rules of nomenclature. Since, however, *Gyroweisla* has been in use for many years and since Schimper himself preferred it to *Weisiodon*, it is recommended that an exception to the rules be made and that the name *Gyroweisla* be retained.—A. W. Evans.

MORPHOLOGY AND TAXONOMY OF FUNGI, LICHENS, BACTERIA, AND MYXOMYCETES

H. M. FITZPATRICK, *Editor*DONALD S. WELCH, *Assistant Editor*

(See also in this issue Entries 5471, 5816, 5817, 5821, 5825, 5826, 5827, 5832, 5833, 5834, 5836, 5842, 5844, 5845, 5849, 5892, 5898, 5924, 5947, 5975, 5982, 5998, 6032)

FUNGI

5771. ALLEN, W. B. [Rev. of REA, CARLETON. *British Basidiomycetae, a handbook of the larger British fungi.* xii + 799 p. Cambridge University Press: 1922 (see Bot. Absts. 12, Entry 1978).] Trans. British Mycol. Soc. 8: 254-256. 1923. [See also Bot. Absts. 12, Entry 5049.]

5772. BATHELLIER, JEAN. Sur les jardins à champignons de l'Eutermes Matangensis. [On the fungous gardens of Eutermes Matangensis.] Compt. Rend. Acad. Sci. Paris 176: 129-131. 1923.—The fungus which is so cultivated is found to be a Xylaria.—C. H. Farr.

5773. BOSE, S. R. Geographical distribution of the Bengal species of Polyporaceae along with a short history of them in Bengal. Jour. Indian. Bot. 3: 19-21. 1922.—Incomplete knowledge of the fungus flora of the world renders a general view of distribution impossible. Polyporaceae apparently are widespread wherever conditions are suitable. Among the Bengal Polyporaceae some are practically cosmopolitan, as *Fomes leucophaeus*, *Polystictus versicolor*, *Ganoderma lucidus*, and *Polyporus gilvus*; others appear to have a strikingly discontinuous distribution, as *Polystictus protea*, *Trametes lactinea*, *T. occidentalis*, *Daedalea quercina*, and *Polyporus luzonensis*; others are restricted to British India and the eastern tropics, as *Polystictus Berkleyi*, *P. suboccidentalis*, *Polyporus Emerici*, *P. fumoso-olivaceus*, *Merulius similis*, and *Fomes annularis*; and recent discoveries in Bengal extend the known range of distribution of several species, as *Lenzites alutacea*, *Polyporus Rhizophore*, *P. anebus*, and others.—A brief review is given of the scattered and fragmentary literature on Bengal Polyporaceae.—Winfield Dudgeon.

5774. CHARDON, CARLOS E. Un nuevo "smut" de Puerto Rico. [A smut new to Porto Rico.] Rev. Agric. Puerto Rico 64: 21-23. 1 fig. 1921.—*Thecaphora pustulata* Clinton attacking *Bidens leucantha* in Porto Rico is described as new to the Island. The fungus deforms the leaves and stems of the host.—John A. Stevenson.

5775. CHRISTIANSEN, M. General Mukormykose hos Svin. [General mucormycosis in swine]. K. Vet. og. Landbohøjskoles Aarsskr. 1922: 131-191. 2 pl., fig 1-11. 1922.—*Rhizopus (equinus* Const. & Lucet. ?) and *Absidia ramosa* var. *Rasti* Lendner have been isolated from peritoneal and other tumors of swine. Rabbits have been successfully infected with pure cultures. A German summary is given.—Ernst Gram.

5776. COKER, W. C. Some fungi new to North America or the South. Jour. Elisha Mitchell Sci. Soc. 37: 13-14. 1921.—The following are reported from Chapel Hill, North Carolina: *Sirobasidium sanguineum*, *Pholiota praecox* (a remarkable form of this species lacking the veil), *Tricholoma venenata*, *Lepiota caerulescens*, *Apodachlya brachynema*.—W. C. Coker.

5777. COKER, W. C., and H. C. BEARDSLEE. The Collybias of North Carolina. Jour. Elisha Mitchell Sci. Soc. 37: 83-107. Pl. 1 (col.), 4-23. 1921.—Twenty-two species are treated with *C. lilacina* described as new.—W. C. Coker.

5778. COKER, W. C., and H. C. BEARDSLEE. The Laccarias and Clitocybes of North Carolina. Jour. Elisha Mitchell Sci. Soc. 38: 98-126. Pl. 1. (col.), 7-33. 1922.—Four species of *Laccaria* and 20 of *Clitocybe* are keyed and described.—W. C. Coker.

5779. COKER, W. C., and F. A. GRANT. A new genus of water mold related to *Blastocladia*. Jour. Elisha Mitchell Sci. Soc. 37: 180-182. Pl. 32. 1922.—This plant (*Septocladia dichotoma* Coker and Grant) was found on a piece of bone in a pool at Chapel Hill, North Carolina. It differs from *Blastocladia* in possessing a septate thallus.—H. M. Fitzpatrick.

5780. EICHELBAUM, F. Die essbaren Pilze der Niederelbe und Trave. Zweites Stück. [The edible fungi of the Lower Elbe and the Trave. Second part.] Verhandl. Naturw. Ver. Hamburg III, 26: 1-28. 1918 [1919].—The 1st part of this work was published in 1917 (see these transactions III, 24: 101-132. 1916 [1917]) and called attention to the greatly increased interest in the edible mushrooms among the German populace during the war. The author there attempted to supply the southern part of Schleswig-Holstein with a list of species that he had personally tested with respect to edibility. This list includes 5 ascomycetes and 101 basidiomycetes. Under each he described the habitat, the degree of frequency, and the distinctive features (especially in the case of those likely to be confused with poisonous forms), and gave both Latin and German names, adding references to published illustrations as far as possible.—In the 2nd part he gives a similar list of 103 additional species which he has subsequently tested. Of non-edible or otherwise objectionable species he recognizes 7 groups, as follows: (1) those containing a single non-volatile poison, not destroyed by boiling or drying; (2) those containing 2 such poisons, sometimes but not always counteracting each other; (3) those usually harmless but said to act poisonously sometimes; (4) those containing a volatile poison, destroyed by boiling; (5), those which are bitter when fresh, the bitterness disappearing upon boiling; (6) those which are edible only while young; and (7) those which are objectionable on account of bad taste or odor. The list includes representatives of all these groups except the 1st and 2nd.—A. W. Evans.

5781. ELLIOTT, JESSIE S. BAYLISS, and OLIVE P. STANSFIELD. Records of Fungi Imperfecti. Trans. British Mycol. Soc. 8: 249-254. Fig. 1-4. 1923.—*Septocylindrium leucum*, *S. melleum*, *Patellina caesia*, and *P. diaphana* are described as new species. Several other species that are new to the British Isles or are rare are discussed.—W. B. McDougall.

5782. F[YSON], P. F. [Rev. of: BOSE, S. R. One new species of Polyporaceae and some polypores of Bengal. Ann. Mycologici 19: 129-131. 1921. (see Bot. Absts. 12, Entry 1954).] Jour. Indian Bot. 3: 155. 1923.

5783. HAWLEY, H. C. Notes on some British pyrenomycetes. Trans. British Mycol. Soc. 8: 226-230. 1923.—This paper consists of short notes on 19 pyrenomycetes, 9 of which are new to the British Isles.—W. B. McDougall.

5784. HIGGINS, B. B. Notes on the morphology and systematic relationship of *Sclerotium Rolfsii* Sacc. Jour. Elisha Mitchell Sci. Soc. 37: 167-172. Pl. 29. 1922.—No fruiting bodies are known but an affinity to the basidiomycetes is indicated by the septate, binucleate mycelium and by the presence of clamp connections. On fleshy plants, such as cantaloupe, growth is profuse and sclerotia are abundantly formed. The mature sclerotia are 0.5-1.5 mm. thick, with a thin corky surface layer, a parenchymatous subcortical layer, and a filamentous central region. On nutrient media the inner filaments sprout through the outer layers to renew mycelial growth. Cultures from different sclerotia allowed to intermingle showed that mixing of strains was not necessary for the production of sclerotia. When dry the sclerotia remain viable for more than 2 years, but it is thought that they do not survive long on moist earth in the field.—W. C. Coker.

5785. KNUDSEN, S. Om Gær og Skimmel i sukret kondenseret Mælk. [Yeasts and molds in sweetened condensed milk.] K. Vet. og Landbohøjskoles Aarsskr. 1922: 282-295. 1922.—In Danish sweet condensed milk a yeast was found, and in Dutch sweet condensed milk 2 yeasts, presumably identical with those described by Pethybridge from Irish condensed milk,

by Miss Hiscox from English condensed milk, and similar to one found by Hammer in American condensed milk. *Aspergillus glaucus* and *Catenularia fuliginea* by their autodigestion cause the formation of "buttons" in condensed milk.—*Ernst Gram*.

5786. LÉGER, L., et E. HESSE. Sur un champignon du type *Ichthyophonus* parasite de l'intestin de la Truite. [A fungus of the *Ichthyophonus* type parasitic on the intestines of trout.] Compt. Rend. Acad. Sci. Paris 176: 420-422. 1923.—A new species, *Ichthyophonus intestinalis*, is described. It is found throughout the digestive tract. Its life history in relation to that of the trout is discussed.—*C. H. Farr*.

5787. McLEAN, R. C. A new species of *Sigmoideomyces* Thaxter. Trans. British Mycol. Soc. 8: 244-246. Pl. 12. 1923.—*Sigmoideomyces divaricatus*, found on the surface of soil in a pot in the greenhouse at University College, Cardiff, is described as new. This is the 3rd species of the genus to be described, the 1st being *S. dispiroides* Thaxter from Tennessee and the 2nd *S. clathroides* described by Mrs. Bayliss Elliott from Birmingham. *S. clathroides* was found by Mrs. Elliott to be correlated with the presence of dead earthworms in the soil but no such connection was found in the case of *S. divaricatus*.—*W. B. McDougall*.

5788. MOUNCE, IRENE. The production of fruit-bodies of *Coprinus comatus* in laboratory cultures. Trans. British Mycol. Soc. 8: 221-226. 1923.—Attempts to obtain fruit-bodies in cultures of horse dung were unsuccessful; but when the mycelium was grown upon a sterilized mixture of horse dung and sawdust buried beneath a thick layer of soil at the bottom of deep culture vessels perfect fruit-bodies were obtained in 9-10 months.—*W. B. McDougall*.

5789. PETCH, T. Parasites of scale-insect fungi. Trans. British Mycol. Soc. 8: 206-212. 3 fig. 1923.—Three genera of fungi which are parasitic on entomogenous fungi are discussed. The following species are described as new: *Sirospora chlorostoma*, *Sirosperma sparsum*, *Byssostilbe fusca*, and *B. tomentosa*.—*W. B. McDougall*.

5790. PETCH, T. The genus *Cladosterigma* Pat. Trans. British Mycol. Soc. 8: 212-215. 1923.—*Microcera Clavariella* Speg. is a *Cladosterigma* and seems to be identical with *C. fusisporum*. It must therefore be known as *Cladosterigma Clavariella*. A new genus, *Trichosterigma*, of the family Stilbaceae, is described to accomodate 3 species of entomogenous fungi found in Ceylon. These 3 species are described as new with the following names: *Trichosterigma clavisporum*, *T. arachnophilum*, and *T. attenuatum*.—*W. B. McDougall*.

5791. STRATTON, ROBERT. The Fimetariales of Ohio. (The Ascomycetes of Ohio. III.) Ohio Biol. Surv. 3: 75-144. Pl. 1-18. [Ohio State Univ. Bull. 26: no. 5.] 1921.—No previous study of the species growing in Ohio had been made, and only a single species had been recorded for the State. Collections of dung of various animals were sent in by 12 persons from as many different localities. Cultures were made in moist chambers, and the species described were grown, for the most part, in these cultures. These species are 6 from the genus *Chaetomium* of the Chaetomiaceae; and 6 of *Fimetaria*, 14 of *Pleurage*, 2 of *Delitschia*, and 6 of *Sporormia* of the Fimetiaceae. New species are: *Fimetaria tetraspora*, *F. pilosa*, *Pleurage hyalopilosa*, and *P. immersa*. The diagnoses are accompanied by keys. The 18 plates contain more than 200 figures. Glossary, bibliography, and index are appended.—*Bruce Fink*.

5792. ULBRICH, E. *Stropharia viridula* Schaef. var. *exanulosa* Ulbrich n. var. Hedwigia 63: 217-218. 1922.—The plant was found in the Berlin Botanical Garden, and in areas near the city, growing on stumps and on decaying vegetable matter in soil. The annulus, a constant character of the parent species, is absent in the variety. A partial veil is present in young specimens, but this adheres to the margin of the pileus as the pileus expands. The stipe and the pileus are larger than in the species. Other minor points of difference are included in the 12-line description.—*Bruce Fink*.

5793. WAKEFIELD, E. M., and A. A. PEARSON. Some additional records of Surrey resupinate hymenomycetes. Trans. British Mycol. Soc. 8: 216-221. Fig. 1-8. 1923.—Several species of resupinate fungi are described and discussed and *Tulasnella allantospora* and *T. microspora* are described as new.—W. B. McDougall.

5794. WEIR, JAMES R. *Poria papyracea* (Schw.) Cke. Phytopathology 13: 187. 1923.—Several collections of this rare fungus are reported.—B. B. Higgins.

5795. WOLF, FREDERICK A. The fruiting stage of the Tuckahoe, *Pachyma cocos*. Jour. Elisha Mitchell Sci. Soc. 38: 127-137. Pl. 34-37. 1922.—The well known but puzzling Tuckahoe is shown to be the sclerotium of a *Poria* and is given the name *Poria cocos*. Fruiting surfaces were obtained on fresh sclerotia after soaking and exposure to light. Fruiting was also obtained on the surface of pieces of the inside of the sclerotia which were placed in test tubes. The development of the sclerotia inside the pine roots is described.—W. C. Coker.

5796. ZIKES, HENRICH. Über die Perithizenbildung bei *Aspergillus Oryzae*. [The formation of perithecia in *Aspergillus Oryzae*.] Centralbl. Bakt. II Abt. 56: 339-343. Fig. 1-3. 1922.—Mature perithecia of *Aspergillus Oryzae* were produced when growing the fungus on a gelatin medium prepared according to Woltje's formula. The conidial stage was again obtained by growing single ascospore cultures on sugar media. The fungus was also studied on various modifications of Woltje's medium. In this connection budding structures were observed.—Anthony Berg.

LICHENS

5797. HERZOG, TH. VON. Beitrag zur Flechtenflora von Bolivia. [Contribution to the lichen flora of Bolivia.] Hedwigia 63: 263-268. 1922.—The lichens considered are part of a general collection of plants made in 1910 and 1911, and were determined by Zahlbruckner. Sixty-three species and subspecies are listed with localities, substrata, and occasionally other data. *Cladonia gracilis polyclada* Zahlbr. is described as new. Since little is known of the lichen flora of the area, the contribution is of special interest to lichenists and phytogeographers.—Bruce Fink.

5798. HILLMAN, JOHANNES. Übersicht über die Arten der Flechtengattung *Xanthoria* (Th. Fr.) Arn. [A survey of the species of the lichen genus *Xanthoria*.] Hedwigia 63: 198-208. 1922.—A key is given followed by descriptions and notes on distribution of the 10 known species, together with a considerable number of subspecies. *Xanthoria parietina* (L.) Th. Fr. and *X. candelaria* (L.) Arn. are distributed over all the grand divisions of the earth; *X. polycarpa* (Hoffm.) Flæg. is found in Europe, Africa, and America; *X. fallax* (Hepp) Arn., in Europe and Africa; *X. lobulata* (Floerke) Bouly de Lesd., in Europe; *X. spinulosa* (Krempelh.) Hillm., in Australia; *X. polycarpoides* Stizenb., in Asia; *X. flammea* (L.) Hillm., in Africa; and *X. ramulosa* (Tuck.) Hillm. and *X. modesta* Zahlbr. in America.—Bruce Fink.

5799. SMITH, ANNIE LORRAIN. Recent work on lichens. Trans. British Mycol. Soc. 8: 193-206. 1923.—This paper consists of a summary of the publications on lichens that were unavoidably omitted from the author's handbook, Lichens, and of those that have appeared since the handbook went to press. The paper closes with a bibliography of 44 titles.—W. B. McDougall.

BACTERIA

5800. ANONYMOUS. [Rev. of: LIESKE, RUDOLPH. *Bakterien und Strahlpilze*. (Bacteria and Ray fungi.) In: *Handbuch der Pflanzenanatomie*. Edited by K. LINSBAUER. II Abt., 1 Teil: Thallophyten, Band 6. iv + 88 p. Gebrüder Borntraeger: Berlin, 1922.] Nature 111: 355. 1923.

5801. CONN, H. J. General characteristics of the soil flora. [Abstract.] Absts. Bact. 7: 84-85. 1923.

5802. DUDGEON, WINFIELD. [Rev. of: HELLER, HILDA HEMPL. Phylogenetic position of bacteria. Bot. Gaz. 72: 390-396. 1921.] Jour. Indian Bot. 3: 118. 1922.

5803. LÖHNIS, F., AND N. R. SMITH. Studies upon the life cycles of bacteria—part II; life history of *Azotobacter*. Jour. Agric. Res. 23: 401-423. Pl. 1-9. 1923.—Experimental tests with 30 strains of *Azotobacter* and several cultures of related bacteria show that only 2 species of this genus have been characterized thus far: *A. chroococcum* and *A. agile*. Members of this genus are characterized by 7 cell types differing physiologically as well as morphologically. These types are (1) large, non-sporulating, globular, oval or rod-like cells, white, yellow, or brown with polar or peritrichous flagella, able to act as gonidia and microcysts; (2) coccoid cells, white, yellow or pink, the vegetative growth of regenerative cells; (3) dwarfed cell types, white, yellow, or red, the vegetative growth of the gonidia; (4) irregular, fungoid cells, yellow, orange, or white or pink; (5) small non-sporulating rods; (6) small sporulating rods; (7) large sporulating cells, white, yellow or brown. Many of these stages have been shown to be identical with previously described species. All types have been transformed into each other. The formation of symplasm and the regeneration of new cells proceed in the manner described in a previous article. The reproductive organs of *Azotobacter* are (1) gonidia; (2) regenerative bodies and exospores, produced in 2 ways, either in lateral or terminal positions, or from the symplasm; (3) arthospores formed from the rod-like or fungoid cells; (4) microcysts, a small globular resting cell; and (5) endospores. Gonidia form the basis for the development of regenerative bodies. Conjunction occurred regularly before the formation of gonidia, regenerative bodies, and both endospores and exospores.—W. H. Burkholder.

5804. MILDENBERG, HERMANN. Über einen blauen Farbstoff bildenden *Bacillus* aus der Luft und seine Beziehungen zum *Bacillus* der blauen Milch [A blue pigment-producing bacillus from the air and its relation to the bacillus of blue milk.] Centralbl. Bakt. II Abt. 56: 309-328. 1922.—This organism is compared in detail with *B. cyanogenus*. It differs in several respects from the blue pigment producers and is thought to be an undescribed organism.—Anthony Berg.

5805. SMALL, JAMES C., and LOUIS A. JULIANELLE. Biological and serologic studies of *Bacillus mucosus* group. Comparison of strains from granuloma inguinale with strains from respiratory tract. Jour. Infect. Diseases 32: 456-470. 1923.—Numerous strains of bacteria of the mucosus group were studied morphologically, for biochemical reactions, for growth in the presence of tartar emetic, and for serologic reactions, with the view of differentiating the strains obtained from lesions of the respiratory tract from those from lesions of inguinal granuloma. The effects of tartar emetic on growth was the only test which distinguished them. Granuloma strains were more resistant to the growth-inhibiting effects of tartar emetic than were the respiratory strains. Lack of motility, presence of capsules, gram-negative staining, inability to produce indol from peptone, the absence of gelatin-liquifying properties, inability to produce creatinin from peptone, ability to reduce nitrates, and to form ammonia and amino-acids from peptone are characters common to the mucosus group, but not useful for identifying subgroups.—R. L. Starkey.

5806. WOLF, F. A. Studies on fermentation of rare sugars by plant pathogenic bacteria. Jour. Elisha Mitchell Sci. Soc. 38: 12-13. 1922.—“In the case of two leafspot diseases of tobacco commonly designated as wild-fire and angular leafspot caused by *Bacterium tabacum* and *B. angulatum* respectively, both are able to form acid from dextrose and saccharose but not from glycerine and lactose, but the former attacks in addition mannitol and galactose whereas the latter is without action on them. A similar specialization obtains in the case of two leaf-spot organisms, *Bacterium glycineum* and *B. sojae* from soybean. This study emphasizes the necessity of employing in phytopathological studies the rare sugars for diagnostic purposes.”—W. C. Coker.

5807. YURI, ETSUO. Final hydrogen ion concentration in the paratyphoid enteritidis group. Jour. Infect. Diseases 32: 479-480. 1923.—The final H-ion concentration of dextrose broth cultures could not be used to distinguish the several types of paratyphoid-enteritidis bacilli. The pH varied within narrow limits (4.6-4.9).—R. L. Starkey.

MYXOMYCETES

5808. GUNN, W. F. Irish Mycetoza. Irish Nat. 29: 76. 1920.—*Lamproderma scintillans* and *Physarum staminipes* are each recorded for the 2nd time from Ireland.—W. E. Praeger.

5809. VONWILLER, P. Über den Bau des Plasmas der niedersten Tiere. II. *Lycogala epidendron*. [Structure of protoplasm of simplest animals.] Arch. Protistenk. 40: 1-15. 1 pl., 3 fig. 1919.—A review of the literature is followed by a description of the microscopic structures of *Lycogala epidendron*.—An account of spore formation is included.—R. P. Hall.

PALEOBOTANY AND EVOLUTIONARY HISTORY

EDWARD W. BERRY, *Editor*

(See also in this issue Entries 5457, 6036)

5810. BANDULSKA, H. On the presence of an Abietean conescale, *Pityolepis durleyensis*, sp. n. in the Bournemouth Eocene beds. Ann. and Mag. Nat. Hist. 11: 705-707. Fig. 1. 1923.—A cone-scale belonging to the middle Eocene period was found at Durley Chine, Bournemouth. The points of similarity and difference between the fossil and cone-scales of living species of *Abies*, *Picea*, and *Pseudotsuga* are discussed. Since it does not quite agree with any one of these, the name *Pityolepis durleyensis* is suggested.—H. H. Clum.

5811. BERCKHEMER, FRITZ. Über die Böttinger Marmorspalte sowie über Funde fossiler Pflanzen aus einigen Tuffmaaren der Alb. [The marble fissure at Böttingen and discoveries of fossil plants in some of the tufas of the Alb.] Jahresh. Ver. Vaterländ. Naturk. Württemberg 77: 66-78. 2 fig. 1921.—The account of the marble at Böttingen is largely geological in character, but the author notes the occurrence of several angiospermous fossils, notably *Podogonium Knorri* Al. Br., as indicative of the Miocene. From the tufas of Grabenstatten, Hengen, Erkenbrechtsweiler, and other localities in the Alb district of southern Germany he describes and figures a well-preserved *Juglans* nut, perhaps referable to *J. nur taurinensis* Ad. Brong., and records the occurrence of 5 other dicotyledonous and 3 monocotyledonous genera.—A. W. Evans.

5812. COCKERELL, T. D. A. [Rev. of: KNOWLTON, F. H. The Laramie flora of the Denver Basin, with a review of the Laramie problem. U. S. Geol. Surv. Professional Paper 130. 176 p., 28 pl. 1922.] *Torrey* 23: 52-53. 1923.—The very complete historical summary brings out the fact that this area has a single distinct flora, existing under warm and moist conditions. The salient feature is the great representation of *Ficus*, with 40 species. *F. navicularis* Ckll. is re-named *F. Knowltoni* Ckll.—J. C. Nelson.

5813. COMPTON, R. H. Botanical aspects of Wegener's hypothesis. *Nature* 111: 533-534. 1923.—The author was quoted (*Nature* 111: 131) as regarding the evidence completely opposed to the theory. The ancient phyla are generally valueless as indicating former land connections, and the distribution of the modern groups took place at a later date; the botanical evidence therefore provides no test.—O. A. Stevens.

5814. F[YSON], P. F. [Rev. of: SEWARD, A. C. A study in contrasts: the past and present distribution of certain ferns. Taken from the published minutes of the Linnean Society of London, for June 1st, 1922 (see Bot. Absts. 12, Entry 5112).] *Jour. Indian Bot.* 3: 121-123. 1922.

PATHOLOGY

FREDERICK V. RAND, *Editor*LILLIAN C. CASH, *Assistant Editor*

(See also in this issue Entries 5290, 5292, 5297, 5302, 5304, 5309, 5310, 5312, 5316, 5317, 5320, 5341, 5342, 5344, 5350, 5356, 5364, 5369, 5372, 5734, 5407, 5471, 5507, 5522, 5530, 5555, 5565, 5567, 5571, 5578, 5614, 5621, 5623, 5627, 5628, 5642, 5643, 5654, 5659, 5667, 5677, 5697, 5699, 5714, 5736, 5740, 5747, 5774, 5775, 5784, 5794, 5795, 5806, 5936, 5938, 5973, 5975, 6000, 6004, 6030, 6031, 6032)

DISEASES CAUSED BY FUNGI

5815. ANONYMOUS. Panama disease. Jour. Jamaica Agric. Soc. 26: 454-456. 1922.—The Panama disease of bananas, caused by *Fusarium cubense*, first appeared in Jamaica in 1911, being reported simultaneously from 3 localities. Control measures followed in Jamaica are as follows: diseased plants are dug up and burned; a ring of healthy plants about the diseased one is also dug up and destroyed; the area thus cleared is fenced and kept clear of plant growth, particularly of cocoes [*Colocasia*].—*John A. Stevenson*.

5816. BAEZ, HORACIO. La rulla o polvillo del trigo. [Wheat rust.] Defensa Agric. [Uruguay] 3: 163-167. 5 fig. 1922.—Black rust (*Puccinia graminis Tritici*) has been very severe on wheat in Uruguay during the past season. The disease appears in February and March and disappears in June. It comes from the south and passes on to Brazil.—The uredostage only is found. The life-history of the fungus is described.—*John A. Stevenson*.

5817. BEAUVERIE, J. Sur les rapports existant entre le développement des rouilles du blé et le climat. [The relation between climate and development of wheat rusts.] Compt. Rend. Acad. Sci. Paris 176: 529-531. 1923.—Three rusts, *Puccinia graminis*, *P. glumarum*, and *P. triticea* are studied. It is concluded that *P. glumarum* appears when the spring is damp; *P. triticea* is the rust of dry years; and *P. graminis*, of wet years. Lists of varieties are given under the following heads: very resistant; fairly resistant; susceptible; very susceptible; most susceptible.—*C. H. Farr*.

5818. BIOLETTI, FREDERIC T. Make mildew scarce. Associated Grower 34: 7, 18. 3 fig. 1922.—Grapevines affected with powdery mildew [*Uncinula necator* (Schw.) Burr.] should be sulphured: (1) when the young runners are about 10 inches long; (2) at blossoming time; (3) if necessary, after the grapes have set. The finest ground sulphur should be used, and applied evenly, not too heavily, and only when the leaves are dry.—*E. L. Overholser*.

5819. BURGER, O. F., E. F. DE BUSK, and W. R. BRIGGS. Preliminary report on controlling melanose and preparing Bordeaux-oil. Florida Agric. Exp. Sta. Bull. 167. 123-140. Fig. 28-32. 1923.—Melanose is very serious in Florida citrus groves, causing a large percentage of low-grade fruit. Stem-end rot is due to the same fungus, and causes much decay in transit. The fungus reproduces in the dead terminal twigs and branches and in the outer dead wood. Removing dead wood is highly recommended. The disease makes its appearance on leaves, twigs and fruit as small, hard, raised, reddish-brown spots scattered over the surface. These spots are generally round with a smooth glazed surface and in severe cases they often run together. The fruit may become streaked, giving a tear-stained appearance. When heavily infested the fruits are dwarfed, the leaves drop, and the young stems are covered with a hard brown crust. On the leaves and sometimes on fruits there are circular markings which are supposed to be formed in the following manner: Many spores held in a drop of water, soon lodge on the edge through surface tension. When the water evaporates these spores are deposited in a circle so as to form the peculiar markings mentioned. The disease is caused by *Phomopsis Citri*. The fungus cannot penetrate healthy bark; it must pass through a wound or natural opening. Young and growing tissues are susceptible. Fruit

becomes immune about the last of May. Bordeaux-oil spray has been used for experimental purposes with good results. A list of spray schedules for citrus trees is presented.—*J. C. Th. Uphof.*

5820. CLAYTON, EDWARD E. The relation of temperature to the *Fusarium* wilt of the tomato. *Amer. Jour. Bot.* 10: 71-88. Pl. 8-11, fig. 1. 1923.—This is a study of the effect of air and soil temperature on the wilt disease of tomatoes caused by *Fusarium Lycopersici*. This fungus in pure culture showed a minimum temperature for growth of 9-10°C., an optimum of 28°C., and a maximum of 37°C. Tomato plants grew from 19 to 35°C., but thrived best at 24-31°C. The various symptoms are described as they appear under optimum temperature conditions, as well as somewhat above and below. Both host and parasite, taken individually, develop at wider ranges of temperature than does the disease itself. The fungus infests the vascular bundles, but death of the host is believed to be due to a toxic action of the fungus rather than to a plugging of the xylem ducts. When soil temperature alone was varied the optimum for the disease was about 28°C., while soil temperatures of 33°C. or above, or of 19°C. or below, inhibited the disease. Air temperature proved as effective in controlling the appearance of the disease as soil temperature. Only when the soil was kept warm (27°C.) and the air warm (27°C.) or hot (33°C.) did the disease develop rapidly. If the soil was kept too cool or too warm, the disease did not develop, even with optimum air temperature. In cool air and optimum soil temperature, heavy infection occurred in the root and base of the stem, but the plant continued to grow and there were no external disease symptoms. Sudden but temporary increases in air temperature seem to increase its virulence.—*E. W. Sinnott.*

5821. CURTIS, K. M. Two fungal diseases of the blue lupin. *New Zealand Jour. Agric.* 26: 240-246. 10 fig. 1923.—A disease due to *Botrytis cinerea* and one presumably caused by *Ascochyta Pisi* are found attacking blue lupin. The *Botrytis* is most common on cultivated plants while the *Ascochyta* occurs chiefly on volunteer plants.—*N. J. Giddings.*

5822. DEMAREE, J. B. Pecan scab experiments in 1922. *Amer. Nut Jour.* 18: 4. 1923.—Two applications of Bordeaux in late summer gave no immediate favorable results but delayed the appearance of the fungus the next year by preventing its hibernation on the twigs. At Baconton, Georgia, satisfactory control was obtained by spraying with 3-6-50 Bordeaux on June 13, with 4-6-50 Bordeaux on July 6, and following by 2 applications of 1-2-50 Bordeaux mixed with 1 gallon of concentrated lime sulphur on July 27 and Aug. 23. At De Witt, Georgia, the best results were obtained with 1-50 lime sulphur spray. The addition of 1 pound of dissolved CuSO_4 to each 50 gallons improved the sticking qualities. Bordeaux was more effective in controlling scab but injured the foliage. The cost of spraying was about 25 cents per application per tree. The addition of soap or casein to Bordeaux did not increase the adhering properties. Spraying was justified on plantings containing 7 or more trees.—*E. L. Overholser.*

5823. DETWILER, S. B. Cooperative white pine blister rust control. *Monthly Bull. California Dept. Agric.* 11: 636-638. 1922.—There are quarantine laws prohibiting the shipment of 5-leaf pines and currant and gooseberry plants west of a line from Minnesota to Texas. Government inspectors examine packages to prevent shipment of prohibited plants. Infections of white pine blister rust dating from 1914 or earlier have been found in British Columbia and Washington. The disease is more disastrous to the western white pine than to the eastern white pine. Complete destruction of black currants in all pine-growing states would be advisable.—*E. L. Overholser.*

5824. FAWCETT, G. L. La "gomosis" de los naranjos. [Gummosis of oranges.] *Rev. Indust. y Agric. Tucuman* 12: 149-155. 5 fig. 1922.—Two types of gummosis of citrus trees are recognized in Tucuman. The 1st attacks the trees at the soil level and below, working out along the main roots. This is the type commonly known as foot-rot and is especially

prevalent on seedlings. It is characterized by a rotting of the bark with more or less copious gum formation and is thought to be due to *Phytophthora terrestris* Sherb. Contributing factors are excessive moisture and improper cultivation. The diseased areas should be thoroughly cleaned out and the wounds treated with Bordeaux paste. As preventive measures sour orange or other resistant stocks should be used and care taken not to plant too deep.—The 2nd type is that known as "scaly bark" and appears in the upper part of the tree. Gummings may or may not be present. The cause is not known.—*John A. Stevenson.*

5825. GILCHRIST, GRACE G. **Bark canker disease of apple trees caused by *Myxosporium corticolum* Edgert.** Trans. British Mycol. Soc. 8: 230-243. Pl. 9-11, 3 diagr. 1923.—This disease is characterized by the formation of large longitudinal scars on the sides of apple-tree branches. In the dead tissues of these scars numerous acervuli are found. These scars increase rapidly only during 1 period each year. The fungus is most abundant in the cortex but occurs also in the phloem and in the first 1 or 2 annual rings of wood. Except under certain conditions the fungus seems to be a weak parasite but when these conditions are met it causes serious injury and may even result in the death of the tree.—*W. B. McDougall.*

5826. GIRARDI, I. **La sarna de las naranjas.** [Citrus scab.] Defensa Agric. [Uruguay] 3: 108. 1922.—Scab, said to be due to *Pleospora esperidearum*, is a serious disease of oranges in Uruguay. Control measures are outlined.—*John A. Stevenson.*

5827. GIROLA, CARLOS D. **Ganoderma sessili** Morrill. [sic] Bol. Ministerio Agric. Nacion [Argentina] 27: 236-239. 2 pl. 1922.—*Ganoderma sessile* Murr. has been prevalent in some parts of Argentina as a cause of root rot of *Prunus armeniaca*, *P. domestica*, *Pyrus*, *Ficus carica*, *Punica granatum*, *Robinia*, *Gourliea decorticans*, *Casuarina*, *Eucalyptus* sp., and other forest trees. Control measures are outlined.—*John A. Stevenson.*

5828. GOLDSWORTHY, MARION C. **Peach leaf curl.** Associated Grower 5¹: 6. 1923.

5829. GONZALEZ, MANRIQUE R. **El añublo o tizon del trigo, la avena y la cebada.** [The smuts of wheat, oats and barley.] Rev. Agric. [Mexico] 7: 307-313. 8 fig. 1922.—The smuts attacking wheat, oats, and barley in Mexico are discussed and control measures outlined.—*John A. Stevenson.*

5830. GRAM, E. **Om Kartoffelbrok og Foranstaltninger mod denne i vore Nabolande.** [Potato wart and control measures in adjacent states.] Ugeskrift Landm. 68: 32-33. 1923.—This is a review of the situation in Germany where *Synchytrium endobioticum* is spreading, in England where it is common in certain regions, in Holland and Norway where it is limited, and in Sweden where in 1912 it was exterminated in 2 localities.—*Ernst Gram.*

5831. HEALD, F. D., G. L. ZUNDEL, and L. W. BOYLE. **The dusting of wheat and oats for smut.** Phytopathology 13: 169-183. Fig 1. 1923.—A report of 2-years' results on dust treatment of seed wheat for the prevention of bunt (*Tilletia Tritici*) is given. The dusts used include copper carbonate, Corona Compound of copper carbonate, anhydrous copper sulphate and calcium carbonate, anhydrous copper sulphate and hydrated lime, and Sedosan. Copper carbonate has given the most satisfactory results. With heavily smutted seed sown in spring, 2 ounces of copper carbonate dust per bushel gave perfect protection in 1921. In 1922, 3 ounces per bushel were required for perfect protection. For fall-sown wheat on fallow land the results have not been so satisfactory, though the copper carbonate dust was more effective than formalin and nearly as effective as copper sulphate solution in field trials of fall-sown wheat.—*B. B. Higgins.*

5832. HERRERA, A. L. **La gomosis del naranjo.** [Gummosis of the orange.] Agric. Mexicano y Hogar 39: 57-59. 1923.—Gummosis, reported as "probably due to *Fusisporium limonii*," is a serious disease of the orange in Mexico. A gummy exudate appears at the base

of the tree and out along the larger roots. This is followed by a rotting of the bark. The disease is favored by faulty drainage and other unfavorable cultural conditions. The remedying of these conditions and the use of resistant stocks is recommended.—*John A. Stevenson.*

5833. KENOYER, L. A. [Rev. of: JACKSON, H. S., and E. B. MAINS. Aecial stage of the orange leafrust of wheat, *Puccinia triticina* Eriks. Jour. Agric. Res. 22: 151-171. Pl. 21, fig. 1. 1921 (see Bot. Absts. 11, Entry 480).] Jour. Indian Bot. 3: 118. 1922.

5834. KING, C. J. Cotton rootrot in Arizona. Jour. Agric. Res. 23: 525-527. 1923.—*Ozonium omnivorum* fruits abundantly at Sacaton, Arizona. The fungus spreads in a "fairy ring" and the fruiting bodies are found abundantly on moist soil at the margin of the ring. A felt-like mat is formed 15-25 cm. outside the outer circle of recently wilted plants.—Cotton plants were infected by placing diseased roots beside healthy ones and also by inoculation with mycelium from pure culture.—Spores are germinated with difficulty and have not been used successfully as a medium of infection.—Progress of the rings has been stopped by saturating the soil at the periphery of the ring with 1 part commercial (40 per cent) formaldehyde to 100 parts water. In alfalfa fields the zone of disinfection must be about 75 cm. outside the line of wilted plants and in cotton fields 150 cm.—*D. Reddick.*

5835. KULKARNI, G. S. Smut (*Ustilago paradoxa* Syd. and Butl.) on sawn (*Panicum frumentaceum* Roxb.) Jour. Indian Bot. 3: 10-11. 1922.—This is thought to be the 1st record of this smut from the Bombay Presidency, where it was found in 1919. Infection occurs in the seedling stage, and can be prevented by treating the seed for 10 minutes with 2 per cent copper sulphate solution.—*Winfield Dudgeon.*

5836. LEHMAN, S. G. Pod and stem blight of the soybean. Jour. Elisha Mitchell Sci. Soc. 38: 13. 1922.—The causal agent is an Ascomycete and is given the name *Phomopsis Sojæ*. It attacks pods, stems, and less often leaves; and seed in diseased pods are frequently invested by a conspicuous, white, fungus covering. Infected areas become specked with minute, black pycnidia which form spores in a few days. The plant overwinters in diseased stems and seeds.—*W. C. Coker.*

5837. McDONALD, A. H. E. Dry treatment of seed wheat for bunt. Agric. Gaz. New South Wales 34: 239-241. 1 fig. 1923.—The machine designed by the Washington Experiment Station for treating with copper carbonate is figured and discussed.—*L. R. Waldron.*

5838. MIYAKE, KOJI, und MASASHI ADACHI. Chemische Untersuchungen über die Widerstandsfähigkeit der Reisarten gegen die "Imochi-Krankheit." Erster Bericht. Vergleich der hauptsächlichsten chemischen Bestandteile von vorläufig zwei in Hokkaido angebauten Reisarten, einer empfänglichen und einer widerstandsfähigen. [Chemical studies of varietal resistance of rice to the rice blast fungus. First paper. Comparison of the chief chemical constituents of a susceptible and a resistant variety cultivated in Hokkaido.] Jour. Biochem. Tokyo 1: 223-239. 1922.—Two varieties of rice, "Akage," which is susceptible to rice blast, and "Bozu," which is resistant, were used. The plants were analyzed at 3 stages of development, (1) appearance of the spikes, (2) beginning of bloom, and (3) when the seed were in milk, analyses being made upon both expressed juice and entire plants. For the studies on expressed juice, the heads were removed and discarded, the leaves and stalks were ground and pressed, and the expressed juice centrifuged to remove starch. The susceptible Akage was lower in total solids in the 1st period and higher in the 2nd and 3rd, than Bozu. It was lower in protein in the 1st and 2nd periods, but higher in the 3rd period; higher in total nitrogen in all 3 periods; higher in protein nitrogen in the 1st and 3rd periods but lower in the 2nd period; higher in non-protein nitrogen in the 1st and 2nd, but lower in the 3rd. Reducing sugars were higher in Akage in the 1st and 3rd periods, lower in the 2nd; while non-reducing sugars were higher in all 3 periods, especially so in the 1st and 3rd. The analyses of entire plants exclusive of heads, showed that Akage was higher in total solids, nitrogen-free

extract, and non-reducing sugars; but lower in crude fiber and ash at all 3 periods of development. Protein and total nitrogenous materials were higher in Akage in the 1st and 2nd periods, and lower in the 3rd; but protein nitrogen was lower in the 1st period, and higher in the 2nd and 3rd, while non-protein nitrogen was higher in the 1st and lower in the 2nd and 3rd. Fat content was identical in the 2 varieties in the 1st and 2nd periods, but lower in Akage in the 3rd. Reducing sugars were lower in Akage in the 1st period, but practically double in the 2nd and 3rd. The distribution of organic and inorganic materials between nodes and internodes in the 3rd period was also studied, the nodes being richer in organic materials than the internodes, and the absolute amounts higher in Akage than in Bozu. Comparative studies of the leaves of the 2 varieties in the 2nd period showed rather small differences, Akage being slightly higher in nitrogenous constituents and reducing sugars, magnesia and phosphoric acid, than Bozu. Ash analyses of entire plants at all 3 periods of growth showed that Bozu is slightly higher in total ash, materially higher in silica and calcium, slightly higher in sodium and sulphur, and lower in potassium and phosphoric acid, throughout the development. The suggestion is made that the higher inorganic content of Bozu, especially in silica, may serve as a mechanical protection against infection by the fungus. [See also following entry.]—*Joseph S. Caldwell.*

5839. MIYAKE, KOJI, und MASASHI ADACHI. *Chemische Untersuchungen über die Widerstandsfähigkeit der Reisarten gegen die "Imochi-Krankheit."* Zweiter Bericht. Der Einfluss der Wasserstoffionenkonzentration auf das Wachstum des Pilzes. [Chemical studies of the varietal resistance of rice to the rice blast fungus. Second paper. The influence of H-ion concentration upon the growth of the fungus.] Jour. Biochem. Tokyo 1: 241-247. 1922.—Cultures of the "Imochi"-fungus [*Dactylaria parasitans* Cavara] were grown upon a synthetic medium composed of 1 gm. asparagin, 1 gm. NH_4NO_3 , 0.5 gm. acid potassium phosphate, 0.25 gm. MgSO_4 , and 20 gm. cane sugar in 1 l. H_2O . Four series of 100 cc. flasks of this solution were prepared and inoculated. One series of 11 flasks received 1-10 cc. $\frac{N}{100}$ HCl, while the others received like quantities of H_2SO_4 , tartaric, and citric acids of like concentration. The range of pH in the series was 6.1-2.6. The fungus made no growth in 10 days at pH 2.6-3.3, very slight at pH 3.3-4.2, fairly good at pH 4.4-5.8, and excellent growth at pH 5.9-6.1. The pH of the medium is altered by the growth of the fungus in direct proportion to the vigor of the growth; solutions which originally had a pH of 6.1 had increased in acidity to pH 5.7-4.9 at the end of 10 days. A similar but smaller shift occurs throughout the series wherever growth occurs. The authors state that in their earlier work (see preceding entry) they found very slight differences in the H-ion concentration of the juice of Akage (susceptible) and Bozu (resistant) rice, but do not present the data, promising further work on the subject.—*Joseph S. Caldwell.*

5840. PHILLIPS, EDITH H. *Checking fig smut.* Associated Grower 5²: 20-22. 1923.—Fig smut, *Aspergillus niger*, is carried by the dried fruit beetle, *Carpophilus* Linn., and the vinegar fly, *Drosophila ampelophila* Weigen. The author recommends removing, burning, or plowing under all waste fruit to destroy the breeding places of the beetle.—*E. L. Overholser.*

5841. POTTER, M. C. *Wart disease of the potato.* Preliminary experiments. Trans. British Mycol. Soc. 8: 247-249. 1923.—The experiments, briefly described, indicate that high soil alkalinity prevents the disease, due to *Synchytrium endobioticum*, but that it also has a tendency to reduce the crop. More extensive experiments on the relation of the wart disease to both alkalinity and acidity are planned for the coming year.—*W. B. McDougall.*

5842. SCOTT, C. EMLÉN. *Disease of chestnut trees new to California.* Monthly Bull. California Dept. Agric. 11: 740-741. 1922.—A disease caused by a species of *Fusicoccum* closely related to *Endothia parasitica* (Murr.) Anders., which causes the chestnut blight, has appeared in Grass Valley, California. The *Fusicoccum* sp. enters the bark through wounds forming a canker which spreads lengthwise and around the branch and finally girdles it,

killing all parts beyond the canker. The disease is probably less virulent than that caused by *Endothia parasitica*. The recommendations for control are to remove all affected parts and thoroughly disinfect pruning wounds.—*E. L. Overholser*.

5843. SHARPLES, A. Final report on treatment of mouldy rot disease with Agrisol. Malayan Agric. Jour. 11: 36-37. 1923.—The treatment earlier reported (see Bot. Absts. 12, Entry 1262) has been continued satisfactorily for a further period of 18 months. In the writer's opinion complete eradication is impossible owing to the periodic production of resting spores of *Sphaeronema fimbriatum*, but effective control at small cost is possible.—*R. E. Holttum*.

5844. SMITH, E. H., AND E. H. PHILLIPS. Studies of the so-called "smut" of white fig varieties. Monthly Bull. California Dept. Agric. 11: 755-758. Fig. 178-180. 1922.—Smut, caused by *Aspergillus niger* (*Sterigmatocystis*), occurs on all white figs, but especially on Adriatics. Natural infections occur in ripe figs ready to pick for fresh shipment, although artificial inoculations are successful even in hard green fruit. Ants, fruitflies, and beetles are the chief spore carriers.—*E. L. Overholser*.

5845. SNELL, WALTER H. The effect of heat upon wood destroying fungi in mills. Proc. Amer. Wood Preservers' Assoc. 18: 25-32. 1922.—This paper is a preliminary report of experiments to determine the thermal death points of the mycelia of 5 mill fungi within wood, using both moist and dry heat. The five fungi were: *Lenzites sepiaria*, *L. trabea*, *Trametes serialis*, *T. carnea*, and *Lentinus lepideus*. None of the fungi could withstand 131°F. for 12 hours, while it took 221°F. for 12 hours to kill all the fungi with dry heat. At 212°F. 1 fungus survived 12 hours and another 24 hours in dry heat. It is concluded that the use of heat in buildings for killing these fungi is of no use, although it is recommended as a deterrent or preliminary preventive. It is pointed out from the curves that kiln drying, as well as the heat developed in certain wood-preservation processes, should kill all of these fungi.—*Walter H. Snell*.

5846. SPIECKERMANN, A. Wie kann die weitere Verbreitung des Kartoffelkrebses in Deutschland verhindert werden? [How can the further spread of the potato wart disease in Germany be prevented?] Illus. Landw. Zeitg. 42: 371-372. 1922.—It is recommended that resistant varieties, clean seed, and quarantine methods be employed to prevent the spread of the potato wart disease caused by *Chrysophlyctis endobiotica*.—*John W. Roberts*.

5847. STANFORD, H. R. Control of peach scab. Monthly Bull. California Dept. Agric. 11: 765-774. Fig. 181-185. 1922.—Peach scab, caused by *Cladosporium carpophilum* Thüm., has been increasing in severity in California. The Lovell variety is most affected; Ontario, Elberta, Muir, and Phillips Cling have been damaged somewhat. Scab caused at least 15 per cent of the peaches in a sample of Lovells to go into inferior grades. If the fruit is canned rather green, many smaller scab spots come off in the lye solution.—The author gives the life history of the fungus.—Two sprays of self-boiled lime-sulphur applied during the period from 1 month after blooming to 6 weeks before ripening gave satisfactory results.—*E. L. Overholser*.

5848. TISDALE, W. H., J. W. TAYLOR, AND MARION A. GRIFFITHS. Experiments with hot water, formaldehyde, copper carbonate, and chlorophol for the control of barley smuts. Phytopathology 13: 153-160. 1923.—Experiments on the control of loose smut (*Ustilago nuda* (Jens.) Kell. and Schw.) and covered smut (*U. Hordei* (Pers.) Kell. and Schw.) of barley were conducted through a period of 3 years. Various seed disinfectants were tried, but special attention was given the modified hot-water treatment and the formaldehyde treatment. Both treatments were effective in reducing the amount of infection by either fungus. Formaldehyde was more effective in the control of loose smut than in the control of covered smut, was only slightly less effective than the modified hot-water treatment, and was much more

easily applied. Both treatments injured germination to some extent; and little or no increase in yield resulted from the treatments. There was considerable variation in the reaction of the different varieties to the treatments used.—*B. B. Higgins.*

5849. WEIR, JAMES R. The genus *Polystictus* and decay of living trees. *Phytopathology* 13: 184–186. 1923.—Several collections of species of *Polystictus* growing on wood of living forest trees are reported. In every case the fungi were growing on injured portions of the tree, and in most cases no extensive decay was produced. The opinion is expressed that fungi of this genus may generally be ignored in forest management.—*B. B. Higgins.*

DISEASES CAUSED BY BACTERIA

5850. ANONYMOUS. Instrucciones para extirpar la gomosis de la caña de azúcar. [Instructions for eradicating gummosis of sugar cane.] *Rev. Agric. Puerto Rico* 6: 23. 1921.—The author recommends the use of disease-free seed of resistant varieties and the destruction of diseased stools.—*John A. Stevenson.*

5851. LEVIN, ISAAC, AND MICHAEL LEVINE. The action of buried tubes of radium emanation on neoplasias in plants. *Jour. Cancer Res.* 7: 163–170. 1 pl. 1922.—In normal adult plant tissue the only perceptible result of the insertion of a radium-emanation tube is a complete destruction of tissue in the immediate vicinity. A similar insertion into crown-gall tissue is followed by inhibition of development of the neoplasia, thus indicating an inhibition of the nuclear proliferating activity. The cellulose cushion seems to play a role in plants in walling off the necrotic area about the radium-emanation tubes and in filtering off the soft beta rays similar to the role played by connective tissue stroma in animal tumors.—*Frederick V. Rand.*

5852. LEVIN, ISAAC, AND MICHAEL LEVINE. The rôle of neoplasia in parasitic diseases of plants. *Jour. Cancer Res.* 7: 171–178. 1 pl. 1922.—Neoplasia in parasitic diseases of plants is, according to the authors, unlike neoplasia in animal cancer since it always represents a protective reaction of the plant organism against the invasion of a parasite. Plant neoplasias behave more like reactive neoplasia in an animal than like animal cancer. Neoplastic tissue in plants is constructed of only 1 type of cells and presents therefore an ideal material for the study of tumor formation. The study of plant neoplasias should become an integral part of all phases of cancer research, whether aiming at the elucidation of the etiology or pathogenesis of the disease or of the correct basis for therapy.—*Frederick V. Rand.*

5853. MATZ, JULIUS. La enfermedad de la gomosis de la caña de azúcar. [Gummosis of sugar cane.] *Rev. Agric. Puerto Rico* 9: 11–14. 2 fig. 1922.—The history of the gumming disease (*Bacterium vascularum* (Cobb) G. Smith) in Porto Rico is reviewed with brief mention of symptoms and control measures. Among resistant varieties are D109, D433, D625, D117, Uba, B208, Yellow Caledonia, B3412, B6292, B1809, P.R. 333, P.R. 334, and P.R. 292.—*John A. Stevenson.*

5854. MATZ, JULIUS. Observaciones en la gomosis de la caña en Puerto Rico. [Observations on gummosis of cane in Porto Rico.] *Rev. Agric. Puerto Rico* 6: 33–39. 2 fig. 1921.—The gummosis (*Bacterium vascularum*) of sugar cane was first discovered in Porto Rico in Feb., 1920, at which time field inspections indicated that the disease was limited to a comparatively small area around Rio Piedras on the North coast. Within a year it had spread over a much wider area. In addition to the usual symptom reported, namely, the exudation of a gummy substance when infected canes are cut, others have been noted. Characteristic markings appear on the leaves, either as gray stripes or short linear spots. There is a tendency toward incomplete unfolding of the center leaves. Infected plants are stunted and commonly develop top rot. The vascular bundles are stained red.—Diseased stools should be dug and only disease-free seed used in replanting. The native white variety (Otahiti) is

very susceptible to the disease, Cristalina and Rayada are more resistant, while Yellow Caledonia and D109 are very resistant. Planting tests with a number of varieties seem to indicate that the disease is not transmitted through the soil.—*John A. Stevenson.*

5855. MATZ, JULIUS. Observaciones sobre la gomosis de la caña en Puerto Rico. [Observations on the gummosis of sugar cane in Porto Rico.] Rev. Agric. Puerto Rico 84: 5-14. 2 fig. 1922.—Within a year after its discovery [see preceding entry], gumming disease (*Bacterium vascularum*) of sugar cane had spread at least 25 km. During 1922 the disease spread over much of the Island. Symptoms are again given [see preceding entry]. Several varieties of cane grew normally in soil from which diseased plants had been removed. Cane varieties varied greatly in resistance: White or Otahiti, Rayada, Cristalina, B376, P.R. 358, and P.R. 491 proved very susceptible; Kavangire, Yellow Caledonia, and a number of Porto Rican seedlings were very resistant, if not immune; other varieties showed greatly varying degrees of resistance between these 2 groups. The importance of using disease-free seed for planting is emphasized.—*John A. Stevenson.*

5856. MILBRATH, D. G. Résumé of pear blight history and methods of control. Monthly Bull. California Dept. Agric. 11: 760-765. 1922.—Pear blight, *Bacillus amylovorus* (Burr.) Trev., occurred in all states where apples and pears were grown in 1922, and was serious in California, Vermont, New Jersey, Michigan, Montana, and Arizona. Descriptions of the symptoms and method of infection are given. Use of resistant or immune root-stocks and trunks, and cutting out of blight cankers are the chief methods of control. Cutting starts in the fall, and should be carefully done. All tools should be disinfected. The solution recommended is mercuric cyanide and bichloride of mercury, 1 ounce of each in 4 gallons of water.—*E. L. Overholser.*

5857. SMITH, ERWIN F. Appositional growth in crown-gall tumors and in cancers. Jour. Cancer Res. 7: 1-105. 28 pl. 1922.—The views of various medical investigators relative to appositional growth in cancers are reviewed, and the following data relative to crown gall are presented by the author: (1) The absence of any capsule, and the conversion of cortex-cells into tumor-tissue by contact (growth by apposition), something easily to be understood in this tumor because it is due to an intracellular schizomycete, and the adjacent cellulose walls of the cortex-cells, ray-cells, and pith-cells are numerous pitted and are fundamentally all 1 type of tissue; (2) the frequent limitation of the appositional growth through the crushing of remoter cells of the cortex; (3) the limitation of peripheral growth on one side or lobe of a tumor for no apparent reason while it continues on the other side or lobes; (4) the penetration of the tumor by way of the medullary ray across the phloem, cambium and the woody cylinders, which are split apart; (5) the formation in some cases of independent small tumors (pseudometastases) in the pith near the primary tumor although the inoculations were restricted to the cortex; (6) the downward invasion of a medullary ray (beginning of a tumor-strand) in the wood; (7) the small size and immaturity of the tumor-cells in comparison with the size and age of the mother-cells and their great affinity for tumor-stains; (8) the enormous multiplication of cells considering that the tumors were produced by single infected needle-pricks and that the whole period of growth was only 3 weeks; (9) the absence of any intercellular spaces in the tumor tissue or in the rapidly dividing transition tissue; (10) the distinct enlargement of the cortex-cells before their conversion into tumor-cells, which leads to a thickening of the cortex around the tumor, a sort of cushion being formed of which the tumor is the center; (11) the tendency of the nuclei in the transition tissue to be large and to be variously notched, cleft, lobed, or mulberry-shaped and the occasional occurrence of 2-4 nuclei in the cell; (12) the big border around the nucleoli, perhaps only an indication of rapid growth; (13) numerous faint-staining abnormal granules in the cytoplasm of the transition tissue and of the tumor tissue as seen under high powers; (14) the fact that in young plants (those less than half grown) almost any cortex-cell is capable of further and repeated division, especially under a tumor-stimulus, whereas results on old tissues tend to confirm Bard's view that the reproductive capacity of old cells is zero; (15) development of roots under and near

the tumors as a result of the tumor stimulus; (16) experimental disproof of Ribbert's dictum that parasites cannot change the form of cells or cause them to proliferate. Schmieden's words respecting his studies of liver tumors describe the hypertrophy on the margin of these crown galls exactly: "aus diesen Riesenzellen wächst unmittelbar eine Brut hervor, die keine Leber [Cortex]-zellen mehr sind, sondern Zellen des Tumors."—*Frederick V. Rand.*

DISEASES CAUSED BY ANIMAL PARASITES (INSECTS, NEMAS, PROTOZOANS, ETC.)

5858. BALLARD, E. *Platyedra gossypiella* Saund., the pink boll-worm in South India, 1920-1921. Mem. Dept. Agric. India Entomol. Ser. 7: 171-193. Pl. 16-18. 1923.—Since 1 boll-worm (*Platyedra*) eats only 2 or 3 seed the damage might be assumed to affect only 1 locule, but in addition to this the lint is often stained, fungus spores enter through the escape-hole of the larva, and threads of lint are often stuck together. Unattacked seed in an attacked boll are also affected.—Larvae of *Earias* spp. wander from boll to boll, destroy buds and young bolls, and by the holes which they make in grown bolls provide an entrance for fungi and bacteria.—Details of actual losses from these insects are given.—*Frederick V. Rand.*

5859. CORBETT, G. H. Preliminary note on the two coloured coconut leaf beetle (*Plesispa Reichel* Chap.). Malayan Agric. Jour. 11: 64-69. 1923.—This insect was formerly little known but is now generally distributed throughout Malaya. It attacks many palms, eating the young leaves before they unfold. Both larval and adult stages feed upon the upper and lower surfaces of coconut palm leaves, eating in straight lines without interruption. Later these lines unite with each other so that the remaining tissue dries and rots, the leaf tears, and the young plants take on a peculiar weather-beaten appearance and their growth is seriously retarded. It is especially a pest of seedlings and young plants but usually causes little permanent injury to older plants. It can be effectively dealt with by means of a solution of lead arsenate.—*R. E. Holthum.*

5860. CORY, ERNEST N. Experiments on the control of the woolly aphis. Maryland Agric. Exp. Sta. Bull. 252. 25-36. 1923.—Two applications per year of an 8 per cent solution of pine-tar oils seem to offer the best promise for control, with a minimum of injury to the apple trees. Injury is likely to result from 15-20 per cent solutions, and repetition of the 2 applications at the 8 per cent strength for 3 seasons caused considerable injury.—*Frederick V. Rand.*

5861. KINSEY, ALFRED C. Studies of some new and described Cynipidae (Hymenoptera). Indiana Univ. Studies 9: 1-141. 1922.—This paper gives descriptions of a large number of gall wasps and the galls which they incite, and offers some data on the variation, distribution, life histories and phylogeny of these insects.—*Frederick V. Rand.*

5862. KINSEY, ALFRED C., and KENNETH D. AYRES. Varieties of a rose gall wasp (*Cynipidae*, Hymenoptera). Indiana Univ. Studies 9: 142-162. 1922.—This is a study of the varieties of *Diplolepis tuberculatrix* Cockerell and includes descriptions both of the insects and the plant galls induced by them.—*Frederick V. Rand.*

5863. MCWHORTER, FRANK P. The nature of the organism found in the Fiji galls of sugar cane. Louisiana Planter 70: 148-150. Fig. 1-2. 1923.—Reproduced from The Philippine Agriculturist [see Bot. Absts. 12, Entry 2644].—*C. W. Edgerton.*

5864. NÜSSLIN, OTTO. Forstinsektenkunde. [Forest insects.] 3rd ed., edited by L. RHUMBLER. xvi + 568 p., 457 fig. Paul Parey: Berlin, 1922.—The 1st part of the work is a general treatise dealing with the morphology, biology, and physiology of insects. In addition, insects injurious and beneficial to forests are briefly discussed.—In the 2nd part insects are treated in systematic order, detailed descriptions being given as well as host reactions.—*Lillian C. Cash.*

INFECTIOUS CHLOROSES (MOSAIC AND PEACH YELLOW GROUPS, ETC.)

5865. ANONYMOUS. Virus diseases of plants. *Nature* 111: 551. 1923.—This is a brief popular review of the virus disease situation with special reference to a review by E. J. BUTLER in *Science Progress* for Jan., 1923.—O. A. Stevens.

5866. CHARDÓN, CARLOS E. Resumen de la literatura sobre el origen de las enfermedades del "mosaico" en las plantas. [Résumé of the literature on mosaic diseases of plants.] *Rev. Agric. Puerto Rico* 9⁴: 13-22. 1922.—The literature dealing with mosaic diseases of tobacco, sugar cane, and other crops is reviewed and the various theories as to the causative agents, such as bacterial, physiological, filterable virus, etc., are discussed. A bibliography is appended.—John A. Stevenson.

5867. CHARDÓN, CARLOS E., y RAFAEL A. VEVE. Sobre la transmisión del matizado de la caña por medio de insectos. [Transmission of cane mosaic by insects.] *Rev. Agric. Puerto Rico* 9²: 9-20. 2 fig. 1922.—A number of workers in Porto Rico and Cuba have investigated the possibility of insects acting as carriers of the mosaic disease of sugar cane, but for the most part with negative results. Brandes, working in Washington, demonstrated that *Aphis maydis* can transmit the disease from diseased to healthy cane. Observations of the authors demonstrated that this insect is of common occurrence on malojillo (*Panicum barbinode*) and other grasses growing as weeds in cane fields and that when the weeds are cut the insects pass over to the cane for a short time, with the result that mosaic appears on previously healthy plants in about 3 weeks. This period of incubation corresponds with that established by Brandes. In order to check up the field observations, large insect-proof cages were placed over stools of the cane variety D1111 and weed grasses allowed to grow. A supply of *Aphis maydis* was placed in one cage and another left as a check. Mosaic appeared on 64 per cent of the cane plants following the cutting of the grass. Plants in the check cage remained free from disease. Similar experiments with a new species of leaf hopper (*Carolinia*) which lives on *Cyperus rotundus* likewise gave positive results.—John A. Stevenson.

5868. CHARDÓN, C. E., and R. A. VEVE. The transmission of cane mosaic. *Facts about Sugar* 15: 281, 283-284. 1922.—[See preceding entry.]

5869. CHARDÓN, CARLOS E., and R. A. VEVE. Transmission of cane mottling disease through insects. *Louisiana Planter* 69: 323-325. Fig. 1-2. 1922.—Translated from *Rev. Agric. Puerto Rico* [see 2nd preceding entry].

5870. COLEMAN, LESLIE C. Transmission of sandal spike. *Indian Forest*. 49: 6-9. Pl. 1-3. 1923.—A number of sandal seedlings (*Santalum album*) were planted in small groups, and after 5-years' development of the trees, spike was introduced into the group by grafting a diseased branch to one member of the group. In 2 months the disease had been communicated to the other trees in the group and upon removing the soil haustorial unions were discovered. In 2 cases the haustoria belonged to the originally healthy tree and were attached to the infected tree by natural grafting. Apparently the infective virus or organism was transmitted freely through the roots.—E. N. Munns.

5871. COLON, E. D. Trabajos de investigación durante el año fiscal de 1919-20. [Investigational work during the fiscal year 1919-20.] *Rev. Agric. Puerto Rico* 6³: 7-14. 1921.—The mosaic disease of sugar cane was attacked from various angles, all divisions of the experiment station giving it attention. Experiments in the transmission of the disease were carried out by the entomologist, varietal resistance tests by the agronomist, and etiology studies by the pathologist. The latter work is said to have demonstrated the presence of certain bodies in the cells of diseased plants which may be those of a causative organism. Other cane diseases, including root disease, were also studied.—John A. Stevenson.

5872. GRAM, ERNST. Kan vi kontrollere os fra Bladrullesygen? [Can potato leaf-roll be controlled by inspection?] Vort Landbrug [Copenhagen] 41: 416-417. 1922.—With the heavy attacks of leaf-roll and mosaic in Denmark during 1922 in mind it is urged to utilize localities which act as "sanatoria," together with the Dutch methods of rigid inspection and control of the progeny.—*Ernst Gram*.

5873. LUGO, F. OLIVER. El mosaico del tabaco y como combatirlo. [Tobacco mosaic and its control.] Rev. Agric. Puerto Rico 10¹: 11-14. 1923.—The author believes that the infectious principle of mosaic disease of tobacco persists in the soil from one season to another and therefore recommends a 3-year rotation in addition to the destruction of diseased plants. Such a rotation would include tobacco, a leguminous green manure crop, and a food crop such as corn, yautía, or sweet potatoes.—*John A. Stevenson*.

5874. MATZ, JULIUS. Recientes investigaciones en el estudio de la naturaleza del mosaico de la caña de azúcar y otras plantas. [Recent investigations into the nature of mosaic of sugar cane and other plants.] Rev. Agric. Puerto Rico 9⁴: 9-12. 1922.—The mosaic diseases have been studied for many years in an attempt to ascertain the cause, but not until recently has definite progress been made. Workers with tobacco and sugar cane mosaic in Java and Hawaii, and the author in Porto Rico, have demonstrated the presence of plasmodium-like bodies in the cells of diseased plants. The exact nature of these bodies is as yet unknown. Those found in diseased sugar cane plants are considered by the author co-generic with *Strongyloplasma Iwanowskii* Palm, the name assigned to the bodies found by Palm associated with the mosaic disease of tobacco.—*John A. Stevenson*.

NON-PARASITIC DISEASES

5875. BARTHOLOMEW, E. T., J. T. BARRETT, and H. S. FAWCETT. Internal decline of lemons I. Distribution and characteristics. Amer. Jour. Bot. 10: 67-70. Pl. 7. 1923.—The term "internal decline" is applied to a physiological abnormality causing the destruction of internal tissues in the lemon fruit, usually in the styler end. It may appear almost anywhere throughout southern California, except among groves situated a few miles from the coast. All varieties may be affected. It usually begins in June, continues until November or December, and is found on trees of all ages. The various external and internal symptoms of internal decline are described as they affect fruits at the different degrees of maturity,— "dark green," "light green," "silver," and "tree-ripe."—*E. W. Sinnott*.

DISEASES OF UNKNOWN CAUSE

5876. SHARPLES, A., and L. LAMBOURNE. Preliminary report on brown bast experiments in Malaya. Malayan Agric. Jour. 11: 30-35. 1923.—Results of experiments on 410 rubber [*Hevea*] trees (divided into plots of about 50 each) subjected to 3-months' preliminary heavy tapping are recorded. As regards periods of development of Brown Bast and of quiescence no definite correlation with external conditions has been observed. In 40 out of 133 trees which developed Brown Bast there was no downward extension of the affection after tapping had ceased; in the other trees it extended downward, stopping either at the limit of virgin bark, at the junction between renewed bark of 2 and 4-6 years' growth, or at the base of the tree. In 1 plot which showed an abnormally long quiescent period the final sudden increase of Brown Bast was correlated with a sudden increase in average tree yield. The conclusion is drawn that Brown Bast is closely associated with the question of high yields and that it almost certainly acts as a limiting factor in the question of high-yielding trees. Brown Bast affection is to be considered as an exhaustion process, and if excessive yielding results in exhaustion high yielders will tend to show this effect sooner than average yielders. The question is thus of primary importance in consideration of possible results of bud-grafting practiced to obtain higher yields. The authors further point out the possibility that high-yielding bud-grafts may show accelerated vital activities and as a result may be susceptible

to diseases not affecting normal trees. The margin of safety is small and too optimistic views have been taken as to the possibilities of bud-grafting.—The phenomenon of phloem necrosis may occur independently of the production of Brown Bast.—*R. E. Holtum.*

GENERAL AND MISCELLANEOUS PATHOLOGICAL LITERATURE.

5877. ANONYMOUS. Pathology of market produce. *Nature* 111: 516. 1923.—In the U. S. A. a new field of scientific investigation has been opened up between crop and consumer. This new field of market pathology is typified in recent studies by Link and Gardner, and by N. E. Stevens.—*Frederick V. Rand.*

5878. ANONYMOUS. Structure and origin of the plant gall. [Rev. of: COOK, MELVILLE T. The origin and structure of plant galls. *Science* 57: 6-14. 1923 (see Bot. Absts. 12, Entry 3452).] *Nature* 111: 483. 1923.—“Prof. Melville T. Cook has rendered a service to workers in a field where the literature is very widely scattered.”—*Frederick V. Rand.*

5879. ANONYMOUS. [Rev. of: PALMER, RAY, and W. PERCIVAL WESTELL. *Pests of the garden and orchard, farm and forest.* 413 p., 47 pl. (3 col.) Henry J. Drane: London, 1922.] *Nature* 111: 530-531. 1923.—“The authors have aimed at meeting the needs of practical agriculturists and horticulturists by collecting into one book all the available information on plant pests and diseases necessary for their guidance.”—*Frederick V. Rand.*

5880. ALLEN, W. J., and W. LE GAY BRERETON. Further experiments with a spray gun. *Agric. Gaz. New South Wales* 34: 354-356. 1923.—Using a varying pressure of 250-290 pounds with an orifice of 0.114 inches the spray gun used 4.9 gallons of spray per tree, whereas 3.8 gallons per tree were used with double nozzles and 2 leads of hose. The latter method requires less spray per tree but takes more time. Decreasing the orifice in the spray gun decreased the amount of spray used. With a coarse jet a height of 36 feet was attained. The spray gun is considered a valuable addition to spray appliances but further tests are necessary in order to measure the value of the device.—*L. R. Waldron.*

5881. ANDERSON, P. J., and A. V. OSMUN. An improved formaldehyde tank for the onion drill. *Phytopathology* 13: 161-168. *Fig. 1-3.* 1923.—It was found that the tanks usually recommended and used on onion seed drills would not deliver the liquid at a constant rate, the rate varying with the amount of liquid in the tank and with the speed of the drill. An attachment has been devised, and is here described, which eliminates the variation due to the weight of the liquid. The rate of delivery of the solution varies only with the speed of the drill.—*B. B. Higgins.*

5882. BRIERLEY, WILLIAM B. [DISCUSSION OF: LANG, WM. H. Some aspects of vegetable pathology in relation to human disease.] *British Med. Jour.* 1922. 962-963. 1922.—There is an unbridgeable gulf between the morphology, anatomy, and physiology of animals and plants. There is, therefore, little that can be helpful and much possibility of confusion in making detailed comparisons of host tissue responses in plant and animal diseases. There is, however, a vast field for common study of the great groups of microorganisms; and the utmost of value can be obtained from an intimate exchange of facts and points of view.—*Frederick V. Rand.*

5883. BUTLER, E. J. Diseases of plants in England in 1920-21. [Rev. of: COTTON, A. D. Report on the occurrence of fungous, bacterial and allied diseases on crops in England and Wales for the years 1920-21. Ministry Agric. and Fisheries Misc. Publ. 38. 104 p. 1922. (see Bot. Absts. 12, Entry 5886).] *Nature* 111: 416-417. 1923.

5884. CALL, A. H. Vacuum fumigation of nursery stock in Ventura County. *Monthly Bull. California Dept. Agric.* 11: 467-468. 1922.

5885. COMPERE, GEO. Origin of fumigation with hydrocyanic-acid gas in California. Monthly Bull. California Dept. Agric. 11: 438-442. Fig. 161-162. 1922.—The author gives a brief history of the discovery and introduction of hydrocyanic-acid gas as a means of fumigating citrus trees in California.—*E. L. Overholser*.

5886. COTTON, A. D. Report on the occurrence of fungous, bacterial and allied diseases on crops in England and Wales for the years 1920-1921. Ministry Agric. and Fisheries Misc. Publ. 38. 104 p. 1922.—This report comprises data as to prevalence, distribution, varietal reactions, etc., relative to diseases of cereals, potatoes, root crops, legumes, forage crops, vegetables, fruit, and miscellaneous crops. Weather charts and a special index to diseases are added. [See also Bot. Absts. 12, Entry 5883.]—*Frederick V. Rand*.

5887. ESCOBAR, RÓMULO. Enfermedades criptogámicas de la alfalfa. [Cryptogamic diseases of alfalfa.] Agric. Mexicano y Hogar 38: 254-258. 1922.—This is a popular account of the diseases of alfalfa found in Mexico and those that might be introduced there.—*John A. Stevenson*.

5888. FERDINANDSEN, C. Det plantepatologiske Arbejde i Danmark. [Phytopathological work in Denmark.] Nordisk Jordbrugsforskning 1922: 333-351. 2 fig. 1922.—Two lectures at the agricultural college in Berlin are printed. A German abstract appears in Der Deutsche Pflanzenschutzdienst 2: 60-62. 1922.—*Ernst Gram*.

5889. GRAM, E. Iagttagelser fra Holland. [Observations from Holland.] Ugeskr. Landmaend 67: 427-429. 1922.—This is a report on Dutch work with plant diseases, particularly those of potatoes.—*Ernst Gram*.

5890. HAUPT, L. O. Spring spraying of peaches. Associated Grower 5²: 5, 18. 1 fig. 1923.—The author briefly describes the control of peach blight, peach leaf curl, peach twig borer, San Jose scale, black peach aphid, and red spider under California conditions.—*E. L. Overholser*.

5891. LOPÉZ, BERNARDO. Algunas enfermedades del tomate en Puerto Rico. [Some Porto Rican tomato diseases.] Rev. Agric. Puerto Rico 9^o: 33-37. 2 fig. 1922.—The author discusses the diseases due to *Cladosporium fulvum* Cke., *Fusarium Lycopersici* Sacc., and *Bacillus Solanacearum* E. F. Sm. which make tomato culture difficult in Porto Rico.—*John A. Stevenson*.

5892. LUCIANO, JOSÉ. El servicio de inspección y cuarentena de plantas y la introducción de plantas a Puerto Rico. [The quarantine and inspection service of Porto Rico and the introduction of plants.] Rev. Agric. Puerto Rico 9^o: 37-41. 1922.—The entry of living plant material into Porto Rico is regulated by Insular quarantine law No. 17 and the various Federal quarantines, more particularly No. 37. These quarantines are administered by the Insular quarantine service in order to prevent further introductions of insect pests and plant diseases from which the Island is now suffering so severely.—*John A. Stevenson*.

5893. MCRAE, W. Report of the Imperial Mycologist. Sci. Rept. Agric. Res. Inst. Pusa, 1921-22: 44-50. 1922.—*Piricularia Oryzae* Br. et Cav., a destructive disease on *Oryza sativa*, has been found in several localities in India. Similar forms of *Piricularia* are destructive to *Eleusine coracana* and a number of other grasses. Some cross inoculation is possible, but it has not yet been determined whether there are 4 distinct species, or only 4 physiological strains of 1 species. A disease of rice caused by an unidentified sclerotial fungus, and another disease caused by *Cephalosporium* (?) sp. are under investigation.—*Tolyposporium Penicillariae* Bref. on *Pennisetum typhoideum*; downy mildew of maize; *Fusarium*, *Diplodia*, and *Acrothecium* diseases of *Pennisetum typhoideum* and *Zea mays*; *Helminthosporium* spp. on cereals; *Urocystis coralloides* Rostrup on mustard; smut resistance in sugarcane; and *Macro-*

phoma Corchori Saw. on jute have been studied.—Demonstrations of methods of spraying fruit trees continue.—A fungus and host index of the mycological herbarium at Pusa has been completed.—A program of work for 1922-23 and a list of papers published during the year are included.—*Winfield Dudgeon*.

5894. MATZ, JULIUS. Informe de la estacion experimental insular. Informe de la división de botánica y patología. Diciembre, 1921. [Report of the division of botany and pathology.] Rev. Agric. Puerto Rico 82: 63-65. 1922.—This is a report of continued investigation of the gumming disease (*Bacterium vascularum*), Plasmodiophora disease, and mosaic of sugar cane as well as of minor diseases of other economic crops.—*John A. Stevenson*.

5895. MILBRATH, D. G. Control of diseases of cucumbers in greenhouses. Monthly Bull. California Dept. Agric. 11: 430-437. Fig. 157-160. 1922.—The author discusses the common diseases of cucumbers in greenhouses giving their importance, symptoms, methods of infection, and measures for control.—*E. L. Overholser*.

5896. NEWELL, WILMON. The quarantine situation—what is needed. Florida State Plant Bd. Quart. Bull. 7: 149-159. 1923.—Opportunities for pests to enter are still numerous and only some of the avenues of entrance have been closed. Dangerous plant material arrives daily at every port of the U. S. A., whether or not quarantine inspectors are stationed at these ports. The Federal Horticultural Board is not affording adequate protection. Out of 35 of the more important maritime and border ports (exclusive of the Canadian line) federal quarantine inspectors are stationed at only 15 and Federal Horticultural Board collaborators (state inspectors) at 10. As to the bulb situation there are indications of a letting up in the policy of increasing protection against foreign pests.—*J. C. Th. Uphof*.

5897. NORTH, D. S. The control of sugar cane diseases. III. Australian Sugar Jour. 15: 73-83. 1923.—An estimate of 9 per cent crop loss at Broadwater has been made. Details for controlling the disease are given. Mosaic and Fiji diseases are being eliminated, but the control of gumming and leaf-scald is proving difficult.—*C. Rumbold*.

5898. SHAW, F. J. F. Report of the Imperial mycologist. Sci. Rept. Agric. Res. Inst. Pusa 1920-21: 34-40. 1921.—*Helminthosporium* diseases of cereals, especially on *Zea mays* and *Pennisetum typhoideum*; *Acrothecium lunatum* Wakker on grasses; smut on *Paspalum scrobiculatum* L.; *Piricularia* on rice [*Oryza sativa*]; diseases of chilli, jute, and areca and palmyra palms have been studied during the year. A host and fungus index of the mycological herbarium at Pusa is projected. Destruction of *Eichornia Crassipes* Solm. (water hyacinth) by spraying with a secret proprietary mixture has been found practicable. A program of work for 1921-22 and a list of publications for the year are given.—*Winfield Dudgeon*.

5899. STRONG, LEE A. The Bureau of Plant Quarantine. Monthly Bull. California Dept. Agric. 11: 852-871. Fig. 207-214. 1922.

5900. WEBER, ANNA. Tomatsygdomme. [Tomato diseases.] Aarbog for Gartneri 1922: 81-150. 10 fig. N. C. Roms Forlag: Copenhagen, 1923.—This is a prize essay from the Danish Gardeners Association containing a key, an account of each disease based on literature studies and original observations, with remarks on control, a summary of general sanitary and control work, and a bibliography and index.—*Ernst Gram*.

5901. WELDON, GEO. P. Spraying deciduous fruit trees. Monthly Bull. California Dept. Agric. 117: 24-29. 1922.—The author discusses the value of spraying, pointing out that it is an unnecessary operation unless there is a pest actually on the trees. He emphasizes the necessity of knowing the different sprays and fungicides to accomplish successful results, and discusses the pests commonly attacking different deciduous fruit trees in California with control measures for each.—*E. L. Overholser*.

5902. WELDON, GEO. P. Spring spraying of peaches with lime sulfur. Monthly Bull. California Dept. Agric. 12: 44-47. 1923.—Spring spraying with lime-sulphur controls twig borer (*Anarsia lineatella* Zeller) and peach leaf curl (*Exoascus deformans* (Berk.) Fekl). Brown mite (*Bryobia pratensis* Garman), San Jose scale (*Aspidiotus perniciosus* Comstock), and peach blight (*Coryneum Beijerinckii* Oudoom.), are also partially or wholly controlled by the same spray. Dry lime-sulphur is as effective as liquid lime-sulphur. Early spring applications give as satisfactory results as late spring applications.—*E. L. Overholser*.

5903. WENIGER, WANDA. Diseases of grain and forage crops in North Dakota. North Dakota Agric. Exp. Sta. Bull. 166. 93 p., 32 fig. 1923.—Information on the occurrence, economic importance, identification, and control of the diseases of cereal and forage crops of the state is brought together. Part I deals with diseases of cereal crops; part II with forage crop diseases; and part III with methods of disease control. Diseases of wheat, oats, barley, rye, flax, corn, proso, and sorghum are described in the order of their importance under their respective hosts. Forage crop diseases are discussed for alfalfa, red and alsike clovers, sweet clover, brome grass, millet, timothy, Sudan grass, the wild grasses of the state, and sunflower. The discussion of specific diseases includes symptoms, cause, importance, and methods of prevention. Methods of seed treatment are given and the problem of disease resistant varieties is discussed. A bibliography of the more important sources of information on specific diseases is included in foot notes.—*Wanda Weniger*.

5904. YOUNG, W. J. Waterglass. A new wound dressing for trees. Monthly Bull. Ohio Agric. Exp. Sta. 8: 13-16. Fig. 7. 1923.—The article comprises a brief discussion of the need for a wound dressing for trees and gives a brief report of the use of a solution of sodium silicate as a wound treatment. This preparation has been found very satisfactory in preventing infection from wood-rooting fungi.—*R. C. Thomas*.

5905. ANONYMOUS. [Rev. of: GREENISH, H. G. The microscopical examination of foods and drugs. 3d. ed., xx + 386 p. J. and A. Churchill: London, 1923 (see Bot. Absts. 12, Entry 4446).] Nature 111: 459. 1923.—Additional matter has not been included in this edition on account of the high cost of printing.—*O. A. Stevens*.

5906. ASTON, B. C. The poisonous, suspected, and medicinal plants of New Zealand. New Zealand Jour. Agric. 26: 230-232. 1923.—Ferns have in some cases been reported as poisonous to stock. Poisoning is likely to occur in stock just turned into pasture containing much fern. Symptoms are described, and it is recommended that any stock showing illness be at once transferred to other pastures.—*N. J. Giddings*.

5907. BOSMAN, LOUIS PIERRE. Castelamarin- a bitter principle from *Castela Nicholsoni*. Jour. Chem. Soc. [London] 123: 207-210. 1923.—An investigation of the chemical constitution and properties of castelamarin showed only slight pharmacological activity. However, at a dilution of 1:2000, castelamarin caused a constriction of the coronary vessels of an isolated mammalian heart, the outflow being reduced to $\frac{1}{3}$ or less.—*F. E. Denny*.

5908. CHRISTENSEN, C. Exzemplanter. Plants producing eczema.] Nat. Verden 6: 259-276. Fig. 1-8. 1922.—Dermatitis venenata may occur as a result of continued occupation with *Narcissus* spp. (lily disease of Scilly Islands), and may even become chronic. Under unfortunate circumstances dermatitis may also be caused by otherwise harmless plants, e. g., *Arctium lappa*, *Angelica*, *Colchicum*, *Convallaria*, *Doronicum*, pumpkin, *Delphinium*,

Humulus, Pastinaca, Euphorbia, Heracleum. Certain woods used for fine furniture contain poisons having a similar effect. Of plants having poison in hairs, *Primula obconica* and, to a lesser degree, *P. sinensis*, *P. mollis*, *P. Sieboldi*, *P. cortusoides*, and *P. Arendsi* are known as eczema plants. They produce less poison when well watered. Washing with alcohol immediately after handling the plants is recommended. Of plants with eczema-producing milk or gum, *Rhus toxicodendron* is well known, but other species should also be indicated.—*Ernst Gram.*

5909. DEAN, A. L., AND R. WRENCHALL. **Making Chaulmoogra oil derivatives.** Pharm. Era 55: 277, 278. 1922.—The authors describe routine methods used at the University of Hawaii for making certain derivatives of Chaulmoogra oil for therapeutic use.—*C. M. Sterling.*

5910. DODD, SYDNEY. **Poisoning of sheep by "Narrawa burr," *Solanum cinereum*.** Agric. Gaz. New South Wales 34: 257-260. 1923.—A sheep fed the berries emulsified in water died within 7 hours, with symptoms of salivation, perspiration, disordered cardiac and respiratory actions, and diarrhoea. The active toxic agent is probably solanin. *L. R. Waldron.*

5911. GIROLA, CARLOS D. **Cultivo de la Yerba Mate en Argentina. Composicion del *Ilex paraguariensis*.** [Cultivation of Yerba Mate in Argentina. Composition of *Ilex paraguariensis*.] Bol. Ministerio Agric. Nacion [Argentina] 27: 186-219. 4 fig. 1922.—The author summarizes all previous work covering analyses of *Ilex paraguariensis*, the plant yielding Yerba Mate or Paraguay tea, with particular reference to the ash and to fresh and dried leaves and their products. [See also Bot. Absts. 12; Entries 5661, 5662.].—*John A. Stevenson.*

GENERAL

5919. ANONYMOUS. [Rev. of: PALMER, LEROY S. *Carotinoids and related pigments: the chromolipoids* 316 p. (American Chemical Society Monograph Series.) The Chemical Catalog Co.: New York, 1922 (see Bot. Absts. 12, Entry 2763).] *Nature* 111: 318-319. 1923.

5920. HILL, A. V. *Hydrogen ion concentration*. *Nature* 111: 434-436. 1923.—This is a general discussion of the subject.—O. A. Stevens.

5921. HUTCHINSON, C. M. *Report of the Imperial Agricultural Bacteriologist*. Sci. Rept. Agric. Res. Inst. Pusa 1921-22: 38-43. 1922.—Work was done on nitrogen fixation; symbiosis between algae and nitrogen-fixing bacteria; plant residues as nutrients for nitrogen-fixing bacteria; and on cross inoculations with nodule bacteria. Studies on nitrification of *Bassia latifolia* cake and solubilization of rock phosphates by composting were continued. The most effective compost tried consisted of 50 gm. *Bassia* cake, 25 gm. nodule phosphate, and 6.25 gm. sulphur, and this yielded 4.32 per cent of citrate-soluble phosphate (P_2O_5). The study of nitrogen loss from cattle dung and urine stored under various conditions was continued. Burned soil from the Konkan Division contained more nitrogen (as ammonia) than the fresh soil. Experimental plots were laid down for the study of sodium nitrate as a fertilizer in connection with irrigation; the vertical distribution of nitrates in the soil; and the influence of cultivation, rainfall, and applications of nitrate on nitrification.—The study of the classification and efficiency of indican hydrolyzers, and experimental work on small apparatus for local manufacture of the sterilizer "E. C." were carried on. A program of work for 1922-23 and a list of publications for the year are appended.—Winfield Dudgeon.

PROTOPLASM, MOTILITY

5922. DANGEARD, P. A., ET PIERRE DANGEARD. *Sur la vitalité des feuilles d'Aucuba conservées dans le vide*. [The vitality of the leaves of *Aucuba* preserved in a vacuum.] *Compt. Rend. Acad. Sci. Paris* 176: 49-53. 1923.—In conformity with the experiment of Maquenne and Demoussy [see Bot. Absts. 12, Entry 4567] adult leaves of *Aucuba* were kept in a vacuum in light for 6 months and still retained their vitality. The cells were all alive, there being no apparent difference between the cells of the treated leaves and of those still remaining on the tree. Two proofs that life still existed are given: (1) there was observed a streaming of the protoplasm within the cells. This is especially true of the epidermal cells, the guard cells, and the cells near the veins. (2) Intravital staining with neutral red and cresyl blue. These dyes

accumulate in the vacuole, leaving the nucleus, cytoplasm, and plastids unstained. In all these respects the exposed and control leaves behaved the same, both in living and fixed material.—*C. H. Farr.*

5923. FUNK, GEORG. Über Bewegungen der Kolonien von *Oscillatoria amphibia* Ag. [Movements of the colonies of *Oscillatoria amphibia*.] Beih. Bot. Centralbl. I Abt. 39: 257-320. Pl. 17-18. 14 fig. 1923.—The colonies contract by the creeping together of the filaments and thin out by the moving out of the individual filaments. Contraction of the whole colony results from mechanical stimulus, darkening, increased light, cooling, and heating.—*L. Pace.*

DIFFUSION, PERMEABILITY PHYSICO-CHEMICAL PHENOMENA

5924. CHURCHMAN, JOHN W. The mechanism of selective bacteriostasis. Proc. Nation. Acad. Sci. [U. S.] 9: 78-81. 1923.—While most of the triphenylmethane stains kill or inhibit gram-positive bacteria but do not readily affect gram-negative forms, the author finds that acid fuchsin has a similar selective effect on gram negative bacteria. Such selective effects do not seem to depend on penetrability; stained bacteria may grow and unstained ones may be inhibited. The bacteriostatic effect evidently is "a paralysis of reproduction," not always leading to death. Bacteriostasis due to staining before culturing is defined as intrinsic, and that due to dye in the culture medium as extrinsic. With gentian violet, intrinsic and extrinsic bacteriostasis are parallel, a given organism being inhibited or not in both cases; with acid fuchsin, 1 of 2 organisms may show intrinsic bacteriostasis only, and the other, extrinsic only.—*Howard B. Frost.*

5925. DORNER, ALFRED. Über das Verhalten der Zellwand zu Kongorot, insbesondere bei Farnprothallien. [The behavior of the cell wall to congo red, especially in fern prothallia.] Centralbl. Bakt. II Abt. 56: 14-27. 1922.—This investigation was undertaken to test Klebs' theory that congo red is a differential stain for living and dead cell walls. Fern prothallia as well as material from a number of higher and lower plants were studied in this respect. It was found that no absorption took place in any case where the presence of a cuticle could be demonstrated. However, when cutinized cell walls were treated with cutin solvents the dye was readily taken up.—*Anthony Berg.*

5926. DORNER, ALFRED. Über die Aufnahme von Anilinfarbstoffen in das Protoplasma und die Zellwand. (Sammelreferat.) [The absorption of aniline dyes by the protoplasm and the cell wall.] Centralbl. Bakt. II Abt. 56: 27-31. 1922.—This is a résumé of the theories promulgated by the various investigators on the absorption of these dyes.—*Anthony Berg.*

5927. KAKIUCHI, SAMURO. Studies on physico-chemical properties of phospholipin. I. The precipitation of lecithin-hydrosol by electrolytes. Jour. Biochem. Tokyo 1: 165-174. 1922.—Lecithin particles in aqueous solution are negatively charged; salts with a monovalent cation exert no precipitating action; bivalent cations precipitate over a wide range of concentration; trivalent cations precipitate only within a very narrow range of concentration and at very great dilution, causing resolution of the precipitate if the concentration of electrolyte be too great. The valency of the anion of the salt used plays a role in the result; monovalent anions are practically without effect upon the concentration of trivalent cation required to precipitate, while the presence of divalent or tetravalent anions with their large negative charges necessitates a material increase in the concentration of cation necessary to precipitate. Many supposed instances of antagonism between salts with monovalent and bivalent cations are in reality due to antagonism between cations and anions.—*Joseph S. Caldwell.*

5928. KOTAKE, YASHIRO, AND M. OKAGAWA. Über den Einfluss des optischen Drehungsvermögens auf die Zell-permeabilität. I Mitteilung. [The influence of optical rotation upon cell-permeability.] Jour. Biochem. Tokyo 1: 159-164. 1922.—Of the 3 forms of oxyphe-nyl-lactic acid, the red corpuscles of the dog are readily permeable only to the laevorotatory

form, slightly permeable to the dextrorotatory form, and not at all to the inactive form. Optical activity may play a rôle of unsuspected importance in biological and physiological relations.—*Joseph S. Caldwell.*

5929. PRICE, THOMAS SLATER. Determination of the isoelectric point of gelatin. A criticism of Patten and Kellems's method. Jour. Chem. Soc. [London] 123: 410-412. 1 fig. 1923.

5930. STILES, WALTER. Permeability. New Phytol. 21: 169-209, 233-251. 1922; 22: 1-29, 72-94. Fig. 13-14. 1923.—After a general statement, with a definition of turgidity, in Chapter IX the quantitative water relations of the cell are considered on the basis of the simple osmotic view. The net pressure sending water into the cell is called the "suction pressure." The 3 methods most used for the determination of the isotonic coefficient are given, and 3 methods for determination of the osmotic pressure of the cell. The magnitude of the osmotic pressure and the relation between the position of a cell in the plant and its osmotic pressure are discussed, along with the relation of habit to osmotic pressure, the influence of external conditions, and the phenomenon of periodicity in the pressure values. Other subjects included are the substances responsible for osmotic pressure, the suction pressure and its determination, the magnitude and range of suction pressures, exudation and root pressure, the inadequacy of the simple osmotic view, the water relations of the cell wall and of the protoplasm, and the effect of imperfect permeability of the cell wall and of tissue tensions on the water relations of cells. Chapter X is devoted to a consideration of the influence of temperature and of the composition of the external medium on the intake and excretion of water in plants. The effect of temperature has been studied by the plasmolytic method, by the rate of linear shrinkage of turgid tissues, and by "the change in weight method." The effect of the composition of the external medium is discussed with special reference to sucrose, sodium chloride, ethyl alcohol, octyl alcohol, chloroform, mercuric cyanide, sulphuric acid, osmic acid, mercuric chloride, ethylic acetate, and the phenols.—In Chapter XI the author considers the methods for determining the permeability of plant cells to dissolved substances. These methods are: direct observation of visible changes, microchemical tests, analysis of expressed sap or tissue extracts, visible changes in the external medium, chemical analysis of the external medium, electrical conductivity of the external solution, electrometric measurements with the hydrogen electrode, colorimetric estimation of the H-ion concentration of the external solution, metabolic action, plasmolysis, weight or volume changes in turgid tissues, tissue tension, diffusion, and electrical conductivity of living tissues—Chapter XII consists of a discussion of "quantitative relations in the penetration of dissolved substances into plant cells." The subheads are: "the unequal absorption of the ions of a salt by plant tissue," "the position of the equilibrium attained in the intake of dissolved substances by plant cells," and "the course of absorption of dissolved substances."—*I. F. Lewis.*

5931. TADOKORO, TETSUTARO. The antagonistic action between salts on the surface tension of organic colloidal solution. Jour. Biochem. Tokyo 2: 361-365. 1923.—The alterations in surface tension of expressed, centrifuged vegetable juices and horse serum produced by additions of single salts or of antagonistic pairs of salts were determined by means of Nouy's surface tension apparatus. A mixture of antagonistic salts preserves the surface tension unaltered while each of the single salts depresses it, but the alterations produced are small and there are many irregularities.—*Joseph S. Caldwell.*

5932. TADOKORO, TETSUTARO, AND YUKIHIKO NAKAMURA. On the difference between the adsorptive powers of charcoal from common and glutinous starch. Jour. Biochem. Tokyo 2: 239-250. 1923.—Certain varieties of rice, millet, and Italian millet possess starch which gives with iodine a red or purple color; these are the so-called glutinous varieties. Starches made from glutinous and common varieties of each of the 3 grains were purified, converted into charcoal, and tested for adsorption of iodine in potassium iodide. The adsorption was in all cases materially greater in the glutinous starch charcoals. Impregnation of the glutinous

starch charcoal with potassium or calcium chloride increased its adsorptive capacity, calcium nitrate and tannin were without effect, and iodine in potassium iodide decreased adsorptive capacity. The adsorptive capacity of the gel from glutinous starch was greater than that from common starch; it also requires a larger quantity of tannin to precipitate it, and the surface tension as measured by Nouy's apparatus changes abruptly with increase of tannin, while a gradual change occurs in common starch so treated.—*Joseph S. Caldwell.*

WATER RELATIONS

5933. BOSWELL, VICTOR R. Dehydration of certain plant tissues. *Bot. Gaz.* 75: 86-94. *Fig. 1-7.* 1923.—Under oven dehydration at 60°C. the author's data, taken at 15-minute intervals, showed that cabbage leaves lost water less rapidly than did tomato leaves. Contrasting results were also found in tender (greenhouse-grown) and hardy (coldframe-grown, March) cabbage leaves. Tomato leaves similarly grown showed little difference. Greenhouse-grown cabbage leaves, produced from plants which were watered with (1) tap water, (2) $\frac{N}{10}$ NaCl, (3) $\frac{N}{10}$ NaNO₃, gave results indicating a relation of hardness to these treatments, the tap water producing the tender leaves and the NaNO₃ the hardest leaves. The author's graphs "show conclusively that there is a close correlation between the degree of hardness and the rate of water loss." The author finds that hardy tissue loses its water more slowly in the early periods than does the tender tissue. "The results suggest that the method of drying described in the present paper may be used to estimate the relative amounts of free and unfree water in plant tissues, and that the comparative rates of water loss under uniform drying conditions are a measure of the relative hardness of certain kinds of plant tissues."—*B. W. Wells.*

5934. PRIESTLEY, J. H., AND R. M. TUPPER-CAREY. Physiological studies in plant anatomy. IV. The water relations of the plant growing point. *New Phytol.* 21: 210-229. *Fig. 1-2.* 1922.—In *Vicia Faba* it is shown that fluid under pressure does not penetrate the meristem at the root apex. A pressure of 1 atmosphere failed to cause the penetration of aqueous eosin, while the meristem resisted a pressure of 2 atmospheres without penetration of malachite green. The meristem of the root tip "is relatively impermeable to the diffusion of salts in solution and acid dyes but stains very readily with basic dyes." The resistance of the living root meristem varied from 2,000 to 10,000 ohms, while in killed roots the resistance fell to a few hundred ohms. In root tips taken from the dry bean and soaked 1 hour in water, the resistance of the meristem averaged 12-13,000 ohms.—On the other hand "the stem apex allows relatively free diffusion of water and solutes within the cuticle, the meristematic protoplasts at the apex staining readily with acid dyes. * * * The sap contained in the endodermal cylinder of the root is apparently more acid than the sap irrigating the stem apex. * * * The relative ease with which the apical meristem of the stem is irrigated with substances, as compared with the supply of these substances to the root apex, is shown to suggest a physiological basis for the important morphological differences characteristic of these 2 growing points."—The experimental results are in direct conflict with Coupin's theory that the growing point is the chief organ of the root for the absorption of water and solutes.—*I. F. Lewis.*

MINERAL NUTRIENTS AND SALT RELATIONS

5935. HAAS, A. R. C. Pot cultures with barley in soil from a long-time fertilizer experiment. *Bot. Gaz.* 75: 95-102. *Fig. 1-4.* 1923.—The soil used to test the effects of the fertilizers was from the orange and lemon tree plots of the Citrus Experiment Station, Riverside, California. The purpose of the experiment was to discover whether or not a cereal like barley would respond to the various combinations of fertilizers in a manner similar to the citrus plants. The author finds a "lack of agreement between the barley-producing form of soils and the yield and condition of citrus on such soils at the time the samples were taken." On a plot fertilized by nitrate, blood, and potassium sulphate, much less grain was produced than would be assumed from the yield of citrus. The writer was further able to demonstrate that the amount of nitrogen previously added to the soil is not an accurate measure of its barley-producing power, and also that "the addition of phosphoric acid or potash to the soil studied has not shown any added advantages for the growth of barley."—*B. W. Wells.*

5936. HESSELINK, E. Zoutwaterschade bij Grienden aan het Hollandsch Diep. [Salt-water injury near Grienden on the Hollandsch Diep.] *Cultura* 35: 67-71. 2 pl., 1 fig. 1923.—An account is presented mainly of the influence of seawater upon willows in inundated fields. It was not difficult to show by flame reaction the presence of NaCl in willow twigs. Not all species are susceptible to the same degree. *Salix viminalis* is most susceptible, then follows *S. amygdalina*, still less *S. vitellina*, and most individuals of *S. alba* are not harmed at all. Also, *S. purpurea* was often badly damaged. It was observed that injury was least in a field where the ditches were cleaned the previous winter, and the mud thrown between the shrubs. It is supposed that it prevented the seawater entering the lower layers of the soil and salt was thus unable to reach the roots. In the field where the ditches were not treated the damage was considerable. There was less NaCl toward the base of the twigs than in the top, which explains why damage is first noticed on the leaves. Cuttings were grown in pots in order to observe the influence of salt water. On May 16 tap water was mixed with 20 per cent seawater, and after 2 days no harmful influence was noticed. During the next 2 days the cuttings were watered with pure seawater and after 2 days all plants were killed.—*J. C. Th. Uphof*.

5937. MÜLLER, WILHELM. Über die Abhängigkeit der Kalkoxalatbildung in der Pflanze von den Ernährungsbedingungen. [The dependence of calcium oxalate formation in plants on the nutritive condition.] *Beih. Bot. Centralbl.* 1 Abt. 39: 321-351. 1923.—Amars and Benecke showed that calcium oxalate formation in green plants depends on nutrition. Calcium oxalate crystals, whether in living or dead cells, are not dissolved in the assimilation processes of any plant, but in contact with the roots such crystals were attacked and corroded. The raphide content did not vary with different nitrogenous sources, and was influenced only by calcium supply. In the absence of nitrogenous material the raphide content is unchanged. Raphide formation requires less calcium than the formation of other oxalate crystal. Light does not influence the formation of raphides. The greater part of the investigation confirms Stahl, whose work appeared after this work was completed.—Plants used in the experiment were *Callisia repens* L., *Stellaria media*, *Impatiens parviflora* DC., *I. Sultani* Hook., *Mimosa Spegazzinii*, *Nicotiana Tabacum*, *Solanum tuberosum* L., *Datura Stramonium* L.—*L. Pace*.

5938. SNELL, KARL. Die Kartoffel in Sand- und Wasserkulturen. [The potato in sand and in water cultures.] *Illus. Landw. Zeitg.* 43: 59-60. 1923.—The experiments showed the extremely favorable results from the presence of potassium salts in the culture media. In both sand and water cultures the plants matured, producing all parts including tubers. In the water cultures the tubers possessed enlarged white lenticels and the leaves became rolled in late summer as usually occurs in the field when there is insufficient water. The author suggests that the curling was probably due to a lack of necessary salts, since the salt solution was not renewed.—*John W. Roberts*.

PHOTOSYNTHESIS, PHOTOCHEMISTRY

5939. HEILBRON, I. M. The photosynthesis of plant products. *Nature* 111: 502-504. 1923.—This article is an abstract of lectures delivered at the Royal Institution on Feb. 1 and 8, and it contains references to the work of Willstätter and more especially to that of Moore and Webster on carbohydrate production. Several investigations in nitrogen assimilation are referred to. "Photosynthesis is in the main the chemistry of one single substance—formaldehyde."—*O. A. Stevens*.

5940. NOYES, W. ALBERT, AND A. B. KOUPERMAN. Photochemical studies I. The photochemical decomposition of solid oxalic acid. *Jour. Amer. Chem. Soc.* 45: 1393-1400. 1923.

METABOLISM (GENERAL)

5941. ARNOLD, R. Application du procédé biochimique de caractérisation du glucose aux fruits de *Viburnum opulus* L., à l'extrait de Quinquina rouge et à des extraits de Cola. [Application of the biochemical method to the identification of glucose in fruits of *Viburnum*

opulus L., and in extracts of red cinchona and kola.] Bull. Soc. Chim. Biol. 3: 547-566. 1921.—Continuing earlier work by Bridel and Arnold [see Bot. Absts. 12, Entry 5189] in which methods for preparation of material for study were described, the present article reports results with the 3 materials named. 100 gm. of unripe fruits of *Viburnum opulus* contained 5.766 gm. of reducing sugar, increasing to 6.232 gm. after treatment with invertase, but showing no further increase after the action of emulsin. By submitting the mixture of reducing sugars to the action of emulsin in 50 per cent methyl alcohol and determining the amount of sugar converted into *b*-methylglucoside, it was found that dextrose constituted 56.6 per cent of the mixture of reducing sugars. That the remainder was levulose was indicated by the optical rotation. Red cinchona extract prepared according to the Codex of 1908 contained 9.78 per cent reducing sugars, of which 43.6 per cent was dextrose as determined by conversion into methylglucoside. Extract of kola made according to the Codex of 1908 was compared with a preparation made from the fresh nut. In the official extract, 53.7 per cent of the reducing sugars was dextrose; when the extract was subjected to hydrolysis with sulphuric acid followed by treatment for 140 days with emulsin renewed at 30-day intervals the dextrose found was 43.95 per cent of the reducing sugar. An extract of the fresh kola nut was very slowly acted upon by emulsin, 21.78 per cent of the reducing sugar present being dextrose. After H_2SO_4 hydrolysis the dextrose present was 48.8 per cent of the reducing sugar. The "biochemical method" as applied to plant material consists in the destruction of enzymes by placing the material in boiling alcohol, extracting with water, clarifying with lead subacetate, removing excess lead with H_2S , extracting with boiling acetic ether to remove lipoids, resins, alkaloids, and glucosides, dissolving out the sugars with boiling 95 per cent alcohol, evaporating to dryness, dissolving in 50 per cent methyl alcohol, and adding emulsin after previous determination of reducing sugar in an aliquot. Repeated additions of emulsin may be necessary to bring the reaction to completion, and complete extraction of sugars with 95 per cent alcohol is difficult in such material as red cinchona.—*Joseph S. Caldwell.*

5942. BOAS, FRIEDRICH. Untersuchungen über Säurewirkung und Bildung löslicher Stärke bei Schimmelpilzen. II Teil. [Acidity and the formation of soluble starch in mucors. Part II.] Centrabl. Bakt. II Abt. 56: 7-11. 1922.—The H-ion concentration, nature of the carbohydrate source, and temperature are important factors in the formation of soluble starch. Saccharose, levulose, dextrose, maltose, and galactose stimulate the formation of diastase in the order named. The presence of diastase in the nutrient solution inhibits the appearance of soluble starch. In *Aspergillus niger* there seems to be a relationship between the formation of diastase and conidia formation; maltose and galactose seem to favor conidia production. In *Aspergillus Oryzae* maltose favors the appearance of soluble starch in the nutrient solution; levulose seems to inhibit it.—*Anthony Berg.*

5943. DELAUNEY, P. Nouvelles recherches relatives à la présence de la loroglossine dans les Orchidées indigènes. [The presence of loroglossin in indigenous orchids.] Compt. Rend. Acad. Sci. Paris 176: 598-600. 1923.—Eleven species are added to the list of those in which this substance has been found. This makes a total of 17 species of indigenous orchids belonging to 5 genera, namely: *Loroglossum*, *Orchis*, *Ophrys*, *Cephalanthera*, and *Epipactis*.—*C. H. Farr.*

5944. GOTO, KIKO. The nature of the carbohydrates in the leaf, stem and tuber of *Amorphophallus Konjaku* and their variations in amount under different conditions. Jour. Biochem. Tokyo 1: 201-211. 1922.—The mature resting tubers contained 58.8 per cent mannan, 18.85 per cent starch, 0.57 per cent dextrose, and 1.2 per cent levulose. Mannan and starch are depleted together as the growth of the new plant begins, and both are found in all parts of the plant at all stages of growth. Starch wholly disappears from leaf and stalk and only a trace remains in the tuber when vigorously growing plants are placed in the dark for 2 months. Dextrose and levulose are found in the leaves and stalks in approximately equal amounts and are the only sugars found; tests for sucrose, mannose, pentose, and methyl pentose made upon stems, leaves, and stalks of growing plants invariably gave negative results.—*Joseph S. Caldwell.*

5945. HERISSEY, H., ET P. DELAUNEY. Présence dans plusieurs Orchidées indigènes de glucosides fournissant de la coumarine par hydrolyse. [Presence in several indigenous orchids of glucosides yielding coumarin on hydrolysis.] Bull. Soc. Chim. Biol. 3: 573-579. 1921.—Coumarin in the free state is not present in *Orchis purpurea* Huds., *O. Simia* Lam., or *O. militaris* L. It can be isolated from each of these after the plant has been subjected to digestion by a preparation of its own enzymes, to hydrolysis by dilute sulphuric acid, to slow drying at a low temperature, or to successive treatment with invertase and emulsin. It is accompanied by an oily substance having the characteristic odor of orchids, which interferes with crystallization. The glucoside which yields coumarin is distinct from loroglossin. No coumarin could be obtained from *Orchis maculata* L. or *O. conopsea* L.—*Joseph S. Caldwell.*

5946. IRVINE, JAMES COLQUHOUN, AND EDMUND LANGLEY HIRST. The constitution of polysaccharides. Part VI. The molecular structure of cotton cellulose. Jour. Chem. Soc. [London] 123: 518-532. 1923.

5947. KOGANEI, RYOICHI. Studies on the fatty substances of tubercle bacilli and their acid-proof staining property. Jour. Biochem. Tokyo 1: 355-364. 1922.—Successive extractions with cold and hot alcohol, ether, and acetone divided the lipid material into 3 fractions. The portion soluble in hot alcohol yielded an ether-insoluble fraction which contained phrenosin, kersin, and sphingomyelin. The acetone-soluble portion consisted principally of glycerides but no cholesterol. The ether-soluble, acetone-insoluble portion was made up of about 20 per cent of kephalin and 80 per cent of tubercle-wax closely approximating cetin in its physical properties. Each of the new constituents was tested in pure form as to its acid-proof staining properties, with the result that kephalin, whether from tubercle bacilli or from ox brain, yielded an intense acid-proof color with the Ziehl-Neilsen's stain. This was not the case with sphingomyelin, kersin, phrenosin, cetin, palmitic acid, and various glycolipins which were subjected to the test.—*Joseph S. Caldwell.*

5948. KOMATSU, SHIGERU, AND HIDENOSUKE UEDA. On the biochemical study of the ripening of the Kaki-fruit I. Chemical composition of the fruit. Jour. Biochem. Tokyo 1: 181-194. 1922.—Non-astringent and astringent varieties of *Diospyros Kaki* when examined by ordinary methods of analysis show no differences which account for the differences in astringency. The authors made a detailed examination of mature fruits of 2 astringent and 2 non-astringent varieties which were found to differ only very slightly in their sugar content. In all cases, sucrose made up less than 10 per cent of the total carbohydrate, the remainder consisting of a mixture of dextrose and levulose in which dextrose predominates. The tannin of both varieties, when prepared free from polysaccharids, reduces Fehling's solution. The pectins of sweet and astringent varieties differ very considerably in their elementary composition from each other and are to be further investigated.—*Joseph S. Caldwell.*

5949. KOMATSU, SHIGERU, AND HIDENOSUKE UEDA. On the biochemical study of the ripening of the Kaki-fruit. II. Jour. Biochem. Tokyo 2: 291-300. 1923.—The transformation of the carbohydrates during the ripening of a sweet (non-astringent) variety of persimmon known as Ansai, were studied in a series of 16 samples collected over the period Sept. 20-Dec. 7. The 1st samples were green and strongly astringent. Ripening occurred early in October, as indicated by color and flavor, while increase in weight of the fruit continued to Nov. 2. Expressed as percentages of dry matter, there is a progressive though somewhat irregular increase in total sugars from 57.36 per cent on Sept. 21 to 70.16 per cent on Nov. 15, after which there is a decrease to 63.37 per cent on Dec. 7. The curve for reducing sugars runs closely parallel with this, the figures being 56.28 per cent on Sept. 21, 66.08 per cent on Nov. 15, and 62.30 per cent on Dec. 7. Cane sugar increases from 1.08 per cent on Sept. 21 to a maximum of 5.29 per cent on Oct. 14, fluctuates between 4.94 per cent and 3.82 per cent from Oct. 16 to Nov. 15, and drops to 1.07 per cent on Dec. 7. Glucose at all times exceeds fructose, the glucose-fructose ratio being 1.62:1 on Sept. 21, rising to 1.85:1 on Oct. 3, then remaining fairly close to 1.60:1 until Nov. 15, when it drops to 1.19:1. Acidity, expressed as malic acid, was 0.94 per

cent on Sept. 21, decreasing steadily to a minimum of 0.333 per cent on Oct. 24, after which it increased again to 0.436 per cent on Nov. 15 and Dec. 7. Tannin, estimated as gallotannin, made up 4.28 per cent of the dry weight on Sept. 21, decreasing to 0.604 per cent on Oct. 10, remaining about this point to Oct. 24, when it dropped to 0.34 per cent, with a further decrease to 0.18 on Dec. 7. Polysaccharids and crude fiber make up 4.5 and 7.2 per cent, respectively, of the dry weight on Sept. 21, both decreasing somewhat irregularly to 2.44 and 5.53 per cent on Dec. 7. The yield of pentose obtained upon acid hydrolysis of the polysaccharids increased steadily up to Nov. 15, then fell off; the yield of hexoses was fairly constant up to Oct. 24, after which it steadily declined. Pectin constituted 4.9 per cent of the total dry weight on Sept. 21, increased to 6.30 per cent on Sept. 30, decreasing with irregular fluctuations to 3.03 per cent on Nov. 2, and remained practically constant after that date. Extraction of the water-insoluble residue with sodium carbonate showed that the decrease in soluble tannin was due to its conversion into a brown insoluble form. The authors "find no chemical evidence in our results to support the theory that the shibu (tannin) becomes insoluble on combining with pectin or some other substance," as Kumagai and Tozaki (Jour. Sci. Agric. Soc. Japan No. 236.360. 1922) have suggested. They regard the shibu as a phlobatannin.—*Joseph S. Caldwell.*

5950. KOMATSU, SHIGERU, HIDENOSUKE UEDA, AND MOTARO ISHIMASA. On the biochemical study of the ripening of the Kaki-fruit III. Chemical composition of the cured fruit. Jour. Biochem. Tokyo 2: 301-308. 1923.—An astringent variety of persimmon (Momidzu) was "cured" to remove astringency in each of 3 ways—by immersion in warm water, by placing in alcohol vapor, and by peeling and drying in the sun. Dry samples of a number of other astringent varieties were also examined. The white powder which collects upon the surface of the sun-dried fruits is composed of 90 per cent dextrose and 10 per cent levulose, although the 2 sugars are present in the fruit in approximately equal quantities, or with glucose slightly in excess. Sucrose was absent from the fruit cured in warm water, and present as a trace only in that cured in alcohol vapor. Sun-dried fruits contained small amounts, less than 1 per cent, of sucrose. The pectin and tannin of the dry samples of different varieties showed considerable varietal differences, being 1.4 per cent and 0.13 per cent, respectively, for the variety Dôjôhachiya, 0.48 per cent and 0.66 per cent for Oshiba.—*Joseph S. Caldwell.*

5951. KOMATSU, SHIGERU, AND HIDENOSUKE UEDA. On the biochemical study of the ripening of the Kaki-fruit IV. Chemistry of the curing process. Jour. Biochem. Tokyo 2: 309-313. 1923.—The chemical changes occurring in 3 astringent varieties of persimmon, Yakigaki, Marugaki, and Momidzu, during slow desiccation in the air were studied in comparison with samples of Momidzu "cured" (rendered non-astringent) by immersion in warm water and treatment with alcohol vapor. When Momidzu fruits containing 18.1 gm. reducing sugar in which the glucose-fructose ratio was 1.7:1 were cured in warm water [temperature and length of immersion not stated] the reducing sugar content decreased to 13.9 gm. with a glucose-fructose ratio of 1.4:1. In other samples cured in alcohol vapor [details of treatment not stated] the reducing sugar content decreased to 15 gm. with a glucose-fructose ratio of 1.5:1. The soluble tannin content of the water-cured fruit was 14.2 per cent, that of the alcohol-cured fruit 5.9 per cent, of that of the fresh fruit. Fruits of Momidzu desiccated by exposure to the air for 210 days contained only 11.3 gm. reducing sugar with a glucose-fructose ratio of 1.3:1. In the same period and under the same treatment Yakigaki lost 43 per cent of its reducing sugar and had the glucose-fructose ratio decreased from 1.5:1 to 1.1:1, while Marugaki lost 40 per cent of its sugar with an alteration of the glucose-fructose ratio from 1.6:1 to 1.4:1. That the loss of dextrose is proportionately greater than that of levulose is due primarily to the greater ease with which it is decomposed in respiration, in minor degree to the fact that the deposit of crystallized sugar upon the surface of the dried fruits is about 90 per cent dextrose. The authors ask, but do not answer, the question whether the composition of this deposit is due to a difference in the velocities of diffusion of the 2 sugars through the cell membranes or to other reasons. That the desiccated fruit is apparently sweeter than that cured by other processes is due to the larger proportion of levulose present after drying. The ripening of a non-astringent variety, Ansai [see Bot. Absts. 12, Entry 5949], and the air-drying of the astringent varie-

ties are similar in that the outstanding changes in both cases are reduction of soluble tannin by conversion to an insoluble form, decrease in acid content, and decrease of the glucose-fructose ratio.—*Joseph S. Caldwell.*

5952. LINDET, L., ET P. NOTTIN. Évolution des grains de féculé dans le tubercle de la pomme de terre. [The development of the starch grains of the potato tuber.] *Compt. Rend. Acad. Sci. Paris* 176: 149-155. 1923.—A study is made of the development of the tubers as to increase in weight, quantity of starch, and increase in dimensions of starch grains. The sugar content varies from 0.5 to 1.5 per cent of the sap. The amylogene probably contains a mixture of the sugars sucrose, invert sugar, and perhaps maltose. Soluble starch might also be expected, but it could not be detected with anhydrous Na_2SO_4 or MgSO_4 . A study is made of the individual starch grains. By measuring the diameter of grains it was possible to calculate their volume and weight, the latter through weighing a million grains of the same size. A means is described for isolating grains of a common size. The formula, $P = 3.26 R^3$, gives the weight in mgm. of a starch grain, if R is the radius of the grain in microns. It is found that over half of the grains measure from 0μ to 10μ , but these comprise only 1.53 per cent of the total weight of starch grains. Only 0.6 per cent of the grains are from 60μ to 80μ . These comprise 19.2 per cent of the total weight. The maximum size is 100μ . The starch grains are about of equal size in all parts of the mature tuber. When the tubers sprout the starch grains nearer the buds become smaller. Simultaneously the sugar content increases to 70 per cent of the sap.—*C. H. Farr.*

5953. LING, ARTHUR ROBERT, AND DINSHAW RATTONJI NANJI. The preparation of xylose from maize cobs. *Jour. Chem. Soc. [London]* 123: 620-621. 1923.—The method is described in detail. The yield of pure xylose was 10-12 per cent of the weight of cobs used.—*F. E. Denny.*

5954. MANGENOT, G. Sur l'amidon des Algues Floridées. [The starch of the red algae.] *Compt. Rend. Acad. Sci. Paris* 176: 183-185. 1923.—In general the starch of the red algae is quite constant in character. With the iodine stain it varies from brown to violaceous. The form of the grains is variable. When of average size they are irregularly polyhedral; when very long they are either concave discoid or ovoid, with hilum and rings very faint. They are found in plastids in close association with the nucleus. The distribution of starch in the tissues is discussed and also the hydrolysis of starch into sugar.—*C. H. Farr.*

5955. MIYAKE, SUGURA. Chemical studies of corn pollen. I. Isolation of phytosterol and inosite. *Jour. Biochem. Tokyo* 2: 27-32. 1922.—The present work is a continuation of earlier studies reported by the author in *Jour. Soc. Agric. and Forest. Sapporo, Japan*, in 1919 and 1921. The results of Anderson and Kulp (Analysis and composition of corn pollen. *Jour. Biol. Chem.* 50: 433-453. 1922), who reported the presence of inosite in corn pollen, are confirmed, the author having obtained the pure crystals from the alcoholic extract of pollen previously extracted with ether in sufficient quantity to make melting point, combustion, and molecular weight determinations in addition to the usual color tests. Phytosterol was obtained from the ether extract, purified by recrystallization from absolute alcohol, and identified by melting point, solubility, and the usual color reactions. The nature of the carbohydrates of corn pollen (Southern Horsetooth Dent) is under investigation.—*Joseph S. Caldwell.*

5956. SHIBATA, NAGAMICHI. Zur Frage der Fettzersetzung einiger Saprophyten. [On the question of fat decomposition by certain saprophytes.] *Jour. Biochem. Tokyo* 1: 249-260. 1922.—Ten saprophytic organisms, including *Bacillus prodigiosus*, *B. proteus vulgaris*, *B. pyocyaneus*, *B. coli communis*, *B. subtilis*, *B. mesentericus*, a staphylococcus, a streptococcus, a vibrio, and a yeast, each in pure culture, were tested as to their ability to decompose fat, 1st upon a medium containing horse flesh of known fat content, later upon a synthetic protein-free medium. The latter consisted of 5 gm. NaCl , 2 gm. K_2HPO_4 , 6 gm. ammonium lactate, and 4 gm. asparagin per l. To 50 cc. of this solution 0.5 cc. of

neutral almond oil was added. Cultures were allowed to grow for 5, 15, 25, and 30 days at 30°C., and analyzed for fat content against sterile controls. The results indicate that *B. subtilis*, *B. pyocyaneus*, *B. mesentericus*, and the yeast accomplished the destruction of 1-2 per cent of the fat of the flesh and 2-5 per cent of the almond oil, but the results were rather irregular, being in one case 3 times as great in a 5-day as in a 30-day culture. The author concludes that the differences may be due to imperfect recovery of the unaltered fat from the cultures, and that the forms studied do not require fats for their development.—*Joseph S. Caldwell.*

5957. TERROINE, EMILE F., A. FEUERBACH, ET E. BRECKMANN. *Unité de métabolisme énergétique et masse active des organismes.* [The unity of the energy of metabolism and the active mass of the organism.] *Compt. Rend. Acad. Sci. Paris* 176: 462-464. 1923.—It has always been the dominant preoccupation of physiologists to determine the causes of the differences in the energy of metabolism of living things, and to find a unit of metabolism common to all. In 1882 it was recognized that the intensity of thermogenesis is governed by that of thermolysis, which in turn is a function of the cutaneous surfaces, and may be calculated by the law of surfaces. Recent studies tend to show that the conception of the law of surfaces is erroneous. Lapique maintains that the law of surfaces cannot be explained by the requirements of heat. Voit points out a correspondence between the intensity of metabolism and the active mass of the organism consisting of albuminoid material. Moulton found that in cattle the correlation of nitrogen was not with weight of body but with the surface. Palladin, in the study of plant respiration, formulated in 1896 a law that the intensity of respiration is rigorously proportional to the indigestible nitrogen, that is, to the nucleinic nitrogen, thus showing the relationship of the nucleus to respiration.—*C. H. Farr.*

5958. VERGELOT, CH. *Application de méthode biochimique de Bourquelot a l'étude de quelques plantes de la famille des Caryophyllées et de celle des Papilionacées.* [Application of Bourquelot's biochemical method to certain members of the Caryophyllaceae and Papilionaceae.] *Bull. Soc. Chim. Biol* 3: 513-519. 1921.—Aqueous extracts of entire fresh plants, previously plunged into boiling alcohol to destroy enzymes, were subjected to the action of invertase followed by emulsin, the optical rotation and the amount of reducing sugar being determined for each solution prior to the treatment and after the action of the enzymes. Data are given for 4 members of the Caryophyllaceae, *Saponaria officinalis* L., *Stellaria holostea* L., *Lychnis githago* Lam., *Lychnis dioica* DC.; and for 7 Papilionaceae, *Anthyllis vulneraria* L., *Genista sagittalis* L., *Ononis spinosa* L., *Ervum tetraspermum* L., *E. hirsutum* L., *Lotus corniculatus* L., and *Lathyrus pratensis* L. All contain a sugar hydrolyzable by invertase, but the application of Bourquelot's index of reduction indicates that in *Saponaria officinalis*, *Genista sagittalis*, *Ervum hirsutum*, and *Anthyllis vulneraria* this is some other sugar than saccharose. All except *Stellaria holostea* contain appreciable amounts of some substance hydrolyzable by emulsin and yielding reducing sugar, but no attempt to determine its nature was made.—*Joseph S. Caldwell.*

METABOLISM (NITROGEN RELATIONS)

5960. FUENTE, CARLOS CASADA DE LA. Über das Reserve-Eiweiss in den Zellen von *Paconia*. [Reserve proteins in the cells of *Paconia*.] *Beih. Bot. Centralbl.* I Abt. 39: 352-354. Pl. 19. 1923.—Cells of root, stem, leaf epidermis, floral leaves, stamens, and fruit are shown after treatment with different substances. Many plants contain protein in solution. *Paconia albiflora* is especially favorable for the study of these proteins. Tests with caffeine, methyl green, ammonia, etc., are described.—*L. Pace.*

5961. HATTORI, GISABURO, AND SHIGERU KOMATSU. The prolamin of *Coix lacryma* L. *Jour. Biochem. Tokyo* 1: 365-369. 1922.—The alcohol-soluble protein, called coicin by Yoshimura and Sagara, was prepared in pure form by extraction of the finely ground kernels with

80 per cent alcohol, precipitating the concentrated extract with water, and repeating the solution and precipitation 4 times. The analysis of this product gave the following percentages: glutamic acid, 20.65; leucin, 4.10; tyrosin, 1.46; arginin, 0.20; histidin, 1.88; and lysin, 0.76. The prolamin consequently resembles that of oats more closely than those of other grains.—*Joseph S. Caldwell.*

5962. MIYAKE, KOJI, AND S. SŌMA. Further studies of the nature of nitrification. *Jour. Biochem. Tokyo* 1: 123-129. 1922.—K. Miyake has previously presented evidence (On the Nature of Ammonification and Nitrification. *Soil Sci.* 2: 481-492. 1916, and Further Studies of the Nature of Ammonification. *Ibid.* 4: 321-325. 1917) that the processes of ammonification and nitrification in soils are autocatalytic monomolecular reactions and that the increase of ammonia and nitric acid can be expressed by formulae. The present study reports results of experiments on nitrification of ammonium sulphate in air-dry soil kept at a moisture content equal to 6 per cent of its water-holding capacity in a 30°C. incubator. Nitric nitrogen and ammonia nitrogen were determined at 3-day intervals over a 35-day period. The results for increase of nitric acid agree closely with those calculated from the formula $\log x - \log (A - x) = K(t - t_1)$, in which x is the amount of nitrogen as nitric acid produced in the time t ; A , the total amount produced in the process; and t_1 , the time in which half the total amount is produced. The decrease of ammonia nitrogen is also expressed by the formula $\frac{\log (A - x)}{\log (x - a)}$ $= (A - a)Kt - K$, in which x is the amount of nitrogen in the form of ammonia at the end of time t ; A and a , the original and the final amount of ammonia; and K and K_1 , constants. The process of diminution of ammonia compounds in soils is an autocatalytic chemical reaction.—*Joseph S. Caldwell.*

5963. SASAKI, TAKAOKI. Über die Bildung der Anthranilsäure aus l-Tryptophan durch Subtilisbakterien. [Formation of anthranilic acid from l-tryptophan by *Bacillus subtilis*.] *Jour. Biochem. Tokyo* 2: 251-254. 1923.—In earlier work [Sasaki, T., and I. Otsuka, *Biochem. Zeitschr.* 121: 167-170. 1921] it was found that *Bacillus proteus* could convert l-tryptophane into l-indol-lactic acid. Employing similar cultural methods with cultures of *Bacillus subtilis* allowed to grow for 40 days in a medium containing 2 gm. l-tryptophane, anthranilic acid, the optical antipode of indol-lactic acid, was formed in sufficient quantity (0.63 gm.) to permit of its identification by determinations of melting point and elementary composition. Its isolation from the end products was accomplished by distillation of the contents of the culture flask after adding alcohol, taking up the residue with water, acidifying the filtrate with phosphoric acid, shaking out with ether, separating the acid constituents from the ether extract by shaking out with $\frac{7}{8}$ NaOH, neutralizing with H_2SO_4 , filtering with charcoal, and adding saturated $CuSO_4$ solution to the filtrate. The precipitate was washed with water, the copper removed with H_2S , and the solution extracted with ether in a Kumagawa-Suto extraction apparatus. Anthranilic acid crystallized out of the ether extract as it was evaporated down. The filtrate from the precipitate with $CuSO_4$ contained a trace of a substance precipitable by basic copper acetate, but the amount was too small to permit identification.—*Joseph S. Caldwell.*

5964. YOSHIMURA, KIYOHISA. Beiträge zur Kenntnis der stickstoffhaltigen Bestandteile der Chayote (Hayato-uri). [The nitrogenous constituents of Chayote.] *Jour. Biochem. Tokyo* 1: 347-351. 1922.—The fresh fruit of the Chayote (*Sechium edule*) contained 4.027 per cent of dry substance. The dry substance contained 2.602 per cent nitrogen, of which 59.99 per cent was protein nitrogen. 20 kgm. of fresh fruit yielded traces of adenin and cholin, 0.7 gm. arginin, and about 0.5 gm. guanidin.—*Joseph S. Caldwell.*

METABOLISM (ENZYMES, FERMENTATION)

5965. AVERSENQ, J. P., L. JALOUSTRE, ET E. MAURIN. Sur quelques actions du thorium X sur les diastases et les microbes. [Certain effects of thorium X on diastase and microbes.] *Compt. Rend. Acad. Sci. Paris* 176: 193-195. 1923.—A report is given of the effect of this material on the action of ptyalin, pancreatic amylase, amylase of germinating rice, emulsin,

ammoniacal fermentation, oxydase of the blood, oxidising ferments of saliva, and certain bacteria. In general it is found that thorium X activates these processes of hydrolysis and oxidation.—*C. H. Farr.*

5966. BRIDEL, MARC. *Action de l'emulsine des amandes sur le lactose en solution dans alcool ethylique a 85°.* [Action of almond emulsin upon lactose in 85 per cent ethyl alcohol.] Bull. Soc. Chim. Biol. 3: 533-538. 1921.—Emulsin was allowed to act for 25-70 days at room temperature, or at 40°C., upon a dilute solution of alcohol. The action ceased when 50 per cent of the lactose had been combined. B-ethylgalactoside and galactose were crystallized out of the products of the reaction and identified by their optical rotation and crystalline form. The lactose present in emulsin is therefore able to act in the presence of 85 per cent ethyl alcohol. The reaction is complex and it could not be determined, under the conditions of the experiment, whether lactose is first split into galactose and dextrose and these respectively combined with ethyl alcohol by galactosidase and glucosidase to form ethylgalactoside and b-ethylglucoside, or whether ethyllactoside is first formed and subsequently hydrolysed to form these 2 products.—*Joseph S. Caldwell.*

5967. BRIDEL, MARC. *Action de l'emulsine sur le galactose en solution dans des alcools propyliques de differents titres.* [Action of emulsin upon galactose in solution in various concentrations of propyl alcohol.] Bull. Soc. Chim. Biol. 3: 498-506. 1921.—Bourquelot and Hérissé established the fact that emulsin from almonds synthesizes b-propylgalactoside when allowed to act at room temperature upon an aqueous solution containing 1 per cent galactose and 20 per cent propyl alcohol. Bridel employed constant quantities of galactose and emulsin in varying concentrations of propyl alcohol, allowing the action to continue 113 days at 30°C., and found that there was little synthesis in the lower concentrations, the amount increasing with increase in concentration up to 45 per cent, where it was less than at 35, then increasing again up to 75 per cent. The enzyme rather rapidly loses its activity when kept in propyl alcohol of less than 45 per cent strength at 30°C., but maintains its activity in alcohol of higher concentrations. At ordinary temperatures activity is little affected whatever may be the strength of alcohol employed, but the synthesis goes on so slowly that the attainment of equilibrium may require months or years.—*Joseph S. Caldwell.*

5968. GORIS, A., ET P. COSTY. *Sur l'urease des Champignons.* [On the urease of fungi.] Compt. Rend. Acad. Sci. Paris 176: 412-414. 1923.—Urease, the hydrolysing ferment of urea, is obtainable from bacteria, fungi, and certain families of phanerogams, the legumes in particular. It is here studied from *Boletus edulis*. It is destroyed at 76°C., and has an optimum temperature of 30-38°C. A study is made of the effects of various inorganic and organic acids, also alkalies, neutral salts, and antiseptics.—*C. H. Farr.*

5969. GRAZEWSKA, MME. Z. *L'action des diastases sur la Laminarine.* [Action of enzyme upon laminarin.] Bull. Soc. Chim. Biol. 3: 490-497. 1921.—The polysaccharid laminarin was obtained from *Laminaria flexicaulis* by repeatedly extracting the dried, pulverized material with boiling water, removing mucilaginous impurities with mercuric nitrate, filtering, removing mercury with H₂S, concentrating, and precipitating with alcohol. Aqueous solutions do not reduce Fehling's solution and are not precipitated by lead acetate or subacetate, though the latter precipitates in ammoniacal solution. Under certain conditions of temperature and concentration, aqueous solutions precipitate spontaneously. Hydrolysis for $\frac{1}{2}$ hour at 120° with 5-6 per cent HCl yielded dextrose equalling 97.5-98.5 per cent of the laminarin used. Pancreatic juice and gastric juice of the dog, as well as a preparation of invertase made from the intestinal mucosa of the dog, and emulsin were without action upon laminarin. Vegetable amylase and invertase in slightly acid solution converted it into dextrose rather slowly, a mixture of equal parts of the 2 acting twice as rapidly as an equivalent amount of either separately. Taka-diastrase was somewhat more active, and an extract of *Helix pomatia* still more so. No trace of maltose was found in the products of digestion.—*Joseph S. Caldwell.*

5970. HARTER, L. L., AND J. L. WEIMER. Amylase in the spores of *Rhizopus Tritici* and *Rhizopus nigricans*. Amer. Jour. Bot. 10: 89-92. 1923.—An enzyme (amylase) capable of hydrolyzing potato starch paste is produced in the spores of these 2 species. Results indicate that the enzyme is produced in the spores regardless of the temperature at which they are grown, nor does the amount of enzyme seem to be correlated with the temperature to which the organism has been subjected. The enzyme produced by the mycelium has a higher hydrolyzing power than that in the spores.—E. W. Sinnott.

5971. MCGUIRE, GRACE, AND K. GEORGE FALK. Studies on enzyme action XXIII. The spontaneous increase in sucrose activity of banana extracts. Jour. Amer. Chem. Soc. 45: 1539-1552. 1923.—During a study of banana sucrose, conditions arose where its action showed a spontaneous increase of considerable magnitude. The state of ripeness proved to be one factor. Also, this increase was more rapid at higher temperatures. The solutions used for the extraction were not a factor nor was the H-ion concentration a factor in increasing the hydrolysis.—J. M. Brannon.

5972. MAYEDA, MINORU. Preliminary communication on mannanase and laevidulinase. Jour. Biochem. Tokyo 1: 131-137. 1922.—Cultures of 17 saprophytic bacteria were tested as to their ability to liquefy Konjak-mannan (prepared from *Amorphophallus Konjaku*, extensively used in the Japanese dietary). Four forms, *B. mesentericus vulgatus*, *B. mesentericus fuscus*, *B. mesentericus flavus*, and *B. leptosporus*, were able to liquefy mannan but no mannose was formed. The product of bacterial action is a trisaccharid which is hydrolyzed by mineral acids to mannose and glucose, and which the author names laevidulin. Fifteen species of fungi including *Penicillium glaucum*, *Verticillium glaucum*, *Monilia candida*, *M. javonica*, *Charla mycoderma*, and 10 species of *Aspergillus*, were tested as to their action upon Konjak. Nine of these—*Penicillium glaucum* and 8 species of *Aspergillus*—were able to liquefy mannan, but no mannose was formed. When cultures of these forms were dried, ground, and added to a medium containing either Konjak or laevidulin, mannose formation occurred, especially in the case of *Aspergillus niger* and *A. albus*. There are consequently 2 enzymes concerned in the process, a mannan-liquefying enzyme, mannanase, which forms laevidulin, and an enzyme which splits laevidulin to mannose, for which the name laevidulinase is proposed. Of various commercial diastase preparations examined, "digestin" and "enddiastase," both made from plant materials, contain both enzymes, while diastases of animal origin do not contain laevidulin. The mannan-liquefying enzyme diffuses through a collodion capsule, laevidulinase does not.—Joseph S. Caldwell.

5973. MIYAKE, KOJI, AND MITSUJI ITO. On lethal temperature of Koji-diastase in aqueous solution and the recovery of its action after heating. Jour. Biochem. Tokyo 2: 255-270. 1923.—An aqueous extract of Koji (polished rice infected by *Aspergillus Oryzae*) containing 1.0115 per cent solids was used. Portions of this were heated for various periods up to 120 minutes at temperatures from 25 to 145°C. and were then tested for power to saccharify soluble starch, the digestion continued 100 hours at 38°C. under toluene. The amount of sugar formed was determined after 1, 5, 15, 25, 50, and 100 hours. Heating to 40°C. for 2 hours, or to 55, 70, 85, or 100°C. for periods ranging from a few seconds to 1 hour decreased but did not wholly prevent diastatic activity. The diminution in activity became greater with increase in temperature, and in the case of any particular temperature it was roughly proportional to the time the heating was continued. A solution heated to 115°C. for 15 minutes or less retained some saccharifying power, but was inert when the time of heating was 30-60 minutes; one heated to 130 or 137.5°C. for "an instant" still showed traces of activity but was inert if the heating was continued 5 minutes or more. Even momentary heating to 140°C. or higher completely destroyed activity. The degree of injury is consequently a function of temperature and time of heating. In the study of recovery of activity after heating, various portions of the solution were heated to differing temperatures for various time intervals, cooled, and kept under toluene at room temperature for periods of 25-480 hours prior to testing. The activity of each of these was checked against a portion of the solution heated to the same temperature for the same time

immediately before the test. In every case in which the temperature and time of heating were insufficient to wholly destroy diastatic activity, the activity gradually increased after the solution had been allowed to stand in an amount proportional to the time allowed to elapse, but the recovery was in every case very imperfect. If the temperature and time of heating were such as to totally destroy activity, there was no recovery. Whether recovery is due to the formation of new enzyme from a mother substance present in the extract or to a true recovery of diastatic action after temporary loss cannot be definitely determined from these experiments, though the authors favor the assumption that it is a true recovery.—*Joseph S. Caldwell.*

5974. THOMAS, ARTHUR W., AND F. L. SEYMOUR-JONES. The hydrolysis of collagen by trypsin. *Jour. Amer. Chem. Soc.* 45: 1515-1522. 1923.—It is commonly stated that trypsin does not attack collagen unless it has been pre-treated with acids or alkalis, or shrunk in water at 70°C., or treated with pepsin. The authors found that trypsin attacked collagen. The optimum reaction is pH 5.9. A pre-treatment with acid does not affect the tryptic digestion. The rate of hydrolysis increases with a decrease in the size of the collagen particles and an increase in the concentration of the enzyme.—*J. M. Brannon.*

METABOLISM (RESPIRATION, AERATION)

5975. CHRISTIANSEN, M. En simpel methode til Dyrkning af anaerobe Bakterier under Pyrogallol. [A simple method for growing anaerobes under pyrogallol.] *K. Vet. og Landbohøjskoles Aarsskr.* 1923: 52-61. *Fig. 1-2.* 1923.—Common agar or bouillon tubes, or even culture media in 250 cc. flasks, are boiled, then the cotton plugs are flamed and pushed a little downwards in the tubes. Absorbent cotton wet with pyrogallol is placed in a short tube connected with the culture tube by means of a rubber tube 25 mm. long. When the tubes are without rims the application is easy if the rubber tubing is wetted. By this method the culture glass is kept free from pyrogallol, the tube may be opened, and the pyrogallol may be renewed.—*Ernst Gram.*

5976. MAQUENNE, L. A propos d'une Communication récente de MM. P. A. Dangeard et Pierre Dangeard. [Concerning a communication of Messrs P. A. and Pierre Dangeard.] *Compt. Rend. Acad. Sci. Paris* 176: 205-207. 1923.—This paper contains a statement of appreciation of the contribution made by the authors named in their paper [see *Bot. Absts.* 12, Entry 5922]. The physiological significance of the discovery is discussed. It is pointed out that it is possible only if the respiratory quotient is at least equal to 1. It is stated that the relationship between photosynthesis and respiration in this connection is yet to be studied.—*C. H. Farr.*

5977. POPOFF, METHODIE. Sur le système respiratoire des plantes. [The respiratory system of plants.] *Compt. Rend. Acad. Sci. Paris* 176: 594-596. 1923.—It is generally recognized that the leaf is well adapted for respiration, since the diffusion of oxygen may take place from the external air and also from the intercellular spaces as a result of the process of photosynthesis. The mechanism affording aeration of the stem and roots, especially of trees, seems to be quite insufficient. The difficulty, however, disappears, if it is admitted that plants have a respiratory system analogous physiologically to that of animals. The salts of Mg, Mn, K, Ca, and Fe are found in the blood serum of animals, even of the invertebrates which have no blood corpuscles or haemoglobin. These same minerals circulate in the vessels of plants. The roots of plants take in $MgSO_4$, KCl , KNO_3 , $NaCl$, $CaSO_4$, $CaH_4(PO_4)_2$, $Fe_3(PO_4)_2$, etc., in solution. The oxygen absorbed in this solution is transported to the roots, trunk, and branches of the plant. This circulation is assured by the incessant transpiration of the leaves. In turn the water of the stream is charged with CO_2 from the cells which take up the oxygen. This CO_2 is carried to the leaves and discharged or used in photosynthesis. In the leaves the water is again charged with oxygen and descends in the tubes of the phloem. The ascending and descending currents are connected by the medullary rays which correspond to the capillaries of animals.—*C. H. Farr.*

5979. GARNER, W. W., AND H. A. ALLARD. Further studies in photoperiodism, the response of the plant to relative length of day and night. *Jour. Agric. Res.* 23: 871-920. *Pl.* 1-19. 1923. —Trials with many kinds of plants, in addition to those previously studied [see *Bot. Absts.* 5, Entry 22], demonstrate the importance of the seasonal range of length of day as a factor in initiating and regulating both sexual and asexual reproduction in plants. Observations are reported on length of day as a factor in the character and extent of branching, in root growth, in pigment formation, in abscission and leaf fall, in dormancy, and in rejuvenescence. Apogeotropic growth—increase in stature as affected by the daily light period—is given detailed consideration in its apparent relation to flowering, fruiting, and the other responses mentioned. —From the more general aspects of the problem it appears that the degree of hydration of the living cell is subject to very delicate regulation by change in the ratio of the number of hours of light to the number of hours of darkness. Regardless of its actual causative significance, hydration is subject to definite regulation by length of day, and change in the degree of hydration is definitely correlated with change in form of expression in the plant.—*D. Reddick.*

GROWTH, DEVELOPMENT, REPRODUCTION

5984. CREMIEU, V. La croissance de végétaux et les principes de la physique. [The growth of plants in relation to physical principles.] *Compt. Rend. Acad. Sci. Paris* 176: 263-265. 1923.—This paper is a consideration of the work done in growth, in the lifting of the plant against gravity. It is calculated that 125 kgm. of oat seed planted on a hectare of ground, lift during their development into mature plants 1500 kgm. of seed and 3000 kgm. of straw to a height of 0.6 m. It is held that the growth of the stem is due to an action characteristic of the interior of the initial cells and independent of the weight of the cells. This action is discontinuous and is directed by the resultant of the field which controls the interior of the cell, without distinguishing between the field of gravity and the field of inertia. It is calculated

that the work done by a young stem of corn or onion per second is about 0.03 erg. The emission of segments of the meristem is compared to the emission of alpha rays from a radioactive atom, and it is said to correspond to a certain value of the turgescence of the cell.—*C. H. Farr.*

5985. HUNTER, C., AND E. M. RICH. Laboratory note. An apparatus for the measurement of stem elongation. *New Phytol.* 22: 44-47. 2 fig. 1923.—By the use of the spherometer with an electrical recording device, growth increments of 0.005 mm. were measured. The method is applicable to *Impatiens* and similar plants in which a leaf axil close to the growing point may be used to support the vertical glass tube employed in the apparatus.—*I. F. Lewis.*

5986. PRIESTLEY, J. H., AND J. EWING. Physiological studies in plant anatomy. VI. Etiolation. *New Phytol.* 22: 30-44. 1923.—If the environments of root and stem are reversed experimentally, little structural modification is seen in the root, but in the stem the great structural modifications known as etiolation appear. Of the various types of etiolation known, the common one shown by *Vicia Faba* and the potato are here considered. Under conditions normal to the root, the stem apex resembles in its development the root. The apical meristem remains relatively impermeable to nutrient sap. Meristematic tissue active in growth is found below the persistent "plumular hook." The rudiments of the lateral leaves and axillary branches therefore fail to develop further. Another consequence of the changed meristematic development is the production of a functional primary endodermis in the stem. To the presence of this endodermis may be attributed in part the reduced cortical development of the stem. Owing to the depression of transpiration extension goes on in an etiolated plant equally by day and night. The experiments cited do not support the hypothesis that elongated growth in etiolation is due to the absence of a growth inhibiting secretion formed by the chloroplasts in the light.—*I. F. Lewis.*

5987. PRIESTLEY, J. H., AND LETTICE M. WOFFENDEN. Physiological studies in plant anatomy. V. Causal factors in cork formation. *New Phytol.* 21: 252-268. 1922.—Experiments with *Begonia* show "that periderm formation involves two processes, first a suberization which seals the injured surface, secondly a meristem formation which follows upon the accumulation of sap at the injured surface." The effect of sap pressure in the formation of meristem is shown by the behavior of cut leaves of *Prunus Laurocerasus* and *Camellia japonica* when supplied with water under a pressure of about 10 cm. of mercury. In this case meristem formed around the cut in less than 2 weeks, while in similar leaves standing in water there was no meristem formation. The preliminary suberization that usually blocks a parenchymatous surface prior to the formation of phellogen is shown to depend primarily upon air. These considerations apply not only to wound cork formation, but also to the scar left at leaf fall and to natural cork formation. They also serve to explain certain "special cases, such as the general absence of periderm formation in the cortex of roots, in the axes of aquatic plants, and in leptosporangiate ferns."—*I. F. Lewis.*

5988. REED, ERNEST. Hypothesis of formative stuffs as applied to *Bryophyllum calycinum*. *Bot. Gaz.* 75: 113-142. Fig. 1-10. 1923.—A summary of previous work on growth correlation is given. The author presents a series of 10 experiments, 2 of which will be given here. An experiment yielding evidence against the "inhibiting factor" theory is as follows: A leaf removed from the plant and thereby cut off from the influence of any inhibiting force, when placed in an upright position in moist sand, did not in 6 months produce any plantlets from the notches. In another experiment portions of several leaves were placed in contact with moist sand, and those notches which were in contact with the substratum were the ones which produced plantlets, no evidence being found to substantiate Loeb's theory of an "available formative stuff" as the controlling factor. From all of his experiments the author deduces the following: "The growth of the foliar shoots in *B. calycinum* is possible only from the performed buds in the notches of the leaf. When these *Bryophyllum* plants are growing under normal conditions the buds in the leaves lie dormant. There are no indications that this dormancy is due to the fact that these units are deprived of formative stuffs or specific substances, the avail-

ability of which would cause their germination. The plant or any organ of the plant does not exert an inhibiting influence over these meristematic units. The dormancy or the germination of these units is an expression of the metabolic condition of the organ of which they are a part. The germination of these units is probably due to physical and chemical changes within the organ of which they are a part. Any factor or group of factors working together which set up this series of changes are indirectly responsible for the growth of the foliar plantlets or those from the axillary buds. One of the conditions which starts the growth from the meristematic units of the leaf is very moist air or water in contact with the leaf. The absence of light also brings about a condition which starts this growth."—*B. W. Wells.*

5989. REED, H. S. A note on the statics [statistics] of cyclic growth. *Proc. Nation. Acad. Sci. [U. S.]* 9: 65-67. 1 fig. 1923.—During their 1st season's growth, 79 apricot branches reached a mean length of 235.95 cm. and produced lateral shoots averaging 37 in number and about 7 times the length of the main branch in total length. The lateral shoots were typically produced in 3 groups, in which number and size of lateral decreased distally along the main axis. The numerical relations were closely approximated by 3 overlapping curves derived from the differential equation of growth, $Z = dy/dx = ky (A - y)$. It is concluded that the length of each lateral and the size of each group is a function of position on the main branch, and that the decreasing size of cycles suggests clamped oscillations.—*Howard B. Frost.*

MOVEMENTS OF GROWTH AND TURGOR CHANGES

5990. CHOLODNYJ, N. Über den Einfluss der Metalle auf den Geotropismus der Wurzeln. [The influence of metals on the geotropism of roots.] *Beih. Bot. Centralbl. I Abt.* 39: 239-256. 1923.—The experiments show that the ions of alkali metals and alkaline earths influence considerably the bendings of roots. It is highly probable that these ions play an important part in the mechanism of the geotropic reaction.—*L. Pace.*

5991. SAXTON, W. T. Autonomous movements in *Eleiotis sororia* DC. *Jour. Indian Bot.* 3: 72-78. 2 fig. 1922.—The lateral leaflets of *Eleiotis sororia*, a plant of northern Bombay Presidency, exhibit movements similar to those of *Desmodium gyrans*. The tip of a leaflet describes an "ellipse," the long axis of which is an arc of about 140°. The period of revolution is about 2 minutes. Synchronously with its other movements the leaflet rotates about 45° on its own axis. Movement parallel to the petiole and rotation of the leaflet on its own axis are brought about by the distal end of the petiolule, while rotational movement about the petiole is due to curvature at the proximal end of the petiolule.—*Winfield Dudgeon.*

5992. SAXTON, W. T. Some observations and suggestions regarding "nyctinasty." *Jour. Indian Bot.* 3: 127-142. 1 pl. 1923.—The author describes observations on "sleep" movements of 31 plants (4 Euphorbiaceae, 23 Leguminosae, *Abutilon indicum* Sweet, *Triumfetta rhomboidea* Jacq., *Thespesia populnea* Soland, and *Achyranthes aspera* L.), all but 1 of which are found abundantly at Ahmedabad, India. Characteristic "sleep" positions of the leaves are described and figured. Most of them are referable to one or another of Kerner's 3 types. In a few plants the movements from day to night position and back are described in detail. In the majority of cases folding and unfolding require about 40-45 minutes each for completion, and are carried out while the sun is up.—After dismissing earlier theories, which seem to assume that the expanded or day position is the normal one, the author proposes the theory that "the night and not the day position is that 'normal' to plants, and that therefore there is no such thing as 'nyctinasty.'" The movement so-called is merely the return of the plant to its normal position after the stimulus is withdrawn which keeps it during the day in another position, regarded here as one of physiological strain. Those plants in which such movements are not seen either have a normal position suited to their daylight requirements, or have not sufficient 'elasticity' to return to the normal position after once departing from it."—*Winfield Dudgeon.*

GERMINATION, RENEWAL OF ACTIVITY

5993. BLOMQUIST, H. L. Dormancy in seed of persimmon (*Diospyros virginiana*). Jour. Elisha Mitchell Sci. Soc. 38: 14. 1922.—The seed have normally a resting period not definitely determined, but apparently lasting from 2 to several years. This was found to be due mainly to a layer of the seed covering which caps the radicle and decreases water absorption. When this cap was removed, 100 per cent germination was secured.—W. C. Coker.

5994. BRANDTS, P. De kieming der zaden. [Germination of seed.] Natuurw. Tijdschr. 4: 233-234. 1922.—“Germination” is usually considered as the emergence of the tip of the root. The writer, however, takes the view that germination takes place when the 1st new divisions occur in the formative region of the root.—J. C. Th. Uphof.

5995. HARRINGTON, GEORGE T. Use of alternating temperatures in the germination of seeds. Jour. Agric. Res. 23: 295-332. 20 fig. 1923.—Seeds of carrot (*Daucus carota*), parsley (*Petroselinum hortense*), timothy (*Phleum pratense*), awnless brome grass (*Bromus inermis*), *Lolium perenne*, *L. multiflorum*, *Festuca elatior*, *Impatiens balsamina*, *Eschscholzia californica*, *Iberis amara*, *Cosmos bipinnatus*, *Kochia scoparia*, *Delphinium ajacis*, *Calendula officinalis*, *Reseda odorata*, *Tropaeolum majus*, *T. inermis*, *Viola tricolor*, *Petunia hybrida*, *Dianthus chinensis*, *Papaver* spp., *Portulaca grandiflora splendens*, *Antirrhinum majus*, *Lathyrus odoratus*, and *Zinnia elegans* germinate nearly or quite as rapidly and completely at favorable constant temperatures as with any alteration of temperatures.—Seeds of *Agrostis palustris*, *Dactylis glomerata*, *Poa pratensis*, *Capriola dactylon*, *Pastinaca sativa*, *Celeri graveolens*, and *Holcus halepensis* require an alteration of temperatures for best germination.—A study of temperature changes in incubators leads to the conclusion that for testing seeds that require alternation of temperatures it is better to use 2 incubators and move the seeds than to depend upon changing the temperature in a single incubator.—D. Reddick.

5996. MUTTERLEIN. Kartoffel-Keimversuche. [Experiments in the sprouting of potatoes.] Illus. Landw. Zeitg. 43: 102-103. 1923.—Experiments are given demonstrating the effects of darkness, temperature, moisture, and cutting on the sprouting of potato tubers.—John W. Roberts.

5997. SEMPERS, J. FORD. Vitality of canna seeds. Amer. Bot. 29: 57-60. 1923.—A few observations were made on the durability of seed coats, especially those of canna.—S. P. Nichols.

TEMPERATURE RELATIONS

5998. BURKE, GEORGINA S. Studies on the thermal death time of spores of *Clostridium botulinum*. 2. The differential staining of living and dead spores. Jour. Infect. Diseases 32: 433-438. Fig. 1. 1923.—Heat increased the permeability of spores of *Clostridium botulinum* to carbol-fuchsin; dead spores stained solid while living spores did not. The amount of heat necessary to bring about the change in permeability varied with the individual spores. The differential penetration of the dye into living and dead spores suggested a rapid method of determining their proportional abundance in cultures.—R. L. Starkey.

TOXIC AGENTS

5999. CHOLODNYJ, N. Zur Frage über die Beeinflussung des Protoplasmas durch mono- und bivalente Metallionen. [The influence of mono- and bivalent metal ions on protoplasm.] Beih. Bot. Centralbl. Abt. 39: 231-238. 1923.—The root hairs of *Trianea bogotensis* were used because of their large size and rich plasma content and the movement of the cytoplasm. KCl, CaCl₂, BaCl₂, NaCl, MgSO₄, LiCl, and MnCl₂ were used.—The author concludes that the ions of all alkali metals possess a more or less positive toxicity which is evident in changes in the consistency of the protoplasm, in the slowing and even complete stopping of plasma movement with, finally, the death of the protoplasm. The toxicity of these substances is not identical.

K and NH_4 salts are more toxic than Na salts. The ions of the alkaline earths and of other bivalent metals are also poisonous, with the possible exception of Ca. But they furnish a more or less evident protection against injury from the monovalent ions of metals.—*L. Pace.*

6000. JANKE, ALEXANDER. *Die Bekämpfung der Kahl Organismen und ihre Bedeutung für die Konservenindustrie.* [The control of the zooglea-forming organisms and their relation to the canning industry.] *Centralbl. Bakt. II Abt.* 56: 1-7. 1922.—The use of allyl-mustard oil proved very effective in controlling the zooglea-forming organisms, which are very often destructive to acid preserves such as tomatoes, sour kraut, etc.—*Anthony Berg.*

6001. KUSONOKI, MICHIO. *On the bactericidal action of hydrosol of silver.* *Jour. Biochem. Tokyo* 1: 381-388. 1922.—*Bacillus coli communis* was employed as the test organism. The dialysates obtained by dialyzing silver sols against distilled water in contact with air or O_2 had high bactericidal power which was abolished by addition of traces of NaCl, thus indicating that the silver ion is the active agent. Dialysates made in an atmosphere of H_2 or CO_2 had practically no bactericidal properties. The author considers that in O_2 or air the silver hydrosol oxidizes to silver oxide, which dissociates, giving the silver ion as the active agent. In the air, silver carbonate, which dissociates more easily than the oxide, is formed by reaction with CO_2 . Bactericidal activity is almost independent of the concentration of the colloidal silver hydrosol provided that there is free access of air, so as to permit the setting free of the silver ion.—*Joseph S. Caldwell.*

6002. MORI, GENSICHI. *A preliminary note on the inhibitory action of the salts of silver and some other heavy metals on amylase.* *Jour. Biochem. Tokyo* 2: 117-129. 1922.—Silver as the nitrate, chloride, and bromide, gold chloride as sodium chloraurate, copper sulphate, and lead acetate were studied as to their inhibitory effect upon formation of maltose from soluble starch by malt diastase. The results do not agree with the conclusion of U. Olsson (*Hoppe-Seyler's Zeitschr. Physiol. Chem.* 114: 51-71. 1921) that the decrease of amylolytic activity is directly proportional to the amount of silver salt added. Working with concentrations of 6×10^{-8} mol or less, the inhibitory action is a constant function of the concentration of the metal; with higher concentrations there is no agreement. The results indicate that there may be a well defined relation between concentration of enzyme and concentration of salt. When the amount of added silver salt is large, the action of the enzyme is directly proportional to the square of the amount of enzyme solution in cc. and inversely proportional to the square of the amount of salt solution in cc. An equation is developed to represent the relation between the concentration of enzyme and metal and the degree of inhibition which agrees fairly well for the experimental data presented for the metals studied. This equation is based upon the assumption that metals depress enzymic activity by formation of a definite metal-enzyme compound. The fact that the activity of a diastase preparation inactivated by AgNO_3 can be restored by addition of H_2S is regarded as bearing out this assumption. The strengths of inhibitory action of silver, gold, copper, and lead stand in the ratio of $1 : \frac{1}{18} : \frac{1}{30} : \frac{1}{1400}$.—*Joseph S. Caldwell.*

6003. NICOLAS, E., ET G. NICOLAS. *L'influence de l'hexaméthylènetétramine et de l'aldéhyde formique sur la morphologie interne et sur le chimisme du haricot.* [The influence of hexamethylenetetramine and of formaldehyde on the internal structure and chemical composition of beans.] *Compt. Rend. Acad. Sci. Paris* 176: 404-407. 1923.—Recently the authors have shown [see *Bot. Absts.* 12, Entries 4595, 4596] that hexamethylenetetramine and formaldehyde added in small amounts to Knop's nutrient media are used as food by beans. The present study is undertaken to find whether these substances have an anatomical effect. A concentration of 0.01-0.025 per cent of hexamethylenetetramine clearly favors the development of secondary wood, which is more abundant and more lignified, as indicated by treatment with phloroglucine, in the treated than in the control. Cells of the pericycle are more differentiated, with walls thicker than in controls. A concentration of 0.05 per cent which is still not toxic, also increases the development of wood and the differentiation of the pericycle, but not to so

marked a degree as in the lower concentrations. A higher concentration induces an abundant growth of epidermal hairs. The lower concentrations favor the deposition of starch in the stem at the periphery of the pith, while a concentration of 0.0321 per cent facilitates the deposition of starch in the root. It is concluded that these results favor the formaldehyde theory of photosynthesis.—C. H. Farr.

6004. VILLEDIEU, G., ET MME. [G. VILLEDIEU]. Action des oxydes insolubles sur le mildiou de la pomme de terre (*Phytophthora infestans*). [The effect of insoluble oxides on *Phytophthora infestans*.] Compt. Rend. Acad. Sci. Paris 176: 534-536. 1923.—It has previously been shown by the authors [see Bot. Absts. 9, Entry 529] that *Penicillium* and *Mucor* are prevented from growing by certain substances, such as the oxides of copper and cadmium, which are practically insoluble. It is now undertaken to study the germination of the conidia of *Phytophthora infestans* in the same way. Drop cultures were observed continuously under the microscope. The solution was prepared by leaving an excess of the oxide in doubly distilled water for 24 hours, and then filtering. Three types of cultures were employed: in 1 this filtrate was used; in the 2nd there was added to the filtrate a little of the solid oxide; and in the 3rd a long drop was made in 1 end of which some of the solid oxide was placed. Conidia were sown throughout each drop. In the 1st case the conidia form active zoospores, which in turn germinate. In the 2nd nothing developed, or, if a zoospore did escape, it immediately died without germinating. In the last case the zoospores were formed and developed normally in the end of the drop in which there was no precipitate, but in the end in which the oxide was placed, nothing remained alive. The oxides used were red oxide of mercury, black oxide of copper, zinc oxide, cobalt oxide, cadmium oxide, and magnesium oxide—which becomes the hydrate in water. It is concluded that the toxicity is due to the basic nature of the oxides, for if the oxides are neutralized with acids the mildew develops. It also develops in solutions of Bi_2O_3 , Fe_2O_3 , Al_2O_3 , Cr_2O_3 , Pb_2O_4 , MnO_2 .—C. H. Farr.

6008. ANONYMOUS. Weeds steal soil moisture. Associated Grower 5*: 7. 1923.—The author quotes Thomas F. Hunt's statement concerning the work of F. J. Veihmeyer and A. H. Hendrickson on soil moisture conservation in California. Their experiments show that

no significant saving of moisture results from cultivation of the soil, provided all weed growth is kept down by surface hoeing. Cultivation on the farm is essential, however, as the only practical means of controlling weed growth. The experiments in California are confirmed by field experiments in Kansas.—*E. L. Overholser.*

6009. CHARDÓN, CARLOS E. *Estudio preliminar sobre la amonificación y nitrificación de los terrenos de Puerto Rico.* [Preliminary studies on the ammonification and nitrification in Porto Rican soils.] *Rev. Agric. Puerto Rico* 61: 37-46. 1921.—The author, from a series of laboratory experiments, concludes that the addition of lime to the typical heavy red soil of Porto Rico is desirable since it aids in nitrification. This holds true whether or not organic nitrogenous fertilizers are applied.—*John A. Stevenson.*

6010. CHRISTENSEN, H. R. *Den kemiske Jordbundsanalyse.* [Chemical soil analysis.] *Ugeskr. Landm.* 67: 393-396. 1923.—This is a review of a lecture by K. A. VESTERBERG printed in *Internat. Mitt. Bodenkunde* for 1922.—Attempts to determine nutritive materials for plants by chemical analysis of the soils have hitherto been unsuccessful. Determinations of the minimum concentrations of phosphoric acid, nitrogen, and potassium required for normal plant development may be helpful. Investigations of drainage water and lysimeter experiments show that these concentrations, in mg. per l. of soil moisture are: 1-2 of P_2O_5 , 2-5 of N, and 10-20 of K_2O . When the amounts of these elements required by the different crops are determined, the power of the soil to produce and maintain the necessary concentrations during the growing season should be investigated.—*Ernst Gram.*

6011. CHRISTENSEN, H. R. *Havrens Forhold til Jordens Kalkindhold.* [The relation of oats to the lime content of the soil.] *Ugeskr. Landm.* 68: 81-82. 1923.—In Danish field experiments increasing amounts of lime increased the crop of oats, even up to an application of 48 tons of calcium carbonate per hectare, and to pH 7.2-7.5. If heavy applications of lime sometimes injure oats on certain heavy clays, the effect is indirect and of unknown nature.—*Ernst Gram.*

6012. CHRISTENSEN, H. R. *Humleagtig Sneglebælgs Forhold til Jordens Surhedsgrad.* [Relation of *Medicago lupulina* to soil acidity.] *Vort Landbrug* 42: 30. 1923.—The investigations of C. Olsen corroborate those of S. Joffe, according to which alfalfa may thrive at pH values considerably lower than 7. Even with a pH value of 5, an acidity seldom found in mineral soils in Denmark, some growth occurs, while an approximately maximal growth is reached at about pH 6.—*Ernst Gram.*

6013. CHRISTENSEN, H. R. *Humleagtig Sneglebælgs Forhold til Jordreaktionen.* [The relation of *Medicago lupulina* to soil reaction.] *Ugeskr. Landm.* 67: 612-614. 1922.—An investigation of 30 soil samples from 9 farms has shown that while the pH as a rule is high where black medic is vigorous, it may thrive well on soils where the pH goes down as far as 6.1 or even 5.8. The average pH of fields with a good crop was 6.7. Apparently the poor spots in the black medic fields are not always due to lack of lime.—*Ernst Gram.*

6014. FRAPS, G. S. *The fixation of phosphoric acid by the soil.* *Texas Agric. Exp. Sta. Bull.* 304. 22 p. 1922.—Higher temperatures increase fixation in some Texas soils, as did prolonged contact. Acid treatment which removed the lime carbonate had little effect on fixation in some soils and decreased it considerably in others. Igniting the soil increased its power to fix phosphoric acid even when the lime was previously removed by acid. A large part of the fixation took place below the mixture of soil and fertilizer. An examination of 761 surface soils and 651 subsoils showed that the percentages of iron and aluminium increase with the increase in the percentages of phosphoric acid fixed.—*L. Pace.*

6015. GODBOLE, S. V. *Some criticisms on Mason's method of determining directly the physiological humidity of the soil.* *Jour. Indian Bot. Soc.* 3: 174-177. 1923.—Mason's method [West Indian Bull. 19: March, 1922] consists in using the points of hard-leaded pencils ("Kohi-

noor" 6H) to absorb water from the soil for a definite period of time, and taking the weight of absorbed moisture as an index of the water-supplying power of the soil. The author finds the method unsatisfactory for the following reasons: (1) different pencils and different parts of the same pencil do not have the same absorbing power; (2) water is absorbed through the varnished sides as well as through the wood exposed at the point; (3) some moisture is lost before weighing unless great precaution is taken; (4) some soil adheres to the point; (5) air-dry pencils contain some moisture; and (6) the absorbing surface is too small.—*Winfield Dudgeon*.

6016. GREENSTREET, V. R. Report on the soils of Lubok Tamang and Cameron's Highlands. *Malayan Agric. Jour.* 10: 281-283. *Sketch map.* 1922.—These soils are of uniformly open texture with adequate content of organic matter and nitrogen; they show striking resemblance to the best tea and Cinchona soils of India and Java respectively and are suitable for market garden purposes. [See also Bot. Absts. 12, Entry 5464.]—*R. E. Holttum*.

6017. GREENSTREET, V. R. The composition of Kedah and Perlis phosphates. *Malayan Agric. Jour.* 11: 70-71. 1923.—These phosphates show great variation, and though a fairly high percentage of phosphorus may be present, in all samples but 1 (Perlis) the amount of iron and aluminium was so much in excess of the calcium as to make the phosphorus "unavailable."—*R. E. Holttum*.

6018. GREVE, M. Om Forholdet mellem Jordens Reaktion og Udviklingen af Humleagtig Sneglebælg. [On the relation between soil reaction and the development of *Medicago lupulina*.] *Ugeskr. Landm.* 67: 618-619. 1922.—An investigation of 8 localities shows that black medic may be very vigorous with a pH of 6.2 or 6.5. Surplus of water or lack of certain plant foods as well as lack of lime may inhibit its growth.—*Ernst Gram*.

6019. HARRISON, W. H. Report of the Imperial agricultural chemist. *Sci. Rept. Agric. Res. Inst. Pusa 1921-22*: 24-33. 1 pl. 1922.—Recommended methods of chemical analysis of manures, fertilizers, and soils have been collated and prepared for publication. An accurate method for the estimation of soil carbonates has been devised. The Pusa method of phosphoric acid determination is found more suited to Indian conditions than either the American 1919 or Prescott's methods.—Experiments with the windrowing of sugar cane continued. " * * * the length of time windrowed canes can be stored is determined by the incidence of heavy rains."—There is uniformly a higher percentage of CO₂ in the soil atmosphere of a grassed plot than of a cultivated plot. Excess of CO₂ is most marked in the monsoon, when high temperature and heavy rainfall favor decomposition of organic detritus from grass roots. During the dry season the moisture content of the soil of grassed plots falls as low as 1 per cent, whereas in cultivated plots it is 5.5 per cent. "Similar differences in the value of the nitric nitrogen are also found."—Movements of nitrates in the soil and sub-soil have been studied. "The investigation, so far as it has progressed, shows that the distribution of nitrates through the sub-soil is determined by climatic factors and the physical characters of the sub-soil layers, and that the growth of the crop is in turn controlled to a considerable extent by this distribution."—A list of publications for the year concludes the report.—*Winfield Dudgeon*.

6020. HASSELBALCH, K. A. Kulturplanternes forskellige Krav til Jordens Reaktion, III Rødkløver. [The different requirements of cultivated plants as to soil reaction, III *Trifolium pratense*.] *Ugeskr. Landm.* 68: 121-123. 1923.—Not the soils but the crops require lime, and they require it to a different degree. R. Christensen has indicated that oats, rye, and potatoes require less lime than do barley or clover, while alfalfa may fail on ground good for clover. This range may also be expressed in pH values, for which the author has proposed the term "Reaktionstal," i.e., reaction figure. But while soils where the relation between lime and acid is 1:2 or 10:20 have practically the same pH, they will need very different amounts of lime to raise the pH from 5 to 7. Preliminary investigations seem to indicate

that for each crop a minimum pH may be found, which must be determined only on fields where all other factors are favorable. For *Trifolium pratense* the minimum is found at 6.0-6.3 and the most copious growth occurs at 6.5 and above.—*Ernst Gram*.

6021. HASSELBALCH, K. A. Om Trivlsen af Humleagtig Sneglebælg som Maalestok for Agerjordens Kalktrang. [The vigor of *Medicago lupulina* as an indicator for the lime requirement of cultivated soils.] Ugeskr. Landm. 67: 577-579. 1922.—On the author's farm black medic has been grown in 2 cases previous to liming, the lime being withheld in those parts of the field where the medic was vigorous. Where black medic grows well the pH was 7.4 (the average of 10 locations), and in poor spots with weak plants whose leaves were yellowish green and which had few nodules, 6.8. The medic will not thrive well where the pH is below 7.0, whereas plants like wheat and barley may thrive on more acid soils. [See also Bot. Absts. 12, Entries 6012, 6013, 6018, 6025, 6028.]—*Ernst Gram*.

6022. HOFFMANN, R. Stickstoff Düngungsversuche auf Grünland. [Experiments on nitrogen-fertilization of meadow lands.] Landw. Jahrb. 58: 567-600. 1923.—Using the formulae of Mitscherlich, the author found that the yield of hay, as a result of fertilization with ammonium sulphate, can be expressed by the formula, $\log (A - Y) = \log A - 0.025 (x + z)$. The factor $C (=0.025)$ was independent of the maximum yield (A) and, therefore, also independent of all growth factors, such as climate, soil, kind of plant, etc. The value z , which indicates what part of the soil-nitrogen equivalent to ammonium sulphate is available, depends upon the soil used. Potassium phosphate fertilization had, in most cases, no appreciable effect. Nitrogen fertilization had a marked stimulating effect upon the growth of the grass, especially the timothy, the clover being almost completely repressed.—*S. A. Waksman*.

6023. KEEN, B. A. Rothamsted and the schools. Determinations of soil moisture at the end of the great drought. School Sci. Rev. [London] 3: 60-62. 1921.—The cooperation of schools with Rothamsted has given reliable data on the degree to which various depths of soil lose water during droughts, and on the moisture content of bare cultivated soil and that carrying vegetation.—*Elsie Hammond*.

6024. KILBINGER, A. Eine einfache und sichere Methode zur Bestimmung des Säuregrades und des Kalkbedarfs der Ackerböden. [A simple and reliable method for determining the degree of acidity and calcium requirements of cultivated soils.] Illus. Landw. Zeitg. 43: 44. 1923.—The measurement of acidity is obtained by the color changes from rose to deep red resulting when a given amount of soil is mixed with a solution of "Rhodan" potassium. By the same method slightly modified, it may be determined whether a non-acid soil is neutral or alkaline and, if alkaline, the degree of alkalinity.—*John W. Roberts*.

6025. MADSEN, M. Om Betydningen af Jordens Brintionconcentration ved Dyrkning af visse kalkelskende Kulturplanter. [The importance of soil acidity for the growing of certain lime-requiring crops.] Vort Landbrug 41: 562-564. 1922.—From an investigation of 39 samples of soils from alfalfa and black medic fields, it is concluded that for both crops, on both light and heavy soils, the pH required to secure a good growth is about 7.0 or higher.—*Ernst Gram*.

6026. MITSCHERLICH, E. A., F. DÜHRING, S. V. SAUCKEN, und C. BÖHM. Die pflanzen-physiologische Lösung der chemischen Bodenanalyse. [The plant physiological solution of chemical soil analysis.] Landw. Jahrb. 58: 601-617. 1923.—As a result of a series of pot experiments with soil and various mixtures of soil and sand in an attempt to solve the chemical analysis of soil by plant physiological means, the authors came to the following conclusions: The value of nitrogen as a nutrient is constant for various soils, as well as for sand, and also for various plants; this furnishes a plant physiological basis for nitrogen as a nutrient

in chemical soil analysis; in other words, vegetative experiments permit determination of the quantities of nitrogen present in a given quantity of soil in a form available to plants.—*S. A. Waksman.*

6027. NĚMEC, ANTONIN, et KVAPIL KAREL. Étude biochimique des sols forestiers. [Biochemical study of forest soils.] *Compt. Rend. Acad. Sci. Paris* 176: 260-262. 1923.—The authors report a study of the acidity of soil and the catalase activity of humus and mineral soils from forests of different kinds of trees.—*C. H. Farr.*

6028. OLSEN, C. Humleagtig Snegleblægs Forhold til Jordens Surhedsgrad (Brintion-concentration). [The relation of *Medicago lupulina* to soil acidity, pH.] *Vort Landbrug* 42: 16-19. 1 fig. 1923.—In jar experiments with a highly acid (pH = 4.0) sandy soil, rich in humus, from a raspberry formation in a forest, calcium carbonate was added so as to obtain the following pH values in the jars: 4.0, 5.1, 6.9, 7.4. When the resulting crop was weighed green the following respective weights were found as an average of 3 jars: 26, 106, 179, and 153 gm. The acidity of the soil was almost unchanged at the close of the experiment.—*Ernst Gram.*

6029. SCHÖNBRUNN, BRUNO. Über den zeitlichen Verlauf der Nitrifikation, unter besonderer Berücksichtigung der Frage nach dem periodischen Einfluss der Jahreszeit. [The temporal course of nitrification with special reference to the question of the periodic influence of the seasons.] *Centralbl. Bakt. II Abt.* 56: 545-546. 1922.—A series of soil cultures kept under different conditions were analyzed at regular intervals to determine the progress of ammonification and nitrification. Some of the cultures were kept at constant temperatures, one of the objects being to determine whether the rhythmic cycle of nitrification as it exists in nature is due entirely to the external factors of climatic variations, or whether the organisms having passed through this cycle for centuries have adapted themselves to follow a certain rhythmic course of activity independent of external factors. The results indicate that temperature is the principal factor influencing ammonification and nitrification, and that the periodic influence of the seasons, independent of climatic conditions, is negligible.—*Anthony Berg.*

6030. SEWELL, M. C. Effect of *Andropogon sorghum* on succeeding crops of *Triticum sativum* vulgare. *Bot. Gaz.* 75: 1-26. Fig. 1-11. 1923.—The author states that 5 possible causes of the harmfulness of kafir have been suggested: depletion of minerals, toxic root excretions, toxic products of decay, diseases associated with the crop, and the effect of soil protozoa and microorganisms. The author's experiments indicate that the most important of these is the "toxic decomposition products of the crop residue." Field data, covering 6 years, show the yield of winter wheat when grown after kafir to be 3 bushels less to the acre than when grown after corn. In the greenhouse, wheat growth in kafir soil was uniformly depressed. When grown in soil watered by (1) corn soil leachings, (2) aerated kafir soil leachings, and (3) non-aerated kafir soil leachings, only the 1st showed depression. Oxidation evidently destroys the toxin. In pot cultures, where wheat was watered with non-aerated leachings from trays containing growing kafir and corn, the leachings from kafir definitely inhibited the development of the wheat. The author also presents data showing that while the kafir crop removes more fertilizing elements from the soil than corn, this is not a factor in depressing the wheat yield. He also finds that the growth of kafir does not affect the ability of the soil to liberate nitrogen.—*B. W. Wells.*

6031. SKINNER, J. J., and F. E. ALLISON. Influence of fertilizers containing borax on the growth and fruiting of cotton. *Jour. Agric. Res.* 23: 433-443. Pl. 1-4. 1923.—Anhydrous borax was mixed with fertilizers and applied at the rate of 5, 10, and 20 pounds to the acre. On most soil types as little as 5 pounds to the acre injured young cotton plants. When the borax was broadcasted instead of drilled in the rows the injury was not so pronounced and

abundant rainfall also lessened the amount of injury. Borax drilled in the row at the rate of 100 pounds to the acre, or broadcasted at the rate of 200 pounds, entirely prevented germination.—*D. Reddick.*

6032. WALTON, J. H. Report of the Imperial agricultural bacteriologist. Sci. Rept. Agric. Res. Inst. Pusa 1920-21: 28-33. 1921.—Nitrogen losses from cattle dung stored under aerobic and anaerobic conditions were found to be relatively small, while urine lost 85 per cent under aerobic and only 15 per cent under anaerobic conditions. In a highly calcareous soil, as that of Pusa, solubilization of phosphate was found to take place upon composting with green manure. Fresh *Bassia latifolia* cake at first lowered the nitrate nitrogen in the soil to zero, but after 4 weeks nitrogen again began to appear, in no case, however, exceeding the percentage originally present in the soil. After composting the cake with Trichi rock phosphate or rock phosphate and sulphur for 4 weeks, 25 per cent of the nitrogen became nitrifiable, and in 1 case 45 per cent.—Promising results in the manufacture of indigo have just been obtained by sterilizing the water with "E.C." (a product developed and made at Pusa) for 12 hours before adding a pure culture of indican hydrolyzer. "The first day's working gave produce of the remarkably high quality of 78.5 per cent, which is probably the highest ever obtained in Bihar." "E.C." has proved effective also in sterilizing wells, in treatment of septic wounds, and for surgical dressings in hospitals.—Yeasts have been isolated and their fermentative power studied, and bacterial rots of potato and onion are under investigation. A program of work for 1921-22 and a list of publications for the year are appended.—*Winfield Dudgeon.*

6033. WESTERMANN, T. Undersøgelser over Fordampning fra ubevokset og bevokset Jord. [Investigations of evaporation from bare and planted soil.] K. Vet. og Landbohøjskoles Aarsskr. 1922: 1-55. 4 fig. 1922.—A system of tanks permitted study under varying atmospheric conditions, in different soils, with different water levels, cultivation, and crops. In summer the evaporation from bare sandy soil varied from 37.7 to 117.5 per cent of the natural precipitation, while for clayey soil the corresponding values were 50.5-132.8. The Papilionaceae have a high evaporating capacity, the small grains rank lower, and potato and mangold lowest of the plants investigated. In the same species the total leaf area of 2 varieties, and also the differences in growth, produced by increasing amounts of fertilizer, exert a distinct influence on the evaporation.—*Ernst Gram.*

6034. YAMANDI, JUAN G. Composición del suelo y su preparación. [Composition of the soil and its preparation.] Rev. Soc. Rural Córdoba [Argentina] 21: 6007-6026. 1922.—The author describes the various soil types and gives their physical characteristics. Soil water and its circulation in the soil are discussed as well as the manner in which plants utilize the moisture. The penetration of air and heat into the soil is necessary for seed germination, plant growth, and the development of soil organisms. The time and methods of working the soils of Argentina for best results are discussed.—*John A. Stevenson.*

6035. ZYL, C. E. VAN DER. De huidige stand der mechanische grondbewerking op Java. [The present condition of mechanical cultivation of the soil in Java.] Mededeel. Proefst. Java Suikerindust. 1922: 155-193. 1922.—The use of mechanical plows in Java is compared with hand labor. Best results were obtained on light sandy soil. On heavy soil mechanical plowing and cultivation is practical only in large fields.—*Peter J. Klaphaak.*

TAXONOMY OF VASCULAR PLANTS

J. M. GREENMAN, *Editor*E. B. PAYSON, *Assistant Editor*

(See also in this issue Entries 5392, 5442, 5465, 5474, 5480, 5738, 5748)

GENERAL

6036. COOK, O. F. Are any species uniform? Jour. Heredity 12: 285-287. 1922.—The author states his thesis in the following paragraph: "Species are maintained by processes of sexual reproduction, with continual crossing of the individual lines of descent, so that each species forms a network of lines of descent. The question of uniformity bears on the nature of the specific network. Are there reasons for believing that the members of the same species are uniform, identical, or homozygous? Or should we think of the members of species as normally diverse, with multifarious germinal constitutions represented among the different individuals and lines of descent that are woven together?"—It is pointed out that the existence of uniform species is a taxonomic ideal that has never been realized, and that unless evidence can be brought forward to prove the existence of such species the idea may as well be abandoned as interfering with clear thinking on the processes of evolution.—R. C. Cook.

6037. [DRUCE, G. C.] [Rev. of: PRAIN, DAVID, Editor. Index Kewensis. Vols. I-V, Suppl. 1-5. 1885-1921 (see Bot. Absts. 11, Entry 3199).] Rept. Bot. Soc. and Exchange Club British Isles 6: 342-347. 1921 [1922].—[See also Bot. Absts. 11, Entry 3189.]

6038. FRITSCH, KARL. Ist *Cardamine bulbifera* als Abkömmling ein Bastardes aufzufassen? [Is *Cardamine bulbifera* to be considered of hybrid origin?] Ber. Deutsch. Bot. Ges. 40: 193-196. 1922.—The author disagrees with Ernst, who considered *Cardamine bulbifera* as a hybrid. Its greater distribution than that of its supposed parents, the fact that *C. bulbifera* is not an intermediate form, and the presence of bulbils do not suggest to the author that this species is a hybrid.—W. C. Muenscher.

6039. КОЗО-ПОЛЯНСКОГО, Б. М. [KOZOT-POLJANSKI, B. M.] Введение В Филогеническую Систематику Высших Растений. [An introduction to the phylogenetic system of vascular plants.] v + 167 p., 6 pl. Природа и Культура [Nature and Culture]. Woronesh, 1922.—An outline of some lectures.—B. M. Kozot-Poljanski.

6040. PELLETT, F. C. What is cow-itch? Amer. Bee Jour. 62: 466. Fig. 1-3. 1922.—The common name cow-itch should be restricted to *Cissus incisa*. But in the South [U. S. A.] the trumpet creeper (*Tecoma radicans*) and other climbing vines are sometimes given this vernacular name.—J. H. Lovell.

6041. ROBINSON, B. L. The need of monographic activity in American botanical taxonomy. Science 57: 307-311. 1923.

PTERIDOPHYTES

6042. ANONYMOUS. Current topics and events. Nature 111: 93. 1923.—This article notes that a special exhibit of epiphytic species of *Platynerium* and some of *Polypodium* has been arranged in the tropical Fern House at Kew, and gives brief descriptions of the habits of several species.—O. A. Stevens.

6043. ALDERWERELT VAN ROSENBURGH, C. R. W. K. VAN. New or interesting Malayan Ferns. Bull. Jard. Bot. Buitenzorg III, 2: 129-136. Fig. a-h. 1920.—The author presents an annotated list of Malayan pteridophytes which contains the following new species, varieties, names, and combinations: *Alsophila heteromorpha* var. *decomposita*, *A. persquamulifera* (v. A. v. R.), *Angiopteris monstrosa*, *Aspidium papyraceum*, *Asplenium bicarinatum*, *A.*

fibrilliferum, *Athyrium macrocarpum* var. *decompositum*, *A. nigripes* var. *Clarkei* (Bedd.), *Cyathea magnifolia*, *C. Doctersii*, *C. binnangensis*, *C. Ramosiana*, *C. amphicosmioides*, *C. densisora*, *Cyclophorus brevipes*, *C. elaphoglossoides*, *Davallia subdissecta* var. *subgenuina*, *Diplazium mesocarpum*, *D. betimusense*, *Dryopteris paraphysophora*, *D. Mannii* (Hope), *D. microcarpa*, *D. tabacifera*, *D. pterospora*, *D. echinospora*, *D. perglandulifera* var. *firmior*, *D. verruculosa* var. *sumatrana*, *D. subfalcinella*, *D. stipellata* var. *obtusata*, *D. submollis*, *Hemitelia montana*, *H. fallax* var. *major*, *H. paraphysophora*, *Histiopteris conspicua*, *Humata lanuginosa*, *H. squarrosa*, *Lecanopteris carnosa* var. *pumila*, *Lindsaya repens* var. *pseudohemiptera*, *Lomagramma sumatrana*, *L. pteroides* var. *negrosensis* (Copel.) and var. *subcoriacea* (Copel.), *Loxogramma prominens*, *L. vittariifolia*, *Mesochlaena sumatrensis*, *Phegopteris lastreoides*, *P. fallax*, *P. rubicunda*, *Plagiogyria subrigida*, *Pleocnemia stenosemioides*, *Pleopeltis subnormalis*, *P. parvifrons*, *P. dendroconchoides*, *P. congregatifolia*, *P. murkeleana*, *P. contigens*, *P. Treubii* var. *Brooksii*, *Polypodium ceramicum*, *P. mutatum*, *P. Yoderi* var. *denudatum*, *P. revolvens*, *Polystichum prolificans*, *P. puncticulatum*, *Pteris appendiculifera*, *P. aberrans*, *Syngamma luzonica*, *Tapeinidium sumatranum*, *Trichomanes minimum*, *T. paniculatum* var. *minus*, *Lycopodium patentissimum*, *L. pinifolium* var. *lanceolatum*, *Selaginella simalurana*, *S. consobrina*, *S. sunaquatilis*, *S. congregata*, *S. flabelliformis*, *S. balica*, *S. xerophila*, *S. fimbriata* var. *grandifolia*, *S. heteromorpha*, *S. rubicundipes*, *S. herpocaulos* var. *acuminata*, *S. Wallichii* var. *deliana*.—Alfred Rehder.

6044. MAXON, WM. R. A new *Salvinia* from Trinidad. Jour. Washington [D. C.] Acad. Sci. 12: 400-401. 1922.—*Salvinia cyathiformis* is described.—Helen M. Gilkey.

6045. MAXON, WM. R. The genus *Culcita*. Jour. Washington [D. C.] Acad. Sci. 12: 454-460. 1922.—The writer considers *Balantium* of the family Cyatheaceae a technical synonym of *Dicksonia*, and advises the substitution of *Culcita* for *Balantium* as known today, since this is an equivalent of the *Balantium* of present writers. Eight species are described 1 of these, *C. blepharodes*, being new.—Helen M. Gilkey.

SPERMATOPHYTES

6046. ALDERWERELT VAN ROSENBURGH, C. R. W. K. VAN. New or noteworthy Malayan Araceae. Bull. Jard. Bot. Buitenzorg III, 1: 359-389. 1919.—The author presents descriptions of, and notes on, Malayan Araceae preceded by an artificial key to the genera. The following species and combinations are new: *Amorphophallus subcymbiformis*, *A. Lorzingii*, *A. Brooksii*, *A. Decus silvae*, *A. timorensis*, *A. Hewittii*, *A. paucisectus*, *A. discophorus*, *Anadendron microstachyum* (De Vries & Miq.), *A. malaianum* (Miq.), *A. superans*, *Cyrtosperma syapense*, *C. cuspidispathum*, *C. subulispalum*, *C. hastatum*, *C. consobrinum*, *Epipremnum ceramense* (Engl. & Krause) and var. *flavispathum*, *E. papuanum*, *E. silvaticum*, *E. mampuanum*, *Lasia concinna*, *Pothos longivaginatus*, *P. Jacobsonii*, *P. Englerianus*, *P. peninsularis*, *P. brevivaginatus*, *Raphidophora crassifolia* (Engl.), *R. celatocaulis* (N. E. Br.), *R. apiculata*, *R. conocephala*, *R. talamauana*, *R. Hallieri*, *R. pilosula*, *Scindapsus mamilliferus*, *S. javanicus*.—Alfred Rehder.

6047. ALMQUIST, ERNST. *Bursa pastoris* Weber. Rept. Bot. Soc. and Exchange Club British Isles 6: 179-207. 9 fig. 1920 [1921].—G. C. DRUCE in the Introduction (pp. 179-190) shows that *Bursa* has priority over *Capsella*. He also gives a history of its segregates. Almquist gives descriptions of 18 species.—G. C. Druce.

6048. AMES, OAKES. A discussion of *Pogonia* and its allies in the Northeastern United States. Orchidaceae 7: 3-38. Pl. 102-108. 1922.—A key is given to 5 genera, namely, *Pogonia*, *Cleistis*, *Isotria*, *Triphora*, and *Psilochilus*. New names are: *Triphora gentianoides* Ames & Schltr. (*Arethusa gentianoides* Sw.) and *Cleistis divaricata* Ames (*Arethusa divaricata* Linn.).—E. D. Merrill.

6049. AMES, OAKES. A new *Oncidium* from Haiti. *Orchidaceae* 7: 159-160. 1922.—*Oncidium haitiense* Leonard & Ames is described as new.—E. D. Merrill.

6050. AMES, OAKES. A triandrous form of *Psilochilus macrophyllus*. *Orchidaceae* 7: 45-48. Pl. 110. 1922.—A new name, *Psilochilus macrophyllus* (Lindl.) Ames, is published, based on *Pogonia macrophylla* Lindl.—E. D. Merrill.

6051. AMES, OAKES. Additions to the orchid flora of the mountain province, Luzon. *Orchidaceae* 7: 141-155. 1922.—The following new species are described: *Acoridium lineari-folium*, *A. perplexum*, *A. pulcherrimum*, *A. unicorne*, *Bulbophyllum alboroseum*, *B. invisum*, *B. papillipetalum*, *Ceratostylis dataensis*, *Eria carnicolor*, *Habenaria boadanensis*, and *H. reticulata*.—J. M. Greenman.

6052. AMES, OAKES. New or noteworthy orchids from different parts of the world. *Orchidaceae* 7: 83-140. Pl. 114. 1922.—The following new species are proposed: *Bulbophyllum cubicum* (Philippines), *B. erratum* (Philippines), *B. nigroscapum* (Samoa), *Campylocentrum panamense* (Panama), *Coelogyne longirachis* (Philippines), *C. Ramosii* (Philippines), *Dendrobium appendiculoides*, *D. candoonense*, *D. sinuosum*, and *Dendrochilum prodigiosum* (Philippines), *Epidendrum sulcatum* (Colombia), *Eria candoonensis*, *E. hirsutipetala*, *E. macera*, *E. microchila*, *E. propinqua*, and *E. vagans* (Philippines), *Liparis magnicallosa*, *L. prava*, and *L. propinqua* (Philippines), *Malaxis bracteosa* (Philippines), *Notylia panamensis* (Panama), *Oberonia linearifolia* (Borneo), *O. lipensis* and *O. minutissima* (Philippines), *Pleurothallis consimilis* (Trinidad), *P. Hitchcockii* (British Guiana), *P. Schaferi* (Cuba), *P. Williamsii* (Panama), *Plocoglottis McGregorii* (Philippines), *Robiquetia Merrillii* Ames (*Malleola Merrillii* Ames), *R. Ramosii* (Philippines), *Sarcophilus tripercus* (Philippines), *Spiranthes bicaudata* (Trinidad), *S. Wrightii* nom. nov. (*Spiranthes monophylla* Cogn. p.p., Cuba), *Stelis parvibracteata* (Panama), *S. pleurothalloides* (Colombia), *S. Williamsii* (Panama), *Thrix-spermum Weberi* (Philippines), and *Trichoglottis brachiata* (Philippines). Critical notes are given on a number of older species proposed by various authors.—E. D. Merrill.

6053. AMES, OAKES. Nomenclatorial changes in *Dendrochilum*. *Orchidaceae* 7: 79-82. 1922.—A new genus, *Pseudacoriidum*, with *P. Woodianum* Ames, based on *Dendrochilum Woodianum* Ames from the Philippines, is described, and the following new names in *Acoridium* appear, based on Philippine species of *Dendrochilum*: *Acoridium affine*, *A. anfractoides*, *A. auriculare*, *A. binuangense*, *A. cinnabarinum*, *A. confusum*, *A. Curranii*, *A. Elmeri*, *A. exile*, *A. Foxworthyi*, *A. hastatum*, *A. Hutchinsonii*, *A. irigense*, *A. Loheri*, *A. longibulbum*, *A. lucbanense*, *A. luzonense*, *A. maleolens*, *A. McGregorii*, *A. microchilum*, *A. mindorense*, *A. pulogense*, *A. pumilum*, *A. purpureum*, *A. quadrilobum*, *A. reniforme*, *A. simulacrum*, *A. Vanoverberghii*, and *A. Wenzelii*.—E. D. Merrill.

6054. AMES, OAKES. Notes on *Erythrodes* with nomenclatorial changes and descriptions of three new species. *Orchidaceae* 7: 63-78. 1922.—The new species are *Erythrodes chicharrasensis* Ames and *E. mexicana* Ames from Chiapas, Mexico, and *E. trinitatis* Ames from Trinidad. The generic name *Erythrodes* Blume, having priority over *Physurus* L. C. Rich. is adopted and the following new names appear, transfers from *Physurus*: *Erythrodes aratanhensis*, *E. arietina*, *E. argyrosticta*, *E. bicolor*, *E. bifalcis*, *E. brachyrhyncha*, *E. calophylla*, *E. caucana*, *E. clavigera*, *E. commelinoides*, *E. debilis*, *E. densiflora*, *E. dolichostachya*, *E. erythrodoides*, *E. foliosa*, *E. hetaerioides*, *E. hyphaematica*, *E. humilis*, *E. juruenensis*, *E. lacteola*, *E. Lehmannii*, *E. Lindleyana*, *E. loxoglottis*, *E. lunifera*, *E. maculata*, *E. major*, *E. Mayorianana*, *E. metallescens*, *E. minor*, *E. mystacina*, *E. nigrescens*, *E. ovata*, *E. paleacea*, *E. parviflora*, *E. Petersiana*, *E. Pittieri*, *E. procera*, *E. rariflora*, *E. repens*, *E. rosea*, *E. stenocentron*, *E. stictophylla*, *E. tridax*, *E. Tuereckheimii*, *E. vaginata*, *E. valida*, *E. rescifera*, *E. xystophylla*, and *E. zeuxinoides*.—E. D. Merrill.

6055. AMES, OAKES. Notes on Mexican species of *Triphora*. *Orchidaceae* 7: 39-44. Pl. 109. 1922.—*Triphora yucatanensis* Ames is described and figured as new, and notes on, and a figure of, *T. mexicana* Schltr. are given.—E. D. Merrill.

6056. AMES, OAKES. Studies of *Otostylis brachycalyx* and the species with which it has been confused. *Orchidaceae* 7: 49-62. Pl. 111-113. 1922.—*Cyrtopodium Broadwayi* Ames from Trinidad is figured and described as new. *Otostylis brachycalyx* Schltr. and *Cyrtopodium cristatum* Lindl. are figured and discussed.—E. D. Merrill.

6057. AMES, OAKES. Two new species of *Malaxis* from Haiti. *Orchidaceae* 7: 156-158. 1922.—*Malaxis domingensis* and *M. Leonardii* are described as new; while the following new combinations are made: *Malaxis carpinterae* (*Microstylis carpinterae* Schltr.), and *M. Adolphii* (*Microstylis Adolphii* Schltr.).—E. D. Merrill.

6058. BACKER, C. A. Contributiones ad cognitionem florae Indiae Batavae. [Contributions to the knowledge of the flora of Dutch East India.] *Bull. Jard. Bot. Buitenzorg* III, 2: 315-330. 1920.—The paper contains a note on *Heliconia indica* Lam.; a description of the new Melastomataceous genus *Triuranthera*, with the 1 species *T. Bakhuizenii*; and descriptions of the following new species, varieties, and combinations: *Aristolochia coadunata* var. *Bossschai*, *A. tripartita*, *Bauhinia viridiflora*, *Crotalaria Valetonii*, *Diplachne polystachya* (Forsk.), *D. tectoneticola*, *Gentiana singgalangensis*, *Mapania Heyneana*, and *Sonneratia ovata*.—Alfred Rehder.

6059. BLAKE, S. F. New composites from Salvador. *Jour. Washington [D. C.] Acad. Sci.* 13: 143-146. 1923.—*Vernonia Standleyi*, *Rensonia salvadorica*, and *Zexmenia iners* are described as new species, with *Rensonia* as a new genus.—Helen M. Gilkey.

6060. BLAKE, S. F. New South American Asteraceae collected by E. W. D. Holway. *Bot. Gaz.* 74: 414-430. Pl. 19. 1922.—Material from Ecuador and Bolivia is dealt with here. The following species are described: *Achyrocline glandulosa*, *A. hyperchlora*, *Polymnia eurylepis*, *Monopholis* gen. nov., *M. hexantha*, *M. Holwayae*, *Wedelia Holwayi*, *W. isolepis*, *Helianthus hypargyreus*, *Perymenium ecuadoricum*, *Steiractinia Rosei*, *Verbesina adenobasis*, *V. latisquama*, *Calea huigrensis*, *Gynoxys hypomalaca*, *Mutisia sagittifolia*, *Hieracium pazense*.—B. W. Wells.

6061. BLAKE, S. F. Three new composites from Bolivia. *Proc. Biol. Soc. Washington* 36: 51-54. 1923.—*Erigeron seneciiformis*, *Aspilia lucidula*, and *Calea rhombifolia* are described as new.—J. C. Gilman.

6062. BLAKE, S. F. Two new genera related to *Narvalina*. *Jour. Washington [D. C.] Acad. Sci.* 13: 102-105. Fig. 1. 1923.—The writer proposes *Cyathomone* and (in collaboration with EARL E. SHERFF) *Ericentrodea*, both genera being based principally upon achene characters. *Ericentrodea* includes the plants originally described under *Narvalina corazonensis* Hieron., *N. homogama* Hieron., and *Bidens mirabilis* Sherff; while the single representative of *Cyathomone* was formerly described under the name *Narvalina Sodiroi* Hieron.—Helen M. Gilkey.

6063. BRITTON, C. E. British Centaureas of the Nigra group. *Rept. Bot. Soc. and Exchange Club British Isles* 6: 406-417. 1921 [1922].—*C. surrejana* and *C. Drucei* are described as new and 4 new varieties are noted.—G. C. Druce.

6064. BRITTON, N. L., AND J. N. ROSE. The two species of deerhorn cactus. *Jour. Washington [D. C.] Acad. Sci.* 12: 328-330. Fig. 1-2. 1922.—To the formerly monotypic genus *Peniocereus*, has been added a second species, *P. Johnstonii*, collected by Ivan M. Johnston in the islands of the Gulf of California. A description of the new species and a key are included.—Helen M. Gilkey.

6065. BRITTON, N. L., AND PAUL C. STANDLEY. Three new plants of the family Rubiaceae from Trinidad. Jour. Washington [D. C.] Acad. Sci. 13: 105-107. 1923.—*Evea tontaneoides*, *Urceolaria clusiaefolia*, and *U. angustifolia* are described.—Helen M. Gilkey.

6066. CAMUS, E. G., ET A. CAMUS. Iconographie des Orchidées d'Europe et du Bassin Méditerranéen. [Illustrations of orchids of Europe and of the Mediterranean Basin.] 4 to 72 p.; folio 122 pl. Paul Lechevalier: Paris, 1921.—This work, as the title indicates, is primarily a collection of illustrations of orchids. Descriptions, synonymy, and bibliography are omitted, except for the new varieties, forms, and hybrids. The authors, however, give full explanations of the plates of which 110 are in color and depict the habit of the entire plant as well as detailed characters of the flowers. The remaining 12 plates are uncolored and illustrate the anatomy of various species. The new varieties, forms, and hybrids included are: *Serapias Lingua* L. f. *nana* G. Cam., × *S. Laramberguei* f. *laxiflora* G. Cam., × *S. meridionalis* G. Cam. var. *lutescens* G. & A. Cam., ×× *Orchiserapias complicata* var. *latiloba* G. Cam., ×× *O. complicata* var. *angustiloba* G. Cam., ×× *O. Fontanae* G. Cam., Berg. & A. Cam. var. *trisecta* G. & A. Cam., *Loroglossum hircinum* Rich. var. *immaculatum* G. & A. Cam., *Orchis papilionacea* L. var. *minima* G. Cam., *O. latifolia* L. var. *Barlae* G. Cam., *O. maculata* L. var. *brachystachys* A. Cam., × *O. Cortesii* G. & A. Cam. = *O. longicornu* × *Morio* G. & A. Cam., × *O. Braunii* Halacsy var. *alpina* A. Cam. = *O. latifolia* × *maculata* var. *brachystachys* A. Cam., ×× *Orchigymnadenia Heinzeliana* G. Cam. var. *gracilis* A. Cam. = *Gymnadenia conopsea* × *O. maculata* var. *brachystachys* A. Cam., *Ophrys Scolopax* Cav. f. *viridiflora* A. Cam., *O. apifera* subsp. *Olympiadae* Ougrinski, × *O. Cortesii* A. Cam. = *O. atrata* × *litigiosa* A. Cam.—J. M. Greenman.

6067. COHEN STUART, C. P. A basis for tea selection. Bull. Jard. Bot. Buitenzorg III, 1: 193-320. Pl. 21-31. 1919.—The paper is an enlarged English translation of the botanical part of the author's Dutch thesis on tea selection published in 1916; it is divided into 2 parts, an historical and geographical, and a systematic part. In the 1st, the author deals with the historical development of the cultivation of the tea plant in Java, British India, and China and with its origin and geographical distribution. In the 2nd, he gives first his reasons for uniting *Camellia* and *Thea* under the name *Camellia*, and a key to the known species of the genus; in another chapter, the varieties of the Tea plant, *Camellia theifera*, are discussed; and the last chapter deals with 4 critical species. An enumeration of the herbarium specimens examined and a bibliography conclude the paper. One species, *Camellia Henryana*, and the following combinations are new: *C. hozanensis* (Hay.), *C. Nakaii* (Hay.) and *C. furfuracea* (Merr.).—Alfred Rehder.

6068. HARMS, H. Ueber Luetzelburgia, eine neue Gattung der Leguminosen aus Brasilien. [Luetzelburgia, a new genus of Leguminosae from Brazil.] Ber. Deutsch. Bot. Ges. 40: 177-180. Fig. 1. 1922.—A new genus, *Luetzelburgia*, is based upon and described from flowering material collected by Ph. von Luetzelburg. This genus is placed in *Sophoreae* but it suggests a connecting link between *Sophoreae* and the higher *Papilionate*. A single species, *L. pterocarpoides*, is described.—W. C. Muenschner.

6069. JUMELLE, HENRI. Le groupe du *Chrysalidocarpus lutescens*. [The group of *Chrysalidocarpus lutescens*.] Compt. Rend. Acad. Sci. Paris 174: 1674-1677. 1922.—This species is a palm of Madagascar. It is separated with difficulty from other species of the same genus, several of which are discussed in this paper.—C. H. Farr.

6070. KILLIP, E. P. Three new species of *Passiflora* from Venezuela and Ecuador. Jour. Washington [D. C.] Acad. Sci. 12: 330-332. 1922.—*Passiflora* (*Granadilla*) *dispar*, *P.* (*Granadilla*) *perlobata*, and *P.* (*Granadilla*) *Popenorii* are described.—Helen M. Gilkey.

6071. KOORDERS, S. H. Beitrag zur Kenntniss der Flora von Java, no. 10, 11 und 15-20. [Contribution to the knowledge of the flora of Java, No. 10, 11 and 15-20.] Bull. Jard. Bot. Buitenzorg III, 1: 136-189. Pl. 7-19. 1919.—This paper consists of separate articles con-

taining notes on various Javanese plants and descriptions of new species. It is preceded by an index to Nos. 1-20 of these contributions giving the title and place of publication of the numbers not contained in the present paper. The contents of the present numbers are as follows: No. 10, *pl. 7, 8*: description of *Elaeocarpus littoralis* Teijsm. & Binn.; No. 11, *pl. 9*: description of *Glochidion palustre* n. sp.; No. 12, *pl. 10*: note on *Clethra javanica* Turcz.; No. 15: description of *Coix palustris* n. sp.; No. 16: note on *Cyrtosperma Merkusii* Schott; No. 17, *pl. 11-13*: description of *Alocasia bantamensis* n. sp., and note on the juvenile form of *Cassia javanica* L.; No. 18, *pl. 14, 15*: description of *Kalanchoe Schumacheri* n. sp., and revision of the Crassulaceae of Java; No. 19, *pl. 16, 17*: description of *Pentapanax elegans* n. sp., with var. *pubescens*; No. 20, *pl. 18, 19*: description of *Zingiber Vanlithianum* n. sp.—*Alfred Rehder*.

6072. KOORDERS, S. H. Beschreibung einer von Dr. Ouwehand im Toba-See, in Sumatra, entdeckten neuen Art von Coix. [Description of a new species of Coix discovered by Dr. Ouwehand in Lake Toba in Sumatra.] Bull. Jard. Bot. Buitenzorg III, 1: 190-191. Pl. 20. 1919.—Description is given of *Coix Ouwehandii* n. sp.—*Alfred Rehder*.

6073. KOORDERS, S. H. Supplement op het Eerste Overzicht der Flora van N. O. Celebes. 2. Untersuchungen über einige in den Jahren 1894-1895 von mir in N. O. Celebes gesammelten Pflanzen. [Supplement of the first conspectus of the flora of N. E. Celebes. Pt. 2. Studies of some plants collected by myself in 1894-95 in N. E. Celebes.] Bull. Jard. Bot. Buitenzorg III, 2: 242-260. Pl. 4-7. 1920.—The contents of part 1 of the Supplement which appeared as a separate publication in 1918 is given. Part 2 contains the following articles: 1, a note on *Hoya maxima* (Karst.) published here as a new combination and as the type of a new subgenus *Paraconchophyllum* which also includes *H. imbricata* Callery and the new *H. pseudo-maxima* from the Philippines, while the remaining species are referred to the new subgenus *Eusperlingia*; 2, a note on *Clethra canescens* Reinw.; 3, description and figure of *Elaeocarpus rhizophorus* n. sp.—*Alfred Rehder*.

6074. MIYABE, KINGO, AND YUSHUN KUDO. Icones of the essential forest trees of Hokkaido. 27 × 38.5 cm. Fasc. IV. P. 39-48, pl. 11-13. April, 1921; Fasc. V. P. 49-56, pl. 14-16. September, 1921; Fasc. VI. P. 57-64, pl. 17-19. November, 1921. Published by the Hokkaido Government.—These fascicles continue the work on the same plan as those previously published, and each fascicle contains descriptions and colored illustrations of 3 species. The species included, in order of their enumeration, are as follows: *Populus Maximowiczii* A. Henry, *P. Sieboldi* Miq., *Salix Urbaniana* v. Seem. var. *Schneiderii* Miyabe & Kudo nom. nov. (*S. cardiophylla* Tokubuchi, not Trautv. & Mey.), *S. jessoensis* v. Seem., *S. Caprea* L., *S. rorida* Lacks., *S. viminalis* L. var. *yezoensis* C. K. Schn., *S. sachalinensis* Fr. Schm., and *S. Miyabeana* v. Seem. [See also Bot. Absts. 10, Entry 329.]-*J. M. Greenman*.

6075. OSTERHOUT, GEO. E. What is *Geranium caespitosum* James? Bull. Torrey Bot. Club 50: 81-84. 1923.—Evidence is presented to show that *Geranium caespitosum* James should be called *G. intermedium* James, and that *G. atropurpureum* Heller is not a synonym, but refers to a different species, while *G. Parryi* (Engelm.) Heller is a synonym of *G. intermedium*.—*P. A. Munz*.

6076. REHDER, ALFRED. Michaux's earliest note on American plants. Jour. Arnold Arboretum 4: 1-8. 1923.—The little known note on American plants sent by A. Michaux to Lamarck and published by him in 1792 with remarks on many of the species in Journal d'Histoire Naturelle is reprinted. An attempt is made to identify the names, which are only partly supplied with descriptions, with recognized species and their nomenclatural status is discussed. Some of the names proposed are not found in Michaux's Flora and not mentioned in Index Kewensis nor in any publications on American plants. Fortunately all these names remain synonyms for various reasons and no changes in nomenclature result from their identification except a possible one in the case of Michaux's *Andromeda wilmingtonia*.—*Alfred Rehder*.

6077. RICCOBONO, VINCENZO. *Pilocereus Catalani* Ricc., nov. spec. Bull. R. Orto Bot. Palermo 2: 223-228. 1921.—Diagnosis and descriptive notes are given of a new *Pilocereus*, the origin of which is unknown.—*Edith K. Cash.*

6078. SANT'ANTIMO, PRINCIPE. *Le Palme di Villa Lucia*. [The palms of the Villa Lucia.] 8vo., 86 p., 31 pl. Tip. Giuntina: Florence.

6079. STANDLEY, PAUL C. New species of plants from Mexico. Jour. Washington [D.C.] Acad. Sci. 13: 5-8. 1923.—From collections of plants made by C. Conzatti in the state of Oaxaca, Mexico, the following new species are described: *Allionia grandiflora*, *Caesalpinia Ortega*, *Amyris Conzattii*, *Schaefferia oaxacana*, *Bouvardia oaxacana*, *Chomelia barbata*, and the tree previously described under the name *Pithecolobium tomentosum* Micheli, is transferred to the genus *Albizzia*, with the specific name *tomentosa*.—*Helen M. Gilkey.*

6080. VALETON, TH. *Cominsia minor* Val. (Marantaceae). Bull. Jard. Bot. Buitenzorg III, 2: 351-353. Pl. 11. 1920.—*Cominsia minor* a new shrubby species from southwestern New Guinea is described and figured.—*Alfred Rehder.*

6081. VALETON, TH. *Stichianthus* Val. genus novum. Rubiacearum. [Stichianthus, a new genus of Rubiaceae.] Bull. Jard. Bot. Buitenzorg III, 2: 349-350. Pl. 10. 1920.—The new genus *Stichianthus* with one species, *S. minutiflorum* [sic], from Borneo is described and figured.—*Alfred Rehder.*

6082. VALETON, TH. Zwei Rhizophoraceen. [Two Rhizophoraceae.] Bull. Jard. Bot. Buitenzorg III, 2: 346-348. Pl. 8-9. 1920.—The author describes and figures *Pellacalyx axillaris* Korth. with the new var. *serratifolia* and the new species *Carallia Hulstijnii*.—*Alfred Rehder.*

6083. WILSON, ERNEST H. The Rhododendrons of northeastern Asia exclusive of those belonging to the subgenus *Anthodendron*. Jour. Arnold Arboretum 4: 33-56. 1923.—Eleven species are recognized in the region under consideration, belonging to the subgenera *Eurhodendron*, *Azaleastrum*, and *Therorhodion*. Keys to the subgenera, sections, and species are provided and of each species the complete synonymy and a description are given and the known varieties, forms, and hybrids enumerated; a new hybrid *Rhododendron Watereri* (R. Metternichii var. *pentamerum* × *catawbiense* hybrid) is described.—*Alfred Rehder.*

REVISIONS AND MONOGRAPHS

6084. MAIDEN, J. H. A critical revision of the genus *Eucalyptus*. Vol. VI. Part 7. P. 341-418, pl. 232-235. John Spence: Sydney, January, 1922.—The present part contains descriptions and illustrations of the following Australian and Tasmanian species: *Eucalyptus agglomerata* Maiden, *E. Simmondsii* n. sp., *E. sepulchralis* F.v.M., *E. torquata* Luehmann, *E. kalganensis* n. sp., *E. melanoxylon* n. sp., *E. Isingiana* n. sp., and *E. aggregata* Deane & Maiden. Under the caption of The Leaf the author continues his discussion of the leaf of *Eucalyptus*, particularly with reference to venation and oil content.—*J. M. Greenman.*

FLORISTICS AND PLANT DISTRIBUTION

6085. ASCHERSON, PAUL, UND PAUL GRAEBNER. Synopsis der mitteleuropäischen Flora. [Synopsis of the flora of central Europe.] Lieferung 91. Vol. V. P. 465-544. Wilhelm Engelmann: Leipzig, June 27, 1916.—The present part continues the treatment of the Caryophyllaceae and includes the genera *Moeckringia* in part, *Arenaria*, *Holosteum*, and *Stellaria* in part.—*J. M. Greenman.*

6086. AUDAS, J. H. Through the Balangum Ranges and at Rose's Gap (Grampians). Victorian Nat. 38: 4-8, 11-16. 1921.—A description of a trip through the Balangum Ranges is given with detailed reference to the flora of the district.—*Wm. Randolph Taylor.*

6087. AUDAS, J. H. **Through the Murra Murra country (Western Grampians).** Victorian Nat. 37: 59-65. 1921.—A description of a trip through the Murra-Murra country is given with detailed reference to the flora of the district. Previous collectors reported 686 ferns and flowering plants, which the present writer was able to increase to 737.—*Wm. Randolph Taylor.*

6088. BABINGTON, CHARLES CARDALE. **Manual of British botany.** 10th ed., with amended nomenclature and an appendix, edited by A. J. WILMOTT. *Small 8vo, 668 p.* Gurney & Jackson: London, 1922.

6089. BERTSCH, K. **Ein Kriegsopfer unserer Flora.** [A sacrifice of our flora to the war.] Jahresh. Ver. Vaterländ. Naturk. Württemberg 77: xxvii-xxviii. 1921.—The rare *Saxifraga amphibia* formerly grew at 2 localities on the Württemberg shores of the Lake of Constance. One of the colonies was destroyed during the war by the establishment of an aeroplane station in the immediate vicinity. The distribution of the species is discussed, the idea being expressed that it represents a relic of the Ice Age.—*A. W. Evans.*

6090. BRITTON, C. E. **British forms of Centaurea Jacea L.** Rept. Bot. Soc. and Exchange Club British Isles 6: 163-173. 1920 [1921].

6091. BRITTON, N. L. **Further botanical studies in Trinidad.** Jour. New York Bot. Gard. 22: 93-102. 1921.—Field observations on the flora and vegetation of Trinidad are recorded.—*H. A. Gleason.*

6092. BROADWAY, W. E. **Botanical collecting in French Guiana.** Jour. New York Bot. Gard. 22: 177-183. 1921.—Field notes on the flora and vegetation near Cayenne are recorded.—*H. A. Gleason.*

6093. BROWN, G. C. **Report of the distributor for 1920.** Rept. Bot. Soc. and Exchange Club British Isles 6: 209-259. 1921 [1922].—The sheets contributed by members for the 1920 distribution amounted to 4,837. Among critical genera which were well represented were *Euphrasia*, *Mentha*, *Centaurea*, and *Potamogeton*. *Ranunculus* and *Erophilia* received little attention.—*G. C. Druce.*

6094. BUTCHER, R. W. **Plant notes, etc., for 1921.** [*Tillaea aquatica* L.] Rept. Bot. Soc. and Exchange Club British Isles 6: 281. 1 fig. 1921. [1922].—This was first found in Britain by the author September, 1921. It is further described by G. C. Druce [see Bot. Absts. 12, Entry 6101].—*G. C. Druce.*

6095. COCKS, R. S. **A list of the trees of Louisiana.** Jour. Arnold Arboretum 2: 204-216. 1921 [1922].—The author presents an enumeration of all the trees native in Louisiana, based upon collections made by himself during the last 15 or 16 years. Under each species and variety a short note on the habitat is given and the flowering and fruiting time recorded. Of 8 exceptionally large trees the height and girth are given.—*Alfred Rehder.*

6096. DEAM, CHAS. C. **Plants new to Indiana-IX.** Proc. Indiana Acad. Sci. 1920: 225-228. 1921.—Thirty-three species, distributed among 29 genera of angiosperms, are reported as new to Indiana. Locality and habitat are given for each species.—*F. C. Anderson.*

6097. DEAM, CHARLES C. **Plants new to Indiana. X.** Proc. Indiana Acad. Sci. 1921: 101-103. 1922.—The list consists of 18 species of angiosperms distributed among 16 genera. The location and habitat are given for each species.—*F. C. Anderson.*

6098. DENSLOW, H. M. **Passaic County, N. J.** Torreyia 23: 31-32. 1923.—Brief notes are given on species of vascular plants collected in this county in September, 1922.—*J. C. Nelson.*

6099. DRUCE, G. C. *Flora Zetlandica*. Rept. Bot. Soc. and Exchange Club British Isles 6: 457-546. 1921 [1922].—The author notes 428 species including adventives and about 200 varieties and forms. The total Zetland flora consists, as at present ascertained, of 443 native and 59 adventive species. Seventy others have been recorded which are mostly errors of identification. Among the plants gathered were *Tolypella nidifica*, a great extension of its known range, *Potamogeton rutilus*, and a new variety of a hybrid of *P. pectinatus*.—G. C. Druce.

6100. DRUCE, G. C. *New county and other records*. [Phanerogams of Britain.] Rept. Bot. Soc. and Exchange Club British Isles 6: 108-163. 1920 [1921]; 369-404. 1921 [1922].

6101. [DRUCE, G. C.] *Plant notes for 1921*. Mostly new plants to the British Isles. Rept. Bot. Soc. and Exchange Club British Isles 6: 272-273, 275-276, 281-282, 283-290, 295, 309, 311, 314-317, 321, 326. 1921 [1922].—Notes are given of the following: *Brassicagallica* (Willd.) comb. nov., *Silene italica* Pers., *Tillaea aquatica* L., *Solidago cambrica* Huds. and new varieties, *T. lingulatum* Dalst. nov. sp., *Orchis latifolia* L., *O. praetermissa* Druce, *O. maculata* L. (= *O. ericetorum* Linton), *O. maculata* L. var. *subintegriflora* Druce, *Agrostis tenuis* Sibth. (= *A. capillaris* L.) and its varieties, and *Poa trivialis* L. var. *septrionalis* nov. var.—G. C. Druce.

6102. DRUCE, G. C., AND D. LUMB. *Plant notes, etc., for 1921*. [*Euphrasia septentrionalis* nov. sp.] Rept. Bot. Soc. and Exchange Club British Isles 6: 298-300. 1921 [1922].

6103. GESSLER, ROBERT, UND MAX [GESSLER]. *Beiträge zur Flora von Stuttgart*. [Contributions to the flora of Stuttgart.] Jahresh. Ver. Vaterl. Naturk. Württemberg 77: 51-62. 1921.—The authors present the results of their exploration in the vicinity of Stuttgart, Germany, made between 1909 and 1919, their paper representing a supplement to Kirchner's *Flora von Stuttgart und Umgebung*, published in 1888. The species listed number 183 and include 5 fugitive garden plants and 5 indigenous species or varieties not recorded for the region by Kirchner. Under the remaining species new stations are reported, accompanied in several cases by notes on distribution. Attention is called to the extinction or increasing rarity of certain species that were formerly abundant.—A. W. Evans.

6104. GLEASON, H. A. *Botanizing in British Guiana*. Jour. New York Bot. Gard. 22: 161-168. 1921.—The author presents a narrative of a collecting trip with notes on the flora and vegetation.—H. A. Gleason.

6105. GOOR, E. *En Perse (fin)*. [In Persia (concluded).] Bull. Soc. Centrale Forest. Belgique 1921: 89-98. 1921.—Notes, botanical and forestry, taken on a journey through Persia from October to November, 1913, are recorded.—W. C. Lowdermilk.

6106. GREGORY, E. S. *Violet notes in 1920*. Rept. Bot. Soc. and Exchange Club British Isles 6: 174-175. 1920 [1921].

6107. GRIERSON, R. *Adventive plants of the Dublin area, 1921*. Rept. Bot. Soc. and Exchange Club British Isles 6: 406. 1921 [1922].

6108. GRIERSON, R. *Adventive plants of the Glasgow area, 1921*. Rept. Bot. Soc. and Exchange Club British Isles 6: 405. 1921 [1922].

6109. HASTINGS, G. T. [Rev. of: BROWN, H. P. *Trees of New York, native and naturalized*. New York State Coll. Forest. Tech. Publ. 15. 401 p., 133 pl. 1921.] *Torreyia* 23: 35-36. 1923.—One hundred and thirty-three species of trees, of which 109 are native, are described and illustrated, with notes on distribution and uses. Three keys are furnished. No shrubs are included.—J. C. Nelson.

6110. HEIMLICH, LOUIS F. Native plants of White County—III. Proc. Indiana Acad. Sci. 1920: 219–224. 1921.—The list includes 120 species of angiosperms, 115 of herbs, and 5 of shrubs, most of which were collected in Honey Creek Township, White County, Indiana.—F. C. Anderson.

6111. HEIMLICH, LOUIS F. Plants of White County—IV. Proc. Indiana Acad. Sci. 1921: 117–119. 1922.—The article is a list of 70 species of ferns and flowering plants distributed among 53 genera.—F. C. Anderson.

6112. KERSHAW, J. A. Ooldea plants. Victorian Nat. 38: 128–130. 1922.—A list is given of 42 species collected by the author near Ooldea, 350 miles west of Port Augusta.—Wm. Randolph Taylor.

6113. LACAITA, C. C. *Cerastium hirsutum* Tenore. Jour. Bot. 60: 56. 1922.—A record is made of the occurrence of *Cerastium hirsutum* on Monte Mai, north of Salerno.—Adele Lewis Grant.

6114. LITTLE, J. E. Notes on North Herts willows. Jour. Bot. 60: 78–80. 1922.—The author discusses the distribution of some of the willows found in the northern part of Hertfordshire.—Adele Lewis Grant.

6115. LOWE, E. N. Plants of Mississippi. Mississippi Geol. Surv. Bull. 17. 292 p. 1921.—A list is given of the flowering plants and ferns of Mississippi, embodying the results of collections made by members of the Geological Survey staff and others, especially Andrew Allison and Thomas L. Bailey. The list of grasses is taken from the Tracy collection in the Department of Botany of the Mississippi Agricultural and Mechanical College. Mohr's Plant Life of Alabama was used as a basis for this bulletin. While the list is not claimed to be complete, it is felt that the mass of material brought together has added some new light on plant distribution in the central Gulf region.—J. M. Beal.

6116. MERRILL, E. D. An enumeration of Philippine flowering plants. Vol. I. Fasc. 1. P. 1–128. 1922; Fasc. 2. P. 129–240. 1922. (Bur. Sci. Philippine Is. Publ. 18.)—The two parts so far issued cover the Gymnospermae, and the Monocotyledonae from the Pandanaceae to Zingiberaceae (*Amomum*). An attempt is made to summarize present knowledge of the Philippine flora, by accounting for all binomials accredited to it; including all references to Philippine and essential extra-Philippine literature; giving the habitat, occurrence, altitudinal range, and the Philippine and extra-Philippine range of each species; citing specimens when necessary or expedient; and recording all available local names under each species. The work is planned for 3 volumes, to be accompanied by full indices, general introduction, and explanatory data. No new species are described, but in the adjustment of synonymy the following new combinations are made: *Pollinia contorta* (*Pogonatherum contortum* Brongn.), *P. glabrata* (Brongn.) Trin. var. *Elmeri* (*P. monantha* Nees var. *Elmeri* Hack.), *P. viminea* (*Andropogon vimineus* Trin.), *Andropogon fragilis* R. Br. var. *malayanus* (*A. fragilis* Merr., not R. Br.), *Digitaria corymbosa* (*Panicum corymbosum* Roxb.), *D. heterantha* var. *pachyrhachis* (*Panicum heteranthum* Nees & Mey. var. *pachyrhachis* Hack.), *D. sanguinalis* (Linn.) Scop. var. *australis* (? *Panicum australe* Spreng.), *Isachne depauperata* (*I. Benecke* f. *depauperata* Hack.), *Ichnanthus vicinus* (*Panicum vicinum* F. M. Bail.), *Chamaeraphis muricata* (*Andropogon muricatus* Linn. f.), *Dinochloa luconiae* (*Bambusa luconiae* Munro), *Hypolytrum scirpoides* (*Albikia scirpoides* Presl), *Cyperus diffusus* Vahl var. *pubesquama* Kükenth. (*C. pubesquama* Steud.), *Pycnus unioides* (*Cyperus unioides* R. Br.), *Mariscus pennatus* (*Cyperus pennatus* Lam.), *Scirpus Merrillii* Kükenth. (*Schoenoplectus Merrillii* Palla), *Fimbristylis Thouarsii* (*Arthrostylis Thouarsii* Kunth), *Schoenus philippinensis* Kükenth. (*Helothrix philippinensis* Palla), *Cladium crinitum* (*Vincentia crinita* Stapf), *Calamus maximus* Blanco var. *nanga* (*C. Merrillii* var. *nanga* Becc.), *C. maximus* Blanco var. *Merrillianus* (*C. Merrillianus* Becc.), *C. usitatus* Blanco var. *major* (*C. mollis* var. *major* Becc.), *C. usitatus* Blanco var. *palawanicus* (*C. mollis* var.

palawanicus Becc.), *Orania palindan* (Blanco) Merr. var. *sibuyanensis* (*O. philippinensis* Scheff. var. *sibuyanensis* Becc.), *Monochoria vaginalis* (Burm. f.) var. *pauciflora* (*Pontederia pauciflora* Blume), *Kolowratia congesta* (*Alpinia congesta* Elm.), *Amomum dalican* (*Hornstedtia dalican* Elm.), *A. irosinensis* (*H. irosinensis* Elm.), *A. microcheila* (*H. microcheila* Ridl.), *A. philippinense* (*H. philippinensis* Ridl.), *A. pubescens* (*A. lepocarpum* var. *pubescens* Ridl.), and *A. purpureum* (*H. purpurea* Elm.). *Languas* Koenig is adopted as the proper generic name for the oriental species long placed in *Alpinia*, and 30 Philippine species are transferred from *Alpinia* to *Languas*. The genus *Garnotiella* Stapf (Gramineae) is reduced to *Asthenochloa* Büse.—E. D. Merrill.

6117. METCALF, F. P. Notes on marsh and aquatic plants of Missouri. Jour. Washington [D. C.] Acad. Sci. 12: 307-312. 1922.—The results, from the standpoint of distribution, of an extensive survey of the marsh and aquatic plants of Missouri, are here published. Of the 17 plants listed, the following 10 have not previously been reported from the state: *Alisma brevipes* Greene, *Hemicarpha aristulata* (Coville) Smyth, *Naias guadalupensis* (Spreng.) Morong, *Nymphoides peltatum* (S. P. Gmel.) Britten & Rendle, *Paspalum pleniolum* Nash, *Potamogeton crispus* L., *P. Friesii* Rupr., *P. heterophyllum* Schreb., *Ruppia maritima* L., *Rynchospora corniculata* (Lam.) A. Gray.—Helen M. Gilkey.

6118. MILLS, W. H., AND A. H. EVANS. *Cirsium tuberosum* All. in Cambridgeshire. Jour. Bot. 60: 21. 1922.—A new locality is given for *Cirsium tuberosum*. It was found in Cambridgeshire among rough herbage in the south of the County.—Adele Lewis Grant.

6119. MURR, J. Plant notes, etc., for 1921. [*Chenopodium album* L. and its forms.] Rept. Bot. Soc. and Exchange Club British Isles 6: 302-306. 1921 [1922].—The new species *C. Drucei* is included.—G. C. Druce.

6120. PAMMEL, L. H. Notes on Buckingham Lake area. Rept. Iowa State Bd. Conservation 1919: 52-54. 1921.—This is a discussion of the Missouri loess and the common herbaceous plants and trees associated therewith.—L. H. Pammel.

6121. PETCH, T. *Lantana* in Ceylon. Jour. Indian Bot. 2: 302-306. 1921.—*Lantana aculeata* L., introduced into Ceylon about 1824, has become common but is not regarded as a troublesome weed. Rather, it is to be considered as beneficial, as it rapidly invades denuded areas and prevents erosion. *Tithonia diversifolia* Gray, a composite, was introduced in 1851 as a garden plant. It has been reported to kill out *Lantana*, but "Ceylon botanists at the present time would hesitate to affirm" this. The identity of the *Lantanas* in Ceylon is also discussed.—Winfield Dudgeon.

6122. PETERSEN, N. F. Flora of Nebraska. A list of the ferns, conifers and flowering plants of the state with keys for their determination. 3rd ed., 8 vo, 220 p. Published by the author: Lincoln, Nebraska, 1922.—The present edition follows in general the same plan as the previous editions. A number of additions and minor corrections have been made. The most noteworthy change is the extension of the volume to include the ferns and fern allies, of which 27 are recorded from Nebraska.—J. M. Greenman.

6123. RIDLEY, H. N. The flora of Klang Gates. Jour. Federated Malay States Mus. 10: 247-252. 1922.—A list is recorded of 21 species found on the lofty dyke of quartzite rising to 1,400 feet named Klang Gates (because the Klang River descending from the Main Range of the Malay Peninsula, towards K. Lumpur, has cut a gateway through it). The author theorises that a xerophytic element found on the crest is the remains of an ancient xerophytic flora which at one time pervaded the whole of the Malay Peninsula. The 21 plants listed are here enumerated. Most of them are not truly xerophytic, but several are either montane or are found near the sea: *Capparis larutensis* King, *Elaeocarpus Mastersii* King, *Rhodoleia Teysmannii* Miq., *Pygeum Hookerianum* King, *Carallia euryoides* Ridl., *Baeckea frutescens* L.,

Anplectrum divaricatum Triana, *Sonerila prostrata* Ridl., *Aleisanthia rupestris* Ridl., *Embelia coriacea* Wall., *Vaccinium eburneum* Ridl., *Rhododendron longiflorum* Lindl., *Fagraea auriculata* Jack., *Didymocarpus primulinus* Ridl., *Trema angustifolium* Bl., *Ficus indica* L., *F. diversifolia* Bl., *Choriophyllum malayanum* Benth., *Eriachne pallescens* Br., *Eulalia Mili-sumi* Ridl., *Cibotium Barometz* Link.—I. H. Burkill.

6124. RIDLEY, HENRY N. *The flora of the Malay Peninsula*. 8vo. Vol. I. Polypetalae. xxv + 918 p., 75 fig. L. Reeve & Co., Ltd.: London, 1922.—The territory covered by this flora is essentially that part of the Malay Peninsula between 1° and 7° N., including the adjacent islands, an area approximating 52,820 square miles. The author gives in the introduction pertinent information relative to climate, rainfall, geology, botanical areas of the region, a brief statement on distribution of plants, names of places, native names and uses of plants, a list of botanists and plant collectors in the Malay Peninsula, and finally references to important literature. The entire work is planned to be encompassed in 5 volumes. The 1st volume includes the families Ranunculaceae to Cornaceae, arranged essentially in the sequence of Bentham and Hooker's *Genera Plantarum*. The keys are clear and concise, and the bibliography and synonymy are limited. A statement concerning the habitat and geographical distribution accompanies the ample description of each species. The following apparently new species, varieties, and combinations are included: *Cyathostemma virianthorum* Griff. var. *Scortechinii* (C. *Scortechinii* King), *Drepananthus carinatus*, *Canarium latifolium* Pierre, *Polyalthia chrysotricha*, P. *Wrayi* (Unona *Wrayi* Hemsl.), *Popowia nervosa* (*Ellipeia nervosa* Hook. f.), P. *pumila* (E. *pumila* King), *Alphonsea Maingayi* Hook. f. var. *elliptica* (A. *elliptica* Hook. f.), *Barclaya Kunstleri* (B. *Motleyana* var. *Kunstleri* King), *Capparis perakensis* (C. *pubiflora* var. *perakensis* King), *Pittosporum reticosum*, *Polygala monticola* Ridl. var. *major*, *Hydnocarpus nana* King var. *pubescens*, *Garcinia lanceolata*, G. *Curtisii*, G. *montana*, G. *Gaudichaudii* Planch. & Triana var. *minor*, *Calophyllum lanceola*, *Ternstroemia Wallichiana* (*Erythrochiton Wallichianum* Griff.), *Eurya monticola* (E. *acuminata* var. *monticola* Ridl.), *Dipterocarpus Skinneri* King var. *hirtus*, *Anisoptera laevis*, *Shorea palustris*, S. *crassifolia*, S. *laevis*, S. *globifera*, *Pachychlamys Thiseltoni* (*Shorea Thiseltoni* King), P. *Hemsleyanus* (*Balanocarpus Hemsleyanus* King), *Hopea nutans*, H. *pubescens*, *Synaptea Maingayi* (*Vatica Maingayi* Dyer), S. *Louii* (V. *Louii* King), S. *lancaviensis* (V. *lancaviensis* Ridl.), S. *nitens* (V. *nitens* King), S. *perakensis* (V. *perakensis* King), S. *cinerea* (V. *cinerea* King), S. *reticulata* (V. *reticulata* King), *Vatica Scortechinii* (*Retinodendron Scortechinii* King), *Balanocarpus pubescens*, *Urena lobata* L. var. *tomentosa* (U. *tomentosa* Bl.), *Bombax insularis*, B. *larutensis* (B. *insigne* var. *larutensis* Prain), *Durio macrophyllum* (D. *testitudinarum* var. *macrophyllum* King), D. *pinangianus* (D. *testitudinarum* var. *pinangiana* Becc.), *Sterculia rubiginosa* Vent var. *ensifolia* (S. *ensifolia* Masters), *Erythropsis fulgens* (*Sterculia fulgens* Wall.), *Pentace hirtula*, P. *acuta*, *Trichospermum cymbiforme* Sprague, *Sloanea javanica* (*Phoenixosperma javanica* Miq.), *Elaeocarpus acmosepalus* Stapf, E. *rugosus* Roxb. var. *singaporensis*, E. *robustus* Roxb. var. *ovalis*, E. *macrocarpa*, *Brachylophon Curtisii* Oliv. var. *Hullettii* (B. *Hullettii* King), *Connaropsis simplicifolia*, *Hydrocera angustifolia* Bl. var. *latifolia* (H. *triflora* Wight & Arn.), *Evodia malayana* (E. *Roxburghiana* Hook. fil., in part), *Citrus malaccensis*, *Gomphia microphylla*, *Canarium pilosum* Benn. var. *hirtellum* (C. *hirtellum* Benn.), *Turraea breviflora*, *Megaphyllaea annulata*, *Dysoxylum cauliflorum* Hiern var. *elongatum* (D. *cuneatum* Hiern), D. *macrothyrsus* Miq. var. *microbotrys* (D. *microbotrys* King), D. *alternatum*, *Chailletia sordida* (C. *deflexifolia* var. *sordida* Hook. f.), *Gomphandra ophirensis* (*Lasiandra lanceolata* Masters, not G. *lanceolata* King), G. *lanceolata* King var. *ovalifolia*, G. *Maingayi* King var. *pubescens* (G. *puberula* Ridl.), G. *gracilis* King var. *gracillima*, *Phytocrene trichura*, *Cantleya* n. gen. doubtfully placed in Olacaceae, C. *johorica*, *Ilex triflora* Bl. var. *longifolia*, *Lophopetalum pallidum* Lawson var. *Curtisii* (L. *Curtisii* King), L. *coriacea* (*Kokoonia coriacea* King), L. *Maingayi* (K. *Scortechinii* King), L. *littoralis* (K. *littoralis* King), *Salacia prinoidea* DC. var. *macrophylla* King (S. *macrophylla* Bl.), *Zizyphus pernettiioides*, *Ventilago velutina*, *Vitis Harmandi* (*Ampelocissus Harmandi* Planch.), *Otopora Hullettii* (*Cipura Hullettii* Ridl.), *Nephelium glabrum* Noronh. var. *sufferrugineum* (N. *sufferrugineum* Radlk.), N. *caudifolium*, N. *setosum* (*Euphoria setosa* Radlk.), *Mischocarpus Lessertianus* (*Cupania*

Lessertiana Camb.), *Meliosma elegans*, *Buchanania lucida* Bl. var. *laxiflora*, *Melanorrhoea pubescens*, *Spatholobus ferrugineus* Benth. var. *sericophyllus*, *Erythrina suberosa* var. *horrida*. *E. rostrata*, *Pongamia glabra* Vent. vars. *typica* and *aerocarpa*, *Derris elegans* Benth. vars. *typica* and *vestita* Prain, *D. amoena* Benth. vars. *typica* and *Maingayana* Prain (*D. Main. gayana* Baker), *Desmodium polycarpum* DC. var. *albiflorum*, *Dialium platysepalum* Baker var. *ambiguum* (*D. ambiguum* Prain), *Polyosma laete-virens* Griff. var. *robusta*, *Corallia euryoides*, *Combretum chinense* Roxb. vars. *Porterianum* and *pubescens*, *Quisqualis densiflora* Wall. var. *parvifolia*, *Leptospermum flavescens* Sm. var. *angustifolia*, *Rhodamnia cinerea* Jack var. *caudata*, *Eugenia trunciflora* (*E. cauliflora* Ridl., not Bergius), *E. densiflora* Duthie var. *angustifolia*, *E. subrufa* King var. *robusta*, *E. alata*, *E. pseudo-subtilis* King var. *subacuminata*, *E. pallidula*, *E. verecunda* Duthie var. *major*, *E. inophylla* Roxb. var. *Bernardi* (*E. Bernardi* King), *E. Prainiana* King var. *Pearsoniania* (*E. Pearsoiana* King), *Melastoma polyanthum* Bl. var. *angustifolia*, *M. normale* Don var. *glabrescens*, *M. perakense* (*M. malabathricum* var. *perakense* King), *Oxyspora floribunda* (*Anerincleistus floribundus* King), *O. collina* (*A. collinus* Ridl.), *O. hirticalyx* (*Allomorphia hirticalyx* Ridl.), *Allomorphia exigua* Bl. var. *capillaris* (*A. capillaris* Ridl.), *Oritrephes Barnesii* (*Anerincleistus Barnesii* Ridl.), *O. grandiflora* (*A. grandiflora* Ridl.), *O. albiflora* (*A. albiflora* Ridl.), *O. Robinsonii* (*A. Robinsonii* Ridl.), *Perillimnastes* n. gen. of Melastomaceae, *P. fruticosa* (*Anerincleistus fruticosus* Ridl.), *Sonerila prostrata*, *S. picta* Korth. vars. *concolor* and *maculata* (*S. flaccida* Stapf), *Marumia nemorosa* Bl. var. *verrucosa* (*M. verrucosa* Cogn.), *Plethiandra sessiliflora* (*Medinillopsis sessiliflora* Cogn.), *Pternandra Jackiana* (*P. coerulescens* var. *Jackiana* Clarke), *P. galeata* (*Kibessia galeata* Cogn.), *P. echinata* Jack var. *bracteata*, *Memecylon tenuifolium*, *M. dichotomum* Clarke var. *eugeniiflorum* (*M. eugeniiflorum* Ridl.), *Casearia flexula* (*C. flexuosa* Ridl., not Craib), *C. Clarkei* King var. *Kunstleri* (*C. Kunstleri* King), *Trichosanthes tricuspidata* Lour. var. *penangensis*, *Begonia Hasskarli* Zoll. & Mor. var. *hirsuta*, *B. Scortechinii* King var. *Kunstleriana* (*B. Kunstleriana* King), *B. Herveyana* King var. *robusta*, *Schefflera lurida* (*Heptapleurum luridum* King), *S. tristis* (*H. triste* King), *S. elegans* (*H. elegans* Ridl.), *S. venulosa* Harms var. *Curtisii*, *S. Curtisii* (*H. Curtisii* King), *S. micrantha* (*Paratropia micrantha* Miq.), *Trevesia rufo-setosa*, *Dendropanax lancifolium* (*Arthrophyllum lancifolium* Ridl.), and *Mastiria megacarpa*.—J. M. Greenman.

6125. RYDBERG, PER AXEL. Notes on Rosaceae-XIV. Bull. Torrey Bot. Club 50: 61-71. 1923.—A discussion is given of the roses of the prairies and plains of the U. S. A. with key to each group and distribution of the species, of which 25 are recognized for this area.—P. A. Munz.

6126. SCHAFFNER, J. H. Additions to the catalog of Ohio vascular plants for 1922. Ohio Jour. Sci. 23: 107-114. 1923.—The list of additions includes 3 pteridophytes, 2 gymnosperms, and 67 angiosperms. A corrected list of 11 Ohio species of *Equisetum* is inserted.—H. D. Hooker, Jr.

6127. SMALL, JOHN K. Along the Juniata River. Jour. New York Bot. Gard. 22: 168-171. 1921.—A record is given of field observations on the flora of the region indicated in the title.—H. A. Gleason.

6128. STEPHENSON, T., AND T. A. STEPHENSON. Plant notes, etc., for 1920. [Epipactis.] Rept. Bot. Soc. and Exchange Club British Isles 6: 44-46. 1920 [1921].—A synopsis of the British forms of *Epipactis* is given.—G. C. Druce.

6129. STEPHENSON, T., AND T. A. STEPHENSON. Plant notes, etc., for 1921. [Orchis purpurella Steph. and its hybrids.] Rept. Bot. Soc. and Exchange Club British Isles 6: 311-314. 1921 [1922].

6130. TADGELL, A. J. A contribution to "The flora of the Victorian Alps." Victorian Nat. 38: 105-118. 1922.—The author adds to a previous paper by A. J. Ewart (Victorian Nat. 27: 104-117. 1910) 83 species of native plants, with 17 varieties and 11 aliens additional. A supplementary note gives 11 natives, 2 varieties, and 26 aliens more, making a total of 476 plants recognized in the district.—*Wm. Randolph Taylor*.

6131. YUNCKER, T. G. A species of *Cuscuta* not hitherto reported from Indiana. Proc. Indiana Acad. Sci. 1920: 229. 1921.—Two localities, Vigo and Posey Counties, for *Cuscuta cuspidata* Englm. are reported for the state of Indiana. This species is typical of the prairie region of the Mississippi River westward.—*F. C. Anderson*.

BOTANICAL ABSTRACTS

A monthly serial furnishing abstracts and citations of publications in the international field of botany in its broadest sense.

6132. ANONYMOUS. Number of seeds per unit weight. Seed World 11²: 22. 1922.—A standard table is presented indicating the number of seed per unit weight for certain kinds of field seeds; it has been adopted by the Association of Official Seed Analysts of North America.—*M. T. Munn.*

6133. ANONYMOUS. State seed testing methods in Denmark. Seed World 10⁴: 23-24. 1921.—A report is presented on the history and work of the Danish State seed testing station. Laboratory methods used in making purity and germination tests are described.—*M. T. Munn.*

6134. ANONYMOUS. Vitality of Lespedeza seed limited. Seed World 11³: 44. 1922.—Well-matured seed give a high percentage of germination when fresh, but the germination decreases rapidly when the seed are kept over. Only a few seed live over the 3rd year.—*M. T. Munn.*

6135. ANONYMOUS. Wimmera rye grass: What it is and where it should be used. Seed World 12³: 24. 1922.—Wimmera rye grass (*Lolium subulatum*) is a drought-resistant form of the biennial Italian rye grass. Like Italian rye grass, the Wimmera variety is an annual and the seed is somewhat similar in form, although minus the awns.—*M. T. Munn.*

6136. BARROW, E. H. Cane varieties at Guanica. Facts about Sugar 15: 500. 1922.—Desirable and undesirable qualities of the most important varieties are recounted.—*C. W. Edgerton.*

6137. BJERG-JENSEN, J. C. A new variety of Danish white clover. Seed World 11⁷: 19. 1922.—The new variety is the Mors white clover.—*M. T. Munn.*

6138. B[ROOKS], C. F. The critical period of wheat at College Park, Md. [Rev. of: SANDO, W. J. The critical period of wheat at College Park, Md. Monthly Weather Rev. 49: 301. 1921.] Bull. Amer. Meteorol. Soc. 2: 84. 1921.—“In eastern Maryland it was found that high yields of wheat occurred in the drier years and vice versa, especially when the rainfall for the 35-50 days before harvest was small.”—*Earl S. Johnston.*

6139. BROWN, E. **Labeling of field seeds by seedsmen.** Proc. Assoc. Official Seed Analysts North America 1919: 27-28. 1921.—In 1919, after an understanding whereby the seed trade voluntarily agreed to label all farm crop seeds with certain information, purchases made indicated that only 10 per cent of the lots of seed so purchased by the U. S. Department of Agriculture for this purpose were fully labeled. Later purchases disclosed an even smaller proportion of the lots fully labeled. It is concluded that any reform must be secured through other means than voluntary agreement.—*M. T. Munn.*

6140. BUSSE. **Tagesfragen aus dem deutschen und ausländischen Tabakbau.** [Present day questions regarding German and foreign tobacco culture.] Mitteil. Deutsch. Landw. Ges. 38: 241-244. 1923.—In this address before the Colonial Section of the German Agricultural Society the speaker called attention to the possibilities of expanding tobacco culture in Germany. Special mention is made of the introduction of American varieties. The work of Garner and Allard is referred to as helpful in selecting varieties that will succeed under German conditions.—*A. J. Pieters.*

6141. CHAMBERLAIN, JAMES F. **Relationship between weather and crops.** Bull. Amer. Meteorol. Soc. 2: 67-68. 1921.—The probable frequency of early and late frosts has been studied and although weather cannot be controlled, agriculturists and shippers can carry on their work by following weather forecasts in such a manner that crop losses may be reduced to a minimum.—*Earl S. Johnston.*

6142. CLAUS, G. **Grundlagen und Aufgaben einer modernen deutschen Saatzuchtwirtschaft.** [Foundations and tasks of a modern German seed breeding establishment.] Mitteil. Deutsch. Landw. Ges. 38: 293-298. 1923.—In this address before the seed breeding section of the German Agricultural Society the speaker outlined the weather and soil requirements for successful seed culture; the organization and physical plant, including machinery; the technical demands and especially the point of view made possible by recent advances in knowledge of heredity.—*A. J. Pieters.*

6143. COLON, E. D., AND A. M. DE ANDINO. **Cane varieties in northern Porto Rico.** Facts about Sugar 16: 32-33. 1923.—The several varieties grown are discussed.—*C. W. Edgerton.*

6144. CUNNINGHAM, BYRSSON. **Indian irrigation.** [Rev. of: Triennial review of irrigation in India, 1918-1921. v + 222 p. Government Printing Office: Calcutta, 1922.] Nature 111: 388-389. 1923.—In 1919-20, there were under irrigation in India 28 million acres, with 55,202 miles of Government channel in operation.—*O. A. Stevens.*

6145. DAHLBERG, R. C. **The identity of certain sweet clover seed.** Proc. Assoc. Official Seed Analysts North America 1919: 25. 1921.—Some of the seed of yellow sweet clover (*Melilotus officinalis*) are sufficiently similar to those of white sweet clover (*M. alba*) to make complete separation of the 2 species impossible. There are, however, seed of yellow sweet clover which are spotted with small splotches of purple of unequal size and degree of color. Seeds so marked can definitely be assigned to *M. officinalis*.—*M. T. Munn.*

6146. DORPH-PETERSEN, K. **Meddelelse om forskellige Undersøgelser ved Stratsfrøkontrollen i København.** [Communication on investigations at the state seed testing station in Copenhagen.] Nordisk Jordbrugsforskning 1922: 429-441. 2 fig. 1922.—The speed of germination is important since a small difference in this respect between 2 samples will be reflected in a considerably lower percentage of germination, both in the laboratory and in the field. Shelled seed of timothy (*Phleum pratense*) have generally only $\frac{3}{4}$ of the germinating value of seed with glumes, and lose their germinating power much more rapidly. The shelled seed of cocksfoot grass (*Dactylis glomerata*), oats, and tall oat-grass (*Arrhenatherum elatius*) are also inferior, although not to such an extent as in timothy.—*Ernst Gram.*

6147. DYMOND, J. R. **Colour characteristics of red clover seed.** Proc. Assoc. Official Seed Analysts North America 1920: 30-32. 1921.—The author's results indicate that in red clover seed harvested in Ontario in 1916 the purple colored seed were slightly more prevalent and in practically every case weighed more per thousand seed than the yellow. Germination tests made 32 months after harvest show that the yellow seed give a higher percentage of germination and contain more hard seed than the purple. The green or immature seed give the lowest percentage of germination but contain a surprisingly high proportion of hard or impermeable seed. The brown seed are shown to be low in vitality and to contain the smallest percentage of hard seed.—*M. T. Munn.*

6148. EASTERBY, H. T. **Bureau of Sugar Experiment Stations. From: Annual report of the director. II.** Australian Sugar Jour. 15: 43-46. 1923.—At the Mackey Experiment Station subsoiling in comparison with the customary cultivation using Green Goru (N. G. 24 B) as the cane crop showed that subsoiling increased the crop. The tabular results are given of trials made with varieties of imported cane to test their commercial values. The dates for arrowing of different varieties of cane growing at the Mackey Station are given in a table.—*C. Rumbold.*

6149. EGGINGTON, GEO. **Irrigation water as a factor in the dissemination of weed seeds.** Proc. Assoc. Official Seed Analysts North America 1919: 20-21. 1921. [See Bot. Absts. 8, Entry 1594.]

6150. EVANS, E. E. **"Canada Peas" grown 100 B. C.** Seed World 94: 30. 1921.—Many varieties of peas that are called "Canadian" have been grown in Manchuria for more than 2,000 years and in the U. S. A. since the time of the Pilgrims.—*M. T. Munn.*

6151. FRENCH, G. T. **The effect of commercial blue blotting paper on the germination of timothy seed.** Proc. Assoc. Official Seed Analysts North America 1920: 55-56. 1921.—Tests reported indicate that the commercial grade of blotting paper is not reliable for germinating timothy and redtop seeds. The behavior of seed on such paper cannot be depended upon to show their state of vigor. Seeds of timothy and redtop show sprouts but no roots upon such paper. Only paper should be used which has been found reliable by comparative tests with paper known to be free from these toxic substances. A chemical analysis of the paper does not appear to be a reliable guide.—*M. T. Munn.*

6152. FROBERVILLE, L. F. DE. **Degeneration of Uba cane.** South African Sugar Jour. 7: 303-305. 1923.—There can be no degeneration of Uba cane in Africa since the cane is always propagated by cuttings, not by seed. Poor cane can be accounted for by lack of cultivation and plant food. Seed-cane should be carefully selected or canes may be imported from other regions in Africa. Manure and lime should be used, and trash should not be burned before harvesting. Legumes should be cultivated in cane fields, and crops rotated.—*C. Rumbold.*

6153. FUENTE, CARLOS CASADO DE LA. **Ueber günstige Wirkung von Gips auf Keimlinge der landwirtschaftlichen Kulturpflanzen.** [On the favorable effect of gypsum on seedlings of agricultural plants.] Illus. Landw. Zeitg. 42: 340. 1922.—This report of pot experiments shows increased growth of maize and lucerne due to the use of gypsum. It is concluded that acid soils should, if practicable, first be treated with calcium carbonate or with quick-lime to neutralize acids. Gypsum should then be used for promoting the development of the young plants.—*John W. Roberts.*

6154. GARMAN, II. **Germination of scarified hard seeds.** Seed World 123: 15; 129: 19. 1922.—The author describes a laboratory scarifier constructed for use on hard seeds of legumes. A table shows a gain of 11.2 per cent in total germination as a result of scarifying 10 minutes in this car with its boxes lined with sandpaper, and 15.8 per cent from treating 20 minutes.—*M. T. Munn.*

6155. GARMAN, H. **Kentucky blue grass seed crop.** Seed World 13⁶: 20-21; 13⁸: 18-19. 1923.—In this discussion of the Kentucky blue grass industry the 1st article deals principally with seed production and the 2nd mainly with purity and germination testing methods.—*M. T. Munn.*

6156. GARMAN, H. **The effect of paradichlorobenzene on the vitality of stored seeds.** Seed World 11⁴: 19-20. 1922.—Tests made imply that seed can be protected by paradichlorobenzene where they are kept rather closely confined, and loss of viability, if any, is slow and very slight. This fumigant stops injury in seed already infested with insects. It was not determined whether the fumigant would leave odor or flavor on seed to be used for food.—*M. T. Munn.*

6157. GERLACH. **Beiträge zur Kenntnis der Wirkung einer Phosphorsäuredüngung.** [Contribution to a knowledge of the effect of fertilizing with phosphoric acid.] Mitteil. Deutsch. Landw. Ges. 38: 259-264. 1923.—The author reviews the arguments of those who advocate a reduced use of phosphoric acid. On a farm on which 26 kgm. phosphoric acid in excess of that removed by crops had been applied per hectare each year from 1870 to 1912, the application in 1922 of superphosphate and Thomas meal resulted in marked increases in the yield of potatoes. The results of phosphoric acid fertilizer tests on potatoes, barley, winter-wheat, and meadows, carried on by a large number of coöperators, are given in tabular form.—*A. J. Pieters.*

6158. GERLACH. **Die Gewinnung von Eiweiss im Inlande.** [Domestic production of protein.] Mitteil. Deutsch. Landw. Ges. 38: 352-355. 1923.—Attention is called to the great decrease in protein-rich feeds and human food in Germany. A decrease is shown in the yield per unit area and in the areas planted, and the following remedial measures are suggested: (1) increase in area cultivated; (2) fertilizing grain-bearing legumes, clovers, meadows, and pastures with nitrogen; (3) better methods of conservation, especially for protein-rich green fodder plants; (4) feeding urea. There is a general discussion under each head. In regard to urea it appears that experiments have not been uniformly favorable and that the high cost makes its use at this time questionable.—*A. J. Pieters.*

6159. GLOYER, W. O. **Sclerema and hardshell, two types of hardness of the bean.** Proc. Assoc. Official Seed Analysts North America 1920: 60. 1921.—The 2 distinct types are: hardness of the interior, to which the name sclerema is given; and hardening of the seed coat, which is termed hardshell. The former results from enzymatic changes produced by storing the seed in damp atmosphere and at a high temperature in the absence of ventilation. The latter is a physical condition produced by storing seed in an artificially heated room with a low relative humidity. Beans ripened in hot, dry weather also acquire this condition in the field. The seasonal variation of the germination of the red kidney and lima beans is due to changes in the impermeability of the seed coat. Mature as well as immature beans develop the hardshell condition, which may be corrected by plunging the seed for 5 seconds in boiling water followed by immersion in cold water, or by exposing the seed to flowing steam.—*M. T. Munn.*

6160. HENKE, L. A. **Cane varieties in Hawaii.** Facts about Sugar 15: 320-321. 1922.—The history and characteristics of the principal sugar cane varieties grown in Hawaii are treated.—*C. W. Edgerton.*

6161. HILLMAN, F. H., AND HELEN H. HENRY. **The identification of seed of Italian alfalfa and red clover.** Proc. Assoc. Official Seed Analysts North America 1919: 24-25. 1921. [See also Bot. Absts. 5, Entry 27.]

6162. HOPKINS, C. G., J. E. WHITCHURCH, H. F. T. FAHRNKOPF, AND F. H. KELLEY. **Yields from ten wheat fields in "Egypt."** Illinois Agric. Exp. Sta. Circ. 236. 1 p. 1919.—The results are given of soil fertility tests on wheat, *Triticum sativum*, grown on 10 experimental fields in the southern part of Illinois.—*O. H. Sears.*

6163. HOPKINS, ELIZABETH F., AND M. T. MUNN. **Variations in seed tests—application of the tolerance formula.** Proc. Assoc. Official Seed Analysts North America 1920: 62-63. 1920. Also, *Seed World* 9: 23-24. 1921.

6164. HORNADAY, W. D. **Results of paper covering of cane.** *Sugar* 24: 249-250. 1922.—Covering cane fields with a specially made paper conserves moisture, prevents packing of the soil, reduces labor, and considerably increases the yield.—C. W. Edgerton.

6165. HUGHES, H. D. **Comparative germination of seeds sampled by hand and by the pneumatic seed counter.** Proc. Assoc. Official Seed Analysts North America 1919: 13-14. 1921.—Data are presented to show that the mechanical seed counter or sampler is a time saver, the personal element is eliminated, and that this method of taking samples of 100 seed for germination testing is accurate.—M. T. Munn.

6166. JONES, J. M., AND R. E. DICKSON. **Grain sorghums versus corn for fattening lambs.** *Texas Agric. Exp. Sta. Bull.* 306. 32 p. 1923.—All west Texas grows more or less of the grain sorghums, while corn is often a failure because of lack of rain. The experiment shows that ground threshed Milo and Kafir produce practically the same gains as ground shelled corn when fed to lambs in the same amounts. There is little difference in the value of milo and kafir. As the sorghums are cheaper than the corn, the cost is 10-17½ per cent less than corn. The Kansas Experiment Station has carried out similar tests which substantiate the results in this report.—L. Pace.

6167. JONES, JENNIE SALES. **Two methods of testing hairy vetch seed for purity.** Proc. Assoc. Official Seed Analysts North America 1920: 60-62. 1921.—Two methods, designated as the Count and the Weight methods were used in an attempt to determine which would give the smaller number of variations. The author is inclined to use the weight method for the present.—M. T. Munn.

6168. KENNEDY, P. B. **Observations on some rice weeds in California.** *California Agric. Exp. Sta. Bull.* 356. 467-494. 1923.—Flooding in summer to germinate the seeds and then plowing under the young seedlings is one of the most effective methods of cleaning foul rice lands. Repeating the flooding and then disking should also be very effective. Controlling water grass by the submergence method is gaining many adherents. Water grass does not come up through 8 inches of water, whereas rice will. Controlling water grass by rotating rice with some other crop, especially a legume, would be an ideal method but as yet the drainage or soil conditions required to grow other crops successfully have not yet been realized. On some of the better lands, not typical rice lands, grain or sorghum will produce good crops in a rotation. Hand weeding is effective but expensive. The use of clean seed rice is an effective method of control. A list of 34 rice weeds, and a discussion of the nature of their growth is given.—A. R. C. Haas.

6169. KLAUTKE, P. **Nutzpflanzen und Nutztiere Chinas.** [Economic plants and economic animals of China.] 159 p., illus. *Weltwirtschaftliche Abhandlungen*, edited by S. BERLINER. Band 5. Hanover, 1922.—Plant geography is discussed in the introduction; and in the various chapters the following are discussed. Field crops: grains, sorghum, millet, wheat, barley, rye, oats, maize, rice. Oil seeds: sesame, beans, rape, peanuts. Fiber plants: cotton, China grass, hemp, jute, flax, Abutilon hemp or Sida hemp. Vegetables: potatoes, sweet potatoes, yams, eggplants, turnips, kohlrabi, taro, cabbage, cucumbers and melons, onions, lotus. Orchard crops: orange, peach, apricot, plum, cherry, pear, apple, medlar, persimmon, lichi, pineapple, berries, grapes, walnuts. Important plant products: tea, opium, sugar, tobacco, varnish, green vegetable tallow, cassia, gallnut, rhubarb, ginger, indigo, shellac, camphor, fiber lace, matting, Ningpo hats, palm-leaf fans, anise, bamboo. Animal industry, the silk industry from cultivated and wild silk, white (insect) wax, and Chinese flower gardens are also covered. There is a general review of the fauna of China, and a bibliography.—W. B. Lydenberg.

6170. KRAMER. Die Zuckerrübenstandweitenversuche des Jahres 1922. [The sugar beet-spacing investigations in 1922.] Mitteil. Deutsch. Landw. Ges. 38: 179-180. 1922.—The drills were spaced 40, 50 and 60 cm. Out of 42 tests, the 40-cm. spacing gave the highest yield in 40.5 per cent of the cases, the 50-cm. spacing in 52.4 per cent, and the 60-cm. spacing in 7.1 per cent. The sugar production per hectare was found highest in 50 per cent of the cases for 40-cm. spacing, in 47.5 per cent for 50-cm., and in 2.5 per cent for 60-cm. spacing.—A. J. Pieters.

6171. KRON, OSKAR. Zum Düngungsversuche mit heissvergorenem Stallmist. Manuring experiments with hot-fermented stable manure.] Mitteil. Deutsch. Landw. Ges. 38: 380-384. 1923.—On field A potatoes were grown in 1921 and wheat in 1922; on field B potatoes were grown in 1922. The results are given in detail in 2 tables and confirm the report previously made that hot-fermented stable manure and green manure produce higher yields than does yard manure.—A. J. Pieters.

6172. LEONHARDS. Neuerscheinungen auf dem Düngemittelmarkt. [Recent appearances in the fertilizer market.] Mitteil. Deutsch. Landw. Ges. 38: 398-400. 1923.—The author refers by trade name to a number of new fertilizers and gives results of tests or of analyses. Most of these preparations were found to be without value; a few have not been sufficiently tested to warrant a positive statement but their value seems doubtful. Many of the preparations mentioned were of the humus type designed to increase the bacterial life of the soils, such as Biohumus.—A. J. Pieters.

6173. LÖBBECKE, VON. Ist es bei der Missernte an guter Leinsaat möglich und ratsam die Ansaat stärker herabzusetzen? [Is it possible and advisable, in case of a poor harvest of flax seed, to sow greatly reduced amounts?] Mitteil. Deutsch. Landw. Ges. 38: 143-144. 1923.—The writer's personal experience was that good results could be had with seeding 30 pounds per morgen provided the seed was drilled in carefully prepared land.—A. J. Pieters.

6174. LUNZ, H. Shall impermeable seeds be counted as part of the germination test. Proc. Assoc. Official Seed Analysts North America 1920: 67-70. 1920. Also, Seed World 9: 21-22. 1921.

6175. McCONNIE, R. C. Cane cultivation at Fajardo. Facts about Sugar 15: 440-441. 1922.—Methods of cultivation are discussed, including lining, plowing, ditching, planting, fertilizing, and harvesting.—C. W. Edgerton.

6176. MEYER, D. Düngungsversuche mit Stickstoff zu Schmetterlingsblütlern. [Fertilizer experiments with nitrogen on legumes.] Mitteil. Deutsch. Landw. Ges. 38: 180-182. 1923.—The trials with red clover showed a slight increase in yields, but no increase in protein content. Those with luzerne showed a fair increase in yield for the 1st cutting but not for the 2nd and a very slight increase in the protein content. The trials with lupines showed no increases whatever.—A. J. Pieters.

6177. MILLIGAN, S. Review of sugar cane agricultural operations in India, 1921-1922. From: Annual review of agricultural operations in India issued by the agricultural adviser to the government of India. Pusa [January, 1923]. Internat. Sugar Jour. 25: 242-246. 1 map. 1923.—An account is given of the successful trials on a field scale of the seedling sugar canes bred at the Sugar Cane Station at Coimbatore. Co 205, Co 210, Co 213, Co 214, and some others are very promising. Some of their characteristics are described.—C. Rumbold.

6178. MUNN, M. T. The nature and cause of the "water sprout" encountered in germination testing. Proc. Assoc. Official Seed Analysts North America 1920: 54. 1921.—The so-called "water sprout" which may be found on germinating seeds of many kinds, especially prevalent and conspicuous on the legumes, is not a normal growth process but occurs on dead

or greatly weakened seeds. The exciting causes of the "water sprout" in many cases appear to be bacteria and fungi of one or more species which have been stimulated to activity by placing infested seed under conditions of moisture and heat in the process of germination.—*M. T. Munn.*

6179. NAIK, KASANJI D. Report of the Secretary, Sugar Bureau (India). Sci. Rept. Agric. Res. Inst. Pusa 1921-22: 88-96. 1922.—The Bureau has propagated and tested promising varieties of Java, Coimbatore (South India), and local sugar cane in North Bihar. Statistical information and advice about machinery and mills have been supplied to manufacturers.—*Winfield Dudgeon.*

6180. NICHOLSON, G. Field experiments with wheat, Wagga experiment farm. Agric. Gaz. New South Wales 34: 322-325. 1923.—There were 17 wheat varieties under trial grown on fallow for grain. Wandilla yielded highest at 32 bushels per acre. Three of these varieties and 2 others were under trial for hay production.—*L. R. Waldron.*

6181. NOLTE, O. Die Düngung landwirtschaftlicher Kulturpflanzen mit Schwefel. [Fertilizing agricultural plants with sulphur.] Mitteil. Deutsch. Landw. Ges. 38: 248-249. 1923.—Pot or field tests were made at 7 stations using lucerne, orchard grass, rye grass, red clover, white clover, and potatoes as indicator crops. Various soil types were used. No notable increases were found with lucerne or potatoes. In the 1 test reported red and white clover showed some, and orchard grass and rye grass, slight increases. Details are given in tables and in 1 case analyses are given of the crops variously fertilized.—*A. J. Pieters.*

6182. PAGE, R. L. Uba cane in Porto Rico. Facts about Sugar 15: 420-421. 1922.—Uba cane was introduced into Porto Rico on account of its resistance to the mosaic disease. It is also a very heavy yielding cane and will probably become firmly established in spite of its small size and high cost of harvesting.—*C. W. Edgerton.*

6183. PIETERS, A. J. Red clover seed consumption in the United States. Seed World 13: 13-14. 1923.—On the basis of the wheat acreage for 1921-22 and data regarding the percentage of wheat acreage seeded to clover, the author estimates the total annual consumption of clover seed in the U. S. A. at 120-130 million pounds, of which 85-92 million pounds is red clover seed.—*A. J. Pieters.*

6184. ROEMER, TH. Anbau und Züchtung der Lupine. [Culture and breeding of lupines.] Mitteil. Deutsch. Landw. Ges. 38: 168-169. 1923.—The writer calls attention to some difficulties attending culture and breeding of lupines.—*A. J. Pieters.*

6185. SAUNDERS, C. B. Fifth annual report, Official Seed Testing Station for England and Wales. Jour. Nation. Inst. Agric. Bot. 1: 24-35. 1922.—A steady growth over the work done in previous years was made. Now a part of the National Institute of Agricultural Botany, the Station has commodious and well equipped quarters and the advantage of close contact with the plant breeding work of the Institute. Tables show the number of tests made of the different kinds of seed, the average results of the tests and the source from which the samples were received. Approximately 10 samples were received from seedsmen for each sample received from farmers. At the beginning of the year the method of testing grass seed was changed from the so-called Irish method to the Continental method. A short course in seed testing was given during the summer.—*E. Brown.*

6186. SCHEUMANN, GEORG. Die Gewinnung von Eiweiss für Futterzwecke und die menschliche Ernährung nach dem Pohlschen Verfahren. [Securing albumin for feed and for human consumption by the method of Pohl.] Mitteil. Deutsch. Landw. Ges. 38: 271-292. 1923.—The speaker called attention to the method patented by Pohl according to which lupine seed is extracted with a salt solution from which the albumin is then precipitated by

appropriate reagents. The product is a whitish yellow powder containing 98-99 per cent pure albumin. Bread made from $\frac{3}{4}$ rye or wheat flour plus $\frac{1}{4}$ lupine meal tastes like good rye bread and has a much higher protein content. This lupine albumin can also be used in many technical industries as in cotton manufacture and in the preparation of photographic plates, films, etc. The ground and extracted lupine seed still contain a large amount of protein and can be mixed with molasses to make a high grade cake. Analysis of the extracted residue is given.—*A. J. Pieters.*

6187. SCHNEIDER, KARL. Die Bewirtschaftung der Wiesen und Weiden unter Berücksichtigung der wirtschaftlichen Seite in Bezug auf Viehhaltung und Viehzucht. [The management of meadows and pastures considered economically with respect to cattle keeping and cattle breeding.] Mitteil. Deutsch. Landw. Ges. 38: 254-258. 1923.—In this address emphasis is laid on drainage and the use of fertilizers.—*A. J. Pieters.*

6188. SHEPARD, COLA W. Dry land agriculture in northeastern Wyoming. Bull. Amer. Meteorol. Soc. 2: 125-128. 1921.—A plea is made to solve the problem of obtaining water for agricultural purposes in the Great Plains region, thereby increasing its productivity many fold. The author believes the rainfall, if none were lost, is sufficient to produce crops. The paramount need is a method for conserving soil moisture and, to some extent, controlling evaporation.—*Earl S. Johnston.*

6189. SHEPARD, COLA W. The grasses of the plains. Bull. Amer. Meteorol. Soc. 2: 130-132. 1921.—The author disagrees with Redway in believing that the soil rather than the climate determines whether the vegetation in the Great Plains region be bunch grass or sod.—*Earl S. Johnston.*

6190. SIFTON, H. B. Longevity of the seeds of cereals, clovers, and timothy. Proc. Assoc. Official Seed Analysts North America 1919: 22-24. 1921.—Seeds of spring wheat, oats, timothy, alsike and red cover, stored in cotton sacks or manila envelopes in galvanized iron chests, were used. Tests were made with an alternation of temperature from 20 degrees to 30 degrees C. Practically all the kernels of spring wheat retain their vitality for the first 5 years. Then the weaker ones begin to die and more than 75 per cent of the seed lose their vitality between the ages of 11 and 15 years, about $\frac{1}{2}$ of these dying in their 13th year. The longevity of oat seed was found to be much greater than that of wheat, 40 per cent of the 19-year-old kernels being alive. Timothy seed begins to depreciate in value at once. The germination percentage began to fall rapidly after the 7th year, when it was 84 per cent. By the 12th year it was 11 per cent, and after 17 years the seed was practically all dead. Both alsike and red clover have a larger proportion than wheat of seed that lives over 15 years, but from the standpoint of a practical seedsman their longevity is not nearly so great. After 11 years, wheat on the average still germinated more than 85 per cent, but 11-year-old alsike and red clover germinated less than 40 per cent.—*M. T. Munn.*

6191. SÖRENSEN, S. Grass seed industry in Denmark. Seed World 13¹: 20-21. 1923.—Seed activities in Denmark are described.—*M. T. Munn.*

6192. SÖRENSEN, S. Root seed industry in Denmark. Seed World 13³: 18-19. 1923. [See preceding entry.]

6193. SPIECKERMANN, A. Wie kann die weitere Verbreitung des Kartoffelkrebses in Deutschland verhindert werden? [How can the further spread of potato wart in Germany be checked?] Mitteil. Deutsch. Landw. Ges. 38: 175-179. 1923.—Within recent years this disease has appeared in commercial potato farms, in addition to its earlier distribution in small gardens, and energetic measures are needed to prevent its further spread, since new channels of distribution are thereby opened up. Furthermore, it is much more difficult to enforce quarantine regulations where extensive farming communities are involved. The

writer doubts the practicability of the police regulation of planting and disposal of the crop, which it is proposed to put into effect in Prussia. Other means must be employed to encourage the use of immune varieties, and the lack of an immune, late, white-fleshed, starch potato must be met by breeding. The ultimate limits of infestation must be determined, since experiment has shown that the disease may be carried in about 10 per cent of outwardly sound potatoes grown in infested soil.—*F. Weiss.*

6194. STEVENS, O. A., AND H. D. LONG. Some modifications of the vertical air-blast separator. Proc. Assoc. Official Seed Analysts North America 1919: 18-19. 1921.—A shelf is substituted for the stand supporting the glass receiving cylinder. The cylinder terminates below in a funnel, the chaff being thereby deposited directly into a container. The regular 1½ inch glass blowing tube has been replaced by a tube of slightly larger diameter and 6 inches longer for certain of the larger sized seeds.—*M. T. Munn.*

6195. VEVE, RAFAEL A. Our experience with cane varieties. Facts about Sugar 15: 482-483. 1922.—Conclusions are drawn from 11 years' tests with different cane varieties at the Fajardo Experimental Station, Porto Rico.—*C. W. Edgerton.*

6196. WALDRON, C. H. Notes on germination of Kentucky bluegrass. Proc. Assoc. Official Seed Analysts North America 1919: 14-15. 1921.—Duplicate samples of Kentucky bluegrass seed germinated in germination chambers with controlled temperature and in daylight with ordinary temperature showed a higher germination in daylight than did duplicates in the dark chamber. The room tests gave an average increase of 21 per cent over the chamber tests. The daylight tests gave the samples of low viability a much greater increase over their dark chamber duplicates than it did to the samples of ordinary viability. It is suggested that direct sunlight has a controlling effect on fungi which was not operative in the dark chamber tests.—*M. T. Munn.*

6197. WEBBER, H. J. The place of plant breeding in commercial seed companies. Seed World 104: 15. 1921. [See also Bot. Absts. 10, Entry 139.]

6198. WHITCOMB, W. O. Correlating laboratory tests of seed germination with field tests. Proc. Assoc. Official Seed Analysts North America 1920: 51-54. 1921.—Many samples of different kinds of seed were selected, tested in the regular way in the laboratory, and duplicates planted in the field in rows of 100 seed each. The statistical method is employed in analyzing the data, which show certain relationships between laboratory and field tests in the germination of seed. Preliminary tests show a somewhat higher percentage of germination in the laboratory tests.—*M. T. Munn.*

6199. WIANCKO, A. T. Italian clover seed is not adapted to Indiana soils. Seed World 91: 23. 1921.—In an experimental comparison of imported Italian red clover seed with native seed the Italian died out during the winter while the strips seeded with native seed showed no winter-killing whatever.—*M. T. Munn.*

6200. WIERINGA, G. "Daylight" germination best method for some varieties of seed. Seed World 132: 31. 1923.—The author reports detailed research with grass, vegetable, flower, and tree seeds germinated in diffuse light and in direct sunlight. Of the grasses, orchard grass, reedtop, timothy, meadow foxtail, Kentucky bluegrass, and rough stalked meadow grass germinated best in diffuse light. Canada bluegrass should be germinated in direct sunlight. Of the garden seeds, chicory, parsnip, and parsley gave the same results whether germinated in the dark or in the light. Celery, endive, and tomatoes gave decidedly better results in sunlight. A table shows the temperatures and days on which counts should be made when seeds are germinated in the dark. Methods for making 2 types of sunlight chambers are given.—*M. T. Munn.*

6201. WILSON, A. C. Tolerance limits of weed seeds. Proc. Assoc. Official Seed Analysts North America 1919: 26-27. 1921.—The author presents a table showing the number of seed per gm. and ounce for some 18 kinds of field-crop seeds. The table also shows the number of noxious weed seeds which taken collectively would render the seed unsalable for seeding purposes when a seed law requires that the prevalence of weed seeds be determined by proportion or ratio.—*M. T. Munn.*

6203. BENECKE, WILHELM. Moritz Büsgen. Ber. Deutsch. Bot. Ges. 39: (87)-(96). 1921/1922.—Büsgen was born July 24, 1858, at Weilburg am Lahn and died July 22, 1921, at Hannöversch-Münden, where for 20 years he was professor of botany at a school of forestry. He had studied the ecology of insect-catching plants and of acid-soil plants, but his chief efforts were in the general subject of forestry. His principal work is *The Structure and Life of Forest Trees*. A list of his publications is given.—*C. A. Weatherby.*

6204. BORESCH, KARL. Friedrich Czapek. Ber. Deutsch. Bot. Ges. 39: (97)-(114). *Portrait.* 1921/1922.—Czapek, professor of botany at the German University in Prague, was born in that city May 16, 1868, and died July 31, 1921, from the after effects of disease contracted while serving as surgeon at a camp of prisoners of war in Bosnia in 1916. His principal studies were in physiological botany; his chief work is *The Biochemistry of Plants*. A list of 94 publications is given.—*C. A. Weatherby.*

6205. CALKINS, GARY N. The debt of science to Pasteur. Sci. Monthly 17: 1-16. 1923.

6206. HARMS, H. August Schulz. Ber. Deutsch. Bot. Ges. 39: (115)-(127). 1921/1922.—Schulz, professor at Halle, was born at Stettin Dec. 8, 1862 and died Feb. 7, 1922. His life was an almost continuous struggle with various physical infirmities; nevertheless, he accomplished much, principally in floristics and phytogeography. His *Outlines of the Development of Central Europe Since the Tertiary Period* and similar works are noteworthy. A list of his 128 publications is given.—*C. A. Weatherby.*

6207. HOWE, JAMES M., JR. George Rogers Hall, lover of plants. Jour. Arnold Arboretum 4: 91-98. 1923.—This is a short biography of Hall, who first sent Japanese plants direct to the U. S. A. and introduced such plants as *Malus Halliana* Parkmanii, *Abies homolepis*, *Magnolia stellata*, *Abies homolepis*, *Thujaopsis delabrata*, and *Lilium auratum*, now highly valued as ornamental plants.—*Alfred Rehder.*

6208. HUARD, V.-H. L'abbé Provancher. Nat. Canadien 48: 160-165, 181-188, 193-194, 198-203, 231-236, 254-260, 280-287, 1922; 49: 45-48, 64-67, 89-92, 105-110, 136-139, 162-168, 186-189, 208-211, 230-234, 258-264. 1923.—This is a continuation of a biographical sketch of the great Quebec naturalist who was the founder of *Le Naturaliste Canadien*.—*A. H. Mackay.*

(See also in this issue Entries 6320, 6650, 6654, 6734, 6736)

6216. DALLEY, R. P. **A visit to the Forest Research Institute, Dehra Dun.** Pt. 1. Indian Forester 49: 227–248. Pl. 9–10. 1923.

6217. GAGER, C. STUART. **Twelfth annual report of the Brooklyn Botanic Garden, 1922.** Brooklyn Bot. Gard. Rec. 12: 25–103. 1923.—Brief summaries are given of investigations at the Brooklyn Botanic Garden during 1922 in plant pathology, forest pathology, exploration, ecology, genetics, and systematic botany; also an account of the educational activities of the Garden. The report of the director is followed by reports of heads of departments and financial statements.—*C. S. Gager*.

6218. GARDEN CLUB OF AMERICA. **Pronunciation of plant names.** 14.5 × 8 cm. 94 p. National Process Co., Inc.: New York, 1922.

6219. KIRKWOOD, ESTHER J. G. **Plant and flower forms: Studies of typical forms of plants and plant organs.** 4 to, xvi, + 80 p. Sidgwick and Jackson, Ltd.: London, 1923.—The underlying idea has been to assist the pupils to observe the typical forms of plants and plant organs, by comparing these drawings side by side with the living specimens; and so to inspire them to make a similar set of drawings for themselves. The clear line drawings are grouped to illustrate the following subjects: natural orders, pollination, fruits and seed dispersal, germination, vegetative reproduction, trees, special morphology (spines and cladodes), climbing plants. Two pages are occupied with a summary of botanical terms.—*C. S. Gager*.

6220. PATEL, R. D. **First steps in evolution.** 120 p. R. D. Patel: Nanpura, India, 1921.

6221. RABER, ORAN. **Botanical facilities in Paris.** *Sci. Monthly* 17: 35-42. 1923.—The facilities for research at the following institutions are outlined: the Normal School, Pasteur Institute, Museum of the Botanical Garden, and the University of Paris. In the last place there are 2 departments where botany is taught,—at the School of Pharmacy and the College of Science.—*L. Pace.*

6222. THONE, FRANK E. A. **Trees and flowers of Yellowstone National Park.** 70 p., 112 fig. J. E. Haynes: Saint Paul, 1923.

6223. TORREY, R. E. **Introductory botany.** 78 p. Massachusetts Agric. Coll.: Amherst, 1922.—This is a textbook written in a condensed style for the use of beginning students in botany at the Massachusetts Agricultural College. It deals wholly with the seed plants with regard to adaptation to environment from an evolutionary standpoint. Successive chapters consider: the seed plant and its organs; the seed and its germination; the root; the stem; the leaf; flower and inflorescence, fruit and seed; history of botany and principles of classification; general ecology.—*R. E. Torrey.*

6224. TORREY, R. E. **The anatomy and physiology of the seed plants.** viii + 85 p. Massachusetts Agric. Coll.: Amherst, 1922.—This companion text [see preceding entry] is for use in a second course in botany. Successive chapters deal with: structure of the cell; activities of the cell; anatomy of the vegetative system; coal and its formation: physiology of the vegetative system; reproduction of seed plants and elementary genetical principles; introduction to the lower forms of plant life. This text, as well as the one mentioned in the preceding entry, is not intended for high school use, but for college classes taught by trained botanists who will expand and clarify by means of charts, lantern slides, and discussions.—*R. E. Torrey.*

6225. WENT, F. A. F. C. **Leerboek der algemeene plantkunde.** [Textbook of general botany.] xi + 599 p., 253 fig. J. B. Wolters: Groningen and the Hague, 1923.—The book is confined to morphology and physiology. It is intended for students who have had only preparatory courses in physics and chemistry, and is planned to cover 2 years' work in college. The physiological section includes the subjects of asexual and sexual reproduction, with several sections on genetics. Systematic botany is excluded.—*C. S. Gager.*

6226. WETTSTEIN, RICHARD. **Handbuch der systematischen Botanik.** [Handbook of systematic botany.] Vol. I. 3rd rev. ed., viii + 467 p., 1915 fig., 3 diag. Franz Deuticke: Leipzig and Vienna, 1923.—The ground plan of the first 2 editions has not been essentially altered, but the details have been brought into harmony with the investigations of the 10 years preceding 1921-22. The range of subjects has been extended, and the illustrations have been increased. The book is to appear in 2 volumes, the 1st volume ending with II Abteilung. Anthophyta, I. Unterabteilung. Gymnospermae. 6. Klasse. Gnetinae.—In the general part the new headings are (1) the evolution theory as the basis of systematic botany, and (2) the significance of alternation of generations for the phylogenetic development of the plant kingdom.—In the special part the new headings are: under class Fungi A, Phycomycetes, Ascomycetes, Basidiomycetes; B, Ascolichenes, Basidiolichenes. Under VII. Stamm. Cormophyta: classification of the Cormophyta, classification of the Pteridophyta, and under the latter heading a new class, Psilophytinae.—*C. S. Gager.*

CYTOLOGY

GILBERT M. SMITH, *Editor*

(See also in this issue Entries 6316, 6474, 6482, 6487, 6615)

6227. CRÜGER, OTTO. Untersuchungen über Mesekret und Autoplastensekret. [Secretions by mesophyll cells and chloroplasts.] Ber. Deutsch. Bot. Ges. 39: 175-178. 1921.—The author examined 393 species for the presence of oil-drop secretions in the leaves. In all cases where drop secretions were observed in the mesophyll cells there was intensive secretion by the chromatophores. He thinks, therefore, that the drops in the mesophyll cells really arise from chloroplast secretions.—All species of the gymnosperms examined (28) and all of the Labiateae examined (26) contained oil-drop secretions in the mesophyll cells. Palmaceae (15), Polygonaceae (9), and Cactaceae (7) had no secretion drops in the leaves of any of the species examined. In all other species examined the presence of oil-drop secretions in the leaves seemed to be correlated with thickness of the cuticle. If the mean thickness was less than 0.5μ oil drop secretion was never observed, but if the mean thickness was over 5.0μ secretion drops were always present.—Mesophyll secretions arose in leaves of *Camellia japonica* in the light even in a CO_2 -free atmosphere, but there were no drop secretions in the darkened leaves.—S. H. Eckerson.

6228. GUILLIERMOND, A. Les constituants morphologiques du cytoplasme. [The morphological constituents of cytoplasm.] Bull. Biol. France et Belgique 54: 465-512. Fig. 1-24. 1921.—Problems in cytology can not be understood until vegetable and animal cytology are combined. In 10 years' study various organs of the frog, man, and many forms of plant life (including Ascomycetes, Algae, monocotyledons, and dicotyledons) were examined, resulting in the following conclusion: Cytoplasm seems to have a homogeneous appearance, containing in suspension certain elements among which are to be distinguished (1) a chondriome, of which a part in chlorophyll is affected by photosynthesis; (2) a vacuolar apparatus, very much reduced in animal cells; (3) fat granules. Chondriome is a constant element of cytoplasm, in both animal and vegetable cells, and seems to be wanting only in very primitive forms in which a typical nucleus is not developed. The vacuolar apparatus is equally constant, at least for vegetable cells. Fat granules are very frequent in vegetable cells, but it is not yet certain that they are generally present in cytoplasm.—A. Chase.

6229. GUILLIERMOND, A. Nouvelles observations cytologiques sur les Saprolegniacées. [New cytological observations on the Saprolegniaceae.] La Cellule 32: 429-454. Pl. 3. 1922.—In *Achlya* and *Leptomitès* the cytoplasmic inclusions and the evolution of the vacuolar system are essentially the same as in *Saprolegnia*, described in 1920. The following inclusions may be distinguished by the use of intra-vitam stains: (1) granular and rod-shaped chondriosomes; (2) lipid droplets, formed by the union of many smaller ones arising as a metabolic product in the cytoplasm (the smaller ones are what Dangeard calls microsomes); (3) granules of a glycogen-like substance, possibly precipitated out by the reagents; (4) vacuoles, containing a substance which has the characters of metachromatin in *Leptomitès* but not in *Achlya*, and which may be precipitated out as granules by the stains. Other granules of unknown composition also occur in the vacuoles.—In young hyphae the vacuolar system is made up of numerous fine, partially anastomosed filaments. As the hyphae age, these swell and unite to form the large axial vacuolar canal. The vacuolar system in a new apical segment of a hypha is not formed de novo, but as an extension of the system in the segment below. In hyphae forming zoosporangia the vacuoles fragment and become very minute and numerous. The zoospores contain such concentrated vacuoles, together with chondriosomes, lipid droplets, and granules of the glycogen-like material. At germination the small vacuoles fuse to form larger ones which develop into the vacuolar system of the new plant.—The vacuolar system, like the chondriome, is a constantly present element of the cell. Vacuoles cannot be regarded as differentiated organities of the cytoplasm (tonoplasts of DeVries; hydroleucites of Van Tieghem) incapable of arising except by division, but appear

rather to represent a system of colloidal substances which are non-miscible with cytoplasm, and which absorb water and swell, or lose water and contract or fragment, according to physical conditions. The system grows by the constant secretion of the substances composing it, and thus has a continuity; it is possible that vacuoles arise *de novo*, but this was not observed. It is probable that the reticular apparatus of Golgi and the canaliculi of Holmgren represent 2 aspects of 1 system which corresponds to the vacuolar system of the plant cell (Guilliermond and Mangelot). [See also Bot. Absts. 8, Entry 1832.]-L. W. Sharp.

6230. LINSBAUER, K. Über die kalkfreien Cystolithen der Acanthaceen. [Calcium-free cystoliths of Acanthaceae.] Ber. Deutsch. Bot. Ges. 39: 41-49. Illus. 1921.—Molisch [Österreich. Bot. Zeitschr. No. 11, 1882] early described the cystoliths of certain Acanthaceae (*Strobilanthes glomeratus*, *S. isophyllus*, *Ruellia ochroleuca*), and gave calcium-free cystoliths as characteristic for the internodes while the nodes had the usual calcium carbonate-incrusted form.—The author finds that the pith cells of young internodes of *Strobilanthes isophyllus* have typical calcium carbonate cystoliths; later the calcium carbonate dissolves and the cystoliths change to the peculiar forms which Molisch saw. The cystoliths of the cells at the nodes still retain their calcium but nodes of stems several years old have calcium-free cystoliths. Thus the calcium-free cystoliths of the Acanthaceae are calcium carbonate cystoliths which have undergone decalcification and subsequent change of form.—With the disappearance of calcium the cellulose skeleton becomes less dense, the protuberances are lost, the body shrinks in the radial direction and sinks against a lateral wall. Lignification of the original cellulose begins within, the outer hull changes to pectin. Secondary cellulose stalks attach the body to the lateral wall. As the adjacent cells divide, the calcium-free cystolith extends the length of 4 or 5 cells and appears much like a sclerenchyma fiber. The striking changes in form are shown in text-figures.—S. H. Eckerson.

6231. PIZEK, ARTUR. Chromosomenverhältnisse, Reductionsteilung und Revision der Keimenentwicklung der Mistel (*Viscum album*). [Chromosome conditions, reduction, division, and embryonic development of the mistletoe.] Jahrb. Wiss. Bot. 62: 1-19. 1923.—The author undertakes to clear up the question of whether the reproduction in the mistletoe takes place normally or parthenogenetically. The somatic divisions show the presence of 20 large chromosomes. The pollen and embryo sac mother cells undergo a typical reduction of the chromosome number, the process being somewhat different in the 2. Normal fertilization takes place, and the embryo develops, after a resting period of a few weeks. The development of the mistletoe is, therefore, not apogamous, and, in the absence of insect pollination, must be aenophilous.—S. F. Cook.

6232. SHOWALTER, AMOS M. The chromosomes of *Riccardia pinguis*. Amer. Jour. Bot. 10: 170-172. 1 pl. 1923.—In this species the haploid number of chromosomes is 10. Occasionally a small, spherical body staining like a chromosome is found among the chromosomes but is probably not chromosomal in nature or origin. The chromosomes differ somewhat in size, but only 1, the smallest, is distinguishable with much certainty. The sporophytic chromosomes have the same general appearance as those of the thallus. There is no perceptible difference between the chromosomes of the male and those of the female plants.—E. W. Sinnott.

6233. WHITING, P. W. Further points of the relation of cytology and genetics. Jour. Heredity 14: 116-118. 1923.—Shull has recently discovered crossing over in *Oenothera* while Gates, on the basis of study of the late prophase before heterotypic division, holds that conditions are not consistent with the chromosome theory of crossing over. Wenrich from cytological studies of very early stages in first spermatocytes of the grasshopper, *Phrynotettix*, shows parasynapsis of single leptotene strands. In temperature experiments with *Drosophila*, Plough shows that crossing over must take place at a very early stage in this form. Bridges shows genetically that crossing over must take place in the 4-strand stage. On the basis of his own cytological studies on *Culex*, Robertson's report on splits in anaphase chromosomes of the last spermatogonial division in grasshoppers, and Taylor's demonstration of the tetrad

nature of the 1st maturation chromosomes in plants (*Gasteria*), the author concludes that leptotene strands are really double, and hence the zygotene quadruple. There is thus the possibility of crossing over in quadruple strands at a stage much earlier than that which Gates has adequately studied.—*P. W. Whiting*.

GENERAL, CONDITIONS, MEASUREMENTS

6234. BAUMANN. Wissenschaftliche Gesichtspunkte für die Beurteilung von Sorten und Sortenversuchen mit besonderer Berücksichtigung der Anbauggebiete. [Scientific points of view for judging varieties and variety tests with special reference to culture regions.] *Mitteil. Deutsch. Landw. Ges.* 38: 309-313. 1923.—This is a discussion of the ecological relations of plants and a plea for a more exact study of their reactions to different factors of the environment.—*A. J. Pieters*.

6235. B[ROOKS], C. F. Bioclimatic zones determined by meteorological data. [Rev. of: HOPKINS, A. D. Bioclimatic zones determined by meteorological data. *Monthly Weather Rev.* 49: 299-300. 1921 (see *Bot. Absts.* 12, Entry 6238).] *Bull. Amer. Meteorol. Soc.* 2: 83. 1921.—It is possible to establish the position of life zones with meteorological data.—*Earl S. Johnston*.

6236. B[ROOKS], C. F. [Abstract of: SHREEVE, FORREST. Vertical gradients of evaporation and soil moisture in desert and coastal mountains. Paper presented at the joint meeting of Amer. Meteorol. Soc. and Assoc. Amer. Geographers, Dec. 30, 1920.] *Bull. Amer. Meteorol. Soc.* 2: 42-43. 1921.—The rainfall-evaporation ratio at the tops and bases of desert and coastal mountains was studied. Conditions best for plant growth were found at the summits of desert mountains and at the bases of coastal mountains.—*Earl S. Johnston*.

6237. GONGGRIJP, J. W. Verslag over een studiereis door een gedeelte van Venezuela. [Report of an expedition through a part of Venezuela.] *Dept. Landb. Suriname Bull.* 43. 64 p. 1921.—Venezuela possesses soil and climate of great diversity. In Venezuelan Guiana forests extend over 45,000,000 hectares. The continuation of the llanos areas appears as savannas. Delta Amacuro is low and flat, rising gradually in the south to the Imataca Mountains that form the limits of the forests. The climate of Delta Amacuro differs little from that of Suriname but is moister than that of Bolivar. Little is known of the climate of Amazonas. The region of the llanos has almost no forests but the coastal region of the Andes is partly forested. The chief forest products are rubber, balata, pendare, tonka beans, copaiva balsam and the bark of the mangrove.—The Botanical forests are apparently the driest and those near the Yuruan moister, especially those against the slopes of the Imataca Mountains. The exploration and exploitation of the forests are carefully guarded by law under which yearly permits are granted for taking lumber and other products. No cutting is allowed within 100 m. of water and provisions are made for the replacement of cut forests. The collection of gums, resins and fruits is regulated so as to prevent cutting. The maximum annual cut allowed on a concession is 1250 hectares.—*J. C. Th. Uphof*.

6238. HOPKINS, ANDREW D. Bioclimatic zones determined by meteorological data. *Monthly Weather Rev.* 49: 299-300. 1921.—The preliminary stages of a system of similar or equal zones of life and climate are presented. The major zones are the familiar frigid, temperate, and tropical, which however do not follow the parallels of latitude even at sea level. Each of the major zones is divided into from 4 to 7 minor zones. The index or characterization elements of the minor zones are many, but the most essential is the "thermal mean principle"

consisting of a table of sea level thermal constants. The thermal principle is based on the theory that (1) the temperature below that favorable for life activities during the coldest month contributes to the poleward limit of the species which characterizes a warmer zone; (2) the temperature above that favorable for the beginning of life activities during the hottest month contributes to the equatorial limit of the species which characterize a colder zone.—Bioclimatic zones thus determined are thought to be more significant than those of other systems. [See also Bot. Absts. 12, Entry 6235].—*Geo. D. Fuller.*

6239. Пачоский, И. К. [PACHOSKI, J. K.] **Основы фитосоциологии.** [Principles of phytosociology.] *iv* + 346 p. Издание студенческого Комитета Сельско-Хозяйственного Техникума [Edition of Student's Committee of Agricultural Practice, Cherson]: 1921.—The introduction is devoted to the problems and methods of study of phytosociology. The existing and possible relationships between this and other branches of botanical studies are examined and illustrated. In the body of the volume the following are among the principal subjects discussed: ecological data; biological types and growth forms (biomorphs); the forms, structure, dynamics, types and composition of plant communities; sociological types; analogies of plant societies; dynamics and stages in the development and retrogression of plant cover; types of plant formations, plant societies, herbaceous plant societies, and forest societies; the distribution of vegetation and the history of plant cover. There are also brief contributions to the study of the vegetation of former geological ages, to the extent of vegetation areas and of floras, to the phylogenetic development of vegetation, and to a consideration of plant societies and culture.—*V. Lashevsky.*

6241. REICHE, KARL. Die Vegetationsverhältnisse in der Umgebung der Hauptstadt von Mexiko. [The vegetation in the vicinity of the Capitol City, Mexico.] *Bot. Jahrb. Beiblatt.* 129: 1-115. 27 fig. 1922-23.—The subject matter is treated under three parts: Part I. Physical geography and climatology. Part II. Plant geography in the State of Mexico. Part III. The floral catalogue. Under the first part the following headings are found: (1) Orography and hydrography; (2) Climatology. The 2nd part is divided into: A. The plant formations; I. Of forests and steppes; 1. The forests in Desierto de Los Leones; 2. The Canada of Contreras; 3. Mount Ajusco; 4. The vegetation of Cerro San Miguel and of the upper part of Canada; 5. The vegetation of the volcano Xitle; 6. The vegetation of the Sierra de las Cruces; 7. The vegetation of the Barranca de Cuajimalpa; 8. Smaller forests; 9. The formation of jungles and thickets as remains of earlier forests; 10. Mount Ixtapalapa; 11. Mount Santa Catarina and its neighbors; 12. The Nochitepec (flower mountain); 13. The Tentli; 14. Mount Chimalhuecan; 15. The Cerro del Pino and its neighbor Texotote; 16. Mount Texcotzingo; 17. The Sierra de Guadalupe; 18. Mount Calacoaya; 19. The Pedregale (lava fields); 20. The vegetation of the rolling and flat lands. II. The formations of the alluvium; 1. Vegetation of more or less saline soils or waters; 2. Vegetation of the non-saline soils or waters. III. The formation of weeds and cultivated plants. IV. Fossil plants. V. Tabular view of the previously described formations. B. Local peculiarities of the flora of the regions concerned; the relation of this flora to the neighboring states and to America as a whole, endemism. C. Ecological peculiarities of some plants of the region; 1. Biology of vegetative organs; 2. Biology of the reproductive organs; 3. Lianes and climbing plants, epiphytes, parasites; 4. Water plants; 5. Periodicity in the vegetation; 6. Notable damage to the vegetation caused by fungi. Under Part III a list of the species is given following comments on the flora and some statistics. A total of 1488 spermatophytes occur in the region. The list includes also the lower plants.—*K. M. Wiegand.*

STRUCTURE, BEHAVIOR, SYMBIOSIS

6243. ANONYMOUS. [Rev. of: ASHBY, EDWIN. Sensitive labellum in orchids. Minutes of a meeting of the Linnaean Society on May 4th, (1922).] Jour. Indian Bot. 3: 116. 1922.

6244. BACHMANN, E. Untersuchungen über den Wasserhaushalt einiger Felsenflechten. [Investigations on the moisture relations of some rock lichens.] Jahrb. Wiss. Bot. 62: 20-64. 1923.—The author has studied the conditions governing the relative amount of water absorbed and given off by several species of foliose and crustose lichens, including the following: *Umbilicaria pustulata*, *Gyrophora vellea*, *G. cirrosa*, *G. polyphylla*, *G. hirsuta*, *G. cylindrica*, *Lecidea bullata*, *L. athroocarpa*, *L. speira*, *Rhizocarpon geographicum*, *R. obscuratum*, *Pannaria pezi-zoides*, *Lecothecium nigrum*, *Diploschistes bryophilus* and *D. scruposus*. The author finds that the foliose species are much superior to the crustose forms in their ability to absorb rain water. However, the crustose forms absorb more running water, per gm. dry weight, than the foliose, and also lose water more rapidly when subjected to dry conditions, with the exception that under the direct rays of the sun the condition is reversed. *Gyrophora vellea* and *G. cylindrica* excel the other forms in absorbing water vapor. The same crustose lichen behaves differently toward water depending on the type of rock substratum. The less compact the rock the more developed is the thallus and consequently the greater is the ability to take up water. In contrast to those lichens possessing special organs of absorption are some which are destitute of these but which still flourish. The author concludes that the plasma of these types can endure more adverse conditions and can carry on the processes of life with less water.—S. F. Cook.

6245. FUNKE, G. L. Recherches biologiques sur des plantes à tiges rampantes. [Biological research on plants with creeping stems.] Compt. Rend. Acad. Sci. Paris 176: 604-606. 1923.—Differences in the humidity of the air immediately about the plants have been held as a possible explanation of differences in the structure of erect and creeping stems of the same species. In a set of experiments plants were grown in dry and moist conditions, the humidity differing by 40°-50° throughout the entire period. The plants in the more humid atmosphere had better developed parenchyma with cells of about the same size, they had fewer but larger vessels, more feebly developed sclerenchyma, a smaller vascular cylinder in proportion to the diameter of the stem, and much thinner leaves. These differences are similar to those of creeping and erect stems. Two species of *Potentilla* and 1 each of *Fragaria*, *Hieracium*, *Lysimachia*, and *Glechoma* were studied.—C. H. Farr.

6246. NAVEAU, R. Enkele veranderingen door aanpassing bij *Sphagna*. [Some changes by adaption in *Sphagna*.] Natuurw. Tijdschr. 4: 166-170. 1922.—Systematic investigations of several *Sphagnum* forms show that the various facies are dependent upon light and water. A plant growing in direct light usually has no green leaves, and shade plants are green. Much light and little water retard the formation of chlorophyll, change the green to yellow or red, and give a low compact plant; but with little light and much water the plant remains green and has a loose appearance. *Sphagnum crassicaudum* v. *plumosum* behaves like a true aquatic, the hyaline cells keep their protoplasm and maintain the same activities as the green cells. When water diminishes the *plumosum* form of several *Sphagnum* species changes. The quantity of water in a *Sphagnetum* depends partly upon the quantity of light. In little light and little water *Sphagna* are very compact, forming cushions. Incurved, wavy and projecting leaves belong to the relatively dry group, incurved stiff leaves to the aquatic group. Different conditions of illumination and water supply produce forms of *S. crassicaudum* Wt. that have been recognized as different varieties. The same thing seems to occur in *S. magnifolium*. The development of red pigment is also promoted by decreased water supply and greater illumination.—J. C. Th. Uphof.

6247. RAMSBOTTOM, J. Orchid mycorrhiza. Trans. British Mycol. Soc. 8: 28-61. Pl. 2-7. 1922.—This paper is essentially a critical review of the literature on mycorrhizas with special reference to the cultivation of orchids and the physiological relations between the seed

plants and the mycorrhizal fungi. It is pointed out that in families in which endotrophic mycorrhizas are typically developed the seeds are small and ill-adapted for successful germination but are produced very abundantly thus increasing the probability that some of them will meet with exceptionally favorable conditions for germination, these conditions usually including the presence of the endophytic fungus.—*W. B. McDougall.*

6248. RAYNER, M. CHEVELEY. Mycorrhiza in the Ericaceae. Trans. British Mycol. Soc. 8: 61-66. 1923.—The recent work of Christoph which is at variance with that of Rayner is criticized as inaccurate and lacking in proof at various stages. It is reiterated that under experimental conditions the development of the *Calluna* seedling is bound up with infection by the endophytic fungus and that such infection takes place regularly from the testa of the seed at, or subsequent to, germination.—*W. B. McDougall.*

6249. RIMBACH, A. Die Jahresperiode der Pflanzen bei Montevideo. [Seasonal periodicity of the plants at Montevideo.] Bot. Jahrb. 58: 182-189. 1923.—Six tables of native, introduced, and cultivated plants are given showing the duration of foliage and the blooming season of herbaceous and woody species and the period of shoot-elongation and fruiting of the latter. Some herbaceous plants bear leaves in summer, others in winter. The leafless period of woody plants is winter or after the spring. Herbaceous and woody plants bloom in all months of the year but the shoots of woody plants occur in the spring.—*K. M. Wiegand.*

VEGETATION

6250. CAMPBELL, DOUGLAS H. Australasian botanical notes. II. Victoria, South Australia, and West Australia. Amer. Jour. Bot. 10: 173-186. 2 pl. 1923.—An account is given of the characteristic vegetation of these states, with notes on some of the more conspicuous and important species. The history of the peculiar flora of Western Australia is discussed.—*E. W. Sinnott.*

FLORISTICS

6251. GLEASON, HENRY ALLAN. Evolution and geographical distribution of the genus *Vernonia* in North America. Amer. Jour. Bot. 10: 187-202. 3 fig. 1923.—The section *Lepidaploa* of this genus includes 120 species in North America. Of this there are 2 sub-sections, each well developed in continental South America and extending northward. In one of these the inflorescence is a leafy-bracted scorpioid cyme and in the other the bracteal leaves are suppressed. Minor species groups are based on differences in achenes, involucre, pappus, and pubescence. Characters presumably primitive in one group may indicate advanced evolution in another, and such characters have no apparent correlation with environment. The center of evolution and migration for these plants is presumably South America. In all cases those groups which are morphologically the most primitive occur farthest south and the more complex ones appear progressively farther north, and this situation is true for most of the individual species, as well. All the evidence indicates that progressive evolution and northward migration have proceeded together.—*E. W. Sinnott.*

6252. Пачоский, П. К. [Pachoski, J. K.] По пескам Днепровского уезда. (Ботанические экскурсии.) [Sandy country of Dnieper district. (Botanical excursions.)] 146 p. [Cherson, 1919.]—Here are given the results of a phytogeographical study of the sandy regions of the Dnieper district (Cherson province). The origin of the elements of the flora is discussed and a synoptical list of the species is given.—*V. Lashevsky.*

6253. RIDLEY, H. N. The distribution of plants. Ann. Botany 37: 1-30. 1923.—Changes in the distribution of plants are discussed comprehensively with numerous examples chosen chiefly from the Malay region. The chief factors dealt with are changes in climate and in land surface and human agencies. Under the latter head are discussions of the destruction of arboreous vegetation (including an account of the fate of a tropical forest), extinction in

wild state of plants of economic value, introduction of ornamental plants which become wild, and weeds. Weeds are considered as follows: (1) relation to human migrations; (2) methods of introduction,—(a) in pot plants, (b) with seeds of cultivated plants, (c) by transport of cattle, (d) in packing material, ballast and cargo of ships; (3) accounts of dissemination of particular weeds; (4) qualities affecting rapidity and distance of travel.—The most widely distributed plants are weeds, sea-dispersed species, and those with bird-carried seeds. Dispersal by sea is superior both in time and distance to that by wind. The reasons for the very wide distribution of certain species of flowering plants and the course of their dissemination is discussed.—Endemics are divided into 2 easily distinguishable groups, (1) relics of a lost flora and (2) species evolved in 1 locality which have spread no further. Many examples of the difficulty of interpreting distribution on the basis of the age-and-area theory are pointed out particularly in regard to weeds where the actual histories of dissemination are known, and in regard to such plants as *Cycads*, *Sequoia*, *Salisburia*, *Platanus*, etc.—*W. P. Thompson*.

FOREST BOTANY AND FORESTRY

W. N. SPARHAWK, *Editor*.

(See also in this issue Entries 6203, 6216, 6237, 6461, 6516, 6517, 6539, 6644, 6652, 6653, 6671, 6680, 6693, 6694, 6710)

6255. ANONYMOUS. Denkschrift des badischen Ministeriums der Finanzen—Forstabteilung—über Waldstreuabgabe und Waldbewirtschaftung. [Memorandum of the forest section of the Baden Ministry of Finance, on utilization of forest litter.] Forstwiss. Centralbl. 45: 107-120. 1923.—As forests are now the chief sources of revenue for several German states, and as there is a great shortage of timber and fuel, it is essential to maintain maximum yields. The practice of granting farmers the right to remove leaf litter for bedding stock, which developed to great proportions during the war, must be restricted or eliminated if possible. The productivity of forest soil depends to a great extent upon the presence of a loose cover of decaying vegetation, which retains moisture, keeps the soil loose and permeable, keeps the fine soil particles and plant food from leaching out or washing away, helps to break down the soil into available plant food, and harbors a multitude of minute life which is indispensable for thrifty forest growth. The volume of bacteria, fungi, protozoans, worms, and insects on a hectare of undisturbed forest soil has been estimated at 1,000-2,000 kgm. or as much as the weight of domestic animals kept on an equal area. Soil culture can accomplish far more than culture of the timber stand in increasing forest yield. In numerous instances continued removal of litter has resulted in retarding growth and even in reducing once thrifty forest to mere scrub. Not only are height, diameter, and volume growth affected, but natural regeneration becomes difficult or impossible, and the forest becomes more susceptible to damage by insects and disease. Experiments over 27 years in Bavaria showed 50 and 30 per cent reduction in yield of beech and pine respectively when the litter was removed; 80-year examples show yields 3-3½ times as great where litter was left on the ground, as compared with stands from which it was removed; 14-year records in Baden showed losses in increment of 11-16 per cent due to removal of litter. In the first 6 months of 1922, about 350,000 cubic m. of litter was taken from the forests of Baden. Each cubic m. represents a lost increment worth 3,000 marks (October, 1922, values), making the total loss 1 billion marks. While some litter may still be taken from forest roads and fire lines, the bulk of the demand should be met by substitutes, especially conifer twigs and peat. A confirmation of the statements in this memorandum is appended over the signature of the Forest Institute of the University of Freiburg.—*W. N. Sparhawk*.

6256. ALLEN, E. T. America's transition from old forests to new. Amer. Forest. 29: 163-168, 235-240. 12 fig. 1923.—This article outlines the destruction by fire, the popular indifference, the vast and mushroom growth of the Middle West with its stimulating demand

for lumber, and finally the period of occupation of the western forests, both governmentally and individually, described as the most defined and pregnant of American forest history. The concluding instalment describes the natural development of forest resources and forest policies in the West, and shows the inevitable drift toward a just and sound national forest policy.—*Chas. H. Otis.*

6257. BALTZ, CARL. *Die Förster der Kommunalverbände, öffentliche Anstalten, gemeinschaftlichen Holzungen und Waldgenossenschaften.* [Foresters of communal organizations, public institutions, community forests, and forest associations.] *Zeitschr. Forst.- u. Jagdw.* 54: 339-348. 1922.—The author defines and clarifies the status and prerogatives of the foresters of the various classes in the light of the municipal officer statute of July 30, 1899, and laws and ordinances of December 24, 1816, August 14, 1876, and October 12, 1897.—*J. Roesser.*

6258. BEALS, E. A. *Discussion of thunderstorms and forest fires in California.* *Monthly Weather Rev.* 51: 180-182. 1 fig. 1923.—The difficulties in forecasting storms are pointed out, and the need for further study of forecasting is emphasized.—*E. N. Munns.*

6259. BERGMANN, M. *Gedanken zur Bonitierung im Dauerwald.* [Suggestions on classifying site qualities.] *Deutsch. Forstzeitg.* 38: 184-185. 1923.—Quality of forest sites may be classified on the basis of height and volume growth, or according to the composition and condition of the soil itself. Height and volume growth depend upon the industry and skill of the forester, while chemical and physical analyses of the soil are hardly practical and do not show the amount of plant food actually available. The native vegetation affords a reliable index of site quality, providing allowance is made for variations in density of forest cover, as the indicator plants under a dense canopy are not the same as those under an open stand on the same site.—*W. N. Sparhawk.*

6260. BERLIN. *Zu "Betriebsregelung im Dauerwalde."* [Concerning "Betriebsregelung im Dauerwalde."] *Zeithschr. Forst.- u. Jagdw.* 54: 309-316. 1922.—The author describes the silvicultural conditions in the forest of Wabel, which has recently been placed under the continuous system of management by the state, and outlines the form of management and control book. The stand is one of almost pure pine, in which most of the old trees have been destroyed by insects. The management form employed is somewhat simpler than that used at Bärenthoren and described by Wendroth [see Bot. Absts. 12, Entry 5593]. Although most advocates of the continuous system consider age-class distinctions worthless, the author finds the construction of age-class tables from the management book a matter of only a few hours extra work, and they provide a second regulator for the determination of cut and yield. The construction of a yearly cutting plan is also deemed necessary.—*J. Roesser.*

6261. BIRNER. *Die Wirtschaftsführung in einem vormaligen Auemittelwalde.* [The management of a former coppice-with-standards forest on meadowland type.] *Zeitschr. Forst.- u. Jagdw.* 54: 290-305. 1922.—The Grünwald forest is threatened with destruction, since it lies in the overflow territory of the Elbe on land desired for farming. The variation between maximum and minimum soil moisture is the greatest in any forest type. The soil is very productive, but when the water is lowered the loam soil becomes almost impervious and vegetation must depend upon atmospheric moisture, which here is lower than elsewhere in Germany. The original silvicultural system was coppice-with-standards, the principal species being elm and pedunculate oak. As the demand for lumber replaced that for fuelwood, the old system was abandoned (1884) for the high-forest system. Contrary to common opinion, it was discovered that the best high-forest stands of elm developed from root sprouts and the typical plan of management now calls for reproduction of elm by root sprouts and filling in after 2 years with ash nursery stock. Greatest care should be exercised in selecting seed for sowing from stands of straight-boled trees. The present form of management is shelter-wood selection with group reproduction.—*J. Roesser.*

6262. BRONSART, VON. Zu "Gedanken aus dem Walde" von Oberförster A. D. Fricke in Januarheft. [In re "Gedanken aus dem Walde" (see Bot. Abst. 12, Entry 5531) by forest superintendent A. D. Fricke.] Zeitschr. Forst.- u. Jagdw. 54: 365-366. 1922.—The controversy between advocates of continuous forest management and of clear-cutting methods has primarily concerned management form only, rather than the more important consideration of soil fertility. Soil care should be the starting point in forest management, and clear-cutting must be avoided; but whether the even-aged high forest or the selection forest shall be retained is immaterial, as maintenance of soil fertility is possible under both forms. To secure and maintain fertility, the chief demand of future management will be to protect the soil from wind, mainly by establishing effective protection screens around the borders of the forest. Other protective methods, such as understory and advance reproduction, will depend upon local factors. With proper treatment of the soil and of the stand, fungous and insect calamities, which now so often threaten to pass beyond control, will gradually be checked.—*J. Roesser.*

6263. BROWN, THOS. W. A report on forestry and horticulture in Palestine. In: A review of the agricultural situation in Palestine. Part II, p. 7-16. Government publication: Haifa, Palestine, 1923.—Aleppo pine is the most valuable timber tree in Palestine, but the cypress (*Cupressus sempervirens* L.) should be cultivated much more than at present. Several species of eucalyptus are cultivated, of which *E. resinifera* Sm. seems to be the best. Carob-trees (*Ceratonia siliqua* L.) are more properly regarded as fruit or fodder trees than as timber, as the pods contain a large amount of sugar. The writer speaks of the various stocks for grafting oranges. He recommends the introduction of sisal as a source of fiber.—*John E. Dinsmore.*

6264. BUTLER, O. M. Seating the Nation. Amer. Forest. 29: 216-217, 244. 2 fig. 1923.—The article concerns chairs and the great and needless waste of wood incurred in their manufacture.—*Chas. H. Otis.*

6265. CLAPP, E. H. The long haul from the woods. Amer. Forest. 30: 259-264, 320. 7 fig. 1923.—This article traces the increased cost of lumber transportation from early times to the present, as large-scale logging in the U. S. A. has passed from East to West and the short hauls have given way to trans-continental freight shipments.—*Chas. H. Otis.*

6266. DE, R. N. Germination of *Barringtonia acutangula* seeds. Indian Forester 49: 268-270. 1923.—The seed float on the flood waters of shallow lakes and rivers until they come to rest during the subsidence of the flood. After germination and early growth, especially after a year, they can again stand submergence, though if covered too deeply they may not survive.—*E. N. Munns.*

6267. DENZIN. Die Zerlegung der Mischbestände nach Teilflächen. [The parcelling of mixed stands.] Zeitschr. Forst.- u. Jagdw. 54: 330-339. 1922.—The author replies to Trebeljahr's critique [see Bot. Absts. 12, Entry 2395] of his previous paper [see Bot. Absts. 11, Entry 2354]. Trebeljahr considers the parcelling of mixed stands even from the purely theoretical standpoint to be impossible. His view, that the working sections defined by the Prussian management-plan instructions of 1912 are not true working sections, as recognized in forestry, is based on a false concept. The method prescribed in the 1912 instructions is based on clearer and more reliable facts, is simpler, secures a better arrangement and more orderliness in the stand, and requires less control calculations by the officer in charge than do the instructions of 1919. In fact, Trebeljahr's condemnation applies to his system more than it does to the instructions of 1912.—*J. Roesser.*

6268. ENDRES. [Rev. of: HEDLER, WALTER. Deutschlands Forst.- und Nutzholzwirtschaft in und nach dem Weltkriege. [German forest and timber administration during and after the war.] 119 p. Reichenbachsche Verlagsbuchhandlung: Leipzig, 1921.] Forstwiss. Centralbl. 45: 63-68. 1923.—Hedler is a military man, not a forester. His book would have

been satisfactory had he stopped with a description of the war-time regulation of forest industries. His treatment of silvicultural and economic matters only betrays his ignorance. Its central thought appears to be that German forestry can function effectively only under the direction of Major Hedler.—*W. N. Sparhawk.*

6269. ESCHERICH, K. *Parasitenwirkung und biologische Bekämpfung.* [The work of parasites and the biological combat method.] *Zeitschr. Forst.- u. Jagdw.* 54: 193-198. 1922.—The author discusses Knoche's criticism of his book and other works advocating the fighting of destructive insects by their natural enemies (biological method), and summarizes briefly his present view of the parasite situation. He asserts that the intensive culture of a host plant has the same significance as the importation of a destructive insect into a country where the parasites which tend to control its spread are missing. Reference is made to the brown-tail and gypsy moth calamities in America. By returning to more natural conditions in forest management and producing more mixed forests in preference to pure stands, the author believes that conditions will favor the natural parasitic enemies of destructive insects and thus lessen the danger from these insects. The recent tendency in forest management seems to be in this direction, due in part, at least, to the ever increasing destruction of forests by insects.—*J. Roesser.*

6270. ETTINGER, J. *A note on the comparative merits of the stone and the Aleppo pine.* In: *A review of the agricultural situation in Palestine.* Part II, p. 25-26. Government Publication: Haifa, Palestine, 1923.—A detailed botanical and economic comparison of the 2 species of pine found in Palestine (*Pinus pinea* L. and *P. halepensis* Mill.) includes directions for propagation, cultivation, and spacing of the stone pine.—*John E. Dinsmore.*

6271. EULEFELD. *Die Durchlüftung des Waldbodens oder Aufhebung der Wurzelkonkurrenz.* [Ventilation of forest soil or prevention of root competition.] *Deutsch. Forstzeitg.* 38: 460-461. 1923.—Loosening the soil to let in the air, by plowing or otherwise, stimulates growth, just as cultivation does with farm crops. Growth stagnation is not due primarily to root competition, as some investigators believe.—*W. N. Sparhawk.*

6272. FABRICIUS. [Rev. of: REBEL, KARL. *Waldbauliches aus Bayern.* [Silvicultural notes from Bavaria.] 293 p. Jos. C. Hubers Verlag: Diessen vor München, 1922.] *Forstwiss. Centralbl.* 45: 68-76. 1923.—The author presents his observations resulting from 14 years in a responsible position in the Bavarian service. While the reviewer does not agree with all of his statements and conclusions, he considers the book an exceedingly valuable contribution to silvicultural knowledge.—*W. N. Sparhawk.*

6273. FABRICIUS, L., UND HANS FR. GROSS. *Heizwert und Wärmepreis der Brennholzer.* [Heating value and price of fuelwood.] *Forstwiss. Centralbl.* 45: 83-100. 1923.—The method of measuring heat values by the bomb calorimeter is described, and a table shows heat units per kgm. and per cubic m. of air-dry wood of various species. Reduction factors are given for computing the heat values for stacked wood of several grades. The conifers generally have greater heating value per kgm., but the greater specific gravity of the hardwoods more than compensates for the difference. With increasing age of tree the heating value per unit weight increases, while the density of the wood decreases. Except for pine, the heating value of fungus-infected wood is practically as great as that of sound wood. The proper price to be paid for fuelwood, in comparison with that for coal, can be computed on the basis of available heat units.—*W. N. Sparhawk.*

6274. FORBES, R. D. *The passing of the piney woods.* *Amer. Forest.* 29: 131-136, 185-186. 7 fig. 1923.—Annually $\frac{3}{4}$ million acres of pine land, chiefly in the Gulf Coast States, are stripped so clean and then burned so thoroughly as to be incapable of satisfactory natural reforestation within half a century, and some will undoubtedly take more than a century. If forestry were practiced it is believed that, with a lapse of only a few years following the

exhaustion of the important virgin stands, an annual cut of 6-8 billion board feet of southern pine could be counted upon indefinitely. If forestry is not practiced the annual cut will become less and less, and the price of lumber higher and higher.—*Chas. H. Otis*.

6275. FRITZ, FRANCIS M. *The elfin forest of California*. 267 p. 123 fig. Times-Mirror Press: Los Angeles. 1923.—This is a popular account of the chaparral forest region of southern California, giving briefly the importance of the chaparral in preserving the water supply and the soil on the mountains, as well as an account of the various trees, shrubs and flowers found in the region.—*E. N. Munns*.

6276. GUIBIER, H. *L'aménagement des forêts en Indochine*. [Forest management in Indo-China.] Bull. Econ. Indochine 24: 491-585. *Illus.* 1922.—This is a comprehensive, well illustrated consideration of forestry and forestry conditions in Indo-China.—*E. D. Merrill*.

6277. HARRER. *Produktionssteigerung im kleinen Privatwald*. [Increasing the production of small private forests.] Forstwiss. Centralbl. 45: 41-52. 1923.—An essential part of the program of increasing German timber production is to increase production from small private holdings which are not now managed for continuous production. These tracts, which include about $\frac{1}{2}$ of the private forests in Germany, or between 3 and 4 million hectares, do not yield much over 1 cubic m. of wood per hectare per annum, while under proper management the yield could be increased by at least 2 cubic m., worth 15 gold marks per cubic m. This increase can be brought about by introducing fast-growing species, particularly Douglas fir, by lengthening the rotations and producing a greater proportion of stem wood, and by coordinating management. The owners individually cannot accomplish it, consolidation of holdings is impracticable, and state ownership out of the question; hence the only practicable means is through the formation of forest cooperatives, managed under state supervision, with membership compulsory for all small owners whose forests do not admit of sustained yield management by themselves.—*W. N. Sparhawk*.

6278. HOENTHAL, GEORG. *Dauerwald und Privatwaldbesitz*. [The continuous forest and private forest ownership.] Zeitschr. Forst.- u. Jagdw. 54: 364. 1922.—A private owner disagrees with Roth. While acknowledging that the continuous forest is correct in principle, he advocates caution in adopting it on private holdings, since its success depends largely upon the experience and ability of the forester in charge. Hohenthal predicts increasing popularity for the system under private management, even though it requires more ability on the part of the forester than does the schematic clear-cutting system.—*J. Roesser*.

6279. HOSMER, R. S. *Town forests and community chests*. Amer. Forest. 29: 155-157. 4 fig. 1923.—This article describes European town forests, the income from which goes to the support of hospitals, libraries, museums and other quasi-public institutions, and shows how similar forests could be utilized in America.—*Chas. H. Otis*.

6280. JUNACK. *Bekämpfung von Waldbränden*. [Fighting forest fires.] Deutsch. Forstzeitg. 37: 784-787. 1922.—Methods are described for trenching, back-firing, patrol, and final extinguishing of fires.—*W. N. Sparhawk*.

6281. K., S. Z. *Fortschritte auf dem Gebiete der Färbung stehender Bäume*. [Progress in coloring standing trees.] Deutsch. Forstzeitg. 37: 770. 1922.—After 10 years' experimentation, Reimann has developed a practical process for coloring the wood of standing trees. The coloring matter, a dilute aniline dye, is introduced near the base of the tree by means of a specially constructed borer and a 100-l. container operating by pressure of the contained liquid. In 2 days the color penetrates even to the foliage. In 8 days more the tree is felled, and 8 days later it is sawed up. Penetration is uniform, and the process gives promise of great economic importance.—*W. N. Sparhawk*.

6282. KATZER, K. *Zur Gliederung der Forstwissenschaft in Produktionslehre und Betriebslehre.* [On the division of forestry into the branches of production and operation.] *Forstwiss. Centralbl.* 45: 100-107. 1923.—The 3 main subdivisions of forestry are: technical forestry, including production and utilization; economic forestry; and forest administration.—*W. N. Sparhawk.*

6283. KIRKLAND, B. P. *The iron horse of the West.* *Amer. Forest.* 29: 205-209. 5 fig. 1923.—It is pointed out that the Pacific Northwest contains the last great stand of old coniferous forests yielding large percentages of clear, first-quality timber. The typical old forest of the Northwest does not exceed 300-500 years in age, although in some limited areas fires appear to have been absent for periods as long as 1,000 years. The forests were from the start in ideal condition for management; but no time should be wasted in establishing young stands following logging operations, since such negligence will result in depletion of growing stock and inevitable future reduction of annual cut. A short history of the lumber industry is given, leading to the statement that at present rates of cutting, privately owned old timber in western Washington will be entirely cut in 20-30 years, with Oregon and California following later. Foresight and intelligence are needed to bring about a continuous yield. The writer believes that, given proper management, the forests of western Washington should give an annual production forever of approximately 6 billion feet of saw-timber and 6 million cords of other forest material.—*Chas. H. Otis.*

6284. KITSON, LELA C. *The piñon.* *Amer. Forest.* 29: 153-159. 2 fig. 1923.—Popular.—*Chas. H. Otis.*

6285. LEMMEL. *Das Problem der volkswirtschaftlichen Produktivität und seine Stellung in der Staatsforstwirtschaft.* [The problem of economic productivity and its significance in state forestry.] *Zeitschr. Forst.- u. Jagdw.* 54: 199-226. 1922.—The author discusses the problem in its relation to state forest management. The big question to be answered is: which production method most fully satisfies the economic interests of the nation? The technical, economic, financial, and highest soil rental rotations are considered separately. The last chapter considers the relation of the previously discussed economic principles to the business of the state; briefly, whether state management should be directed toward securing financial gain or toward social or community betterment.—*J. Roesser.*

6286. MCCARTHY, E. F. *Forest fire weather in the Southern Appalachians.* *Monthly Weather Rev.* 51: 102. 2 figs. 1923.—The relationship of temperature, humidity, evaporation, precipitation, and vapor pressure to the occurrence of fires from September to November, 1922, is pointed out. The fact that Weather Bureau data can be translated into usable information regarding the fire situation shows the value of graphic studies of existing records.—*E. N. Munns.*

6287. McLOUD, N. C. *Holding the banks of the Mississippi.* *Amer. Forest.* 29: 242-243, 249. 3 fig. 1923.—The author describes the making of willow mats, sometimes as large as 250 by 1,000 feet and their use as revetments to stop erosion and cutting of the banks of the Mississippi River.—*Chas. H. Otis.*

6288. MADLUNG. *Wirksame Verdrängung der Heide durch die perennierende Lupine.* [Suppressing of heather by means of perennial lupine.] *Deutsch. Forstzeig.* 38: 324-327. 1923.—Lupine sowed between the rows in oak nursery beds, and scattered broadcast on bushy areas on exposed sites, has proved very effective in keeping down the growth of weeds and heather, and at the same time stimulates the growth of the young trees. It furnishes forage for wild game during the fall and winter, and its blue flowers are of great esthetic value.—*W. N. Sparhawk.*

6289. MILNER, C. E. *A visit to Myitmaka training works, Burma.* *Indian Forester* 49: 175-182. Pl. 7-8. 1923.—An account is presented of a project to reclaim lowlands and to develop a stream suitable for floating logs.—*E. N. Munns.*

6290. MOBBS, E. C. **The management of high forests in the Vosges and Jura Mountains.** *Indian Forester* 49: 183-197. 1923.—The author gives an account of a trip through the French forests.—*E. N. Munns.*

6291. MÖLLER. **Allgemeine Wirtschaftsgrundsätze.** [General principles of management.] *Zeitschr. Forst.- u. Jagdw.* 54: 243-250. 1922.—Möller makes public 2 communications, one from the chief forester of Stettin, the other from the Department of Agriculture and Forestry of Prussia, in relation to the management of forests in the plains region of northwest Germany. The principles of the continuous management system (avoidance of clear-cutting, natural regeneration, and soil culture and protection) are prescribed. The latter edict enters into considerable detail; demands, in general, the prevention of further soil deterioration (raw humus formation), the reduction of the amount of dry peat deposits, and the conversion of undesirable stands, especially pure conifer stands, into mixed stands of conifers and hardwoods.—*J. Roeser.*

6292. OELKERS. **Die Aufforstungen in der Lüneburger Heide.** [Afforestation on the Lüneburger heath.] *Deutsch. Forstzeitg.* 37: 800-803. 1922.—Hanover, which is 18 per cent forested, has 133,835 hectares of moorland, half of all there is in Prussia; 98 per cent of it is privately owned. Over 23,000 hectares has been afforested by the provincial government, communes, and private owners. Planting was done on plowed strips, using 1-year pine and 2-year spruce seedlings, and seeds of pine, spruce, and larch. Along paths and roads, protection strips of oak, birch, maple, and alder were planted. Shallow plowing and seeding proved more successful than deep plowing and planting. The common method is to burn during the 1st winter at a time when only the heather will be burned and the humus will be left intact, harrow the ashes into the soil, plow 20 cm. deep the 2nd year, and sow the seed in the 3rd spring.—The cool, damp climate, the absence of lime in the soil, and the cultivation of pure conifer stands tend to cause the formation of hardpan and upland moors. Remedies include cultivation of mixed stands, early and heavy thinning, removal of litter. Introduction of beech, fir, and larch has stimulated growth of the pine.—*W. N. Sparhawk.*

6293. O[SMASTON], A. E. **A review.** [Rev. of: (1) CHAPMAN, H. H. **Forest mensuration**, xxii+ 553 p. J. Wiley & Sons: New York: Chapman and Hall, Ltd.: London, 1921 (see Bot. Absts. 12, Entry 1695). (2) WINKENWERDER, HUGO, and E. T. CLARK. **Handbook of field and office problems in forest mensuration.** 2nd ed., 133 p. J. Wiley & Sons: New York, 1922.] *Indian Forester* 49: 82-93. 1923.—Both books are worth reading and keeping for reference. Many of the American problems are closely akin to those of India. It is difficult at first reading to understand the American terminology. [See also Bot. Absts. 12, Entries 393, 2354.]—*E. N. Munns.*

6294. PARKER, R. N. **Artocarpus hirsuta as an underwood for teak.** *Indian Forester* 49: 248-251. 1923.—Usually *A. hirsuta* has failed in sowings under teak, but success attended broadcast sowing followed by hoeing and covering of the seed. Growth was rapid on established trees, the maximum being 38 inches in girth at 18 years. Five teak standards and 83 *A. hirsuta* saplings were found on a "square chain." When the 2 species are introduced together, it is doubtful as to which will form the final stand.—*E. N. Munns.*

6295. PARKER, R. N. **Natural regeneration of Eucalyptus.** *Indian Forester* 49: 251-252. 1923.—Natural seedlings of *E. dealbata* and *E. globulus* were found after a severe fire on an area where *Pinus longifolia* had been destroyed by fire.—*E. N. Munns.*

6296. PICCIOLI, ELVIRA. **Richerche sperimentali su legni stranieri, mogano, Cedrela.** [Researches on foreign woods, mahogany, Cedrela.] *Staz. Sper. Agrarie Ital.* 55: 51-79. 6 fig. 1922.—This article discusses the characteristic differences between the genera *Swietenia* and *Cedrela*. It includes information on the source of the principal commercial species sold as mahogany or cedrela, the quantities imported, their technical properties, uses, and dis-

tinguishing anatomical characteristics. Figures drawn from microtome sections, in 3 planes, are shown for *Swietenia mahagoni* and *Cedrela odorata* respectively.—The following species of *Swietenia* are discussed: *S. angolensis* Welw., *S. humilis* Zucc., *S. macrophylla* King, and *S. mahagoni* Jacq. The common and trade names used in different countries are cited. A very detailed discussion of the anatomical characteristics of *S. mahagoni* is given which includes vessel and ray-cell dimensions. A classification of mahoganies into 5 groups based on the characters of the rays and their contents is presented. A brief historical account of the early recognition and exploitation of mahogany mentions the Europeans landing in America in 1597 from the Walter Raleigh as the first to become acquainted with it, and cites its use by Spaniards in ships, and its importation into England in 1724 by Capt. Gibbon. It states that in 1753, 520,000 cubic feet was imported from Jamaica and before the recent war about 12,000 tons a year was imported by France, 70,000 by England, and 7,000 by Germany. The tree was introduced into India in 1795 and is now cultivated to a considerable extent. The best grades now come from mountain slopes in southern Mexico, British Honduras, and Guatemala. Strength figures are quoted from Laslett and Sargent.—The following woods which may be sold as mahogany, but which do not come from *Swietenia* are discussed: *Curatella americana* L., *Ratonia apetala* Griseb., *Anacardium occidentale* L., *Simaruba amara* Aubl., *Tabebuia Donnell-Smithii* J. N. Rose, *Khaya senegalensis* A. Juss., *K. grandifolia* C.DC., *Entandrophragma Candollei* Harms., *Dysoxylon Muelleri* Benth., *Soymida febrifuga* Juss., *Eucalyptus botryoides* Sm., *E. marginata* Sm., *E. pilularis* Sm., *E. resinifera* Sm., *E. robusta* Sm., *Juglans regia* L., *Ptaeroxylon utile* Eckle. & Zeyn., *Boswellia* sp., *Persea indica* Spreng., *Myristica* sp., and a number of species of *Cedrela*. Methods of finishing such woods as maple, walnut, locust, poplar, chestnut, and elm to look like mahogany are given as follows: (1) oxide of titanium, potash and gall nuts, (2) infusion of Brazil wood, (3) infusion of logwood, (4) infusion of seed of *Bixa orellana* L., (5) gommagutta or saffron, (6) dilute nitric acid followed by an alcoholic solution of the resin from the fruit of *Daemonorops draco* Blume (dragon's blood), root of *Anchusa tinctoria* L., and aloë.—Thirty-five species of *Cedrela* and their sources are mentioned. The following are discussed in detail: *C. odorata* L. and its varieties, *C. bogotensis* Triana & Planch., *C. fissilis* Vell., *C. guianensis* Juss., *C. inodora* Hassk., *C. sinensis* Juss., and *C. toona* Roxb. The article closes with a page summary of the characteristics in regard to color, odor, taste, hardness, annual rings, specific gravity, and structure of vessels, fibers, wood parenchyma, and rays, which serve to distinguish *Swietenia mahagoni* and *Cedrela odorata*.—*Eloise Gerry*.

6297. RANDALL, C. E. Farming the forest for a pine crop. Amer. Forest. 29: 195-198, 250. 5 fig. 1923.—This article points out the financial value of white pine plantations as paying investments to farmers and to towns, with a warning of the dangers to the crop, and especially of the white pine blister rust.—*Chas. H. Otis*.

6298. RECORD, S. J. The Paraná pine of Brazil. Amer. Forest. 29: 215. 1 fig. 1923.

6299. RECORD, S. J. When we build our house. Sci. Amer. 128: 80-81. 5 fig. 1923.—This popular article gives facts regarding kinds and grades of lumber which should be known by the home builder.—*Chas. H. Otis*.

6300. RECORD, S. J., AND GEORGE A. GARRATT. Cocobolo. Yale Univ. School of Forest. Bull. 8. 42 p., 7 pl., 1 fig. 1923.—The authors identify the wood of commerce under this name with the genus *Dalbergia*, and 3 species, *D. retusa* Hemsley, *D. hypoleuca* Pittier, and *D. granadello* Pittier, indigenous in Panama and the west coast of Costa Rica, Nicaragua, Honduras, and Mexico. Botanical descriptions, macroscopic and minute anatomy of the woods, commercial sources of supply, methods of exploitation, and uses are given. For cutlery handles, no satisfactory substitute for cocobolo has been found. The annual consumption is 80,000 cubic feet.—The dust of the wood in factories causes a skin eruption similar to that caused by poison ivy. From 10 to 20 per cent of workmen are susceptible. The toxic principle is an oleoresin with violent irritant properties capable of producing an inflammatory

condition of the skin of the type of "dermatitis venenata." It is soluble in alkalies but is precipitated by acids. The trouble is rarely of a serious nature and usually responds promptly to treatment.—*H. H. Chapman.*

6301. RHODES, G. H. Perpetuating the redwoods. *Amer. Forest.* 29: 147-152. 5 fig. 1923.—California stands among the leading states in regard to constructive forest laws, having begun to formulate them as early as 1885. Reforestation in the redwood region began in 1843, when the first sawmill was built in Mill Valley; for, as soon as the redwood trees were cut, sprouts sprang from the stumps, and at present there are 10 or more good trees where 1 stood in the virgin forest. Since lumbering began, approximately $\frac{1}{3}$ of the virgin forest area has been cut over and approximately $\frac{1}{4}$ of this has been cleared for farming. At the present rate of cutting, the remaining timber will last 140 years. An increased rate may reduce the time to 70 or 100 years. Second-growth redwood is flourishing on practically all the cut-over land that is not being farmed. The age of this new timber is 1-75 years and there are stands with as high as 130,000 board feet to the acre. While the second growth redwood will not be as large when cut for lumber as are the trees of the virgin forests, the stand will be much more dense and uniform, making the yield per acre greater than the average yield from the virgin forests. Both virgin timber and second growth are protected from loss and fire damage by the owners, individually and through co-operating associations, ably assisted by the counties and the State Board of Forestry. In 1921 the area burned over was 4,260 acres, with a loss of only \$1.04 an acre.—*Chas. H. Otis.*

6302. RICALTON, J. Russian white birch—rare tree of a thousand uses. *Amer. Forest.* 29: 153-154. 2 fig. 1923.—This is a popular article on *Betula alba*, its growth under Russian conditions and its use by the peasantry.—*Chas. H. Otis.*

6303. SCH. Bestimmungen über Walddabtriebe in der Tschecho-Slowakei. [Regulation of cutting in Czechoslovakia.] *Deutsch. Forstzeitg.* 38: 363-364. 1923.—Forest owners who are not operating under a fixed working plan are required to notify the proper officials 4 weeks in advance of intended cutting. Cutting is not allowed in stands less than 60 years old in case of high forest, and 20 years for coppice or coppice-with-standards. The area cut over yearly may not exceed $\frac{1}{10}$ for tracts of high forest under 50 hectares, or $\frac{1}{50}$ for larger tracts; for coppice the limits are $\frac{1}{10}$ and $\frac{1}{50}$, respectively.—*W. N. Sparhawk.*

6304. SCH. Mecklenburgisches Waldschutzgesetz. [Mecklenburg's forest protection law.] *Deutsch. Forstzeitg.* 38: 315. 1923.—Mecklenburg-Schwerin adopted a forest protection law on March 10, 1923. It provides that cut-over land must be restocked within 3 years; existing denuded land suitable for forest production must be replanted; no further forest destruction is allowed; owners of less than 25 hectares of forest may manage it as they please; the owner of 25-100 hectares must secure the approval of the authorities if he intends to cut over more than 4 per cent of the area in any 1 year; and the owner of over 100 hectares must follow an approved working plan, under the guidance of a trained forester, unless he himself can qualify as a forester.—*W. N. Sparhawk.*

6305. SCHNEIDER. Die Buchenschildlaus (*Cryptococcus fagi*) in der Revierförsterei Burgsteinfurt i. W. [The beech scale.] *Deutsch. Forstzeitg.* 38: 305-308. 1923.—The damage resulting from attacks of this insect is discussed, and methods of control are suggested.—*W. N. Sparhawk.*

6306. SEITZ. Fraget die Eichen, wie sie wachsen. [Ask of the oaks, how they grow.] *Zeitschr. Forst.- u. Jagdw.* 54: 321-330. 1922.—The author discusses the retrogression of native oak stands (*Q. pedunculata* and *Q. sessiliflora*) and the problem of preserving and extending good stands. Because of overlapping of sites and flowering periods, hybrid races have been produced. Racial variation studies such as have been made with pine should be undertaken with the oaks. Foresters are concerned chiefly with the dominance of characteristics influencing the habit of the tree, and with selecting and propagating those individuals which express the desired characteristics and can pass them on to their progeny.—*J. Roesser.*

6307. SHOW, S. B., and E. I. КОТОК. The occurrence of lightning storms in relation to forest fires in California. *Monthly Weather Rev.* 51: 175-180. *Fig. 1-4.* 1923.—In the 10-year period 1911-1920, 77 per cent of the fires caused by lightning occurred in July and August, which are also the months of highest temperature. Most storms cause relatively few fires, but as high as 339 fires have been set by a single storm. Well defined areas, "lightning zones," exist where fires are frequently set, in which there is a striking parallelism in heavy storms. A series of maps shows these features.—*E. N. Munns.*

6308. SUDWORTH, G. B. The age of Monterey cypress. *Amer. Forest.* 30: 270-271. 3 *fig.* 1923.—Popular.—*Chas. H. Otis.*

6309. SWEET, C. V. Further experiments in the air-seasoning of Indian timbers and general recommendations as to seasoning methods. *Indian Forest Rec.* 9⁵: 147-226, 241-288. *Pl. 1-6.* 1922.—Natural methods of seasoning timber are possible for most of the important Indian species, though kiln drying is much more satisfactory. Seasoning in the log is generally unsatisfactory because of splitting and checking. The best results are obtained from green conversion if the timber is handled soon after cutting and properly stacked and protected, though many species may be girdled 18 months in advance to facilitate handling. Those that are severely damaged by insects should ordinarily not be treated in this way. When logs can not be sawn immediately, special precautions should be taken to prevent damage, water storage being the best method. Good seasoning depends largely upon the degree of protection given the lumber from sun and wind, and the season of cutting, while the rate varies markedly with the species and with the local climate. Complete data are given for 53 species.—*E. N. Munns.*

6310. TRESCKOW, VON. Forstwirtschaftlicher Rückblick auf das Jahr 1921. [Forest economic review for 1921.] *Zeitschr. Forst.- u. Jagdw.* 54: 257-289. 1922.—The review takes up the economic situation of forest industry in Germany under the following headings: the general economic situation, which in 1921 was one of the darkest in German history; conditions of the construction market; indemnity payments of forest products; the course of lumber prices; the situation in the most important countries exporting lumber to Germany; economic measures, including the problem of increasing the cutting budget; the economic situation in East Prussian forests; organization and legal questions; silvicultural questions, mainly centered upon the discussion of the continuous management system, which is beginning to receive the eager attention of private owners; the oak tan-bark question; secondary forest products; and a financial statement and summary of Prussian forests. In 1918 expenditures amounted to 39 per cent of receipts; in 1919, 34; in 1920, 13; in 1921, 34, and in 1922, 42 per cent. Through the Versailles treaty 636,000 hectares have been lost, the present area of the Prussian state forests being 2,416,008 hectares. Numerous tables are given.—*J. Rocser.*

6311. VANSELOW. Wirtschaftsziele und Wirtschaftsverfahren im Hochspessart. [Aims and methods of management in the Upper Spessart.] *Forstwiss. Centralbl.* 45: 1-12, 53-63. 1923.—The objects and principles of management of the "High" Spessart from 1666 to the present time are described. This division of the Spessart forest contains 19,927 hectares, and the stand consists of hardwoods chiefly (80.4 per cent), including oak (17.3 per cent) and beech (63.1 per cent). The old oaks, 300-800 years old, which are famous sources of cabinet wood, are the result of the early form of management. The large-crowned oaks were left to form a forest cover and furnish mast, while the more slender, small-crowned oaks and the beech were taken out for the construction of castles and for firewood. Except for a few pure oak stands starting early in the 17th century, there was little reproduction of oak, hence the present scarcity of oak timber between 120 and 300 years old. About 1800 the silvicultural system was changed, using a form of shelterwood cutting, with an 80-year rotation for beech, later extended to 120-130 years. Natural reproduction of oak did not follow, but considerable was planted. In the late 1870's a selection method was adopted. For various reasons there was not sufficient young timber in the stand for this to be successful,

and the careless and destructive methods of logging and skidding destroyed a great deal of the reproduction which started. A strip- or "border"-cutting system, using the shelterwood method, is recommended. This will secure immediate natural reproduction of beech, and any openings should be planted with conifers.—*W. N. Sparhawk.*

6312. VORKAMPFF. *Baumhöhenmesser*. [A tree hypsometer.] *Deutsch. Forstzeitg.* 38: 244-245. 1923.—The instrument described is very simple to make, easy to use, yet sufficiently accurate. It does not require measurement of the distance between tree and observer.—*W. N. Sparhawk.*

6313. WILSON, ERNEST H. *Northern trees in southern lands*. *Jour. Arnold Arboretum* 4: 61-90. 1923.—The paper deals with the introduction of trees of the northern hemisphere, chiefly North American and European, into South Africa, Australia, and New Zealand. After some remarks on the forest wealth and the forest problems of the southern lands, the behavior of northern soft-wood trees in the southern hemisphere is discussed. The most valuable is *Pinus radiata* D. Don, though it is of little importance in its native country; in most parts of the southern hemisphere where it has been planted it grows rapidly and yields 3 crops of merchantable timber per century. Other pines which have proved of value are *P. pinaster* Ait., *P. pinea* L., *P. canariensis* Smith, *P. longifolia* Roxb., *P. ponderosa* Dougl.; many of the Mexican pines also are doing well. *Pseudotsuga taxifolia* Brit. is promising in some parts of Australia as is *Larix decidua* Mill. *Cedrus* and several *Cupressus* and *Juniperus* species are growing well and are promising. Of little forestal value are *Abies*, *Picea*, *Tsuga*, *Chamaecyparis*, *Thuja*, *Cunninghamia*, *Cryptomeria* and others. None of the hardwood trees has proved of great importance, except poplar and willow; most others, though successfully used as ornamental and avenue trees, grow too slowly to be of value for forest planting. A chapter on southern trees in northern lands concludes the paper. *Eucalyptus* is named as the only one which has proved of great value in various parts of the northern hemisphere; while many others have been introduced, such as species of *Acacia*, *Grevillea*, *Leucadendron*, *Sophora*, *Araucaria*, *Cordyline*; they are planted chiefly as ornamental trees.—*Alfred Rehder.*

6314. BEAN, R. BENNETT. *Notes on the body form of man*. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 7-19. Williams & Wilkins Co.: Baltimore, 1923.—This paper deals chiefly with stature and sitting height, under the following heads: sitting height throughout the world; standards for stature, sitting height and sitting height index; morphologic index; American whites and negroes, and Filipinos; growth of sitting height; and the relation of sitting height to type. The materials include measurements by the author of 6,219 men, women and children, American whites and negroes, and Filipinos; records of other authors representing about 45,000 persons from 396 groups of peoples throughout the world. Two other groups have been reported by Giuffrida-Ruggeri numbering 44,929 Swedes and 119,571 Spaniards. In both sexes, Europe has the greatest sitting height, the Pacific Islands the least, America and Asia are next to Europe and Africa next to the Pacific Islands. The modal stature of the four great continental masses of peoples is represented by that of Europe and Asia, 165 cm. for ♂ with North America slightly higher, Africa much higher and Central America much lower. The records from Africa are not from the true negroes but are from mixed American, Bantu, Nilotic, Nigerian, etc., and the records from Central America are of Indians mixed with Spanish. The modal stature for ♀ is taken as about 155 cm. The modal standard sitting height for Europe, Asia, and North America is above 85 cm., and for Africa, Central America and the Pacific it is 85 cm. or less for the ♂. It is about 80 for the ♀. The modal sitting height index of Europe and America is about

52.5, of Asia 53.5, and of Africa 48.0-50.0. The sitting height index of the true negro is better represented by that of 9 groups from Central Africa with indices varying from 47.9 to 49.6. The normal standards are given for both ♂ and ♀: (males) stature 165.0 cm., sitting height 85 cm., sitting height index 52.5; (females) stature 155.0 cm., sitting height 80 cm., sitting height index 53.5. The morphologic index is a number representing the percentage difference between racial means and a standard taken as a basis for computing the percentage difference. This standard should be as near the average of the 4 great masses of peoples as possible with present knowledge; it may have to be revised and may change in the course of time. The morphologic index may be used with any factor, either actual measurements or indices. The most distinctive characteristic of the morphologic index for stature is the low index for Central America and the Pacific. For sitting height the morphologic index is high for Europe, Asia, and North America, and low for Central America. The morphologic index for the sitting height index is high for Asia and extremely low for Africa. In the sitting height index for outlying groups, the lowest index is among the Australians and the highest among the Eskimos. Closely related to the Australians are the Negroes, Negritos, Melanesians, and East Indians; and closely related to the Eskimos are the Siberians, Chinese, Ainos, and Pigmies of Africa. A low index relates to the negroes except in the case of the Pigmies, and a high index to peoples of low stature who live under adverse conditions. The stature of the American whites and negroes is about the same, but that of the Filipinos is 10 cm. less. The sitting height of the three groups is different, the negroes being nearer the Filipinos than to the whites. The sitting height index is the same for the whites and Filipinos but it is lower for the negroes. The negroes are hybrid Afro-Americans with a preponderance of white blood. The Filipinos are from all parts of the Philippines, with a considerable Negrito blood but with a larger proportion of Chinese and European. The Chinese and Negrito neutralize each other because the former has a high sitting height index and the latter a low one, therefore the index is the same as for the European or white. The sitting height index is lowest in girls between the ages of 12 and 14, and in boys between the ages of 14 and 16. This is the period when the lower extremities are ceasing to grow rapidly and the torso or bust is beginning to grow rapidly. The bust of the girls is absolutely longer than that of the boys between the ages of 10 and 15. The period of most rapid growth in sitting height in girls is from 11 to 13 years, and in boys from 14 to 16 years; the girls are precocious and the boys retarded. The Asiatic seems to have a short youth and long adolescence, because the lower extremities are retarded early in their growth, and the bust is accelerated early and retarded late in its growth. The adult Asiatic has a long torso and short lower extremities. The African seems to have a long youth and a short adolescence, because the lower extremities grow to a late age and the rapid growth of the sitting height is late and short. The adult African has a short torso and long lower extremities. The European is intermediate between the Asiatic and African in the growth of both the torso and lower extremities. This varies with the type. Selected cases are given to show some extreme conditions that may be found among the American whites and negroes, and Filipinos. Then are separated those below 170 cm. stature, and finally each of the 3 primary types is subdivided into 3 other types. The records are all of ♂. The differences are readily seen, and, throughout the negro is discernible by reason of the lower index. Three types may be found among the people of any group but any clear separation of individuals is difficult and more or less relative. The extreme cases are easily discerned, but the intermediate grades are more difficult to detect.—*R. Bennett Bean.*

6315. BELL, ALEXANDER GRAHAM. Saving the six-nippled breed. *Jour. Heredity* 14: 99-111. 10 fig. 1923.—A summary is presented of Bell's experiments to produce a multi-nippled, twin-bearing strain of sheep. At the time of his death Bell had a flock that always bore twins and triplets, but whether the character is hereditary had not yet been satisfactorily proved.—*R. C. Cook.*

6316. BENDERS, A. M. Onze constitutie. [Our constitution.] *Genetica* 2: 301-322. 1920.—The author discusses the Galenian theory of disease and its influence during centuries,

until Virchow in 1894 brought forth the organic (cell) theory; the effect of the latter on the advancement of the knowledge of diseases is considered.—The author accepts Lubarsch's definition of disease, "that tendency of the organism, which determines the manner of reaction to stimuli;" and of disposition, "that tendency of the organism, which enables external influences to act as stimuli." For example, scrophulous constitution; the disposition allows the tubercle bacillus to gain a foothold, and the constitution determines that the patient becomes scrophulous.—The theory of an hereditary constitution, determined at fertilization of the egg-cell, as advanced by Tandler, Hart and Hijmans van den Bergh, is discussed.—Certain diseases are recognized as hereditary. These, if appearing regularly in the same manner in the same family, may be due to 1 factor, as for instance amaurotic idiocy. About 60 abnormalities (diseases) are listed as hereditary.—The advance of investigations during the last 10-15 years is noted. Experiments of Goldmann, Arnold and others regarding cell functions, cell fermentations, permeability of cell walls, excretion of cells, degeneration of cells, etc., are discussed. Degeneration giving rise to organic nerve diseases has been but little studied. The accumulation of waste in the cells and the increased function of the cell is very dangerous for the cell. Diseased conditions might also be caused by absence of cell functions.—Dietetics are corrective methods against such conditions.—The theory of determination of hereditary influences in the cell is next discussed, including nuclear and cytoplasmic inheritance. Small differences, enlargements, etc., in localization may appear in the different members of a family.—The author believes that the possibility of small changes in the egg plasma is greater than changes in chromosomes during nuclear division, and that "localisation" influenced by plasma, as the seat of the material, is more logical than that it should be influenced by nuclear chromosomes.—The constitution then has its origin in the germ and is a problem of heredity.—*Peter J. Klaphaak.*

6317. BENEDICT, R. C. Artificial varieties under natural conditions. Jour. Heredity 14: 115-116. 1 fig. 1923.—A horticultural variety (Whitmani) of the Boston fern has grown wild in Florida for 12 years, maintaining its typical form with no greater change than would be expected under unfavorable greenhouse conditions. The original plant has spread until about 2 square rods of ground are irregularly covered.—*R. C. Cook.*

6319. CLARK, HUBERT L. The distribution and derivation of some New England echinoderms. Amer. Nat. 57: 229-237. 1923.—There are sufficient data on the distribution of 40 of the 46 species of echinoderms known to occur on the New England coast to permit an interpretation of their derivation. Thirty-two of these are of northern origin and 8 of southern origin. The data on the distribution of these echinoderms indicate that: (1) they have a northern origin with few exceptions; (2) they have little tendency to form endemic species or varieties on these coasts; (3) they are representatives of genera that in warmer seas become differentiated into numerous constant forms. Some details are given of the distribution and place of origin of *Strongylocentrotus dröbachiensis*, *Crossaster papposus*, *Ophiopholis aculeata*, *Arbacia punctulata*, *Asterias forbesi*, *A. vulgaris*, *Leptosynapta inhacrens*.—*Geo. T. Hargitt.*

6320. CONKLIN, E. G. Problems of organic adaptation. Rice Inst. Pamphlet 8: 299-380. 1921.—The 3 lectures which constituted this course at the Rice Institute are entitled respectively: fitness in the living world; the mechanism of adaptation; mechanism, vitalism, and teleology.—*J. R. Schramm.*

6321. DAVIS, B. M. Species, pure and impure. Science 55: 107-114. 1922.—The conception of species as modified by extended knowledge is discussed. The author states that chiefly as the result of genetical studies of the near present there are 2 conceptions of species: (1) The pure species as conceived by Darwin and others, which, as expressed in the

terminology of the modern geneticist, is homozygous for all genes responsible for the species characters other than those of sex or sex-linked characters. For the latter the germplasm is heterozygous in either the ♂ or ♀ individual, at least where animal forms are under consideration. The author does not agree with Lotsy's definition: "A species is the total of all individuals of the same hereditary composition, forming but one kind of reproductive cell," since it calls for the absolutely pure race, almost an abstraction in higher animals and plants. (2) The impure species, the germplasm of which in the diploid condition carries different sets of genes affecting characters other than those associated with sex, and which therefore is heterozygous. It is therefore clearly hybrid in its genetical constitution, but frequently shows little or no evidence of segregation, thus breeding true or nearly true to type. This may be due to: (a) the death, sterility, or the failure of maturation of classes of gametes, eliminating the possibilities of development of whole groups of segregates; (b) the failure of gametes to produce in conjugation viable zygotes due to diverse conditions, among them the presence of lethal factors.—Thus are left favored gametes, which carry between them those genes which in combination reproduce the impure heterozygous germinal constitution of the parent stock.—As an example of an impure species the author refers to *Oenothera Lamarckiana* used by de Vries in his explanation of the mutation theory and to *O. Neo-Lamarckiana*, an impure synthetic species selected by selfed seed for 6 generations by the author from hybrid ancestry, and which agrees in all essential characteristics with *O. Lamarckiana*. The author states that most species of *Oenothera* are impure. One, however, a line of *O. franciscana*, he regards as most nearly a pure *Oenothera* species. It gave 87.3 per cent of germination. Among 1,425 plants (52 of which died as seedlings) no exceptions to type were present, and crosses with *franciscana* pollen showed that the F₁'s were uniform, indicating that pollen was genetically alike. Cytological studies showed a regular pairing at meiosis.—The author treats in condensed form the use of the theory of lethals in *Oenothera* and *Drosophila* hypotheses, showing the similarity of one to the other. He then discusses the appearance among certain plants of: self-sterility, e.g., chicory; free or open cross-pollination, e.g., corn; and consequences of inbreeding, e.g., *Crepis*.—Another type of impure species is mentioned as existing only in certain types or groups of plants, e.g., violets, blackberries, tree fruits, etc., perpetuated by vegetative means.—The author concludes with the question as to whether the impure species should be grouped for convenience as collective species.—*Peter J. Klapaak*.

6322. DUCK, RUSSEL W. Colors of short-horn cattle. Jour. of Heredity 14: 65-75. 6 fig. 1923.—Tracing color-inheritance by means of the data contained in the Herd-books of the Short-Horn Breeder's Association brings in many chances of error, because of inaccurate registration. In tracing 11,685 matings, and corresponding with breeders in doubtful cases, it is concluded that red is the basic color in Short-horns, and that white is "due to the absence of any color factor." Red-and-White represents the red factor in the heterozygous condition, in the absence of the roan "extension factor." Roan is considered to be due to the presence of an extension factor when the factor for red is heterozygous. A table is included giving the data obtained in tracing these matings.—*R. C. Cook*.

6323. EAST, E. M. Weatherwax on maize endosperm. [Rev. of: WEATHERWAX, PAUL. A rare carbohydrate in waxy maize. Genetics 7: 568-572. 1922 (see Bot. Absts. 12, Entry 3281).] Science 57: 416-418. 1923. [See also Bot. Absts. 12, Entry 6337.]

6324. ELLINGER, T. Metoder til Analys af Stamtavler med Hensyn til Indavl og Slaeftskab. [Methods for analyses of genealogies in respect of inbreeding and relationship.] Nordisk Jordbrugsforskning 1921: 49-66. 3 fig. 1921.—The author discusses Pearl's coefficients of inbreeding, relationship and partial inbreeding indices and suggests certain modifications for the purpose of bringing all measurements of inbreeding and relationship on the same scale. He points out the desirability of coefficients of total inbreeding and relationship and a total relationship inbreeding index, the last to measure the proportion of the inbreeding that is due to relationship between the sire and dam.—*Sewall Wright*.

6325. ENGLEADOW, F. L. **The inheritance of glume length in a wheat cross (cont.).** *Jour. Genetics* 13: 79-100. 1923.—Previous work carried through the F_2 generation [see *Bot. Absts.* 8, Entry 253] was continued through the 2 succeeding generations but only upon glume length of the Polish wheat of the Polish-Kubanka cross. The material and methods were scrutinized with great care but nothing was found to warrant a conclusion different than the one previously announced,—that the extracted Polish glume length in all cases was approximately 20 per cent shorter than the parental glume length. Further studies in the inheritance of solidness of straw did not show that these results had to do with “shift” in mean glume length.—Although double fertilization occurs in wheat no evidence could be found of the presence of more than 1 endosperm type in the F_2 endosperms borne by the F_1 plant. It is presumed that the endosperm is maternal in its nature.—An attempt was made to explain the nature of “shift” in glume length by the multiple factor hypothesis but in this cross this was found impossible although it is still a matter of uncertainty whether the phenomenon of “shift” is distinct from multiple factor action.—*L. R. Waldron.*

6326. ERNST, ALFRED. **Chromosomenzahl und Rassenbildung.** [Chromosome number and species formation.] *Vierteljahrsschr. Naturf. Ges. Zurich* 67: 75-108. 1922.—A summary and discussion are presented of the literature on the origin of new types of plants differing in chromosome number from the stock from which they came as a result of: (1) mutation, (2) action of outer influences, (3) hybridization between forms with different chromosome numbers.—*Margaret C. Mann.*

6327. ETHERIDGE, W. C., W. H. EYSTER, and L. J. STADLER. **A genetic analysis of maize.** *Missouri Agric. Exp. Sta. Bull.* 197. 69 p. 1922.—Brief notes are given on the inheritance of zigzag culms and scarred endosperm in maize, and also on the relative frequency of crossing-over in megasporogenesis and microsporogenesis. Papers dealing with these several subjects in detail have appeared elsewhere [see *Bot. Absts.* 12, Entries 1783, 3167, 3168].—*J. H. Kempton.*

6328. FAIRCHILD, MILTON. **Pure science work in higher eugenics.** 2nd Internat. Congress Eugenics. Vol. II. *Eugenics in race and state.* 358-360. Williams and Wilkins Co.: Baltimore, 1923.—Educationists throughout the country are looking to students of science, having to do with human life, for “adequate and reliable generalizations for use in deciding what education ought to be given boys and girls as a preparation for their lives as fathers and mothers in the homes of the nation.”—*Charlotte Elliott.*

6329. GOWEN, J. W., and M. R. COVELL. **Studies in milk secretion. XII. Transmitting qualities of Holstein-Friesian sires for milk yield, butter fat percentage and butter fat.** *Maine Agric. Exp. Sta. Bull.* 301. 253-308. 2 fig. 1921.—A study is reported of Holstein-Friesian advanced registry sires to determine their ability to transmit milk yield, butter fat percentage, and butter fat to their offspring. One hundred and eleven sires were found to have had 2 or more tested daughters from tested dams, all of which had met advanced registry requirements. The transmitting ability of the bulls is measured by the increase or decrease shown by the daughters (after making suitable age corrections). The names and numbers of the sires, the number of daughter-dam pairs, the net difference, and a condensed record (by quartiles), showing the relative level within the breed of the individual dams and daughters, is presented for each of the characters studied. It is shown that only 11 of the sires increased their daughter's yield 2 times its probable error and only 3 lowered their yield a similar amount. No significant differences in inbreeding, relationship, or in the ancestry of these animals could be found. Essentially similar results were found for butter fat percentage and production. A comparison of transmitting ability of sires and sons gave no clear evidences of heredity. A study of 2 major groups of sires, those with daughters superior to their dams in both milk yield and butter fat percentage, and those inferior in both respects yielded no significant differences in inbreeding, relationship of sire and dam, or ancestry. A comparison of both groups with random sires, none of whose daughters had met advanced registry requirements, again brought out no important differences in ancestry.—*Sewall Wright.*

6330. GUYER, M. F. **Internal secretions and acquired characters.** [Rev. of: CUNNINGHAM, J. T. **Hormones and heredity.** $xx + 246$ p. Macmillan Co.: New York, 1921.] Jour. Heredity 14: 136-138. 1923.—The reviewer points out that Cunningham uses the term "hormones" "in a much wider sense than is warranted by our actual knowledge."—R. C. Cook.

6331. HARRIS, J. ARTHUR, AND H. R. LEWIS. **The correlation between the time of beginning and the time of cessation of laying in the first and second laying year in the domestic fowl.** Genetics 8: 37-74. 10 *diagr.* 1923.—Records on 443 White Leghorns made during their first 2 years at the Vineland Contest are reported. Correlation coefficients are reported as follows: (1) time of beginning laying on the 2 years, $r = .2295$; (2) time of cessation of laying on the 2 years, $r = .5020$; (3) time of beginning to lay the 1st year and cessation of laying the 1st year, $r = .2439$; (4) time of beginning to lay the 2nd year and time of cessation of laying the 2nd year, $r = .3969$; (5) the time of cessation of laying the 1st year and beginning to lay the 2nd year, $r = .5007$; and (6) time of beginning to lay the 1st year and ceasing to lay the 2nd year, $r = .1561$. The correlation factors indicate the existence of a positive relationship in the 6 groupings made.—F. A. Hays.

6332. HERIBERT-NILSSON, NILS. **Kritische Betrachtungen und faktorielle Erklärung der Laeta-velutina-Spaltung bei Oenothera.** [Critical considerations and factorial interpretation of the laeta-velutina segregation in Oenothera.] Hereditas 1: 312-342. 8 *fig.* 1920.—A study of the literature regarding the *laeta-velutina* segregation (or similar segregations) in *Oenothera* showed that de Vries obtained from the *velutina* ♀ × *laeta* ♂ crosses, only *laeta*. Renner, however, obtained from the same cross mainly *O. Lamarckiana* and only a small number of *O. laeta*. The author repeating the cross found neither *laeta* nor *Lamarckiana* alone, but mainly a 3rd distinctive type. He believes that both de Vries and Renner obtained this same type, but that both classified it according to specific characters which proved their theories. The new type was *Lamarckiana*-like in the vegetative parts and *biennis*-like in the floral parts. The author calls this type *ambigua*. *Ambigua* buds are smaller and barrel-shaped in contrast with *Lamarckiana* buds, which are large and cone-shaped. They are similar to *O. biennis* buds, but larger and coarser and colored reddish-brown. The flowers vary in size between those of F_1 *laeta* × *biennis*. The flower shape is most like *biennis*, the style is short, the floral internodes (inflorescence) are shorter, and the fruits are reddish-striped and more horizontal than in *Lamarckiana*. The vegetative parts are like *Lamarckiana*, the branching is more erect. About $\frac{1}{4}$ of the F_1 of the *ambigua* type were very much like *Lamarckiana*, with only a slight difference in flower size. Some have very large flowers and a very long pistil, others have shorter flowers and shorter pistils which do not reach above the stamens.—Besides plants of the *ambigua* type, *laeta* plants were obtained by the author in his cross. In all crosses of this type *laeta* appears in very small numbers.—de Vries finding "only *laeta*" must have classified *ambigua* and *Lamarckiana* as modified *laeta*, because he mentions that "some *laeta* were *Lamarckiana*-like." Renner on the other hand, finding mostly *Lamarckiana*, mentions difference in flower size, grouping therefore *ambigua* under *Lamarckiana*.—The author regards flower size as an important factor, which up to the present has usually been left out of consideration. In the cross *biennis* × *Lamarckiana* small flower-size is dominant over large. *O. biennis* contains therefore the factor *B* (small flower size). The F_1 is then small-flowered independent of type. F_2 as found by both Renner and the author is mainly small-flowered, in 1 F_2 , 33 small-flowered, 14 large-flowered were obtained.—Besides flower size, *B* influences also type of branching, length of internodes of inflorescence, direction of buds and fruits, and form of buds and flowers. It is thus a complex factor. Renner's "albicans complex" influencing only white veins has no meaning, as *O. Lamarckiana* has white veins. It does not influence other characters. *r* in *Lamarckiana* (factor for white veins) as opposite to *R* (red veins) is therefore the same as the "albican complex."—The author, not agreeing with Renner's homozygotic theory (in which the homozygotes are lethal), accepts the presence of 2 factors, *L* and *V*, which show strong repulsion for one another, so that no "positive" homozygotes are formed. *Lamarckiana* is then *LlVv*, as only the gametes *Lv* and *lV* are formed; *biennis* is *llvv*. *O. biennis* × *Lamarckiana* gives

then the following combinations: $lv \times Lv$ and $lv \times lV$ or Llv and lVv , which, being heterozygotic, are viable. The acceptance of the factor B in this scheme as belonging to *biennis* explains the appearance of *ambigua* in the cross *laeta-velutina*. The author claims that his explanation by factorial (Mendelian) inheritance does away with the de Vriesian hypothesis of 2 lethal factors and a special mutation process.—The *blandina (velutina)* and *simplex (laeta)* types obtained by de Vries from selfed *Lamarckiana* can be explained by the author's hypothesis of 2 factors, L and V , which may sometimes combine (about once in 100,000 times), but which are highly repulsive to one another. The gametes are formed in the following ratio: 1 LV : 100,000 Lv : 100,000 lV : 1 lv . All positive combinations ($\frac{1}{2}$ of all combinations), i.e., those containing either LL or VV or both, are lethal; the negative ones are vital.—The author states finally that most if not all of the differences in observations on *Oenothera* phenomena are due to the terminology used. Mutation is complicated segregation (repulsion, homozygote elimination, heterogamy); complex inheritance is pleiotrophy; nuclear chimaera means the formation of pure gametes, and abnormal ratios are due to certation, i.e., a different power of growth of genotypically different pollen tubes. An English summary concludes the paper.—*Peter J. Klaphaak.*

6333. HERTWIG, PAULA. Der bisherige Stand der erbanalytischen Untersuchungen an Hühnern. [The present status of genetic investigations in poultry.] Zeitschr. Indukt. Abstamm.- u. Vererb. 30: 183-254. 1923.—This paper furnishes a very complete review of work done on the many phases of poultry breeding. Most of the important genetic work on this problem has been presented in comprehensive form. The paper furnishes a valuable summary and reference list.—*F. A. Hays.*

6334. HUNT, H. R. The Allegheny College birth rate. Jour. Heredity 14: 50-60, 139-144. 1 fig. 1923.—In this statistical study of the birth rate of the graduates of Allegheny College it develops that "the birth and marriage rates have remained fairly constant for graduates of Allegheny College (classes of 1870-1899), but the group has probably fallen somewhat short of producing enough children to replace itself."—*R. C. Cook.*

6335. JOHNSON, ROSWELL H. Mate selection. 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics, and the family. 416-425. Williams & Wilkins Co.: Baltimore, 1923.—Assortive mating in man accentuates attributes, tending to confine high attainment to certain strains, and to restrict defects to other strains. Mate selection may be influenced by the possession of a particular quality, in which case the intensity of that quality among descendants may eventually come to lie outside the normal range of variation of the race. Matings may be the result of preference, though the precise reason for the choice may or may not be recognized by the suitor. The range of effective mating can be restricted by differential death rates of the sexes, geographical and social segregation, celibacy, sterility, and delayed marriage.—The importance of beauty is frequently overemphasized. Stability, persistence, judgment, etc., in women are likely to be undervalued by men. Public record of the results of mental tests is desirable as an aid to intelligent choices of mates. The racial usefulness of superior persons consists largely in having offspring, which will pass on their excellent qualities to posterity. Superior women should not persistently insist on excessively high qualifications in a mate, for such an attitude may entirely prevent their marrying. Sterility resulting from venereal disease is probably on the whole eugenic, because of its greater frequency among mentally inferior persons. Laws restricting the diffusion of the knowledge of birth control are undesirable, for such control should be applied on a eugenic basis.—*H. R. Hunt.*

6336. KAHN, E. [German rev. of: FUCHS, W. Psychiatrischerbbiologische Korrelationsphänomenologie. (Study of psychiatric-genetic correlation phenomena.) Zeitschr. f. Ges. Neurol. u. Psychiatrie 69: 153-168. 1921.]—Zeitschr. Indukt. Abstamm.- u. Vererb. 30: 139. 1922.

6337. KEMPTON, J. H. **Erythrodextrin in maize.** [Rev. of: WEATHERWAX, PAUL. A rare carbohydrate in waxy maize. *Genetics* 7: 568-572. 1922 (see Bot. Absts. 12, Entry 3281.) *Science* 57: 556-557. 1923. [See also Bot. Absts. 12, Entry 6323.]

6338. KNOFF, S. A. **Eugenics in its relation to the tuberculosis problem.** 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 298-308. Williams & Wilkins Co.: Baltimore, 1923.—While education and sanitation have done much to lower the tuberculosis death rate from environmental causes, thousands of tuberculous individuals still die annually in spite of treatment, education, etc.—Direct bacillary transmission of tuberculosis occurs so rarely that the disease is no longer considered hereditary. Tuberculous predisposition may, however, be inherited due primarily, the writer thinks, to the mingling of the blood in the maternal and foetal circulation.—Any inherited predisposition becomes manifest and mortality is highest between the ages of 18 and 35. Since this is also the period when marriages are most frequently contracted it is at this period that the importance of eugenics in its relation to the tuberculosis problem should be considered.—When 2 individuals whose physique indicates a tuberculous tendency marry their offspring rarely escape the disease; when the mother only is predisposed the children may or may not be weak and predisposed. The writer recommends obligatory examination of individuals wishing to marry, instruction in parenthood, and birth control clinics such as are held in Holland. He believes that if the tuberculosis problem in the U. S. A. were attacked from the eugenic as well as from the environmental side there would be hope of the absolute eradication of the disease, but that without judicious scientific birth control tuberculosis will not be controlled.—*Charlotte Elliott.*

6339. LIDBETTER, E. L. **Pedigrees of pauper stocks.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 391-397. Williams & Wilkins Co.: Baltimore, 1923.—There is, in the general population of England, a well-defined pauper group characterized by varying degrees of mental disorder, low grade incompetence, and lack of morality. This pauper group shows a remarkable degree of assortive mating which is fostered by the Poor Law system.—*H. R. Hunt.*

6340. LINDSTROM, E. W. **Hereditary characters of maize XIII. Endosperm defects—sweet defective and flint defective.** *Jour. Heredity* 14: 127-135. 5 fig. 1923.—Two distinct types of heritable endosperm defects of maize were isolated by inbreeding in Golden Bantam sweet corn and in Yellow Flint corn. Data for 3 generations prove that the sweet-defective kernels of the Golden Bantam variety are excessive in inheritance and are conditioned by a simple, Mendelian factor. A new mutant type of endosperm defect arose during the progress of the experiment. The endosperm defect discovered in the flint corn was also recessive and due to a single factor. This factor is completely linked with white or albino seedlings.—*E. W. Lindstrom.*

6341. LIPPINCOTT, W. A. **Genes for the extension of black pigment in the chicken.** *Amer. Nat.* 57: 284-287. 1923.—Crosses were made to discover whether Dunn's E^m factor for the extension of melanic pigment in poultry is identical with the E factor reported by Lippincott in Anadalusians. A blue-splashed Anadalusian male was mated with Light Brahma, Buff Orpington, Rhode Island Red, and Lakenvelder females. All offspring were blue. This fact indicates that factors E^m and E are not identical and that the blue-splashed Anadalusian ♂ carried factor E^m while the females carried factor E .—*F. A. Hays.*

6342. LOTSY, J. P. [Dutch rev. of: (1) ÅKERMAN, Å. **Untersuchungen über Bastarde zwischen Epilobium hirsutum und E. montanum.** (Investigations on hybrids between *Epilobium hirsutum* and *E. montanum*.) *Hereditas* 2: 99-112. 1921 (see Bot. Absts. 9, Entry 1290). (2) RASMUSON, H. **Beiträge zu einer genetischen Analyse zweier Godetia-Arten und ihrer Bastarde.** (Contribution to a genetic analysis of two *Godetia* species and their hybrids.) *Hereditas* 2: 143-289. 1 pl., 29 fig. 1921 (see Bot. Absts. 9, Entry 1366.) *Genetica* 5: 79-80. 1923.

6343. LOTSY, J. P. [Dutch rev. of: BEEBE, WILLIAM. **A monograph of the pheasants.** Vol. 2. 269 p., 48 pl. (24 col.), 4 fig., 5 maps. H. F. and G. Witherby: London, 1921.] *Genetica* 5: 83-87. 1923.

6344. LOTSY, J. P. [Dutch rev. of: BEEBE, WILLIAM. **A monograph of the pheasants.** Vol. 3. 204 p., 45 pl. (24 col.), 4 maps. H. F. and G. Witherby: London, 1921.] *Genetica* 5: 88. 1923.

6345. MANDEKIĆ, V. **Die Vererbung einiger Eigenschaften bei Mais.** [The genetics of several maize characters.] *Zeitschr. Pflanzenzucht.* 9: 23-34. 8 fig. 1923.—Comparisons of the progenies from different selections of Croatian Round corn showed length of ear to be inherited, conforming well with Galton's law. Correlation was observed in the material studied between number of rows and length and circumference of ear, yield and length of ear and number of rows, length of ear and circumference and number of rows, circumferences of ear and of cob, and number of rows and circumferences of ear and of cob. The use of a pure line is considered essential in studying inheritance of characters in corn.—*H. M. Steece.*

6346. MANGELSDORF, P. C. **The inheritance of defective seeds in maize.** *Jour. Heredity* 14: 119-125. 5 fig. 1923.—The extensive inbreeding of corn for the purpose of isolating pure lines has brought to light a large number of defective seeds in which the endosperm is partially or completely aborted or in which the seed fails to go into the resting stage. These characters have been found in more than 30 American and several foreign varieties. Breeding experiments show that there are many distinct genetic types of this abnormality.—*P. C. Mangelsdorf.*

6347. MjøEN, JON A. **Harmonic and disharmonic race crossings.** 2nd Internat Congress Eugenics. Vol. II. Eugenics in race and state. 41-61. Williams & Wilkins Co.: Baltimore, 1923.—The writer cites examples to show that crossings between widely different races such as the Lapps and Norwegians may lower both the physical and mental level. From results of crossings between the races of rabbits he concludes that there are many striking analogies between the defects resulting from race crossing among humans and those resulting from race crossings in animals. While the author does not wish to draw conclusions from one race crossing he states that experience to date points decidedly in one direction and that until we have more definite knowledge of the effects of race crossings it would be wise to avoid crossings between widely different races.—*Charlotte Elliott.*

6348. MOIR, W. W. G. **Clonal type selection in sugar cane.** *Facts about Sugar* 16: 133-135, 172-173, 232-233. 1923.—Type mutations, which may be isolated in pure lines, exist in sugar cane. The behavior of the progeny is the basis for the study of these type selections. The 1st field selection is of primary importance as this isolates the pure lines. Type selection of cane has given quick and surprising results in Hawaii.—*C. W. Edgerton.*

6349. NAGAI, ISABURO, and SHUICHI SAITO. **Linked factors in soy-bean.** *Japanese Jour. Bot.* 1: 121-136. 1923.—In some genetic studies on soybeans there appeared a mutant which lacked pubescence. This character was found to be dominant over the presence of pubescence. The factor for glabrousness, *P*, was linked to the factor *M*, for mottling in the seed coat, with a percentage of crossing over of 18.12. Glabrousness is accompanied by lessened vigor of growth and reduced assimilative activity.—The following factors for seed coat colors and patterns have been studied: *C*, responsible for the formation of the chromogenic substance in the seed coat; *c*, same action as *C*, but to a slight extent. *O*, responsible for converting the chromogenic substance to brown pigments; *o*, same action as *O*, but to a deeper brown. *R*, responsible for converting the chromogenic substance to black pigment (anthocyanin); *r*, no effect. *M*, responsible for the development of the black pigment in a mottled pattern; *m*, no effect. *H*, responsible for fully inhibiting the formation of the chromogenic substance in the seed coat; *h*, no effect. *I*, responsible for partially inhibiting

the formation of the chromogenic substance; *i*, no effect. *K*, responsible for partially inhibiting the pigment, giving rise to the "patched" pattern; *k*, no effect. *G*, responsible for the formation of chlorophyll pigments in the seed coat; *g*, responsible for the formation of yellow pigments in the seed coat.—Certain factor interactions were noted. Thus, *R* produces a full black seed coat in the presence of *C*, but only to a certain extent with *c*; likewise, *M* gives a full expression of black mottling with *C*, but this action occurs only to a slight extent with *c*.—*C. M. Woodworth.*

6350. NOHARA, SIGEROKU. Genetical studies on *Spinacia*. Japanese Jour. Bot. 1: 111-120. 1923.—Crosses were made between *Spinacia oleracea* Mill. and *S. spinosa*. In the former, the persistent bractlets covering the fruits are smooth; in the latter, horned. Horned fruits and smooth fruits were found to be simple allelomorphs, the horned character being dominant, and a 3:1 ratio being obtained in F_2 .—The sex ratio of the plants used approached closely 1:1. The author inclines to the belief that *S. spinosa* is the species-type and *S. oleracea*, its variety.—*C. M. Woodworth.*

6351. OSTENFELD, C. H. Experimentelle Undersøgelser over Artsdannelsen hos Slaegten Høgeurt. [Experiments with creation of species in *Hieracium*.] Nat. Verden 5: 400-417. Fig. 1-4. 1921.—In 1900 a multitude of species and forms were described and it was shown by Schultz that they might be hybridized, and by Mendel that the hybrids were of constant type (did not "mendelate"). Directed by the demonstration of agamy in *Antennaria* by Juel and in *Taraxacum* by Raunkiaer, the author "agamised" the flowers of several forms of *Hieracium* and found the seed developing without fertilization, giving a progeny identical with the mother plant. The 3 species of the subgenus *Stenotheca* investigated do not develop agamic seed, and at least *H. venosum* develops the oocyte normally. Of 70 species of *Archhieracium* all but a few were apogamic, and the oocyte had the double number of chromosomes. Of *Pilosella* some species are normal, others develop agamic seed and have an abnormal oocyte. *H. excellens*, the anthers of which are sterile, develops agamic seed, and such is also the case in *H. aurantiacum* following agamisation. But if *H. excellens* is fertilized with pollen from *H. aurantiacum* the F_1 shows some individuals identical with the mother as well as several types of hybrids. In F_2 each of these types breeds true, though the occurrence of sterile hybrids is frequently noted. In *H. rigidum*, an agamic and constant species, 2 new types have appeared, 1 rather weak, the other stout and fertile, which may be termed apogamic mutations. In both subspecies hybridization is the original cause of the polymorphism, while the apogamy will secure the constancy of the forms.—*Ernst Gram.*

6352. POLLOCK, HORATIO M. Eugenics as a factor in the prevention of mental disease. 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 322-326. Williams & Wilkins Co.: Baltimore. 1923.—Mental disease in the U. S. A. is discussed as regards cost and loss to the nation, rate of increase, inheritance, and measures for checking its increase. Much evidence exists that Mendelian inheritance of neuropathic constitution occurs, but more comprehensive studies are necessary. Mental disease may occur in almost any type of intellectual or temperamental make-up, as clearly shown during the World War. Psychopathic personalities give way to the common stresses of life; stronger personalities yield only to extraordinary mental strain. It is evident, therefore, that the whole etiology of a case of mental disease must be carefully studied before the related family stock can be safely discredited.—The data collected by the New York State Hospital Commission seem to indicate that slightly more than $\frac{1}{2}$ of ascertained cases have no discoverable hereditary basis. More thorough inquiries might increase the proportion of patients with unfavorable family history, but the significance of the history in relation to the family stock is open to question in many cases.—In 1920, data from the Commissioners' hospitals showed that of 1st admissions 61 per cent of ascertained cases were temperamentally normal and 88 per cent were rated as intellectually abnormal.—The absence of marked abnormalities in individuals prior to the onset of the psychosis cannot be construed as conclusive evidence that there are no hereditary defects in the make-up, neither can the development of the psychosis be taken

as proof of a defective constitution. All the facts in connection with the onset of the mental disorder and previous reactions must be brought together before the constitutional make-up of the patient can be positively determined.—Notwithstanding these and many other complications, there is abundant evidence that mental disorders occur much more frequently in some family stocks than in others, and that prolonged inbreeding of degenerate stocks produces disastrous results.—Three lines of action are suggested: (1) environmental stresses may be lessened and natural resistance strengthened; (2) procreation of defective stock may be checked; (3) procreation of normal stock may be increased. Segregation of the insane is fairly complete, but as only about $\frac{1}{4}$ of the 1st admissions are under 30 years of age on admission, its value in preventing procreation in this group is not as great as would appear when only the number of patients under treatment is considered.—Something can be done to lessen reproduction among the unfit by enlightening public sentiment and by better marriage laws. Marriage of persons with marked intellectual or temperamental abnormalities should be entirely prohibited.—*Horatio M. Pollock.*

6353. RABAUD, ETIENNE. *Developpement compare des produits successifs d'une meme couple.* [Comparative development of successive progeny of the same parents.] 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 303-305. Williams & Wilkins Co.: Baltimore, 1923.—The popular idea that the 1st-born is less well endowed than the other children, rests upon prejudice and inaccurate observation. There are no satisfactory human statistics on this question. The writer worked on mice. The results did not, in general, confirm the popular belief. Several types of crosses were used, the ages and relationships between the parents varying. Each resulting litter was weighed at birth, then regularly for 4 consecutive weeks, and finally at the end of the 3rd month. Insignificant differences existed among the litters. In a general way, the growth of the descendants of a pair, under normal conditions of nutrition, depends upon the constitution of the pair.—*H. R. Hunt.*

6354. RANT, A. *Einige Beobachtungen bei Clitoria ternatea L.* [Some observations on *Clitoria ternatea* L.] Bull. Jard. Bot. Buitenzorg III, 4: 241-246. Pl. 11, 12. 1922.—A preliminary report is presented on the crossing of different forms, white and blue, zygomorphic and peloric, of *Clitoria ternatea*. The author found the blue color and the peloric form to be dominant characters. In the F_2 generation of a cross between plants with dark blue flowers and strains with white flowers, plants with violet flowers appeared. There is also a note on a bud-variation of *C. ternatea* and on the influence of altitude on habit, which is climbing at low, and shrubby at higher altitudes.—*Alfred Rehder.*

6355. RAU, VENKATA. *Inheritance of some morphological characters in Crepis capillaris.* Univ. California Publ. Agric. Sci. 2: 217-242. 2 pl. 1923.—The hereditability of the 3 characters, length of leaf, number of lobes per leaf, and diameter of flower heads, has been studied. Strains showing marked differences in these characters were found to breed true. Accurate classification of F_2 plants from the cross long \times short leaf was difficult because of somatic variability of this character. The inheritance of leaf lobes depended upon the action of 4 sets of genes, which determined respectively (a) the presence or absence of lobes, (b) depth of incisions, (c) number of lobes per leaf, and (d) the development of secondary lobules of the midrib of the leaf into full sized lobes. Crosses involving the number of lobes per leaf indicated that multiple factors were operating as well as in the inheritance for size of flower head. It was found that terminal flower heads of a cyme were slightly larger than later ones and that the 1st heads of flowers were usually the larger. Very little correlation was found between number of lobes and length of leaf.—*J. L. Collins.*

6356. REESE, H. H. *Horse-breeding suggestions for farmers.* U. S. Dept. Agric. Farmers' Bull. 803. 20 p., 10 fig. 1923.

6357. ROEMER. *Die Züchtung der Lupinen.* [The breeding of lupines.] Mitteil. Deutsch. Landw. Ges. 38: 134. 1923.—In this brief report of an address before a section of

the German Agricultural Society, it is reported that the blue lupine (*L. angustifolius* ?) is self-fertile while the yellow (*L. luteus*) is self-sterile. Plants from early seeding remain shorter stemmed and bloom and ripen earlier than those from later seeding. The rough hairy lupine (*L. hirsutus* ?) is low in alkaloid. Attempts to combine valuable qualities of different species by crossing have failed. Improvement must be by selection of variations.—*A. J. Pieters.*

6358. SEELHORST, VON. *Die am landwirtschaftlichen Institut der Universität Göttingen bislang geleistete Arbeit zur Förderung und Pflege landwirtschaftlicher Pflanzenzucht.* [On the work thus far accomplished by the Agricultural Institute of the University of Göttingen for promotion and fostering of agricultural plant breeding.] Beitr. Pflanzenzucht 5: 9-26. 14 fig. 1922. (Discussion p. 26-29.)—This general discussion of the work at this institute states some of the more important accomplishments. The 1st director, Drechsler, began breeding Göttinger rye in 1879, Göttinger oats in 1880, and the bearded Square head wheat in 1885. Cultural and breeding methods are described, the latter consisting at first of head or panicle selection year after year in the same line, and later of pedigree breeding from new selections in the original lines. Publications of investigations in plant physiology at the institute are listed and some of the results of more general interest are briefly outlined.—*C. E. Leighty.*

6359. SIEMENS. [German rev. of: MEIROWSKY und BRUCK. *Über die Vererbung und Ätiologie der Muttermäler.* (On the heredity and etiology of birth marks and moles.) Münchner Med. Wochenschr. 68: 1048. 1921.] Arch. Rass.- u. Ges. Biol. 14: 449. 1923.

6360. SIEMENS. [German rev. of: SIEMENS. *Über rezessiv-geschlechtsgebundene Vererbung bei Hautkrankheiten.* (Recessive sex-linked inheritance in the skin diseases.) Arch. Dermatol. 136: 69-88. 1921.] Arch. Rass.- u. Ges. Biol. 14: 442-443. 1923.

6361. SIEMENS. [German rev. of: WEINBERG. *Das Geschlechtsverhältnis bei Basedow und seine Ursachen.* (The sex ratio in Basedow and its origin.) Münchner Med. Wochenschr. 68: 1157. 1921.] Arch. Rass.- u. Ges. Biol. 14: 449. 1923.

6362. SIEMENS. [German rev. of: WEINBERG. *Zur Lehre vom multiplen Allelomorphismus.* (Our knowledge of multiple allelomorphism.) Münchner Med. Wochenschr. 68: 950. 1921.] Arch. Rass.- u. Ges. Biol. 14: 448-449. 1923.

6363. SUMNER, F. B. *Some facts relevant to a discussion of the origin and inheritance of specific characters.* Amer. Nat. 57: 238-254. 1923.—Characters separating subspecies (of *Peromyscus*) are genetical [see Bot. Absts. 12, Entry 2452]. Correlations are to be found between climatic environment and certain physical characters, notably between humidity and pigmentation. Increased humidity may favor chemical processes responsible for pigmentation, or modified pigmentation may be induced by environment acting selectively. No certain correlations are evident between physical environment and proportional or absolute size of parts. Any such relationship existing must be obscure and not evidently adaptive. Excluding direct environmental influences and adaptive modifications, sub-specific modifications might be due to (1) differential distribution centers or (2) the result of "orthogenesis." If the orthogenetic hypothesis is invoked, it is necessary to explain many of the variational series in terms of space rather than of time. But either of these explanations, highly speculative as they are, suffices only to account for presence of graded series and not character origins. An orthogenetic explanation involves radical departure from the commonly understood mutation theory.—A positive correlation of about 0.3 is found between shade of pelage and width of tail stripe but no other intra-individual correlation has been found. In hybridization between subspecies of *Peromyscus*, both F_1 and F_2 individuals showed intermediate values for the various subspecific characters. Neither the character complex nor components of the same acted as "simple Mendelian unit characters." Certain conditions render doubtful a tenable explanation on the basis of multiple factors. Finally, the facts do not yet warrant an adequate general hypothesis as to species formation.—*L. R. Waldron.*

6364. TREDGOLD, A. F. **Educability and inheritance.** 2nd Internat. Congress Eugenics. Vol. II. Eugenics in race and state. 361-372. Williams & Wilkins Co.: Baltimore, 1923.—The capacity for mental development varies with individuals, social classes, and races, and is determined by innate germinal potentialities which cannot be exceeded. Such differences can be correlated to some extent with brain structure and function. In mental deficiency there is a numerical shortage of cells, an irregularity in their arrangement, and an imperfection of their development; certain layers of cortical fibers which are associative in function undergo a gradual increase with normal mental development. A diminution of educability is probably due to 1 of 2 causes; to a lack of intellectual stimulus continued for many generations past or to a pathological condition due to an impairment of germinal potentiality by disease, alcoholism, etc. Such defective educability due to germinal impairment is probably unimprovable and is transmissible. There is evidence for the belief that the continued stimulus of education and exercise of the mind generation after generation may augment the germ potentially for mental development and so increase the educability of the race.—*Charlotte Elliott.*

6365. WITTE, HERNFRID. **A probable case of "rogue" in red clover.** *Hereditas* 4: 55-58. 1923.—Two red clover plants of a type thought to be practically self-fertile were crossed. Of 3 individuals raised as a result of this cross 1 was peculiar in having very narrow leaflets, the width being to the length as 1:7.6 or 1:8 as compared with the ordinary type, in which this ratio is 1:1 or 1:3. The plant proved to be sterile, and Witte suggests that this is a "rogue" in the same sense of Bateson and Pellew.—*A. J. Pieters.*

6366. WOLLNY. [German rev. of: MEGGENDORFER, F. *Über die Rolle der Erbllichkeit bei der Paralyse.* (On the role of heredity in paralysis.) *Zeitschr. Ges. Neurologie u. Psychiatrie* 65: 18-33. 1921.] *Arch. Rass.- u. Ges. Biol.* 14: 461. 1923.

6367. WOODS, FREDERICK A. **The conification of social groups. Evidence from New England families.** 2nd Internat. Congress Eugenics. Vol. I. Eugenics, genetics and the family. 312-328. Williams & Wilkins Co.: Baltimore. 1923.—Social groups sometimes tend to assume the form of a cone; that is, figuratively, some of the group climb upward on the shoulders of others. The development of an aristocracy depends upon the following facts: (1) like tends to mate with like; (2) like begets like. These two forces acting simultaneously lead toward diversification in a population.—The British Dictionary of National Biography shows that the percentage of eminent men coming from the families of craftsmen, artisans, and unskilled laborers has decreased from 11.7 per cent for all time prior to the 19th century, to 4.2 per cent for the 2nd quarter of the 19th century. Thus the gap between the common people and the aristocracy of intellect is widening. In New England conification is actually observed. The great majority of early settlers in Massachusetts Bay were yeomen (artisans, small shopkeepers, etc.), with a sprinkling of gentry (members of gentle English families, the wealthy, learned, etc.). Forty colonial families including more than 3,000 persons have been studied. Differences in wealth and amount of intermarriage between classes were chosen as measures of the extent of conification. Rich men of New England have become progressively richer, by comparison with average men, since the colonial period. The percentage of marriages of the gentry with yeomanry has decreased from about 23 per cent (13 families, marriages prior to 1721), to less than 6 per cent (12 families, marriages since 1821). Assortive mating, heredity, and the possibility of transmitting wealth have thus resulted in social conification within a democracy.—*H. R. Hunt.*

6368. WOODWORTH, C. M. **Calculation of linkage intensities where duplicate factors are concerned.** *Genetics* 8: 106-115. 1923.—This paper concerns the development and application of formulae by means of which from F_2 trihybrid distributions, the degree of linkage can be determined between 2 factors 1 of which is a duplicate, but inherited independently of the 3rd factor involved in the cross.—Application is made to soybean data showing a linkage relation between cotyledon and seed-coat colors. Tables are included giving

theoretical distributions for several assumed gametic series, representing both coupling and repulsion phases, for F_2 in both characters, and also for F_2 in seed-coat color with F_2 in cotyledon color.—*C. M. Woodworth.*

Indochine 25: 143-158, 325-343, 387-430. Illus. 1922.—A general consideration of the native and introduced oil-producing plants in Indo-China. The more important species are illustrated.—*E. D. Merrill.*

6378. DERN. Auswahl und Beschaffung von brauchbaren Amerikanerreben zu Unterlagshölzern. [Selection and production of useful American vines for stocks.] Mitteil. Deutsch. Landw. Ges. 38: 274-275. 1923.—The author points out that while the German vine-growing sections are still comparatively free from Phylloxera the difficulty of keeping them so is becoming increasingly great. The good and bad points of some of the more common American stocks at present used in France are brought out.—*A. J. Pieters.*

6379. HOOKER, H. D., JR. Localization of factors determining fruit bud formation. Missouri Agric. Exp. Sta. Res. Bull. 47. 19 p. 1921.—A statistical study of fruit spurs of apple showed an increased tendency toward fruit-bud formation with increased length of spur. More fruit buds were formed on spurs which had grown 3-10 cm. in the previous year than on those which had grown 1-3 cm. Further analysis of data showed a pronounced tendency toward mass action, as far as fruit-bud formation is concerned, by individual trees, scaffold limbs, and branches. From this it would appear that the relation between fruit-bud formation and length of spur is a parallel manifestation of the same influence rather than a cause and effect relationship. This idea is strengthened by data showing that spurs which never blossom alternate in length growth as do blossoming spurs. Chemical analyses of spurs and bark on bearing and non-bearing trees showed increased carbohydrates in the non-bearing trees in both cases. Apparently the conditions in the bearing spurs influence the composition of remote parts of the limb, and the non-bearing spurs. Whether or not remote parts influence the spurs is not yet known. The author concludes that, while the individual spurs may act as units, they may at times be influenced by the performance of other spurs.—*A. M. Burroughs.*

6380. LESOURD, F. Pincement ou non pincement des arbres. [Pinching or non-pinching of trees.] Rev. Hort. 94: 260. 1922.—Some evidence is presented for and against the practice. Detailed experimental work is suggested.—*E. J. Kraus.*

6381. MACOUN, W. T. Recent developments in plant breeding. Canadian Hort. 46: 141-160. 1923.—The author points out that the need for better varieties to take the place of the fruits and vegetables already on the market and for more beautiful varieties among ornamental plants has become more and more impressed upon horticultural workers.—Some of the difficulties in plant breeding are noted particularly with reference to pollen germination. In transmission of characters valuable information is accumulating, as for example the ability of the McIntosh apple to transmit its characters to its seedlings.—*E. F. Palmer.*

6382. MUNN, M. T. Testing lawn grass seed mixtures. Seed World 12: 21. 1922.—The author states that seedsmen should exercise greater care in preparing lawn grass seed mixtures. Many mixtures contain excessive amounts of inert matter and are foul with weed seeds of many kinds. They are also weighted with the heavy grass seeds. Wide variations in results may occur when testing these mixtures.—*M. T. Munn.*

6383. NOMBLOT-BRUNEAU. Bigarreau Gustav Dupau. [The cherry, Gustav Dupau.] Rev. Hort. 94: 56. 1 pl. (col.). 1922.—The tree, distributed in 1922, is productive, hardy, and vigorous. The fruit has yellow, firm flesh, of very good quality.—*E. J. Kraus.*

6384. PALMER, E. F. The pollination of fruits. Canadian Hort. 44: 173-188. 1921.—A brief discussion is given of self-sterility and self-fertility of various deciduous tree fruits and grapes, together with the results of investigations in grape pollination.—*E. F. Palmer.*

6385. PETIT, A. L'ensachage des fruits influe-t-il sur la durée de leur conservation. [Does the bagging of fruits influence the length of time they may be kept?] Rev. Hort. 94: 76. 1922.—Neither the time, nor the conditions of keeping of apples, at least, is influenced by bagging.—*E. J. Kraus.*

6386. PETIT, A. Résistance des sarments à la dessiccation. [Resistance of grape shoots to drying.] Rev. Hort. 94: 61. 1922.—Shoots subjected to marked drying out should be

placed in water several hours before being used in propagation. Buds on such soaked shoots start several days in advance of those not so treated. Shoots dessicated for 31 days had 36.9 per cent moisture as compared with 48.5 per cent in those freshly cut. Buds from such dried shoots were delayed 8 days in starting.—*E. J. Kraus.*

6387. SHOEMAKER, J. S. Cause of lime-sulphur injury. *Canadian Hort.* 46: 117-140. 1923.

6388. SHULL, C. A. *Fundamentals of fruit production.* [Rev. of: GARDNER, V. R., F. C. BRADFORD, AND H. D. HOOKER, JR. *The fundamentals of fruit production.* xvi + 686 p. McGraw-Hill Book Co.: New York, 1922 (see Bot. Absts. 12, Entry 452).] *Bot. Gaz.* 75: 103. 1923.—The reviewer commends the large number of literature citations presented, amounting to nearly 1000. He further commends the attention the authors have given to the rôle of fundamental science in the realm of horticulture and states that "if its publication leads to the requirement of larger training for students of horticulture in fundamental physics, chemistry and physiology, a great service to horticultural science has been rendered."—*B. W. Wells.*

6389. STOCKDALE, F. A. *The cultivation of pineapples in Ceylon.* Dept. Agric. Ceylon Bull. 50. 12 p., 4 pl. 1921.—The subject is considered generally and from an agricultural and commercial standpoint in reference to Ceylon conditions.—*E. D. Merrill.*

6390. VIDAULT, A. *La multiplication d l'oranger.* [The propagation of the orange.] *Rev. Hort.* 94: 76-77. 1922.

6391. WICKSON, E. J. *California fruits and how to grow them.* 9th rev. ed., 508 p., 15 pl., 93 fig. Rural Pacific Press: San Francisco, 1921.—This is a manual of methods used in the production of fruits under California conditions. The following chapter headings indicate the nature of the contents. Part I: 6 chapters dealing with climate, soils, wild fruits, Mission fruits, and the place of California in the fruit industry of America. Part II treats of the culture of fruits in 9 chapters: clearing the land; the nursery, budding and grafting; preparation of soil and trees for planting; pruning and thinning of trees and fruit; tillage; fertilizers; and irrigation. Part III: 9 chapters on the fruits themselves,—apple, apricot, cherry, peach, nectarine, pear, plum, prune, and quince. Part IV: 4 chapters on the grape,—the industry, propagating and planting, pruning and care, and varieties. Part V: 8 chapters on semi-tropical fruits,—the avocado, date, fig, olive, orange, pomelo or grape fruit, lemon, and minor ones. Part VI: 1 chapter, on berries and currants. Part VII: 3 chapters on nuts,—the almond, walnut, and minor ones. Part VIII: a chapter on fruit preservation,—canning, crystallizing, and drying. Part IX: 4 chapters on fruit protection,—injuriously insects, diseases, suppression of injurious animals and birds, and wind and frost. Part X: a chapter on utilization of fruit wastes; and a topical index.—*Guy L. Philp.*

6392. ZIEGLER. Über die züchterische Verbesserung des weissen Burgunders im Jahre 1922. [On the improvement by breeding of white Burgundy (grape) in 1922.] *Mittel. Deutsch. Landw. Ges.* 38: 355-357. 1923.—This progress report gives an account of selection and breeding work being done with this variety at various stations in Germany.—*A. J. Pieters.*

FLORICULTURE AND ORNAMENTAL HORTICULTURE

6393. ANONYMOUS. *Antirrhinum* under glass. *Jour. Roy. Hort. Soc.* 48: 92-97. 1923.—A test was made of growing *Antirrhinum* in pots under glass. A classified description of varieties showing awards and notes is given.—*J. S. Bailey.*

6394. ANONYMOUS. *Dahlias* at Wisley, 1922. *Jour. Roy. Hort. Soc.* 48: 98-105. 1923.—A trial was made of 16 classes of Dahlias including over 80 varieties. This included those receiving awards the previous year and new varieties not previously tested. A classified list showing awards made and giving descriptions of new varieties is given.—*J. S. Bailey.*

6395. ANONYMOUS. **New or noteworthy plants in the Society's gardens, III.** Jour. Roy. Hort. Soc. 48: 60-64. Fig. 22-23. 1923.—The introduction, culture, and value of *Primula Winteri*, *Primula Juliae*, *Lonicera thibetica*, and *Rhododendron hemitrichotum* are discussed.—*J. K. Shaw*.

6396. ANONYMOUS. **Notes on Rhododendrons.** Rhododendron Soc. Notes 2: 107-109, 112-142. 1922.—Notes under varying titles by 16 members of the Rhododendron Society are given on the flowering, ornamental merits, hardiness, behavior, etc., of Rhododendrons in different places in the British Isles.—*Alfred Rehder*.

6397. ANONYMOUS. **Summer flowering stocks at Wisley, 1922.** Jour. Roy. Hort. Soc. 48: 113-120. 1923.—Stocks (150 varieties) were set out for trial. The awards of the judges, classified descriptions, and notes are given.—*J. S. Bailey*.

6398. ANONYMOUS. **Sweet peas at Wisley, 1922.** Jour. Roy. Hort. Soc. 48: 106-112. 1923.—Stocks (160) of Spencer sweet peas, including only those of pale pink shades, were tested. A classified list is given showing the awards made and including brief descriptions.—*J. K. Shaw*.

6399. ANONYMOUS. **Violas at Wisley, 1922.** Jour. Roy. Hort. Soc. 48: 121-133. 1923.—Stocks (221) of Violas were set out for trial and judged as to their bedding or exhibition value. The awards of the judges, classified descriptions, and notes are given.—*J. S. Bailey*.

6400. BOSCAWEN, A. T. **Some New Zealand trees and shrubs in Cornish gardens.** Jour. Roy. Hort. Soc. 48: 1-8. Fig. 1-7. 1923.—Many species representing *Pittosporum*, *Metrosideros*, *Leptospermum*, *Olearia*, *Senecio*, *Myrtus*, *Fagus*, *Hoheria*, *Gaya*, *Corokia*, and others are discussed. Their qualities as ornamental plants are considered, cultural directions given, and opinions of their value in England expressed.—*J. K. Shaw*.

6401. CHITTENDEN, F. J. **The award of garden merit II.** Jour. Roy. Hort. Soc. 48: 58-59. Fig. 19-21. 1923.—This article discusses the culture, habit, and value as ornamental plants of *Stranvaesia undulata*, *Pyracantha Gibbsii*, and *Rubus biflorus quinqueflorus*.—*J. K. Shaw*.

6402. CORREYON, H. **Les Romneyas.** [The Romneyas.] Rev. Hort. 94: 209-210. Fig. 66. 1922.—*R. trichocalyx* is fully hardy at Geneva, blooming profusely there; *R. Coulteri* is less hardy. A hybrid between the species is intermediate in character, and very vigorous.—*E. J. Kraus*.

6403. COUTTS, J. **Lilies.** Jour. Roy. Hort. Soc. 48: 22-37. 1923.—Some of the practices of lily culture are discussed very briefly. Several methods of propagation are given, indicating the species to which they are suited. Certain species are better suited to pot or greenhouse culture than others. A number of species are listed with brief notes of origin, habit of growth, cultural requirements, etc. Attention is called to the very small number of hybrids found in this genus.—*J. S. Bailey*.

6404. DAVEAU, J. **A propos de la floraison du Phyllostachys aurea.** [Concerning the flowering of *P. aurea*.] Rev. Hort. 94: 215. Fig. 68. 1922.—The caryopsis of this bamboo is figured.—*E. J. Kraus*.

6405. DURYEA, MINGA POPE. **Gardens in and about town.** xvi + 183 p., 97 fig. E. P. Dutton & Co.: New York, 1923.—Foreword by RICHARDSON WRIGHT.—Fourteen chapters on: the heritage of the brownstone front; with its back to the street; the garden in a well; architecture and city gardens; the community garden; hanging gardens; gardens on the roof of the world; gardens on the edge of town; gardens in windows; screening the objectionable; furnishing the city garden; plants that will grow; care of city gardens; four seasons in town.—*C. S. Gager*.

6406. ELEY, CHARLES. Concerning stocks on which to graft *Rhododendrons*. *Rhododendron Soc. Notes* 2: 110-111. 1922.—The superiority of *Rhododendron caucasicum* hybrids over *R. ponticum* as stock for grafting is emphasized and attention is drawn to the use of *R. Smirnowii* as stock, which seems to be well adapted for that purpose.—*Alfred Rehder*.

6407. GÉRÔME, J. Au sujet du *Camellia*; sa multiplication. [Concerning the *Camellia*; its propagation.] *Rev. Hort.* 94: 193-194. *Fig. 62*. 1922.

6408. GÉRÔME, J. Au sujet du *Camellia*, son importance horticole, autrefois et maintenant. [Concerning the *Camellia*, its past and present horticultural importance.] *Rev. Hort.* 94: 172-174. 1922.

6409. GUILLAUMIN, A. Les monstruosites florales des Dahlias. [Monstrosities in *Dahlia* flowers.] *Rev. Hort.* 94: 259. *Fig. 83-84*. 1922.—At the center of the disc the axis is prolonged and another disc is formed more than 1 cm. above the lower one. The latter bears a single row of ligulate flowers at its margin; the 2nd disc bears both ligulate and tubular flowers. The effect is decorative; the variety should prove of horticultural value.—*E. J. Kraus*.

6410. HESSE, A. *Picea Breweriana* Wats. *Rev. Hort.* 94: 97. *Fig. 35*. 1922.

6411. LERAY, C. Le *Rhododendron calophytum* Franch. *Rev. Hort.* 94: 187-188. *Fig. 57-59*. 1922.

6412. LERAY, C. Un intéressant sapin pleureur: le *Picea Breweriana* Wats. [An interesting weeping spruce; *Picea Breweriana* Wats.] *Rev. Hort.* 94: 49-50. *Fig. 14*. 1922.—Distribution, description, and decorative value are discussed.—*E. J. Kraus*.

6413. LESOURD, T. L'Iris chez les anciens. [The iris among the old horticulturists.] *Rev. Hort.* 94: 98-100. *Fig. 36-37*. 1922.—Historical notes are given on early varieties and species.—*E. J. Kraus*.

6414. MAGNIER, C. *Polemonium Magnieri*. *Rev. Hort.* 94: 81. 1922.

6415. MOTTET, S. Deux nouvelles Clématites. [Two new Clematis.] *Rev. Hort.* 94: 213-215. *Fig. 67, 1 pl. (col.)*. 1922.—The forms are hybrids between *C. Spooneri* × *C. montana rubens*, and *C. Spooneri* × *C. vedrariensis*. The forms are very similar in both cases, resembling *C. Spooneri* except that the flowers are rose colored; hence the name *C. Spooneri rosea* has been applied.—*E. J. Kraus*.

6416. MOTTET, S. Ipomée a grande fleur bleue très hative. [Very early, large flowered, blue *Ipomoea*.] *Rev. Hort.* 94: 78-80. *1 pl. (col.), fig. 32*. 1922.

6417. MOTTET, S. Les iris a fleurs d'orchidée. [Orchid flowered irises.] *Rev. Hort.* 94: 236-237. *1 pl. (col.)*. 1922.—The possible value of several species as parents of new varieties is discussed. Descriptions are given of a number of varieties, more or less new.—*E. J. Kraus*.

6418. MOTTET, S. L'oeillet de Chine royal. [The royal strain of the Chinese pink.] *Rev. Hort.* 94: 102-103. *Fig. 33, 1 pl. (col.)*. 1922.

6419. MOTTET, S. *Lycoris aurea*. *Rev. Hort.* 94: 51-52. *Fig. 15*. 1922.

6420. PROSCHOWSKY, A. R. Floraison d'une variété de *Phyllostachys aurea*. [Blooming of a variety of *P. aurea*.] *Rev. Hort.* 94: 108. 1922.—Mainly because of differences in color from that of the type, the variety is named *P. aurea viridi glaucescens*.—*E. J. Kraus*.

6421. PROSCHOWSKY, A. R. *Ipomée a grande fleur bleue très hative*. [Very early, large flowered, blue *Ipomoea*.] *Rev. Hort.* 94: 78-80. 1922.

6422. PROSCHOWSKY, A. R. *Sasa paniculata* Makino et Shibata. *Rev. Hort.* 94: 134. 1922.

6423. RIVOIRE, A. *Quelques plantes grimpantes de serre*. [Some climbing greenhouse plants.] *Rev. Hort.* 94: 254-256. *Fig. 82*. 1922.—Brief descriptive and cultural notes are given on *Allamanda Hendersonii*, *Gloriosa Sanderiana*, *Abutilon vexillarium*. Species of *Swainsonia*, *Passiflora*, and *Dipladenia* are suggested.—*E. J. Kraus*.

6424. SLOOTEN, D. F. VAN. *Index Combretacearum quae anno 1921 in horto botanico bogoriensi coluntur*. [List of Combretaceae cultivated in 1921 in the Botanic Garden at Buitenzorg.] *Bull. Jard. Bot. Buitenzorg* III, 4: 281-282. 1922.

6425. SLOOTEN, D. F. VAN. *Index Verbenacearum quae anno 1921 in horto botanico bogoriensi coluntur*. [List of Verbenaceae cultivated in 1921 in the Botanic Garden at Buitenzorg.] *Bull. Jard. Buitenzorg* III, 4: 283-287. 1922.

6426. STERN, F. C. *Gardening on chalk*. *Jour. Roy. Hort. Soc.* 48: 9-15. *Fig. 8, 10*. 1923.—Experience in growing ornamental plants on chalk in a garden on the Sussex downs is given. The original vegetation consisted of sycamore trees, *Viburnum lantana*, blackberries, dogwood, wild clematis and apple and pear trees. It was found that if the hard rock chalk was broken up to a depth of 2-3 feet, all trees and shrubs that tolerate lime grew well. Azaleas, *Styrax*, and *Rhododendrons* with the exception of *R. rubiginosum* did not tolerate lime. The Japanese and North American floras as a general rule dislike lime. Observations of the behavior of many shrubs and some annual plants on various kinds of chalk soils are given.—*J. K. Shaw*.

6427. TESNIER, F. *La floraison des iris*. [The flowering of irises.] *Rev. Hort.* 94: 174. 1922.—A list is given of species and varieties, with period of flowering.—*E. J. Kraus*.

6428. THOMAS-JAVIT, G. *Observations sur la culture de l'Ipomoea rubro-caerulea*. [Observations on the culture of *I. rubro-caerulea*.] *Rev. Hort.* 94: 109. 1922.—The plant may be grown in the open as an annual if old seed, the coats of which have been broken before soaking, are planted in April and the plants transferred to open ground in May.—*E. J. Kraus*.

6429. WALLER, L. D. *Flower seed industry in California*. *Seed World* 10²: 15-18. 1921.

6430. WICKSON, E. J. *California garden flowers, shrubs, trees and vines*. 2nd ed., rev. 255 p., 15 pl., 12 fig. Pacific Rural Press: San Francisco, 1923.—This text of 6 parts and 28 chapters is designed primarily for the working amateur giving suggestions of California conditions, cultural treatments, and adaptations of flowers; also, the selection of shrubs, trees, vines, and protection against plant pests.—*Guy L. Philp*.

6431. WRIGHT, RICHARDSON. *Flowers for cutting and decoration*. xi + 218 p., 20 fig. E. P. Dutton & Co.: New York, 1923.—The book consists of the following 12 chapters: five garden perplexities; the nursery and the cutting garden; annuals and biennials for cutting; cut flowers from tubers and bulbs; perennials for cutting; some of the flowering shrubs; roses indoors and out; cutting and arranging flowers; bouquets for spring, summer, and autumn; winter bouquets from summer flowers; the garden still room; after frost.—*C. S. Gager*.

VEGETABLE CULTURE

6432. ANONYMOUS. **Beet at Wisley, 1922.** Jour. Roy. Hort. Soc. 48: 68-73. 1923.—The awards, notes, and descriptions based on the tests of 107 stocks of beets are given. Special attention is called to regaining of purity of seed since the war and to the value of round varieties as vegetables.—*J. S. Bailey.*

6433. ANONYMOUS. **Broad beans at Wisley, 1922.** Jour. Roy. Hort. Soc. 48: 74-78. 1923.—The results of the test of 83 stocks of broad beans are given. Awards are announced and a classified list of varieties is presented.—*J. S. Bailey.*

6434. ANONYMOUS. **Celeriac at Wisley, 1921-22.** Jour. Roy. Hort. Soc. 48: 84-85. 1923.—Thirteen stocks of celeriac were set out for trial. The awards, description, and notes of the judging committee are given.—*J. S. Bailey.*

6435. ANONYMOUS. **Celery at Wisley, 1921-22.** Jour. Roy. Hort. Soc. 48: 79-83. 1923.—Sixty stocks of celery were placed under trial. A list of awards, descriptions, and notes by the fruit and vegetable committee is given.—*J. S. Bailey.*

6436. ANONYMOUS. **Late peas at Wisley, 1922.** Jour. Roy. Hort. Soc. 48: 86-91. 1923.—Stocks of peas (143) were tested. The qualities considered by the judges are enumerated, and awards, classified descriptions, and notes are given.—*J. S. Bailey.*

6437. BARR, J. E. **Summary of vegetable seed situation.** Seed World 13⁷: 13-14. 1923.

6438. BUISSON, J. M. **Le melon Kroumir Parisien.** [The melon Kroumir Parisien.] Rev. Hort. 94: 126-127. 1 pl. (col.) 1922.—The author states that this melon is better, thicker fleshed, and usable through a longer season than the cantaloupe.—*E. J. Kraus.*

6439. GUELF, C. P. **Thousands of acres of radishes grown in Michigan for seed.** Seed World 12¹²: 34-35. 1922.

6440. LOIZEAU, A. **La tomate pour l'exportation.** [The tomato for export.] Rev. Hort. 94: 73-75. Fig. 26-30. 1922.

6441. MORSE, L. L. **Growing lettuce seed in Santa Clara Valley.** Seed World 12⁶: 13-14. 1922.

6442. MORSE, L. L. **Growing onion bulbs in California.** Seed World 13⁹: 20-21. 1923.

6443. MORSE, L. L. **Growing onion seed in California.** Seed World 13⁶: 13-14. 1922.

6444. MUNN, M. T. **Practical value of germination tests and some factors affecting the test.** Seed World 11⁴: 23. 1922.—The author states that the seed analyst should strive to make germination tests of truck-crop seeds in such manner and under such conditions as will give the grower information of the greatest practical value.—*M. T. Munn.*

6445. REICHELT. **Sortenanbauversuche mit Frühkarotten.** [Variety tests of early carrots.] Mitteil. Deutsch. Landw. Ges. 38: 141-143. 1923.—A report is made on 2 varieties, "Pariser Markt" and "Duwiker," at 6 stations. The latter gave the largest yields at all stations.—*A. J. Pieters.*

6446. SÖRENSEN, S. **Garden seed industry in Denmark.** Seed World 13⁵: 18-19. 1923.—Seed activities in Denmark are described.—*M. T. Munn.*

6447. THURLIMANN, LEOTA. **Commercial garden seed laboratory problems.** Seed World 12⁵: 13-14. 1922.—Many problems arise in the germination testing of garden seeds which

should be solved by careful research. The important problems discussed are: dormancy in germination; germination versus viability; cause of abnormal sprouts; moldiness in testing; carry-over stock; and need of experimental work. The difficulties encountered in testing flower seeds is discussed.—*M. T. Munn.*

6448. VAUGHAN, L. H. Safeguards in the garden seed business. *Seed World* 12¹: 34. 1922.

6449. WHITE, K. S. Some objections to governmental control of garden seed sales. *Proc. Assoc. Official Seed Analysts North America* 1919: 28-30. 1921.—The author expresses the belief that state control of garden seed sales is not worth what it costs with the possible exception that packages be dated as to the year of output.—*M. T. Munn.*

6450. WICKSON, E. J. *The California vegetables in garden and field. 5th rev. ed., 319 p., 23 pl., 6 fig.* Pacific Rural Press: San Francisco, 1923.—This book of 39 chapters thoroughly covers the field of vegetable growing under California conditions, including a discussion of soils, irrigation, fertilizers, drainage, garden location and arrangement, propagation and planting, together with a treatment of the several crops grown.—*Guy L. Philp.*

HORTICULTURAL PRODUCTS

6451. CRUESS, W. V., and J. H. IRISH. Fruit beverage investigations. *California Agric. Exp. Sta. Bull.* 359. 526-567. 1923.—Most of the so-called fruit beverages now on the market contain little or no fruit juice. Excellent syrups and carbonated beverages may be made from loganberries, raspberries, oranges, lemons, and apples, and from blends of strawberries with blackberries, of Muscat with red wine grapes, of raisins with oranges and lemons, and of loganberries, red grapes or pomegranates with oranges and lemons. Sugar was used in the preparation of all syrups except those made from grapes and apples. Concentration by freezing and in a glass lined vacuum pan were both satisfactory methods of concentrating grape, apple, and citrus fruit juices. Syrups were preserved satisfactorily by pasteurizing in glass at 175°F. for 30 minutes, or by storage at 0-15°F. in sealed containers, without pasteurization. Glass containers were better than enamel-lined tin containers for pasteurized syrups. Preservatives imparted a disagreeable flavor and their use is not recommended. The syrups were found excellent for the preparation of carbonated bottled beverages, for soda fountain use, the preparation of centers for candies, and for home use in the preparation of punch, gelatin desserts, sauces, jellies, etc. Loganberry, grape, strawberry-blackberry blend, apple, raspberry, and fruit punch bottled carbonated beverages have retained their flavor and color satisfactorily for 6-15 months. Orange, lemon, and strawberry deteriorated markedly in quality after 2 months' storage. Pasteurizing at 150°F. for 30 minutes destroyed yeasts and prevented spoiling of carbonated fruit beverages heavily inoculated with yeast, mold, and bacteria. Heat-resistant molds and bacteria were not killed by this treatment, but the carbon dioxide prevented their development. As a result of the investigations the writers are convinced that carbonated fruit beverages can be made and sold at retail for 10 cents a bottle with a profit to all concerned. A large proportion of the surplus and cull fruits of California might be utilized to advantage in the preparation of fruit syrups and carbonated beverages.—*A. R. C. Haas.*

6452. IRISH, J. H. Pear by-products. *California Agric. Exp. Sta. Circ.* 259. 4 p. 1923.—The purpose of the investigations here reported is to discover new outlets for cull pears in the form of by-products. Methods and preparation are given for the utilization of cull pears as spread, vinegar, candy, and syrup.—*A. R. C. Haas.*

MORPHOLOGY, ANATOMY AND HISTOLOGY OF VASCULAR PLANTS

E. W. SINNOTT, *Editor*

(See also in this issue Entries 6212, 6230, 6231, 6245, 6295, 6404, 6409, 6514, 6607, 6650, 6654, 6689, 6693, 6694, 6705)

6453. ARBER, AGNES. On the 'Squamulae intravaginales' of the Helobieae. *Ann. Botany* 37: 31-42. 5 fig. 1923.—Squamulae intravaginales are very small scale-like structures found among the leaf-bases of the Helobieae and certain Araceae. A study of serial sections of the stem apex of several species shows that they are appendages not of the leaf, in the axil of which they occur, but of the surface of the internode which separates this leaf from the one next above. In terms of the "leaf-skin" theory of Saunders, which the author favors, they are to be regarded as dorsal outgrowths from a downward skin-like prolongation of the leaf next above and are therefore not related to stipules or ligules as has been suggested.—W. P. Thompson.

6454. BOWER, F. O. Size, a neglected factor in stelar morphology. *Proc. Roy. Soc. Edinburgh* 41: 1-25. Fig. 1-19. 1920.—This article presents an application of the principle of similar structures, enunciated by Galileo, to the vascular system of plants. Other things being equal, the rate of interchange of substances in solution is proportional to the tissue-surface involved. For each form of structure there is a size limit beyond which sufficient rapidity of interchange will be impossible without modification in form or quality of the tissue-surface through which diffusion must occur. This applies to internal limiting surfaces as well as external. The endodermis forms both a structural and a physiological barrier between the stele and the surrounding tissues, regulating by its own protoplasts all exchange of soluble substances. As the sporeling develops into the adult fern there is reached a limit in size of the stem beyond which the conically enlarging stele cannot supply the surrounding tissues, unless there is deviation on the part of the endodermal surface from the simple conical form. The protostele, the most primitive stelar condition, is found in all juvenile forms and is retained in the adult stem of some ferns. When larger dimensions of the stele were attained the problem of the limiting endodermis was solved by: (1) corrugation and involution of its surface as in the fossil forms *Ankyropteris Grayi*, *Asterochlaena laxa*; (2) the interruption of the endodermal barrier and the development of meristemes as in *Osmundites skidegatenensis* and *O. Carnieri*; (3) in the *Leptosporangiateae*, a transformation of the protostele, giving rise to the solenostelic, dictyostelic, and eventually the polystelic condition. These modifications all result in an increase in endodermal surface in proportion to bulk of stelar tissue and are accompanied by a great increase in transverse section of the stele. They may be traced in both ontogeny and phylogeny and perhaps account for the great success of the *Leptosporangiate* type. That size is not always the determining factor is shown by *Pandanus* in which there is no stelar disintegration, even in roots 5 cm. in diameter. The dicotyledons and gymnosperms have solved their problem by development of a cambium and the resulting secondary increase together with medullation.—Ray C. Friesner.

6455. COLE, J. W. Teratological phenomena in the inflorescences of *Fagus sylvatica*. *Ann. Botany* 37: 147-150. 2 fig. 1923.—Abnormal female inflorescences were frequently observed showing hermaphrodite and male flowers on the cupules. There was a graded series from the normal female flowers through forms with more or less rudimentary inferior ovary and reduced androecium to typical male flowers with or without a vestigial superior ovary. The higher the insertion of the flower on the segment of the cupule the nearer it approached the normal male structure. Abnormal examples were also found in which the structure of the whole inflorescence was transitional to that of the male. Out of 355 female inflorescences gathered indiscriminately 17 per cent were abnormal in some way.—W. P. Thompson.

6456. CONNORS, C. H. Twin and triplet peaches. *Jour. Heredity* 14: 89-92. 3 fig. 1923.—Double fruits are not uncommon on the peach, but in certain seasons are more numerous

than in others. These originate usually from twin blossoms but may come from double or triple pistils. Varieties of the Crawford or Persian group are more likely to form multiple fruits. It is an hereditary tendency which is enhanced by environmental factors tending to cause doubleness in the blossom.—*Author's abstract.*

6457. COOK, O. F. Evolution of compound leaves in walnuts and hickories. Jour. Heredity 12: 77-88. 6 fig. 1923.—Instead of the customary division of the leaves into 3 elements, 2 primitive elements may be recognized, the foot and the blade. The foot is the part of the primitive sheathing leaf-base that surrounded the succeeding internode. The blade is the expanded leafy portion. A distinct pulvinus at the end of the petiole may indicate the point of union of the 2 elements. In the walnuts and hickories no stipules are supposed to be present, but they may be recognized in the bud-scales, and in rudimentary organs that correspond directly with the lower pinnae of the compound leaf. Occasionally 1 or more pairs of pinnae other than the lower pinnae are replaced by stipule-like organs, and the leaf may be regarded as being made up of a number of these reduplicated stipules, only the terminal pinna representing the blade-element. Such reversions, and the combination of existing characters, are called metaphasic variations or "internal hybrids." This form of variation has particular evolutionary interest, as by it an organism continually tries out various combinations of characters that it already possesses.—*R. C. Cook.*

6458. CZAJA, A. TH. Studien zur Apogamie leptosporangiaten Farne. I. Über die Apogamie der *Pellaea atropurpurea* (L.) Link. und das Auftreten von Tracheiden im Prothallium. [Studies on apogamy in leptosporangiate ferns. I. On apogamy in *Pellaea atropurpurea* and the occurrence of tracheids in the prothallium.] Ber. Deutsch. Bot. Ges. 40: 346-352. 1922.—In diffuse daylight 3 types of prothallia develop: (1) weakly developed males; (2) larger females with prosenchymatic tissue and tracheids in the central region, and a well defined meristem from which apogamous outgrowths develop; (3) very short sterile prothallia with only parenchymatous cells in the central region, a limited meristematic activity, and some apogamous outgrowths. Besides a few small males, only prothallia of type (3) are developed under blue glass, and only type (2) under red glass. Because tracheids appeared in prothallia having arrested apogamous growths, De Bary and Goebel regarded the tracheids as a result of the arresting influence, but this seems improbable in view of the fact that under red glass all the prothallia with tracheids showed good development on the part of the apogamous sporophytes. The presence of tracheids is more probably due to disturbances in the correlation between the differentiation of elements and the place at which the differentiation occurs. Such tracheids are precociously differentiated sporophytic elements.—*L. W. Sharp.*

6459. DEBBARMAN, P. M. A floral abnormality of the Indian water lily. Jour. Heredity 14: 96. 1 fig. 1923.—A flower of *Nymphaea rubra* was observed in which a supernumerary flower had issued from the axils of 1 of the petals, and several of the stamens had developed into leaflike structures. The causes of this abnormal condition are not known.—*R. C. Cook.*

6460. ГОБИ, Х. Я. [GOBI, CH. JA.] Генетическая классификация плодов семенных растений. [The genetical fruit classification of angiosperms.] Ann. Inst. d'Essais de Semences Jard. Principal Bot. Republique Russe 44: 1-30. 1921.—This classification is close to that of Warming (1880) but the genetical relations among the groups are illustrated. The classification is based primarily upon the difference between dehiscent and indehiscent fruit, the latter of which is believed to have originated from the former. The primitive form of dehiscent fruit is the capsule. From this have been derived the 3 chief types of indehiscent fruit, the nut, the berry, and the drupe. Different fruit types may be present in the same family. In the Oleaceae, for example, 4 are represented: *Olea* (drupe), *Syringa* (capsule), *Fraxinus* (samara), and *Ligustrum* (berry). The same thing is true for the Rubiaceae, Capparidaceae, and others. The author believes that the primitive capsular type has become transformed in 3 different directions during the course of evolution.—*V. Lashevsky.*

6461. GRAF, J. Beiträge zur Kenntnis der Gattung *Populus*. Ber. Deutsch. Bot. Ges. 39: 193-194. 1921.—[See Bot. Absts. 11, Entry 439.]-Paul C. Standley.

6462. LOSCH, HERMANN. Ascidienbildung an Staubfäden vergrünter Blüten von *Tropeolum majus*. [Formation of ascidia on stamens of greened flowers of *T. majus*.] Ber. Deutsch. Bot. Ges. 37: 369-372. 1919.

6463. MANN, ANNETTE G. Observations on the interruption of the endodermis in a secondarily thickened root of *Dracaena fruticosa* Koch. Proc. Roy. Soc. Edinburgh 41: 50-59. Fig. 1-11, photo. 1-2. 1921.—Roots of *Dracaena* have a well indurated endodermis and a process of cambial increase similar to that of the stem. Serial transverse sections, beginning $1\frac{1}{2}$ inches back of the root tip, showed a gradual formation of internal cambium from the pericycle, followed by a distortion and finally an interruption of the endodermis, and later a cessation of cambial activity and a linking up of the endodermal cells. At about $3\frac{3}{4}$ inches from the tip the endodermal ring is almost complete and external cambium begins to appear. This gradually spreads around the root. Near the region of the stem secondary structures are present both inside and outside the endodermis, which is now broken up into groups of cells. Once it is well established, the external cambium is more active than the internal.—Ray C. Friesner.

6464. SCHÜEPP, OTTO. Zur Theorie der Blattstellung. [On the theory of phyllotaxy.] Ber. Deutsch. Bot. Ges. 39: 249-257. 1921.

6465. STEVENS, O. A. Double sweet clover seeds. Seed World 13⁸: 30. 1923.—In biennial white sweet clover and yellow-blossomed sweet clover 2-seeded pods are quite frequent, the seed lying side by side. The adjacent sides of the 2 seed are distinctly flattened.—M. T. Munn.

MORPHOLOGY AND TAXONOMY OF ALGAE

E. N. TRANSEAU, *Editor*

L. H. TIFFANY, *Assistant Editor*

(See also in this issue Entries 6241, 6487, 6507, 6514, 6595, 6647, 6657)

6466. BULLOCK-WEBSTER, G. R. Some Charophyte notes 1917. Irish Nat. 29: 55-58. 1920.—Records of distribution in Ireland, chiefly from Achill Island, are given.—W. E. Praeger.

6467. CROW, W. B. Dimorphococcus Fritschii, a new colonial protophyte from Ceylon. Ann. Botany 37: 141-146. 1 fig. 1923.—The new species was collected in fresh water in Ceylon. Its comparative morphology and relationships are discussed.—W. P. Thompson.

6468. CROW, W. B. The taxonomy and variation of the genus *Microcystis* in Ceylon. New Phytol. 22: 59-68. Pl. 1. 1923.—A key is given for the 17 species of *Microcystis* considered to be fully known. Of these, 8 are recorded from Ceylon, including 2 new species (*M. protocystis* and *M. pseudofilamentosa*). A new form (f. *elongata*) of var. *incerta* (Lemm.) Crow of *M. pulvereae* (Wood) Migula is also described. The species are shown to be connected by numerous transitional forms, the nature of which is described in the forms from Ceylon. The distinction between *Aphanocapsa* and *Microcystis* is an artificial one. *Coelosphaerium dubium* Grun. is related to the pseudovacuolate species of *Microcystis*. *Coelosphaeriopsis* Lemm. is not distinguished by a valid generic character.—I. F. Lewis.

6469. GRIFFITHS, B. MILLARD. Tetraedroides spetsbergensis gen. et sp. nov., a new alga from Spitzbergen. New Phytol. 22: 69-71. Pl. 2. 1923.—The thallus of this new green alga of uncertain affinities is composed of 2 uninucleate cells with thick outer walls and many chloroplasts each containing a pyrenoid.—I. F. Lewis.

6470. GRUBB, VIOLET M. Preliminary note on the reproduction of *Rhodymenia palmata*, Ag. Ann. Botany 37: 151-152. 2 fig. 1923.—The female fronds were discovered. The procarps are developed in groups in acropetal succession. Each one bears a long trichogyne with a distinct nucleus. Though no antheridial fronds were recognized, bodies resembling spermatia were found on the trichogynes.—W. P. Thompson.

6471. GRUBB, VIOLET M. The attachments of *Porphyra umbilicalis* (L.) J. Ag. Ann. Bot. 37: 131-140. 8 fig. 1923.—The plant is commonly attached to rocks by small discs from 0.5 to several mm. in diameter. A disc is made up of interwoven filaments, some long and slender, others short and stout, which grow out from individual cells of the thallus. Filaments in contact with the substratum become attached by suckers or swell up and divide to give cells which are attached by their gelatinous walls. An endless variety of forms is assumed. Many filaments also turn outward and often cut off cells which form a compact outer parenchymatous tissue. This may creep along the substratum and produce new fronds. The plants sometimes grow on breakwaters and then the filaments have the power to penetrate the wood to considerable depths. In two plants growing on *Fucus* it was found that the filaments had penetrated far into the living tissues and even into the living cells of the host.—W. P. Thompson.

6472. HALL, CHARLES A. Desmids of the Clyde area: new records. Glasgow Nat. 8: 122-127. 1920.—Forty-nine species and varieties of desmids, hitherto unreported for the area, are listed. This brings the total records for the area to 192 species and varieties.—Ray C. Friesner.

6473. HITCHCOCK, ROMYN. *Tolypella longicoma* in Cayuga Lake, New York. Bull. Torrey Bot. Club 5: 173-176. Pl. 8. 1923.—The occurrence of *Tolypella longicoma* A. Braun in Cayuga Lake is reported and the habit and structure are discussed.—P. A. Munz.

6474. JANET, CH. Sur l'ontogénèse du *Volvox aureus* Ehr. [The ontogeny of *Volvox aureus*.] Compt. Rend. Acad. Sci. Paris 176: 997-999. 1 fig. 1923.—The figure shows successive bipartitions as exhibited in the surface layer. The final stage is said to contain 1,024 cells. The cells have a tetradic arrangement during the entire development. Each facet of a cell is determined by the tension of the protoplasmic and plasmodesmial connections. At each bipartition new plasmodesma appear; certain preexisting plasmodesma are retained unchanged; and certain other preexisting plasmodesma are multiplied.—C. H. Farr.

6475. NAUMANN, E. Einige Gesichtspunkte betreffs der bildlichen Darstellung des Kammerplanktons. [Some aspects of the figurative representation of plankton.] Archiv. f. Hydrobiol. u. Planktonk. 12: 454-467. 5 fig. 1920.—Methods of graphically representing the plankton collected in the Kolkwitz chamber are given. Previous methods of representing this chamber plankton suffer from limitations. For larger organisms a low magnification of the whole chamber area of 1 square cm. may be used, but for smaller forms a higher magnification of only a part is better. For these 1 square mm. is adopted, and the projection of organisms from a column of the usual chamber height of 2.63 mm. made. When the organisms are more numerous a depth of 1 mm. may be used, and $\frac{1}{10}$ mm. when very numerous. For organisms which are so infrequent that they cannot be detected in 1 cmm. a determination may be made of the frequency in 1 cc.—Harold Kirby.

6476. OEHLER, RUD. Flagellaten- und Ciliatenzucht auf reinem Boden. [Flagellate and ciliate culture.] Arch. Protistenk. 40: 16-26. 1919.—Species of *Bodo* and *Prowazekia* were grown on pure strains of the bacteria *Coccus pyogenes flavus*, *Vibrio metschnikof*, *Bacterium timothea*, and *B. coli*, and also on *B. coli* killed by heating. Both the agar-plate and agar-tube methods were successful. The ciliates *Colpoda steinii* and *Colpidium colpoda* were also grown in culture by the same methods. Various sterile organic culture media, such as peptone, beef extract, and egg white, were found to be much less favorable than media containing bacteria.—R. P. Hall.

6477. PASCHER, A. Über die übereinstimmungen zwischen den Diatomeen, Heterokonten und Chrysomonaden. [The relation between the Diatoms, Heterokonts, and Chrysomonads.] Ber. Deutsch. Bot. Ges. 39: 236-248. 1922.—The Chrysomonads, Diatoms, and Heterokonts may be united into a basic group, the *Chrysophyceae*. They show similarity in wall structure, this having in representative forms at least in one phase of development a lamellate structure, as in *Hyalobryon*, *Rhabdoderma*, and *Tribonema*. The wall is also frequently in 2 halves, as in Chrysomonad cysts, most Diatoms, and *Ophiocytium*. Silicification may be present as in Chrysomonad cysts, *Mallomonas*, some Heterokontae (*Halosphaera*), and Diatoms. Flagellation is somewhat similar, 1 flagellum or 1 long and 1 very short one being present, but little is known regarding the flagellae on reported Diatom zoospores. The pigments show some differences, but the most divergent group, the Heterokontae, may be a side line early distinguished by a loss of brown color. The Heterokonts and Chrysomonads have in common leucosin as the assimilate, and all have oils and fats.—*Wm. Randolph Taylor*.

6478. SAMPAIO, JOAQUIM. Desmideáceas do Porto e arredores. [Desmids from Oporto and vicinity.] Brotéria Sér. Bot. 20: 26-48. Pl. 1. 1922.—This list contains 101 species in 17 genera, mostly with rather complete descriptions. Of them, 38 were previously unreported for the Portuguese flora and 51 unreported in the vicinity of Oporto. *Closterium varzinense*, *Cosmarium stagnale*, and *C. portuense* are proposed as new species; *Micrasterias denticulata* var. *lusitanica* and *Cosmarium subtumidum* var. *minor* as new varieties. The authority in all cases is Sampaio f.—*E. B. Chamberlain*.

6479. SAUVAGEAU, C. Sur l'état quiescent prolongé d'une Algae phéosporée éphémère. [On the quiescent stage prolonged in an ephemeral pheosporic alga.] Compt. Rend. Acad. Sci. Paris 176: 478-482. 1923.—Most attention is given to a study of *Mesogloia Griffithsiana*. This alga appears only for a short period; later it cannot be found. It was grown in culture in an attempt to find the other stages in the life history. These are carefully described. Brief reference is also made to other members of the Chordariaceae.—*C. H. Farr*.

6480. SCHULZ, P. *Fragilaria exigua* (W. Sm.) Lemm., ein Beitrag zum Variabilitätsvermögen der Bacillariaceen. [A contribution to the variability of the Bacillariaceae.] Arch. Hydrobiol. u. Planktonk. 12: 750-755. 16 fig. 1920.—A series of transitional forms between the cross-formed *Fragilaria construens* var. *genuina* Grun. and the tripolar *F. exigua* is described and illustrated. This is the 1st observed case of the origin of a tripolar from a cross form and suggests that *F. exigua* is only a variety of *F. construens*. Similarities are noted to the fossil *F. pacifica* var. *trigona* J. Brun and *F. parasitica* var. *trigona* Grun., showing the existence of tripolar variants in other species of *Fragilaria*.—*Harold Kirby*.

6481. SVEDELIUS, N. Einige Bemerkungen über Generationswechsel und Reduktionsteilung. [Some remarks on alternation of generations and the reduction division.] Ber. Deutsch. Bot. Ges. 39: 178-187. 1921.—The discovery of the life cycle of *Laminaria* renders untenable the theory of Bower and Wettstein in which the reduction of the gametophyte generation is considered an adaptation to a terrestrial habit, because the series *Dictyota-Laminaria-Fucus* shows a comparable series in aquatic plants. The discovery that the reduction division occurs at different points in the life history in 1 group (e.g. Florideae) shows that the point of occurrence of this phase is not necessarily a fundamental feature of such a group. Fertilization permits of but little variety in the sorting of chromosomes while the reverse is true of the reduction divisions, which fact is of importance in plant variability and evolution. As a hypothesis it is suggested that the establishment of a diploid sporophyte through the postponing of the reduction divisions gives the plant the chance to effect many reduction divisions and so many more fundamental combinations of chromosomes. The diploid plant can produce the greater effect with the least material output provided the vegetative efficiency of the gametophyte is not greater than that of the sporophyte. The life history in which there is 1 reduction division following fertilization directly is that of primitive organisms, while that of fertilization followed by a sporophyte giving many reduction divisions

is more evolved. The gradual reduction of the gametophyte has occurred because this form has become increasingly unnecessary.—*Wm. Randolph Taylor.*

6482. VIRIEUX, J. Structure et division cellulaires chez *Coscinodiscus Grani*. [Structure and cellular division in *C. Grani*.] Bull. Biol. France et Belgique 54: 58-60. Fig. 1-6. 1920.—Studies of cytology, structure, and nuclear division of diatoms have been based mostly on fresh water species. The pelagic dredging of Wimereux yielded a great quantity of *C. Grani* Good. The nucleus, subcentral in repose, is seen as a voluminous, easily stained caryosome in a clear envelope. Surrounding it is a mass of rather compact protoplasm with prolongations reaching toward the valves and making connection with the parietal chromatophores. At the time of division the caryosome becomes more or less obliterated and its parts are aggregated in 2 masses of granules. Only in this brief stage is anything found which resembles chromosomes. The caryosomes shortly form again, withdraw toward the 2 poles, and become fixed against the valves with only a bridge of protoplasm uniting them. Two new valves then form at the equator and do not at once break the continuity of the protoplasm, strands of which extend through the large hexagonal pores of the valvular poles. The 2 daughter cells are united for a time in the maternal envelope, and only when they separate do the nuclei move to the centers of the new cells.—*A. Chase.*

MORPHOLOGY AND TAXONOMY OF BRYOPHYTES

ALEXANDER W. EVANS, *Editor*

(See also in this issue Entries 6226, 6232, 6241, 6246, 6514, 6647, 6649, 6657, 6727)

6483. DISMIER, G. Additions à la flore bryologique des Alpes-Maritimes et du Var. [Additions to the bryophyte flora of the Maritime Alps and the Var.] Bull. Soc. Bot. France 67: 35-47, 113-120. 1920.—The present paper is supplementary to an earlier work on the bryophytes of the French department of the Maritime Alps published in 1915. It records the results of explorations carried on by the author during the winter of 1916-17, using Cannes as a base of operations. The region studied extended from Antibes to Aguay and was almost wholly coastal in character, the most inland station visited being scarcely 10 km. from the Mediterranean. The author first lists, as new to continental France, *Acaulon mediterraneum* Limpr., *Pottia commulata* Limpr., and *Rhynchostegiella Letourneurii* (Besch.) Broth. The last is of especial interest, having been previously recorded only from Algeria and Morocco. It includes, however, as synonyms, *Eurhynchium curvisetum* var. *laevisetum* Nich. & Dix., of Portugal, and *Rhynchostegiella littorea* var. *brevifolia* Amann, of southern France, so that it is not actually new either to Europe or to France. He then lists, with definite stations, 54 mosses and hepatics as new to the department of the Maritime Alps and 31 as new to the department of the Var.—*A. W. Evans.*

6484. DISMIER, G. Les Muscinées du Valentinois méridional (Drôme). [The bryophytes of southern Valentinois (Drôme).] Bull. Soc. Bot. France 68: 241-248. 1921.—In 1918 the author made a protracted stay at Étoile-sur-Rhône, near Valence, in the department of the Drôme, France, and carefully explored the surrounding country for bryophytes. The region is dry, sparsely wooded, and almost destitute of rocks, while the range in altitude is comparatively slight. In spite of these rather unfavorable conditions 170 mosses and 31 hepatics were collected, and these are listed in full, since the bryophytes of the Drôme were previously unknown. Although the species are predominantly southern in distribution a few northern species are represented. The following are of especial interest: *Amblystegium riparium* var. *trichopodium* Br. Eur., *Aschisma carniolocum* (W. & M.) Lindb., *Cheilothela chloropus* Lindb., *Didymodon cordatus* Jur., *Phascum mitraeforme* (Limpr.) Warnst., and *Zygodon Forsteri* (Dicks.) Wils.—*A. W. Evans.*

6485. DISMIER, G. Une mousse nouvelle pour la France dans la Drôme: *Orthotrichum Shawii* Wils., et présence aux environs de Valence des *Camptothecium aureum* Br. Eur. et *Epipterygium Tozeri* (Grev.) Lindb. [*Orthotrichum Shawii*, a moss new to France in the Drôme, and the occurrence in the vicinity of Valence of *Camptothecium aureum* and *Epipterygium Tozeri*.] Bull. Soc. Bot. France 69: 321-325. 1922.—The author reports the presence of *Orthotrichum Shawii* in the vicinity of Die, in the department of the Drôme, France. This rare species was previously known only from Scotland, northern Germany, and Corsica. Of the other 2 species noted in the title, *Camptothecium aureum* has a wide Mediterranean distribution but was previously unknown in the interior of France, while *Epipterygium Tozeri* was likewise supposed to be restricted to coastal regions. The latter species consistently avoids calcareous rocks.—A. W. Evans.

6486. SHOWALTER, AMOS M. Studies in the morphology of *Riccardia pinguis*. Amer. Jour. Bot. 10: 148-166. Pl. 16-19, 3 fig. 1923.—This species is cosmopolitan and varies somewhat under different environments. It is probably dioecious but male and female thalli may be distinguished only by their reproductive branches or the presence or absence of sporophytes. Discharged spores do not ordinarily adhere in tetrads. The growth of the thallus is apical, by means of a "two-faced" apical cell, which gives rise to segments alternately from its right and left cutting faces. The early divisions of the primary segment of the apical cell follow the scheme of Leitgeb (1877). The axial row of the archegonium develops from a mother cell which divides to form a central cell and a neck-canal mother cell; the latter divides once, increasing the axial row to 3 penultimate cells, which divide in acropetal succession forming ultimately an egg, a ventral canal cell, and 4 neck-canal cells. Disintegrating archegonia were numerous in the material here studied, the egg and the ventral canal cell frequently breaking down before the maturity and disintegration of the neck-canal cells. The young embryos show an order of division slightly different from that reported by Miss Clapp (1912). A massive "calyptra" is formed around the sporophyte by the rapid growth and division of the cells of the venter and of the cells of the thallus immediately below the archegonium.—E. W. Sinnott.

6487. STEIL, W. N. The antherozoid of the genus *Riccardia*. Bull. Torrey Bot. Club 50: 197-201. 5 fig. 1923.—The antherozoids of *Riccardia pinguis*, *R. multifida*, and *R. palmata* are described and figured. It is shown that the 2 cilia are unequal in length and attached at different points close to the anterior end of the long and slender body. The author makes the statement that "the nature of the cilia of the antherozoid suggests a possible heterokont relationship."—P. A. Munz.

MORPHOLOGY AND TAXONOMY OF FUNGI, LICHENS, BACTERIA, AND MYXOMYCETES

H. M. FITZPATRICK, *Editor*

DONALD S. WELCH, *Assistant Editor*

(See also in this issue Entries 6241, 6514, 6520, 6523, 6528, 6530, 6533, 6534, 6542, 6547, 6595, 6612, 6647, 6649, 6657)

FUNGI

6488. BISBY, G. R., AND A. H. R. BULLER. Preliminary list of Manitoba fungi. Trans. British Mycol. Soc. 8: 91-109. 1923.—The list contains 574 fungi: myxomycetes, 34; bacteria, 8; phycomycetes, 20; ascomycetes, 62; imperfect fungi, 38; smuts, 20; rusts, 80; polypores, 63; agarics, 108; Thelephoraceae, 36; other basidiomycetes, 57; and lichens, 48.—W. B. McDougall.

6489. B[ROOKS], F. T. [Rev. of: GWYNNE-VAUGHAN, DAME HELEN. *Fungi: Ascomycetes, Ustilaginales, Uredinales*. ii + 232 p., 196 fig. Cambridge University Press: 1922 (see Bot. Absts. 11, Entries 2707, 4253).] Trans. British Mycol. Soc. 8: 109-110. 1923. [See also Bot. Absts. 11, Entry 4247; 12, Entry 1968.]

6490. CUNNINGHAM, G. H. A singular *Cordyceps* from Stephen Island, New Zealand. Trans. British Mycol. Soc. 8: 72-75. Fig. 1-3. 1923.—*Cordyceps Kirkii* is described as new.—W. B. McDougall.

6491. ELLIOTT, W. T. Some observations on the mycophagous properties of slugs. Trans. British Mycol. Soc. 8: 84-90. 1923.—Observations were made during 4 years using 10 species of slugs and 60 species of fungi. The results, given in tabular form, show that of the 10 species of slugs 3 are extremely partial to fungous food, 1 feeds only on lichens, 1 eats fungi only under compulsion, and the other 5 feed upon fungi as readily as upon various other kinds of food. Fungi that are poisonous to man are not avoided by slugs. Slugs are partial to all species of *Russula* but they refuse tough and hard fungi, such as *Scleroderma vulgare* and *Panus stypticus*.—W. B. McDougall.

6492. FITZPATRICK, HARRY MORTON. Monograph of the Nitschkieae. Mycologia 15: 45-67. 1923.—This is a continuation of the study previously noted [see Bot. Absts. 12, Entry 4199.] The 4 remaining genera are described and the following species noted. Under *Calyculosphaeria* nom. nov. (*Winterella* Berl.) *C. calyculus* (Mont.) comb. nov., *C. pezizoidea* (Pat. & Gaill.) comb. nov., *C. collapsa* (Romell) comb. nov., and *C. macrospora* sp. nov. are described; under *Tympanopsis* the species described are *T. euomphala* (B. & C.) Starbäck, *T. coelosphaerioides* Penz. & Sacc., and *T. uniseriata* sp. nov.; under *Thaxteria* the species described are *T. leptosporoides* (Wint.) comb. nov., and *T. didyma* (Speg.) Sacc.; under *Acanthonitschkea* the species *A. argentinensis* Speg. and *A. macrobarbata* sp. nov. are described.—H. R. Rosen.

6493. GÄUMANN, ERNST. Mykologische Mitteilungen. [Mycological contributions.] Bull. Jard. Bot. Buitenzorg III, 3: 121-127. Fig. 1-4. 1921.—The author describes 3 new species of fungi, *Triphragmium Trevesiae*, *Gloeosporium tremellinum*, and *Ravenelia Erythrinae*, and gives additional information on *Hamaspora gedeana* Rac.—Alfred Rehder.

6494. GLEISBERG, W. Zur Revision der Gattung *Pestalozzia* de Not. [Contribution to a revision of the genus *Pestalozzia*.] Ber. Deutsch. Bot. Ges. 39: 79-83. Fig. 1. 1921.—While investigating a species of *Valsa* on *Thuja occidentalis* a species of *Pestalozzia* was found. Study showed that it conforms equally to the descriptions of 3 distinct species of *Pestalozzia* as diagnosed by Saccardo, namely, *P. funeria*, *P. foedans*, and *P. Conigena*. The plant should be called *P. funeria* because of the priority of this name but this study shows that the diagnosis of species of *Pestalozzia* as given by Saccardo is inadequate and the whole genus is in great need of revision. Attempts to infect living plants of *Thuja* with *P. funeria* were unsuccessful and the fungus is considered a harmless saprophyte.—W. B. McDougall.

6495. LINGELSHEIM, ALEXANDER. *Stilbella Arndtii*, ein neuer entomogener Höhlenorganismus aus Schlesien. [*Stilbella Arndtii*, a new entomogenous cave organism from Silesia.] Ber. Deutsch. Bot. Ges. 39: 149-151. 1921.—Several fruit-bodies of *Mycena filopes* Bull. were found in caves in Silesia. *Stilbella Arndtii*, found growing upon *Heleomyza serratae* L., is described as new. This is the first entomogenous species of the genus *Stilbella* to be reported from Central Europe and only 4-5 entomogenous species are known from other parts of the world, most species of the genus having been reported as growing upon plants. It is suggested that further studies may reveal other interesting relations between cave fungi and cave animals.—W. B. McDougall.

6496. MURRILL, W. A. *Poria Cocos* (Schw.) F. A. Wolf. Mycologia 15: 105-106. 1923.—The author notes a yellowish *Poria* found associated with a large sclerotium which had been found attached to dead roots of *Eucalyptus*.—H. R. Rosen.

6497. OVEREEM-DE HAAS, C. VAN, UND D. VAN OVEREEM-DE HAAS. Verzeichnis der in Niederländisch Ost-Indien bis dem Jahre 1920 gefundenen Myxomycetes, Fungi und Lichenes. [Enumeration of the myxomycetes, fungi and lichens collected up to 1920 in the Dutch East Indies.] Bull. Jard. Bot. Buitenzorg III, 4: 1-146. 1922.—The authors state that the enumeration is based chiefly on literature which is very scattered and difficult of access and that it is not intended to be critical. The enumeration contains 91 Myxomycetes, 2,232 Fungi, and 503 Lichenes. An index to the literature cited concludes the paper.—*Alfred Rehder.*

6498. REA, CARLETON. Presidential address. A brief review. Trans. British Mycol. Soc. 8: 11-22. 1922.—This paper presents a summary of the main advancements that have been made in mycology since the founding of the British Mycological Society 25 years ago.—*W. B. McDougall.*

6499. STEVENS, F. L., AND RUTH I. DOWELL. A *Meliola* disease of cacao. Phytopathology 13: 247-250. Fig. 1-3. 1923.—At Coverden, British Guiana, a leaf spot of *Theobroma cacao*, due to *Meliola guianensis* n. sp., was found in abundance. The *Meliola* was in some instances overgrown by *Helminthosporium guianensis* n. sp., and by *Nectria portoricensis* Stev.—*B. B. Higgins.*

6500. WAKEFIELD, E. M. The Worcester foray. Trans. British Mycol. Soc. 8: 1-8. 1922.—This is a report of the 25th annual meeting and foray of the British Mycological Society held at Worcester, Sept. 19-24, 1921. A complete list of the fungi collected, numbering about 435 species, is given.—*W. B. McDougall.*

6501. WEESE, J. Über die Gattungen *Ophiosphaeria* W. Kirschst., *Acanthophiobolus* Berl. und *Ophiochaete* Sacc. [On the genera *Ophiosphaeria*, *Acanthophiobolus*, and *Ophiochaete*.] Ber. Deutsch. Bot. Ges. 39: 114-120. 1921.—The relationships and synonymy of the 3 genera are fully discussed. It is concluded that with a proper rearrangement of species the genera *Ophiosphaeria* and *Acanthophiobolus* should be retained while *Ophiochaete* should be relegated to synonymy.—*W. B. McDougall.*

6502. WEESE, J. Über einige Ascomyceten aus dem Mährisch-schlesischen Gesenke. [On some Ascomycetes from Silesia.] Ber. Deutsch. Bot. Ges. 39: 108-113. 1921.—*Nectria tricolor* Höhnelt is discussed and described in detail. *Epicymatia episphaerica* Niessl is found to be identical with *Berlesiella parasita* (Fabre) Höhnelt, and *Meliola sudetica* Niessl is believed to be identical with *M. nidulans* (Schweinitz) Cooke.—*W. B. McDougall.*

6503. WOLLENWEBER, H. W. Zur Systematisierung der Strahlenpilze. (Gattung *Actinomyces* Harz.) [The systematic arrangement of the radiating fungi. The genus *Actinomyces* Harz.] Ber. Deutsch. Bot. Ges. 39: 26-30. 1921/1922.—The genus is divided into 5 sections: the 1st sclerostroma, distinguished from the others by the presence of sclerotia; the others separated on the basis of the color of the conidia. In the 2nd section, poliophaeospora, the conidia are gray to brown; in the 3rd, leucospora, white, yellowish or greenish white; in the 4th, erythrinospora, red or reddish, and in the 5th, glaucospora, blue. Most of the species belong to the section leucospora and this section is further subdivided.—*W. B. McDougall.*

LICHENS

6504. KNIGHT, H. H. Lichens found during the Worcester Foray. Trans. British Mycol. Soc. 8: 10. 1922.—A list is given of 46 species of lichens collected during the Worcester Foray, Sept. 21-24, 1921.—*W. B. McDougall.*

6505. LINDAU, G. Lichenes novo-guineenses. Bot. Jahrb. 58: 250-254. 1923.—This is No. 84 of Series X of the Beiträge zur Flora von Papuasien. Ledermann's collection, so rich in phanerogams, furnished no new species of lichens. Thirty-one species in 18 genera are listed, accompanied by notes on distribution.—*K. M. Wiegand.*

6506. RIDDLE, LINCOLN W. The lichens of the Isle of Pines. *Mycologia* 15: 68-88. Fig. 1. 1923.—A list is given of 127 species in 49 genera, "of which 1 genus, 14 species, and 1 variety are new. Of the new species, 11 grow on rocks." A Latin description is given for every new form. The new genus, *Monoblastia*, belongs to the family Pyrenulaceae. The new species are: *Thrombium echinulosporum*, *Microglaena Brittonii*, *Monoblastia palmicola*, *Porina macrocarpa*, *P. subfirmula*, *P. Wilsonii*, *Opegrapha oleaginea*, *Leptotrema polyporum*, *Phyllospora cryptocarpa*, *Anema bullata*, *Blastenia Brittonii* Zahlbr., *Buellia Brittoniae*, *B. flavogranulosa*, and *B. subdispersula*. The new variety is *Opegrapha lithyrgea* var. *notha*. The following new combinations occur: *Microglaena scopularis* (Wainio), *Phylloporina dilatata* (Wainio), *Ocellularia subtilis* (Tuck.), *Leptotrema simplex* (Tuck.), *Bacidia microphyllina* (Tuck.), *Bilimbia Sprucei* (Muell. Arg.), *Phyllopsora isidiotyla* (Wainio), and *Thyrea cubana* (Tuck.).—H. R. Rosen.

BACTERIA

6507. CROW, W. B. The structure and affinities of *Leuconostoc mesenteroides* (Cienkowski) Van Tieghem. *Trans. British Mycol. Soc.* 8: 76-84. Fig. 1-2. 1923.—*Leuconostoc mesenteroides*, which occurs most commonly as gelatinous masses in vats in sugar beet factories, is discussed in detail from cultural, structural, and microchemical points of view. The conclusion is reached that *Leuconostoc* is not closely related to any of the algae but is allied to certain bacteria and should be provisionally placed in the Coccaceae.—W. B. McDougall.

6508. FROBISHER, MARTIN, JR. A comparative study of media for the quantitative estimation of bacteria in milk. *Amer. Jour. Public Health* 13: 474-478. 1923.—The media studied were the medium of the American Public Health Association, lactose agar, milk-powder agar, milk-powder-yeast agar, and milk-powder agar with the addition of 1 per cent lactose. "The milk-powder agar and lactose agar are apparently the media of preference for routine work." All enriched media gave a higher count of larger, more uniform colonies than the standard medium. There was also less variation in counts by different individuals and more opportunity for differentiation of species.—C. A. Ludwig.

6509. GICKLHORN, JOS. Zur Morphologie und Mikrochemie einer neuen Gruppe der Purpurbakterien. [On the morphology and microchemistry of a new group of the sulphur bacteria.] *Ber. Deutsch. Bot. Ges.* 39: 312-319. 1921.—Two new species of sulphur bacteria are described. They are peculiar in containing, together with sulphur, large quantities of calcium carbonate, up to 60 per cent of the total volume. They are: *Chromatium Linsbaueri* n.sp. and *Rhabdochromatium Linsbaueri* n.sp. The author places them in the group "lime bacteria."—S. F. Cook.

MYXOMYCETES

6510. LISTER, G. List of Mycetozoa found during the Worcester Foray. *Trans. British Mycol. Soc.* 8: 8-9. 1922.—After brief mention of some of the more important finds, a list of 38 species of Myxomycetes collected during the Worcester Foray, Sept. 19-23, 1921, is given.—W. B. McDougall.

PALEOBOTANY AND EVOLUTIONARY HISTORY

EDWARD W. BERRY, *Editor*

(See also in this issue Entries 6251, 6457, 6480, 6481, 6593, 6647, 6683, 6694)

6511. COLLINS, G. N. An ear of prehistoric maize that resembles the fossil form, *Zea antiqua*. *Jour. Heredity* 14: 61-64. 2 fig. 1923.—The ear was found by Colonel John W. Gulick, in a prehistoric grave near Arica, Chile. The "Arica ear" is somewhat smaller than the fossil ear described by Knowlton, but presents practically the same characteristics. The grains are arranged in approximately 20 rows, and although quite small they contain true

starch, unlike the majority of small-grained varieties today. The ear does not throw much light on the origin of maize, but it does show that nearly all the steps in developing maize as we know it today were taken at least as early as the time of the "Arica ear."—*R. C. Cook.*

6512. CONWENTZ, H. Über zwei subfossile Eibenhorste bei Christiansholm, Kreis Rendsberg. [Two subfossil yews at Christiansholm.] *Ber. Deutsch. Bot. Ges.* 39: 384-390. 1921.—The occurrence of the yew is noted outside the present range in prehistoric time. Boles and stumps of a pine-yew-oak forest floor were earlier noted at a depth of 1 m. in sphagnum turf of lowlands of Hannover, where only a single pair of wild trees is now known. Yew wood was much used in the prehistoric wooden utensils from Jütland, Seeland, Fünen, and Bornholm. Old or sub-geologic forests of oak, yew, and other trees are found near the surface of the sandy soil about Christiansholm. Quite recent, marked restriction of the yew is indicated. Some of the material is charred.—*G. R. Wieland.*

6513. HOLLICK, ARTHUR. The taxonomic and morphologic status of *Ophioglossum Alleni* Lesquereux. *Bull. Torrey Bot. Club* 50: 207-213. *Pl.* 10-12. 1923.—The fossil plant from the shales of Florissant, Colorado, originally described by Lesquereux as *Ophioglossum Alleni* and later referred by him to *Salvinia*, has also been placed under the following genera: *Tmesipteris*, *Carpolithes*, *Phyllites*, and *Brachyruscus*, the last named genus being in the Spermatophyta. The present paper gives data to show that *Carpolithes Alleni* (Lesquereux) Cockerell is "properly applicable."—*P. A. Munz.*

6514. Мейер, К. И. [MEYER, K. I.] Происхождение наземной растительности. [The origin of the land vegetation.] 75 p., 60 fig. Государственное издательство, Москва. [Edition of the State, Moscow.] 1922.—In this book by a Russian liverwort specialist, there is an exposition of the change of generations and origin of land flora; also the views of Pringsheim, Celakovsky, Bower, Potonie and Davis, and modern data of change of generations in cellular plants are considered. The author examines the present status of the question of the origin of land vegetation and gives a theoretical characterization of the ancestor of land plants. This ancestor is an alga, showing a dichotomous branching of thallus, with homotypical Dictyota-type-alternation of generations. The gametophyte produces a gametangium having the character of a many-chambered sporangium. The other generation—the sporophyte—has sporangia or, it is possible, tetrasporangia. The author tries to represent a possible way of evolution, which the alga-type, mentioned above, followed when it became terrestrial. Both the Bryophyta and Pteridophyta have developed from the same prototype, but their ways of evolution diverged at the very beginning and this has brought about the principal difference between them. The author represents the hypothetical ancestor of the Bryophyta—the Protosphaerocarpus. It is like a sphaerocarpus, but without sexual differentiation in the thallus, with antheridia and archegonia on the same thallus. This type has left the water. The many-chambered sporangia were transformed according to Davis' theory, into the antheridia and archegonia. The bryophyte sporangium is a total generation, the rest of the sporophytic thallus. The first phase of the phylogenetical branch, Pteridophyta-Gymnospermae-Gyneciateae, is the transformation of the dorsiventral thallus in the radial vertical shoot. The evolution of this branch has proceeded under the influence of factors established by Bower.—*V. Lashevsky.*

6515. METCALF, W. An ancient pine cone. *Amer. Forest.* 29: 172. 1 fig. 1923.—A cone from a Knobcone pine estimated to have been buried in the ground for 40-50 thousand years is compared with the cone of the same species of today.—*Chas. H. Otis.*

PATHOLOGY

FREDERICK V. RAND, *Editor*LILLIAN C. CASH, *Assistant Editor*

(See also in this issue Entries 6152, 6156, 6182, 6193, 6202, 6217, 6241, 6247, 6248, 6262, 6269, 6271, 6297, 6305, 6316, 6365, 6378, 6387, 6391, 6426, 6430, 6447, 6455, 6471, 6476, 6488, 6489, 6490, 6491, 6494, 6495, 6497, 6498, 6499, 6503, 6612, 6613, 6617, 6635, 6636, 6639, 6642, 6694, 6696, 6726, 6733, 6734, 6736)

DISEASES CAUSED BY FUNGI

6516. ANONYMOUS. Pine blister disease in Europe. *Amer. Forest.* 29: 244. 1923.—This is an interview with Perley Spaulding concerning his 8-months' study of blister-rust conditions in Europe. The disease has been known in Switzerland since 1854, but has become widely destructive only within the last 10 years. The black currant, almost universally cultivated, is the most susceptible and dangerous host in both Europe and America.—*Chas. H. Otis.*

6517. ANONYMOUS. Report of the proceedings and recommendations of the eighth annual blister rust conference held in Boston, Massachusetts, Feb. 8-10, 1923. 126 p. (*mimeographed*). 1923.—This report comprises discussions by various investigators as to "our object and its attainment," State, Federal, and Canadian policies as regards white pine blister rust, educational work, problems of blister rust agents, scientific investigations, and 7 special papers. [A full report of the preceding conferences was never published or mimeographed. A résumé of most of them will be found in *The American Plant Pest Committee Bull.* 2, 4, and 6 covering the years 1918-1920 (see *Bot. Absts.* 3, Entries 393, 396, 409, 411, 416, 417; 7: 1140, 1203, 1224, 1246; 10: 1277, 1307); in the bulletin on white pine blister rust published by the Committee on Suppression of the White Pine Blister Rust in North America, covering the year 1917 [1918]; and in New York Conservation Commission Bull. 15, entitled "The pine blister," by B. H. Paul, covering the year 1916. No blister rust conference was held in 1921 or 1922].—*Frederick V. Rand.*

6518. ANONYMOUS. Studies on Phytophthoras. [Rev. of: (1) BRUYN, HELENA L. G. DE. The saprophytic life of Phytophthora in the soil. Mededeel. Landbouwhoogeschool Wageningen 24: 4-37. 8 fig. 1922. (2) LÖHNIS, M. P. Onderzoek over Phytophthora infestans (Mont.) de By. op de aardappelplant. H. Veenman: Wageningen, 1922 (see *Bot. Absts.* 12, Entries 1241, 4270).] *Nature* 111: 305. 1923.—The former contains no information "as to whether *P. infestans* was found to live and grow in unsterilized soil; and speculation as to whether the survival of this fungus in the soil from season to season may account for primary outbreaks of potato blight seems altogether too premature."—*O. A. Stevens.*

6519. A., S. F. The Sclerospora disease of sugar-cane in Formosa. *Agric. News [Barbados]* 20: 382-383. 1921.—Downy mildew of sugar-cane (*Sclerospora Sacchari* Miyake) is described as to history, symptoms, the parasite, injury caused, other crops affected, and control. [Cf. also *Agric. News* 21: 79. 1922; and, *Sugar* 24: 619. 1922].—*Frederick V. Rand.*

6520. BOURNE, B. A. Researches on the root disease of sugar cane. Rept. Dept. Agric. Barbados. 17 p., 5 pl. [1922?].—This disease is not confined to any type of soil. With existing agricultural methods plant canes do not appear to be seriously attacked, but ratoon canes seem to be especially susceptible under certain conditions. *Rhizoctonia Solani* and *R. pallida* have both been found associated with newly infected and dying cane roots in typical cases of root disease and also in advanced stages of the disease, and both fungi have been proved by inoculation tests to cause typical root disease. Inoculations with *Marasmius Sacchari* and with *Fusarium* sp. have invariably given negative results. Furthermore, *Marasmius Sacchari* has never been isolated from freshly diseased and dying cane roots, only from dead

roots.—Cultural characters of the 2 species of *Rhizoctonia* are given.—Recommendations for control comprise the use of resistant varieties and healthy cuttings from plants free of disease, proper crop rotation, tillage and drainage, and proper “trashing” of fields of young plant and ratoon canes to conserve soil moisture and to keep down the temperature.—*Frederick V. Rand.*

6521. BRISLEY, HAROLD ROY. Studies on the blight of cucurbits caused by *Macrosporium cucumerinum* E. & E. *Phytopathology* 13: 199–204. *Fig. 1–3.* 1923.—This leaf blight has recently produced serious damage to the cantaloupe [*Cucumis melo* L.] crop in Arizona. The first noticeable evidence of the disease on leaves is a small tan-colored spot the size of a pin head at the point of infection. The spots enlarge until they coalesce and kill the entire leaf. The older spots are made up of concentric dark and lighter colored rings, with always the lighter center. A fruit rot is also produced on over-ripe fruits on diseased vines. Infections were produced by artificial inoculations on leaves of cantaloupe, squash, watermelon, cucumber, Irish potato, and tomato. Apparently the parasite is carried through the winter by the mycelium in dead plant tissue.—*B. B. Higgins.*

6522. BRYCE, G. The toxicity of lime to *Fomes lignosus* Klotzsch. *Dept. Agric. Ceylon Bull.* 64. 17 p. 1923.—*Fomes lignosus* is the causative organism of a serious root disease of para rubber (*Hevea brasiliensis*). The results obtained demonstrate that quicklime applied to the soil has little fungicidal value for *Fomes lignosus*.—*E. D. Merrill.*

6523. CHUPP, CHARLES, AND GRACE L. CLAPP. *Fusicoccum* canker on apple. *Phytopathology* 13: 225–230. *Pl. 12.* 1923.—An apparently new canker disease of apple trees was found on nursery stock in storage at Newark, New York. Black cankers appeared at or near the bud union and occasionally further up the stem. Isolations from canker tissue gave a species of *Fusicoccum* capable of reproducing the disease. The fungus, after comparison with specimens and descriptions of similar pycnidial fungi, is considered a new species and is here described as *Fusicoccum Pyrorum*. It does not seem to be very actively parasitic. In every case observed, affected trees have been in a weakened condition previous to infection.—*B. B. Higgins.*

6524. CLAYTON, EDWARD E. The relation of soil moisture to the *Fusarium* wilt of the tomato. *Amer. Jour. Bot.* 10: 133–147. *Pl. 13–15.* 1923.—Tomato plants were grown in crocks of sterilized soil inoculated with a spore suspension of *Fusarium Lycopersici* Sacc. By weighing, in certain cases, and by the auto-irrigator, in others, the soil was held at moisture contents of 13–35 per cent, the latter value representing complete saturation. Plants growing in soil with a low moisture content (13–19 per cent) became infected readily but were very resistant, the disease progressing slowly. Those grown in saturated soil were entirely immune to attack, infection never taking place. This immunity seems to be related to the almost complete absence of nitrates in the tissues of the host plant under these conditions. Vigorous, rapidly growing plants, produced when soil moisture was optimum for growth, were attacked vigorously, but these could be rendered disease-resistant by allowing the soil to become very dry. Plants soon lost their resistance or immunity when the moisture content of the soil became such as to stimulate vigorous growth.—*E. W. Sinnott.*

6525. CZARNECKI, HELEN. Studies on the so-called black heart disease of the apricot. *Phytopathology* 13: 216–224. *Pl. 11, fig. 1–4.* 1923.—A new disease of apricots [*Prunus armeniaca* L.] and of almonds [*Prunus amygdalus* Stokes] is reported from California. The disease is characterized by a sudden wilting of the leaves, the only external symptom, and by the blackening of the heart wood. It usually appears first in June when its presence is manifested by a sudden wilting at the tip of 1 or more branches. The wilting spreads back and the entire tree is soon killed. The disease is most common on young trees. Many isolations from diseased wood from various localities have shown the constant association of a species of *Verticillium*; and inoculations of this fungus into healthy trees have reproduced the disease.—*B. B. Higgins.*

6526. DETMERS, FRED A. *Dothichiza* canker on Norway poplar. *Phytopathology* 13: 245-247. Pl. 13. 1923.—A canker of Norway poplar (*Populus Eugenei* Simon-Louis) caused by *Dothichiza populea* Sacc. & Briard is here recorded for the 1st time, though cankers produced by this fungus are common on other species of poplar. In a large planting of Norway poplar in Ohio the young trees were so badly damaged that they were dug up and burned.—*B. B. Higgins.*

6527. DICKSON, JAMES G. Influence of soil temperature and moisture on the development of the seedling blight of wheat and corn caused by *Gibberella Saubinetii*. *Jour. Agric. Res.* 23: 837-870. Pl. 1-6 (1 and 2 col.), fig. 1-15. 1923.—*Gibberella Saubinetii* causes a seedling blight of both maize [*Zea*] and wheat [*Triticum*]. The disease develops from infected seed, scabbed seed in the case of wheat, and from infested soil. It appears (1) as a blight of the seedlings prior to emergence from the soil (commonly spoken of as poor germination), (2) as a blight after emergence with resulting yellow and wilted seedlings, and (3) as a dwarfing of the seedlings due to weakened root systems. The extent of blighting is in direct proportion to the amount of infestation, environmental factors being equal. The most important environmental factor in determining seedling blight is soil temperature. The pathogen in pure culture has a wide temperature range of growth, varying from 3 to 32°C. The optimum temperature for spore germination, vegetative development, and sporulation is about 24°C. on unacidified media, and 28°C. on acidified media. Wheat develops best at low soil temperatures while maize develops best at high soil temperatures. The most favorable soil temperature for the blighting of wheat ranges from 12 to 28°C., below which blighting seldom occurs. The most favorable soil temperature for the blighting of maize ranges from 8 to 20°C., while above 24°C. no blighting occurs. Low moisture is most favorable for blight of wheat, even at low soil temperatures. Results of experiments in sowing maize and wheat in the field at various dates, and recording soil moisture and temperature are in accord with the above results obtained in the greenhouse. The mean daily soil temperature in the field corresponds to the constant soil temperature in the greenhouse. There is a sharp critical temperature for both the blight of maize and wheat. This is between 20 and 24°C. for maize and about 12°C. for wheat. The seedlings become susceptible to the pathogen when they are unable to respond favorably to the environment.—*W. H. Burkholder.*

6528. DOWSON, W. J. Contributions from the Wisley Laboratory. XLI.—The wilt disease of Michaelmas daisies. *Jour. Roy. Hort. Soc.* 48: 38-57. Fig. 11-18. 1923.—The cause of this disease was found to be a fungus of the genus *Cephalosporium* working in the water conducting tissue. It produces a toxic substance which causes yellowing and dying of the leaves. Control of the disease is based on experimental results showing that (1) healthy plants may be grown from suckers taken from diseased stock; (2) the disease rarely kills plants the 1st season; and (3) the fungous mycelium is localized in the base of the plant during spring and early summer and does not occur in the suckers. A technical description of the causal organism, *Cephalosporium Asteris* n. sp., is given, followed by a list of 13 references to literature.—*J. S. Bailey.*

6529. EARLE, F. S. Sugar cane root disease. A neglected enemy of cane and ways of controlling it. *Facts about Sugar* 16: 314. 1923. [See Bot. Absts. 11, Entry 2867.]

6530. FARIS, JAMES A. Anthracnose of the Boston fern. *Mycologia* 15: 89-95. Pl. 8-9. 1923.—From brown, withered tips of *Nephrolepis exaltata* growing in the Brooklyn Botanic Garden, a fungus was obtained in pure culture which when inoculated on healthy fronds produced the same symptoms. A description of both an imperfect (*Colletotrichum*) stage and a perfect (*Glomerella*) stage of the fungus is given. It is tentatively named *Glomerella Nephrolepis* sp. nov. Control measures are given.—*H. R. Rosen.*

6531. F[YSON], P. F. [Rev. of: SUNDARARAMAN, S. Helminthosporium disease of rice. *Agric. Res. Inst. Pusa Bull.* 128. 7 p., 4 pl. (2 col.). 1922 (see Bot. Absts. 12, Entry 6546).] *Jour. Indian Bot.* 3: 155. 1923.

6532. F[YSON], P. F. [Rev. of: SUNDARARAMAN, S. **The coconut-bleeding disease.** Agric. Res. Inst. Pusa Bull. 127. 8 p., 6 pl. (1 col.). 1922 (see Bot. Absts. 12, Entry 6547).] Jour. Indian Bot. 3: 155. 1923.

6533. GAINES, E. F., and F. J. STEVENSON. **Occurrence of bunt in rye.** Phytopathology 13: 210-215. Fig. 1-2. 1923.—*Tilletia Tritici* has been found occurring naturally in a few heads of Rosen rye (*Secale cereale* L.) and in wheat × rye hybrids. Artificial inoculations of seed of 9 varieties of rye showed 5 entirely immune. The other 4 produced some infected heads. The wheat × rye hybrids were much more susceptible. Spores from the smutted rye were much less virulent on wheat than were spores from wheat; and they failed to produce any infection on rye. It is suggested that *Tilletia Tritici* (Bjerk.) Wint. and *T. secalis* (Cda.) Kühn. are in reality the same fungus.—B. B. Higgins.

6534. HUNGERFORD, CHAS. W. **A Fusarium wilt of spinach.** Phytopathology 13: 205-209. Fig. 1-4. 1923.—A root rot and wilt of spinach [*Spinacia oleracea* L.], first noted at Moscow, Idaho, in 1919, is attributed to *Fusarium Spinaciae* n. sp. The leaves become pale yellow, the edges roll inward and die, and the entire plant succumbs within 2-3 weeks. Most of the fine fibrous roots of such plants are decayed. The vascular tissues in the main root and in the base of the stem are darkened.—B. B. Higgins.

6535. JONES, L. R., and J. C. WALKER. **Yellows-resistant cabbage varieties.** Some necessary precautions for seedsmen to consider in the production and distribution of seeds of new special strains. Seed World 13³: 20-21. 1 fig. 1923.

6536. LANSING, K. H. **Discovers how to control lettuce "drop" (*Sclerotinia libertiana*).** Formaldehyde treatment of seed beds found to be a very effective method of control. Seed World 12³: 20. 2 fig. 1922.—This control treatment including methods of application is made possible through the research work of W. S. BEACH and is here briefly described.—Frederick V. Rand.

6537. LEE, H. ATHERTON. **A disease of Satsuma and Mandarin orange fruits caused by *Gloeosporium folliculorum* Nishida.** Philippine Jour. Sci. 22: 603-615. Pl. 1 (col.), 1 fig. 1923.—A general discussion of the disease and the causative organism is presented. In Japan it has been observed to cause a loss of 20 per cent of the crop of the Wase Unshiu variety of orange. It seems to be confined to this one variety, but inoculation experiments have shown that at higher temperatures it affects other varieties of the Unshiu and the Mandarin oranges.—E. D. Merrill.

6538. LEE, H. ATHERTON, and F. B. SERRANO. **Banana wilt of the Manila hemp plant.** Phytopathology 13: 253-256. 1923.—A heart rot of Manila hemp plant (*Musa textilis* Neé) is produced by a *Fusarium*, apparently identical with *F. cubense* E. F. Smith. The fungus was readily isolated from tissue in early stages of decay, and in 1 series of 134 inoculations produced 66.41 per cent infections. A similar rot was produced in hemp plants inoculated with *Fusarium* from wilted banana plants. A comparison of the 2 organisms showed them to be similar morphologically and in cultural characters.—B. B. Higgins.

6539. LIESE, I. **Neue Beobachtung über *Cenangium abietis* Pers.** [Recent observations on *Cenangium abietis*.] Zeitschr. Forst.- u. Jagdw. 54: 227-229. 1 fig. 1922.—Under favorable conditions this saprophytic fungus attacks and kills young shoots of pine, gaining access through the buds. In this particular case, 1-year-old Scotch pine (*Pinus silvestris*) in a nursery in the forest range of Koppelsburg, Pomerania, was attacked. The disease manifested itself by the dying-off of the stem and leaves immediately below the terminal bud, and included the upper $\frac{1}{2}$ of the tree. Previous opinion commonly considered that only pines over 5 years of age were subject to attack. In general, the trees attacked recovered, and the disease may be considered as a temporary one, causing little destruction.—J. Roeser.

6540. LINE, J. The parasitism of *Nectria cinnabarina* (coral spot) with special reference to its action on red currant. Trans. British Mycol. Soc. 8: 22-28. Pl. 1. 1922.—*Nectria cinnabarina* is ordinarily not capable of infecting living portions of a red currant (*Ribes vulgare*) plant directly. It may occasionally gain entrance through wounds but the normal method of attack is by spreading through the wood cells from a dead portion into healthy wood. Injury is due to clogging of the wood cells by the fungus hyphae thus causing wilting and subsequent death of the parts above.—W. B. McDougall.

6541. [McCALLAN, E. A.] Snapdragon rust. Agric. Bull. Bermuda Dept. Agric. 26: 7. 1923.—A call is made for cooperation in eradicating the pathogen [*Puccinia Anterrhini*], and a plan of operation is outlined.—H. H. Whetzel.

6542. MILBRATH, D. G. Downy mildew on lettuce in California. Jour. Agric. Res. 23: 989-993. Pl. 1-3. 1923.—California conditions, especially in the winter months, are very favorable for the development of *Bremia Lactucae* on lettuce [*Lactuca*] and the mildew is widespread in the areas of commercial production. Affected heads do not stand shipment and storage as well as healthy ones.—The variety New York, which is most commonly grown, is very susceptible to the disease, while Iceberg, Big Boston, and Hanson are resistant.—During the cool months, December-March, and at a temperature of 10°C., conidia of *B. Lactucae* commonly germinate by means of swarm spores.—D. Reddick.

6543. MUNN, M. T. Further studies of the fungous associates of germination tests. Proc. Assoc. Official Seed Analysts North America 1920: 57-59. 1921.—The amount of moldiness, or fungous infestation, of seeds as shown in germination testing depends upon conditions of harvesting, character of the seed coat (whether smooth or rough), and the condition of the substratum used (whether sterile or foul with inert material and inoculum). The older and weaker the seeds the more subject they seem to be to attacks of fungi, being unable in many cases to germinate satisfactorily. Certain cases of low germination could be definitely traced to unsatisfactory conditions of weather and methods at the time the seeds were harvested, these facilitating bacterial and fungal infestation. Methods of seed treatment and the use of various chemicals and disinfectants need to be carefully reinvestigated before it will be safe and desirable to use them as an aid in measuring the viability of seed.—M. T. Munn.

6544. PASSY, PIERRE. Sur la gale des poires. [Pear scab.] Rev. Hort. 94: 71-72. Fig. 21-25. 1922

6545. SCILLEY, H. Leaf spot of sugar beets. Facts about Sugar 14: 500-501. 1922.—The leaf spot of sugar beets [*Cercospora beticola*] caused considerable loss in northern Colorado in 1921. Usually there is less loss in the northern part of the state than in the southern on account of the altitude and temperature. The disease does not develop below 70°F. Rotation of crops and later planting are advised as preventive measures.—C. W. Edgerton.

6546. SUNDARARAMAN, S. Helminthosporium disease of rice. Agric. Res. Inst. Pusa Bull. 128. 7 p., 4 pl. (2 col.) 1922.—Disease signs on the leaves consist of small spots with brownish centers bearing smoky black dots made up of spores and hyphae. These spots coalesce and sometimes the whole leaf withers, turns yellowish, and dries up. Continued rains and moist weather favor the spread of the disease. The nodes and glumes are also sometimes attacked. Microscopical examination, cultural and spore-germination studies, and inoculation experiments with this undetermined species of *Helminthosporium* are given. The fungus is said to be a weak parasite, and under normal conditions there is no serious loss of crop. [See also Bot. Absts. 12, Entry 6531.]—Frederick V. Rand.

6547. SUNDARARAMAN, S. The coconut-bleeding disease. Agric. Res. Inst. Pusa Bull. 127. 8 p., 6 pl. (1 col.) 1922.—The first external sign of disease consists in the oozing out of

a dark reddish brown fluid from cracks in the stem of an affected plant. This fluid turns black and dries. The tissue below decays and turns yellow, and later the whole internal tissue rots, no fruit is borne, the crown dwindles in size and the tree finally dies. The causal fungus, *Thielaviopsis paradoxa*, is described, and inoculation experiments and preventive measures are discussed. [See also Bot. Absts. 12, Entry 6532.]-*Frederick V. Rand.*

6548. TOOLE, E. H. Mould prevention in seed germinators. Seed World 11: 15. 1922.—Moldy seeds probably result from the growth of fungi introduced with the seed indicating that unfavorable conditions existed during the harvesting or early storage of the seed. Moldiness may or may not affect viability of seeds. Special attention should be given to seed-borne parasites. The laboratory and germinator should be kept free of old seed or other material which may supply mold spores. The germination chamber should be sterilized when there is a tendency for all samples to mold. As low a temperature for germination should be employed as the requirement of the seed will permit. If it becomes necessary to treat the seeds with chemicals before germination extreme care must be exercised. Complete sterility must be sacrificed to avoid seed injury.—*M. T. Munn.*

6549. VOLLERSTEN, CONRAD. Some facts about blight. Amer. Nut Jour. 17: 30-31. 1922.—None of the filbert varieties are immune to blight, but some European varieties show resistance. Blight can probably be controlled by cutting affected parts.—*E. L. Overholser.*

6550. WALKER, J. C. The hot water treatment of cabbage seed. Phytopathology 13: 251-253. 1923.—The results of several experiments indicate that cabbage seed infested with *Phoma lingam* (Tode.) Desm. may be completely freed of the fungus by treating 30 minutes with hot water at 50°C. Some injury to germination may be expected, depending upon the age and vigor of the seed.—*B. B. Higgins.*

DISEASES CAUSED BY BACTERIA

6551. LUTMAN, B. F. Potato scab in new land. Phytopathology 13: 241-244. 1923.—Several experiments are described in which clean potatoes [*Solanum tuberosum*] were disinfected and planted in new soil at the Vermont Experiment Station. In every case some scab developed. Poured agar-plate cultures from this new soil developed quantities of organisms of the *Actinomyces chromogenus* type. The results indicate the general occurrence of the organism in soils where potatoes have never been grown. It is believed that the organism is generally saprophytic on cellulose matter in the soil and that the parasitism on potatoes is merely secondary.—*B. B. Higgins.*

6552. MATZ, JULIUS. La gomosis de la caña. [Gummosis of sugar cane.] Sugar 24: 352-354. 1922.—This is a popular description of gummosis (*Bacterium vascularum*) with methods of control. A list showing the resistance or susceptibility of different varieties is included.—*C. W. Edgerton.*

6553. MATZ, JULIUS. The gumming disease of sugar cane. Facts about Sugar 15: 258-259. 1922.—The gumming disease of sugar cane, caused by *Bacterium vascularum*, is spreading rapidly in Porto Rico. It is especially common on the Otaheite variety. Some other varieties are resistant or immune. It is advised that the Otaheite variety be avoided.—*C. W. Edgerton.*

6554. SANFORD, G. B. The relation of soil moisture to the development of common scab of potatoe. Phytopathology 13: 231-236. Fig. 1-3. 1923.—During 2 years, potatoes [*Solanum tuberosum* L.] were grown in scab (*Actinomyces scabies*)-infested soil containing various degrees of moisture. During the 2nd year the H-ion concentration of the soil was determined at intervals. The results indicate that the moisture content of the soil is of greater importance than the H-ion concentration. Potato tubers grown in soil with a high moisture content were free from scab, while those grown in comparatively dry soil were badly scabbed, although the H-ion concentration was greater in the dry soil.—*B. B. Higgins.*

DISEASES CAUSED BY ANIMAL PARASITES (INSECTS, NEMAS, PROTOZOANS, ETC.)

6555. ANONYMOUS. The Rhododendron bug. (*Leptobyrsa* (*Stephanitis*) *rhododendri*, Horv.) Jour. Ministry Agric. (London) 29: 555-558. 1 pl. 1922.—This insect is found upon Rhododendrons and in the U. S. A. on species of *Kalmia*. The obvious signs consist of chocolate-brown spots on the lower and a pale "freckling" on the upper leaf surface. The life-history, methods of control, and administrative measures are discussed.—*Frederick V. Rand*.

6556. BROCK, J. A. The principal foes of the sugar beet crop and their control. III. Sugar beet nematode. Facts about Sugar 15: 118-119. 1922.—This is a popular discussion of the nematode, its effect upon the beet, and methods of control.—*C. W. Edgerton*.

6557. BRYCE, G. Experiments with the green muscardine fungus on Rhinoceros beetle larvae. Dept. Agric. Ceylon Bull. 65. 7 p. 1923.—The green muscardine fungus (*Metarrhizium anisopliae* (Metch.) Sor.) is apparently not strongly pathogenic to rhinoceros beetle larvae. The fungus seems to be effective only on larvae that have been in captivity for a considerable period, and have accordingly suffered to some extent a reduction in vitality. The use of the fungus as a means of controlling the rhinoceros beetle on coconuts is therefore not recommended.—*E. D. Merrill*.

6558. DOCTERS VAN LEEUWEN, W. Some galls from Hongkong. Bull. Jard. Bot. Buitenzorg III, 4: 268-278. Fig. 1-20. 1922.—Thirty-four galls collected on various plants near Hongkong are described and 20 of them figured.—*Alfred Rehder*.

6559. DOCTERS VAN LEEUWEN, W. The galls of the islands of the Krakatau group and of the Island of Sebesy. Bull. Jard. Bot. Buitenzorg III, 4: 288-314. Fig. 1-20, map. 1922.—The author describes 82 galls collected on several small islands situated between Java and Sumatra which were completely devastated in 1883 by a volcanic eruption.—*Alfred Rehder*.

6560. DOCTERS VAN LEEUWEN, W. Ueber einige von Aphiden an *Styrax*-Arten gebildete Gallen. [Galls caused by aphids on species of *Styrax*.] Bull. Jard. Bot. Buitenzorg III, 4: 147-162. Pl. 1, fig. 1-16. 1922.—Eighteen different galls caused by aphids on various species of *Styrax* are described and most of them are figured.—*Alfred Rehder*.

6561. [EASTERBY, H. T.] Bureau of Sugar Experiment Stations. Combating insect pests. [Report of E. JARVIS at Meringa.] Australian Sugar Jour. 15: 148-150. 1923.—Satisfactory progress in experiments with paradichlorobenzene for control of cane grubs was obtained in plots at Greenhills, where first ratoons (*Badilla*) were treated with $\frac{1}{2}$ ounce injections placed 1 foot apart, 2 inches from stools and $4\frac{1}{2}$ inches deep on each side of rows. The cane was $4\frac{1}{2}$ feet high at the time of application. These experiments were made successfully, also, at Meringa, using D. 1135 first ratoons growing on volcanic soil infested with grubs. Exchanges of grub parasites have been made with Java. Cocoons of the Australian digger-wasp, *Campsomeris tasmaniensis* and *C. radula*, have been sent which are to control the ravages of scarabæid grubs,—*Lepidiota stigma* Fab. and *Leucopholis rorida* Fab.,—affecting cane and cassava crops. In exchange there will be sent 2 species of scoliid parasites from Java, for introduction into the cane fields to attack grubs of the grey-back cane beetle and of *Lepidiota frenchi*.—In Lower Burdekin successful field demonstrations have been made with carbon bisulphide as a soil fumigant for "white ants" attacking cane. [Cf. also: JARVIS, EDMUND. Work of the Division of Entomology. Ann. Rept. Bur. Sugar Exp. Sta. [Brisbane] 22: 52-56. 1922.]—*C. Rumbold*.

6562. FLINT, W. P. Shall we change our recommendations for San Jose scale control. Jour. Econ. Entomol. 16: 209-215. 1923.—During the years of 1920-1922, inclusive, the San Jose scale, *Aspidiotus perniciosus*, has increased very rapidly in southern Illinois and neighboring states. In southern Illinois it has resulted in the loss of over 1,000 acres of commercial orchard annually treated with lime sulphur.—Experimental work was carried out in the spring

of 1922 with miscible oil and lubricating oil emulsion, similar to those used by the Federal Bureau of Entomology in Florida. The lubricating oil emulsion gave nearly as good control of the scale as did the miscible oil and a much higher degree of control than was obtained from the best grades of liquid lime sulphur. As a result of this work the lubricating oil will be generally used in southern Illinois during the coming year.—*Author's abstract.*

6563. FRANCHINI, G. Essais d'inoculation de latex parasités aux souris blanches. Abcès du foie expérimentaux déterminés par les amibes des latex. [Inoculations of white mice with plant latex. Experimental abcess of the liver caused by amoebae from the latex.] Bull. Soc. Path. Exotique 16: 162-166. Fig. 1. 1923.—The parasitized latex of *Euphorbia* spp. and cultures of amoebae derived from plant latex were pathogenic to white mice when ingested or inoculated into the peritoneum.—*Philip Brierley.*

6564. HYSLOP, J. A. Insect pest survey work in the United States. Jour. Econ. Entomol. 16: 215-221. 1923.—After reviewing the history of survey work in the U. S. A. from 1889 to the present date, and recounting earlier attempts at this type of work by the U. S. Bureau of Entomology, the scope and objects of survey work are set forth. The main thesis brought forward is that survey work, i.e., the accurate recording of insect abundance from year to year, will indicate, after a reasonable number of years, the zone of optimum ecologic conditions affecting any given insect, and the yearly abundance of an insect will be determined by the departures from these optimum conditions.—*From author's abstract.*

6565. LUTMAN, B. F. An outbreak of hopper burn in Vermont. Phytopathology 13: 237-241. Fig. 1. 1923.—An outbreak of hopper burn, produced by the potato leaf hopper [*Empoasca mali*], on potatoes [*Solanum tuberosum*] is described. The injury to the potato leaves is compared with that produced by physiological tip burn. The author expresses the opinion that the leaf hopper extracts the juices from the vascular and adjoining tissues, causing them to become plasmolyzed to such an extent that they can not recover turgidity and so finally die.—*B. B. Higgins.*

6566. SASSCER, E. R. Important foreign insects collected on imported nursery stock in 1922. Jour. Econ. Entomol. 16: 152-158. 1923.—This paper is primarily a summary of the more important insects intercepted on foreign nursery stock arriving in the U. S. A. in 1922.—*From author's abstract.*

6567. THORNE, GERALD. Suggestions for control of nematode. Through the Leaves 1923: (March): 97-99. The Great Western Sugar Co.: Longmont, Colorado, 1923.—This popular article gives a brief description of the sugar beet nematode (*Heterodera schachtii*) with its habits and methods of control,—the latter based entirely on crop rotation and prevention of infestation. [Cf. also: Facts about Sugar 16: 192-193. 1923.]—*Frederick V. Rand.*

INFECTIOUS CHLOROSSES (MOSAIC AND PEACH YELLOWS GROUPS, ETC.)

6568. BRUNER, STEPHEN C. Mosaic and other cane diseases and pests in Cuba. Louisiana Planter 70: 452-455. Fig. 1-4. 1923.—The mosaic disease of sugar cane is present in many localities in Cuba but it does not seem to be spreading as rapidly nor doing as much damage as in some other countries like Porto Rico. The Crystalina cane, the variety which is largely grown in Cuba, is more resistant than many varieties. It is believed that the disease is not a menace to the Cuban sugar industry and that it can be controlled satisfactorily with immune and resistant varieties. Other cane diseases are mentioned very briefly.—*C. W. Edgerton.*

6569. BUTLER, E. J. Some characteristics of the virus diseases of plants. British Med. Jour. 1922: 963-964. 1922.—The diseases of plants caused by an ultramicroscopic agent or virus appear to fall into 4 main groups: (1) mosaics (the largest group); (2) the peach yellows group; (3) forms of variegation which can be transmitted by grafting and in which natural

infection is unknown; and (4) that group resembling in many respects the mosaics, but characterized by phloem necrosis.—The transmission, passage of the virus within the plant and properties of the virus are in turn briefly discussed.—Transmission may be by organic union, by insects, by inoculation with juices from infected plants, or more rarely through the seed. The phenomena of immunity and of "carriers" are exemplified among these diseases. There is much evidence that the virus is conveyed chiefly through the phloem. Plant pathologists were the first to have convicted insects of playing a primary role in natural infection of virus diseases, and they have proved that these diseases may be hereditary in both host plant and insect. They have also shown that the plant cuticle presents an impassable barrier to infection, that a saprophytic life of the causal organisms is highly improbable and that the latter are often so closely associated in some way with the living tissues that infection is only possible in some cases when organic union takes place between diseased and healthy tissues. Plant pathologists, finally, are demonstrating the remarkable effect of the environment, especially temperature, on the course of some of these maladies. Human pathologists, on the other hand, have done more to advance the study of the possible causative agents. [Cf. also: *Sci. Progress* 17: 416-431. 1923.]—*Frederick V. Rand.*

6570. EARLE, F. S. Mosaic disease danger. Prompt action needed to stop its spread in Cuba. *Facts about Sugar* 16: 230-231. 1923.—The mosaic disease of sugar cane is spreading rapidly in Cuba and very little is being done to control it. In Porto Rico, the disease is being controlled by seed selection and roguing.—*C. W. Edgerton.*

6571. MATZ, JULIUS. Naturaleza del mosaico de la caña. [Nature of cane mosaic.] *Sugar* 25: 222-223. 1923.—This is a discussion of the bodies found in the tissues of mosaic-affected plants.—*C. W. Edgerton.*

6572. MAUPAS, ALBERT. Sur la maladie de l'enroulement des feuilles de tomates. [Leaf roll disease of tomatoes.] *Rev. Hort.* 94: 52-54. 1922.—The cause of the disease is unknown. There is an accumulation of starch in the parenchymatous cells of the leaf, a lack of chlorophyll, and often a disintegration of the vessels of the leaf. Strains immune to the disease have been secured by planting seed of individual plants showing resistance.—*E. J. Kraus.*

6573. SEVERIN, HENRY H. P., WILLIAM J. HARTUNG, EDWARD A. SCHWING, AND WILLIAM W. THOMAS. Control of the beet leafhopper. *Facts about Sugar* 15: 134-135, 137. *Fig. 1-6.* 1922.—The leafhoppers and consequently the curly leaf disease of the sugar beet were decreased by dusting the plants with nicotine compounds. It is believed that the disease could be decreased to a considerable extent in isolated fields provided the dust is applied shortly after the spring flight of the hoppers into the cultivated fields.—*C. W. Edgerton.*

6574. VEVE, R. A. The efficiency of the "roguing" method for the eradication of the mottling disease. *Louisiana Planter* 69²: 30. 1922.—At Fajardo, Porto Rico, the mosaic of sugar cane has been reduced from 0.5 to 0.002 per cent by roguing. It is believed that good results can be obtained by this practice if the percentage of the disease is less than 15. [Cf. also: VEVE, R. A. *Cane Mottling Eradication. Facts about Sugar* 15: 78. 1922.]—*C. W. Edgerton.*

PARASITIC PHANEROGAMS

6575. SCHELLENBERG, GUSTAV. Eine sonderbare neue Wirtspflanze der *Lathraea Squamaria* L. [An unusual new host plant of *Lathraea Squamaria*.] *Ber. Deutsch. Bot. Ges.* 37: 427-429. 1919.—In the Botanical Garden of the University of Kiel a growth of *Lathraea* was found apparently parasitizing the beds of *Gunnera manicata* Linden and *G. chilensis* Lam. Investigation showed that *Lathraea* seed can germinate on *Gunnera chilensis* and are able to develop not only into seedlings but into much older plants with several branches. It was not formerly known that *Lathraea Squamaria* could grow on an herbaceous host plant and *Gunnera*

is especially noteworthy in this respect since it possesses especially fleshy roots. The previously known hosts of *Lathraea* are all woody plants without fleshy roots. The parasite is able to endure the relatively high tannin content of the *Gunnera* roots. Perhaps this large amount of tannin makes growth on *Gunnera* roots possible since *Lathraea* prefers as hosts plants with roots rich in tannin.—*Lillian C. Cash.*

NON-PARASITIC DISEASES

6576. BARTHOLOMEW, E. T. Internal decline of lemons II. Growth rate, water content, and acidity of lemons at different stages of maturity. *Amer. Jour. Bot.* 10: 117-126. 1923.—The size and growth rate of lemon fruits was determined by diameter measurements with a caliper, the acidity by the hydrogen electrode, and the water content by drying in a vacuum oven. The lemon tree tends toward the production of new fruit continuously, but the age of the tree and climatic and soil conditions make production more or less seasonal. Growth rate of fruit is determined by the time of year when set, the age of the tree, and various environmental conditions. Experiment shows that fruits may decrease considerably in size and in water content while still attached to the tree, in consequence of the withdrawal of water from them by the leaves. This may result in the collapse of a portion of the tissue at the styler end of the fruit, which is the first visible step in the production of internal decline. The wilting coefficient of the soil, as indicated by the leaves, cannot therefore be used to tell whether the fruits are suffering from lack of water. The water content of the 2 ends of a normal lemon is practically the same. As the lemon enlarges, its water content increases, although this increase is very small after the fruit reaches a diameter of about 3.8 cm. The size of the fruit is not necessarily proportional to the amount of water it contains. Mature lemons vary in water content, the range in these experiments being from 88.20 to 92.14 per cent. Total acid content increases rapidly as the fruit approaches maturity, but the true acidity increases very little after a diameter of 3.8 cm. is reached. Both ends of a normal lemon have approximately the same acidity. Mature lemons vary in acidity.—*E. W. Sinnott.*

6577. NEILSON, J. A. The winter injury problem. *Canadian Hort.* 44: 189-192. 1921.—The prevalence of winter injury on various fruits throughout the Province of Ontario is noted. Many forms of winter injury occur, ranging from complete killing of the tree to bud injury, and include root injury, sunscald, black heart, killing of bark on large and small limbs, killing of fruit spurs, fruit buds and terminal growth. Factors which predispose fruit trees to winter injury are noted and discussed together with preventive measures. These include temperature and winds, soil and cultural influences, heavy fruiting and stocks for propagation.—*E. F. Palmer.*

6578. PETIT, A. Un cas de chlorose guéri par le calcaire. [An instance of chlorosis eliminated by lime.] *Rev. Hort.* 94: 154-155. 1922.—Lime is effective against chlorosis caused by acidity of the soil, although an excess of lime causes chlorosis in certain plants particularly sensitive to it, such as some *Hydrangeas*, *Calceolarias*, *Rhododendrons*, and others.—*E. J. Kraus.*

DISEASES OF UNKNOWN CAUSE

6579. EARLE, F. S. Unknown cane disease found. *Facts about Sugar* 16: 383, 385. 1923.—The presence of an unknown cane disease is reported in Porto Rico. The disease first appears as small whitish water-soaked spots on the small leaves while they are still enrolled in the terminal bud spindle. On old leaves the very numerous spots are $\frac{1}{8}$ – $\frac{1}{4}$ inch wide and 1-2 inches long. The cause of the trouble was not determined, but the appearance suggested a bacterial origin.—*C. W. Edgerton.*

6580. LEE, H. A., C. G. WELLES, AND M. G. MEDALLA. Fiji disease in the Philippines. *Sugar* 24: 676-677. 1922. [See also *Bot. Absts.* 12, Entry 1317.]

GENERAL AND MISCELLANEOUS PATHOLOGICAL LITERATURE

6581. ANONYMOUS. A preliminary list of the diseases of cultivated plants in Ceylon. Dept. Agric. Ceylon Bull. 52. 24 p. 1922.—This is a compilation by members of the staff of the division of botany and mycology. The hosts are arranged alphabetically and under each the causative organisms of the various types of diseases are listed by their technical names under leaf, stem, and root diseases.—*E. D. Merrill.*

6582. ANONYMOUS. Summary of laws and regulations in force in Ceylon in respect of plant pests and diseases. Dept. Agric. Ceylon Bull. 48. 6 p. 1921.—A brief summary is given of the laws and regulations in force covering the importation, disinfecting of plants, destruction of plant pests, etc.—*E. D. Merrill.*

6583. ARNOLD, G. F. Uniformity of nursery stock fumigation requirements. Jour. Econ. Entomol. 16:161-166. 1923.—Recommendations for fumigating nursery stock in the different states vary considerably in the strength of hydrocyanic acid gas to use and the time of exposure necessary. The variations in temperature and humidity throughout the U. S. A. would not permit of standard fumigation regulations for the entire country. It would seem desirable for the states in each section (e.g., the Southern States) to adopt similar fumigation requirements for each kind of plant to be fumigated. Further experiments are suggested to determine the fumigation schedule that could be adopted in each group of states in the country.—*Author's abstract.*

6584. BALD, CLAUD. Indian tea: its culture and manufacture, being a text-book on the culture and manufacture of tea. 4th ed., viii + 397 p., 36 fig. Thacker, Spink and Co.: Calcutta, 1922.—Thirty-one pages of this work are devoted to a popular discussion of "tea blights" including insect and related pests, fungous diseases, and injuries by lichens and mosses, and by hail.—*Frederick V. Rand.*

6585. BALL, BERT. Seed potato treatment increases acre yield and profit. Seed World 11:15. 1 fig. 1922.—The author recommends hot formaldehyde solution.—*M. T. Munn.*

6586. BEATTIE, R. KENT. Important plant diseases collected on imported nursery stock in 1921 and 1922. Jour. Econ. Entomol. 16:146-151. 1923.—Quarantine 37 seeks to reduce the risk of importing foreign plant diseases and insect pests by limiting the entry of plants to those necessary and by surrounding such entry as is permitted with the safeguards of (1) freedom from soil, (2) importation in safest form, (3) inspection on entry, (4) disinfection, (5) field inspection, (6) port inspection of baggage and freight. A list of important plant diseases intercepted during the years 1921 and 1922 is appended.—*Author's abstract.*

6587. BROOKS, F. T. Disease resistance in plants. British Med. Jour. 1922: 964-966. 1922.—In man the parasites are chiefly bacteria and protozoa, in plants most pathological agents are fungi. In plants individual differences in reaction to disease are less pronounced but races of plants often show marked differences in susceptibility. As to the actual causes of disease resistance in plants little is known. Much so-called immunity is nothing more than disease escape. On the other hand the host does sometimes actively resist penetration by a parasitic fungus, as in certain rusts where the parasite attacks the host so feebly that haustoria cannot be established in the host cells and the fungus soon dies; in other cases the fungus may attack so vigorously that it surrounds itself with a barrier of dead cells which it cannot penetrate. These cases of immunity are purely local in effect and any antibodies found during the struggle are not transferred to other parts of the plant, there to confer immunity to subsequent attacks. With few exceptions parasitic attack in plants is relatively localized, the parasite only gradually enlarging its domain by progressive advancement.—On the other hand, fungi inhabiting the vascular system sometimes secrete toxic substances which, carried in the sap, cause death in distant tissues.—The environment is of particular

significance as regards the incidence of plant diseases.—In plant pathology high resistance rather than absolute immunity is usually concerned. Potato wart is one exception to this rule.—No examples are known where artificial immunity may be conferred on plants by inoculation with a weak strain of an otherwise virulent parasite.—Many plant diseases are due to wound parasites, the latter infecting only by way of dead cells. Although differences in susceptibility to diseases of this type may be just as marked as with obligate parasites like the rusts, the explanation of relative immunity is probably of a considerably different nature in the 2 categories.—*Frederick V. Rand.*

6588. EDGERTON, C. W. Rose diseases in Louisiana. Louisiana Agric. Exp. Sta. Extension Div. Cir. 63. 8 p., 3 fig. 1923.—The common rose diseases, mildew, leaf spots, crown gall, blossom blight and canker, are briefly described and directions given for their control.—*C. W. Edgerton.*

6589. GADD, C. H. Nut fall of coconuts. Dept. Agric. Ceylon Bull. 53. 18 p., 3 fig. 1922.—Very young immature nuts fall as a consequence of an excess of female flowers, sometimes influenced by drought conditions. The fall of older nuts may be caused by the attack of *Phytophthora* sp., or may be caused by mechanical or physiological factors. Bordeaux mixture spray is recommended as a preventive of nut fall caused by fungus attack.—*E. D. Merrill.*

6590. GADD, C. H. The efficacy of formaldehyde vapour as a disinfectant of tea seed. Dept. Agric. Ceylon Bull. 51. 8 p. 1921.—The method of disinfection at Colombo is economically unsound, and it does not prove an adequate safeguard against the introduction of fungus pests with tea seed.—*E. D. Merrill.*

6591. GRAM, ERNST, OG SOFIE ROSTRUP. Oversigt over Sygdomme hos Landbrugets og Havebrugets Kulturplanter i 1922. [Review of diseases of cultivated plants, 1922.] Tidsskr. Planteavl 29: 236–307. 1923.—This report covers the period from Oct. 1, 1921 to Sept. 30, 1922. The weather was dry during the fall, exceptionally cold during the winter, the spring was late and the summer cool and moist. The following were reported: *Pleospora graminea* was serious in a few cases on barley; *Tilletia caries* is decreasing because of seed treatment; *Ustilago Hordei*, *U. Avenae*, and *Urocystis occulta* have increased; *Heterodera Schachtii* var. *Avenae* was most destructive where oats were grown too frequently; larvae of *Oscinis frit* and *Chlorops taeniopus* were disastrous in Jutland; larvae of *Hylemyia coarctata* attacked wheat after several inactive seasons; *Agriotes lineatus* larvae infected summer and winter grain; *Biston zonarius* larvae devoured an alfalfa field; *Hypochnus Solani* was severe; *Sclerotinia sclerotiorum*, *Ascochyta Pisi*, and *Macrosiphum Pisi* were common on legumes; *Trioza viridula* occurred in Jutland; potato leaf roll, mosaic, and other virus diseases have greatly increased due to hot, dry weather; *Apanea testacea* larvae ruined meadow fescue; *Fusarium Willkommii* (conidial form of *Nectria galligena*) caused storage rot in apples and pears; *Xyloterus dispar* injury on fruit trees was reported for the first time in Denmark; *Hoplocampa testudinea* and *H. fulvicornis* were numerous on apples, pears and plums; *Marsonia Potentillae* var. *Fragariae* was reported for the first time causing strawberry leaf spot; *Anthonomus Rubi* caused severe injury in strawberries; *Acalla comariana* larvae were serious on strawberries; *Phyllotreta nemorum* and other flea beetles made rescuing necessary in many cases; *Meligethes aeneus* spoiled seed crops of swedes and other crucifers; *Phyllotreta cucurbitacearum* occurred in leaf-spots on muskmelons; *Heterosporium Allii* appeared on leeks. Frost injury was bad on some varieties of wheat when late sown and on fruits and ornamentals; salt water injury was caused by heavy storms; spray injury occurred on apples and roses due to 2 per cent Burgundy mixture with 0.05 per cent Schweinfurther green, and on pears due to formalin; a tobacco extract containing free ammonia caused complete defoliation. *Phytophthora infestans* was successfully controlled with 2 per cent Bordeaux mixture on tomato fruits; *Cladosporium fulvum* in greenhouses was controlled by ventilation and night heating, and a 1:40 lime sulphur spray was better than 2 per cent Bordeaux mixture. The migration of *Aphis Fitchii* to grass roots

was demonstrated; the larvae of *Chortophila brassicae* were controlled experimentally with tar paper discs and with 2 waterings with a 0.1 per cent solution of corrosive sublimate; numerous experiments proved that beet mosaic was not carried by seed, and the newly hatched larvae of *Nematus ribesii* were destroyed by tobacco extract spray.—*Albert A. Hansen.*

6592. HAUDUROY, PAUL. Atlas de parasitologie. [Atlas of parasitology.] 53 p., 25 pl. O. Doin: Paris, 1923.—This "atlas" comprises a set of plates each with a descriptive page, systematically arranged, figuring and briefly describing the parasites of man and animals, beginning with amoebae, flagellates and spirochaetes, including the other parasites of animal affinities, and ending with fungus parasites.—*Frederick V. Rand.*

6593. LANG, WILLIAM H. II. Some aspects of vegetable pathology in relation to human disease. British Med. Jour. 1922: 958-961. 1922.—The common features of all living things justify the attempt at comparisons between pathological processes in plants and animals but it is well to maintain a critical rather than an optimistic attitude.—Comparison is made between pathological reactions in certain fossil Devonian plants and intumescences and wound-calluses of today. It seems obvious to the author that a general correspondence can be traced between the healing of a wound in the plant vs. the animal body, but that more specific comparisons would only lead astray.—Crown gall (*Bacterium tumefaciens* Sm. & Town.), especially as set forth in the researches of Erwin F. Smith, is discussed in some detail, with references also to plant galls of animal causation and to several other diseases of fungus and bacterial origin. There is no doubt that the resemblances between sections of some of the tumor-like growths of crown gall and of animal tumors are striking and may well interest the human pathologist. The author, however, does not accept on the evidence before him all the direct comparisons with malignant tumors in animals nor does he think it wise to draw conclusions as to the etiology of the latter from the undoubted facts as to *B. tumefaciens* being the cause of crown gall. The conception of embryomatous tumors in animals involves the early distinction of germinal layers and of somatic and reproductive cells; there is no strict parallel to this, he says, in plants. The question of actual intrusion, as distinguished from extension of the morbid process to adjoining cells, requires critical reinvestigation.—It is of interest to note that Erwin F. Smith's studies of crown gall have led him to consider and experimentally attack such general underlying problems as the tracing of pathological processes back to changes in the cells and their protoplasm, and as such work is more and more carried out fundamental common features of disease in plants and animals will become increasingly evident. To the philosophical human pathologist the study of some plant diseases will be light-giving, and it is perhaps better not to expect it to be fruit-giving.—*Frederick V. Rand.*

6594. NORTH, D. S. The control of sugar cane diseases. Pt. I.—(Continued.) II. The nature of our diseases and the means for their control. Australian Sugar Jour. 15: 9-24. 1923.—All the more important Australian cane diseases have been imported with cane and can be propagated by diseased cuttings. The diseases discussed are grouped into 3 types. Type 1. Gumming, leaf scald, leaf stripe, Fiji disease, and mosaic will always produce diseased plants from a diseased set. The diseased plant is highly infectious. There may be alternate hosts, but they have not been traced. Control is by careful selection of healthy seed, eradication of diseased cane, and use of resistant varieties.—Type 2. Red rot, root fungus disease (*Marasmius* type) and the Sclerotial diseases of the leaf sheaths are caused by weak facultative parasites. They live on decaying cane which is attacked only when enfeebled. Healthy cane can be propagated from infected plants. Control is by judicious rotation of crops, cultivation, and use of resistant varieties.—Type 3. Leaf spots such as true rust, eye spot, and ring spot are caused by strict parasites. They are conspicuous but not especially harmful diseases and appear and disappear at particular seasons. Control is by the use of resistant varieties.—Part II. To prevent spreading disease with different varieties of cane safeguards are suggested. Those endorsed in one part of Australia are: (1) every precaution practicable should be taken at the forwarding end that healthy plants are selected for sending; (2) every imported cane should be grown in strict quarantine until its health is assured. Foreign im-

portations should be limited to a few varieties at intervals of years. Only varieties of outstanding promise should be imported. No cane plants should be sent from state to state or mill to mill within Australia except under supervision. Quarantine might be waived only in case of neighboring mills where similar conditions exist, same diseases occur and same standard varieties are grown. Within a mill district bulk transportation of cane should be discouraged except under technical supervision. (3) New varieties should be obtained by raising seedlings rather than importing from abroad. Only seedlings of highest promise should be exchanged with other centers. The exclusion of all foreign canes, at least temporarily, should be considered, but first a general agreement as to quarantine measures should be reached. A quarantine system is now used in 1 region for the introduction of canes from Fiji and New Guinea. A few cane plants are grown in gardens of private residences near Sidney. These gardens are about 1 mile apart. Although so far south of the tropical cane areas, the plants grow satisfactorily when cared for. Monthly inspections for 2 years are made for the presence of diseases or pests.—*C. Rumbold*.

6595. SORAUER, PAUL. *Handbuch der Pflanzenkrankheiten begründet von Paul Sorauer*. 4th ed. Edited by G. LINDAU in cooperation with E. KÖHLER, R. LAUBERT, W. WOLLENWEBER, AND H. ZILLIG. Vol. 3. *Die pflanzlichen Parasiten*. Pt. 2. [Handbook of plant diseases founded by Paul Sorauer. Diseases caused by vegetable parasites.] vi + 310 p., 55 fig. Paul Parey: Berlin, 1923.—This volume continues the discussion of parasitic fungi begun in volume 2, part 1, and under this heading includes the Basidiomycetes and Fungi Imperfecti, with a special chapter on the genus *Fusarium* by H. W. Wollenweber. This is followed by sections on parasitic algae, lichens, phanerogamic parasites; and a final section on prevention and control of fungous diseases of plants, a special chapter on the smuts, by H. Zillig, and a supplement to the Hypodermataceae.—Treatment of the subject includes general descriptions and discussions of the major groups with keys to the principal genera, and descriptions and discussions of genera and species. [See also Bot. Absts. 12, Entries 2050, 2051.]—*Frederick V. Rand*.

6596. STEARNS, L. A., AND W. S. HOUGH. *Spreader tests on apples and peaches*. Jour. Econ. Entomol. 16: 198-207. 1923.—Casein and flour-paste have received considerable attention for some time as spreaders and adhesives in spray solutions. In 1922, orchard tests were conducted with Kayso, a prepared casein spreader, and Magnet Dry Paste, a prepared flour-paste spreader to determine their effectiveness as influencing the spreading and adherence of the summer applications in the scheduled programs for apple and peach spraying in Virginia.—Neither of the spreaders used increased the effectiveness of the spray solution in protecting the fruit from insects and diseases. The same was true in case of the foliage. It is doubtful whether the addition of a spreader, such as the 2 used, would pay for the increased cost of the spray. Nicotine sulphate 40 per cent (Black Leaf 40) and casein (Kayso) as used, were uncongenial.—*Authors' abstract*.

6597. TAUBENHAUS, J. J. *The culture and diseases of the sweet potato*. xv + 286 p., 29 fig. E. P. Dutton and Co: New York, 1923.—Of this comprehensive work on the sweet potato 75 pages are devoted to its diseases. The discussion under this head includes the morphology of the healthy host, losses from sweet potato diseases, specific diseases, insects, and other pests. Under "Specific diseases" some 25 or more sweet potato maladies are discussed as to kind and amount of injury, causal organism if any, control, and other special points of interest relative to particular diseases.—*Frederick V. Rand*.

6598. [TAYLOR, E. H.] *Cane diseases in the Philippines*. Sugar 24: 504-505. 1922.—This is a brief account of the Fiji disease and the Formosa leaf-stripe disease of sugar cane, 2 diseases introduced into the Philippines within the preceding 10 years.—*C. W. Edgerton*.

6599. WHETZEL, H. H. *Dusting in Bermuda*. Agric. Bull. Bermuda Dept. Agric. 2⁵: 9-10. 1923.—Observations and suggestions are presented on the status of dusting in the Islands with directions and suggestions for its more effective application.—*H. H. Whetzel*.

6600. WHETZEL, H. H. The plant disease situation. [Special report on plant diseases in Bermuda.] Agric. Bull. Bermuda Dept. Agric. 2⁵: 2-9. 1923.—A report on diseases and pests was presented to the Director and Board of Agriculture following a 10-days' visit to the Islands during April, 1923. The epiphytotic of onion blight caused by *Peronospora schlei-deniana* is briefly presented. A loss of about 75 per cent of the crop is predicted. Late blight of the potato is reported as severe in the Garnet crop due to the cool rainy season. Snapdragon rust, caused by *Puccinia Anterrhina*, first observed in Bermuda in 1922 has swept the Islands, practically ruining this ornamental plant and promising to make the growing of snapdragons there impossible in the future. The oleander scale (*Aulicaspis pentagona*), so destructive during the past 2 or 3 years, is rapidly being brought under control by imported parasites. Celery blight (*Septoria petroselinia*) and onion pink rot (*Fusarium Mali*) were less severe than in 1922. Remarkable progress in development of dusting in the Islands is reported.—H. H. Whetzel.

6601. ANONYMOUS. The cultivation of medicinal plants in France. Amer. Druggist and Pharm. Rec. 71: 11-14. 6 fig. 1923.—The author describes the organization of the Committee of Medicinal Plants, which was necessary because of the failure of supplies from Germany and Austria; the conditions under which collection and marketing wild plants is profitable, and the cultivation of plants which cannot be supplied by other means.—C. M. Sterling.

6602. BLOKZEYL, K. R. F. Essential oil production in Java. Pharm. Era 56: 667-670, 694. 5 fig. 1923.—An account is given of the sources, collection of plants, and distillation of oils of Citronella, Lemongrass, Cananga, Vetivert, Patchouli, and Cajuput.—C. M. Sterling.

6603. GORTER, K. Sur la laurotétanine, l'alcadoïde tétanisant de diverses Lauracées. [On the constituents of laurel—the alkaloidal content of various Lauraceae.] Bull. Jard. Bot. Buitenzorg III, 3: 180-198. 1921.

6604. JONESSON, A. The most widely used crude drug. Pharm. Era 56: 607-608. 4 fig. 1923.—The author gives a history of the varieties of senna, their collection, marketing, and uses.—C. M. Sterling.

6605. KOCH, F. J. The whence of the lavender. Amer. Druggist and Pharm. Rec. 71: 20-21. 2 fig. 1923.—A brief account is presented of the habitat, collection, and preparation of lavender.—C. M. Sterling.

6606. KRITIKER, D. B. Some important drugs of India, their chemical constituents, therapeutics and native uses. Amer. Druggist and Pharm. Rec. 71: 20-22. 1923.—A description is given of the most important drugs derived from India, giving the habitat and methods of preparation as well as the chemical constituents and therapeutic uses of Indian Hemp, Sandalwood, Myristica, Mace, Podophyllum, Nux Vomica, Pomegranate, Turmeric, Catechu, and Opium.—C. M. Sterling.

6607. MOLL, J. W., AND H. H. JANSSONIUS. Botanical pen-portraits. viii + 472 p., 111 fig. Martinus Nijhoff: The Hague, 1923.—The authors have attempted for micrography what has been so well done in phytography. The work attempts to give so accurate and so complete a description of the microscopic structure of the plant or part of the plant (the authors have selected for their study the description of 100 vegetable drugs), that a drawing is not

needed. A pen-portrait gives more than any drawing, for the latter can represent only a single individual and therefore but one aspect of the object. The pen-portrait not only combined the descriptions of sections in various directions into a perspective description, and thus portrays the tissues as bodies with 3 dimensions, but can also combine the descriptions of several individuals, so that a knowledge of "habit" of that particular object is acquired. In order to do this, 21 "guiding schemes" for the descriptions have been constructed, each calling critical attention to what ought to be observed. For example, in the Guiding Scheme for the Description of the Leaf, more than 150 points are stressed; even in the Guiding Scheme for the Description of a Stamen attention is called to more than 150 points. In nearly all cases the authors, after giving the Latin and English official names, and the part official, describe the (1) "macroscopic characters," a scheme for which is also included among the list of schemes; (2) "anatomical characters," under which caption appears a fairly exhaustive literature on the drug, a remark on the nature of the material used,—whether fresh or dry, if fresh, how fixed, etc., and the list of reagents used; (3) "micrography," the main portion of the work; (4) "micrography of the powder," given in only part of the cases. A carefully arranged list of literature on the subject, a complete list of the chemicals and reagents used, and a glossary of the anatomical terms used, add to the value of the work. Following is a list of the drugs described, 60 of which are in the U. S. Pharmacopoeia: *Amylum Manihot*, *Amylum Marantae*, *Amylum Maidis*, *Amylum Oryzae*, *Amylum Tritici*, *Bulbus Scillae*, *Carrageen*, *Caryophylli*, *Cortex Alyxiae*, *Cortex Cinnamoni*, *Cortex Condurango*, *Cortex Cuspariae*, *Cortex Fructus Aurantii*, *Cortex Granati*, *Cortex Hamamelidis*, *Cortex Mezerei*, *Cortex Pruni virginianae*, *Cortex Quillariae*, *Cortex Rhamni Frangulae*, *Cortex Rhamni Purshianae*, *Cortex Syzygii*, *Cortex Viburni prunifolii*, *Flores Arnicae*, *Flores Chamomillae vulgaris*, *Flores Cinae*, *Flores Tiliae*, *Folia Althaeae*, *Folia Buchu*, *Folia Cocae*, *Folia Digitalis*, *Folia Eucalypti*, *Folia Jaborandi*, *Folia Laurocerasi*, *Folia Menthae piperitae*, *Folia Salviae*, *Folia Sennae*, *Folia Stramonii*, *Folia Taraxaci*, *Folia Trifolii fibrini*, *Folia Uvae Ursi*, *Fructus Anethi*, *Fructus Anisi*, *Fructus Carui*, *Fructus Colocynthis*, *Fructus Conii*, *Fructus Coriandri*, *Fructus Cubebae*, *Fructus Foeniculi*, *Fructus Pimentae*, *Fructus Piperis nigri*, *Fructus Sambuci recentes*, *Gallae*, *Glandulae Lupuli*, *Herba Absinthii*, *Herba Aconiti recens*, *Herba Belladonnae recens*, *Herba Cannabis indicae*, *Herba Cardui benedicti*, *Herba Centaurii*, *Herba Conii*, *Herba Hyoscyami*, *Herba Sabinae*, *Lichen islandicus*, *Lignum Guaiaci*, *Lignum Quassiae*, *Lignum Santalinum*, *Lycopodium*, *Petala Rhoeados Petala Rosae gallicae*, *Radix Aconiti*, *Radix Althaeae*, *Radix Armoraciae*, *Radix Belladonnae*, *Radix Helenii*, *Radix Jalapae*, *Radix Liquiritiae*, *Radix Pyrethri*, *Radix Sarsa parillae*, *Radix Taraxaci*, *Radix Valerianae*, *Rhizoma Arnicae*, *Rhizoma Calami*, *Rhizoma Filicis*, *Rhizoma Hydrastis*, *Rhizoma Podophylli*, *Rhizoma Zingiberis*, *Secale cornutum*, *Semen Amygdalae dulcis*, *Semen Amygdalae amarae*, *Semen Cardamomi*, *Semen Colchici*, *Semen Lini*, *Semen Myristicae*, *Semen Physostigmatis*, *Semen Sinapis albae*, *Semen Sinapis*, *Semen Stramonii*, *Semen Strychni*, *Stigmata Croci*.—*C. GENERAL

6608. FALK, I. S. The role of certain ions in bacterial physiology. *Absts. Bact.* 7: 33-50, 87-105, 133-147. 1923.—This is a review of the literature to Sept., 1922, and partially revised to Feb. 1, 1923. The following chapters are included: cations in general physiology; inorganic content of the bacteria; cations in synthetic media; cations in growth, viability, and disin-

fection; cations in soils, ammonification, nitrification, nitrogen fixation; cations in permeability; cations in immunity reactions; theory of ion action; bibliography (p. 133-147).—*D. Reddick.*

DIFFUSION, PHYSICO-CHEMICAL PHENOMENA

6609. ADDOMS, RUTH M. The effect of the hydrogen ion on the protoplasm of the root hairs of wheat. *Amer. Jour. Bot.* 10: 211-220. 1 pl. 1923.—Wheat seedlings were grown in 5 nutrient solutions selected from Shive's "optimal" group, in all of which the osmotic concentration (1.75 atmospheres) and the lime-magnesium ratio were essentially constant. The H-ion concentration varied from pH 3.94 to pH 3.47 owing to differences in the amount of KH_2PO_4 used. In those solutions in which the H-ion concentration was high, the root systems were abnormal in being short, stubby, and much branched. In the root-hairs of such roots, when studied under the dark-field microscope, the protoplasm was found to be coagulated and flocculated as compared with its normal condition in other roots. The relation of this effect to the colloid chemistry of protoplasm is discussed. The author suggests that the injurious influence of high H-ion concentration is due to the fact that it renders the root-hairs ineffective as absorbing organs, and she believes that a direct relation between the H-ion concentration of a nutrient solution and any single plant character, such as yield, consequently cannot exist.—*E. W. Sinnott.*

6610. HOFLER, KARL. Über den zeitlichen Verlauf der Plasmadurchlässigkeit in Salzlösungen I. [The speed of plasma penetrability in salt solutions.] *Ber. Deutsch. Bot. Ges.* 37: 314-326. 1919.—The author investigated the length of time for the protoplast to take up salt solutions, using cells of *Tradescantia elongata* and a technique described in an earlier paper [*Ber. Deutsch. Bot. Ges.* 36: 414. 1918.] Cane sugar and KNO_3 were the substances used, both in hypertonic solutions. When the protoplast, after a 2-hour plasmolysis, reaches its final form and the direct measurement can be made, the permeability is still normal. Similar cells behave very differently. Even the same cell can, in consecutive experiments, take up varying amounts of KNO_3 . The clearest line of behavior is the very gradual increase of permeability in the hours before death. Furthermore there are demonstrated unknown reversible variations in permeability in the living protoplast, which are very different in single cases and which can not be caused by direct reaction from outside stimuli.—*S. F. Cook.*

6611. HOFLER, K., UND A. STIEGLER. Ein auffälliger Permeabilitätsversuch in Harnstofflösung. [A striking experiment in permeability with a urea solution.] *Ber. Deutsch. Bot. Ges.* 39: 157-164. 1921.—Experiments were performed, using the epidermal cells of the stem of *Gentiana Sturmiiana* and following the plasmometric method. It was found that urea penetrated in great quantities and quite rapidly, as shown by the fact that the protoplasm shrank for a few minutes and then very quickly returned to its normal position. The amount of penetration was 30-60 times as much as has been observed in the case of other plants (*Rhoeo*, *Tradescantia*, *Allium*). It was found that the permeability of the cells to urea was 170 times greater than the permeability to KNO_3 . Furthermore, only the stem epidermal cells could be made to show this unusual permeability to urea, and the authors state that this is the 1st surely proved case of a differential permeability of the plasma of different tissues of the same plant.—*S. F. Cook.*

6612. QUIRK, AGNES, J., AND EDNA H. FAWCETT. With introduction by ERWIN F. SMITH. Hydrogen-ion concentration vs. titratable acidity in culture mediums. *Jour. Infect. Diseases* 33: 1-59. Pl. 1 (col.), fig. 1-10. 1923.—Extensive experiments are reported with regard to measuring and adjusting the reaction of beef infusion media. The titrimetric and H-ion methods of determining acidity and alkalinity are compared. The color "faint but distinct, pink" by phenolphthalein was found to be pH 8.2 and was called the zero of the Fuller's scale. The 1st change in color occurred at pH 7.8. At the rose pink color the pH was 8.4. Formulae are given for converting pH readings to Fuller's scale and for obtaining the pH having given the Fuller's scale titration readings. Experiments were conducted to determine the effects

of dilution in preparing beef broth, the variations in media prepared from different samples of the same portion of beef, and the variations between broths from different cuts of beef with and without dilution. It was found that average pH values varied in the same direction as the average titration values. Fuller's scale values were readily transferable to pH values. Media having graded additions of acid and alkali showed buffer effects causing the reaction to vary from the theoretical. The reaction by the Fuller's scale and pH followed one another closely, but did not coincide. The reaction became more acid in the media upon standing. The hot infusion had a slightly greater buffer effect than the cold. These 2 varied appreciably only at the extreme ranges. The Fuller's scale and pH reactions of beef extract broths having graded additions of alkali did not coincide as they did in beef infusions. Gelatin increased the buffer content of beef infusion while agar exerted no appreciable effect.—The authors conclude that the titration method of determining the reaction of media based on peptone beef infusion is not illogical and unusable as Clark and others have claimed. In general, titrametric methods were believed to be fully as desirable as the colorimetric determination of the H-ions for obtaining the reaction of beef infusion media within the limits of +30 and -10 Fuller's scale, corresponding to pH 5.2 and 9.2 respectively. Of a considerable number of plant pathogens studied most of them exhibited growth limits within these ranges.—*R. L. Starkey.*

6613. SCHAEDE, REINHOLD. Über das Verhalten von Pflanzenzellen gegenüber Anilinfarbstoffen. [The behavior of plant cells toward anilin dyes.] *Jahrb. Wiss. Bot.* 62: 65-91. 1923.—The author made a study of dye penetration into the root hairs of *Hydrocharis morsus ranae*. Great care was exercised to use fresh material and protoplasmic streaming was taken as a criterion of the normal condition of the cell. The following dyes were used: chrysoidin, Bismark brown, methyl violet, gentian violet, methylene blue (in distilled and tap water), neutral red, safranin, acid fuchsin (in distilled and tap water). Chrysoidin was the only dye which penetrated uninjured plasma. There was coloration with Bismark brown and gentian violet after injury to the cell. No case of nuclear staining, *intra vitam*, was observed. Methyl violet and gentian violet penetrated the microsomes but this is connected with the toxic effect of the dyes. A precipitate of doubtful nature was caused in the cell sap by methyl violet, gentian violet, and safranin. The author points out the correlation between the acidity or basicity of the dye and the cell as determined by the penetration of the dyes. The cytoplasm is basic when alive and acid when dead. The microsomes are probably acid and the cell sap neutral.—*S. F. Cook.*

6614. STERN, KURT. Über negative Osmosen und verwandte Erscheinungen. [Negative osmosis and related phenomena.] *Ber. Deutsch. Bot. Ges.* 37: 334-343. 1919.—The scheme of the processes taking place on semipermeable precipitation membranes and the theory of osmotic pressure have until recently served to explain the passage of liquids through plant cell membranes. The author considers the question of the limitation of this method and its correct application. After a critical review of the work on electro-endosmosis from Dutrochet and Graham to the present time he concludes that if at present no definite proof of the presence of negative osmosis in plant protoplasm has been discovered, nevertheless, in view of the physical and physiological evidence, it must be regarded as very probable. *S. F. Cook.*

6615. WEBER, FRIEDL. Die Zellsaftviscosität lebender Pflanzenzellen. [The cell sap viscosity of living plant cells.] *Ber. Deutsch. Bot. Ges.* 39: 188-193. 1921.—The author uses the time in which calcium oxalate crystals fall through the sap of cells of *Callisia repens* as a criterion of the viscosity of the sap, applying the formula of Stoke's law: $V = \frac{2}{9} \frac{D-d}{n} gr^2$. He finds that the viscosity is about 2 times that of water, and that it decreases with a rise of temperature with a coefficient of from 1.13 to 1.19.—*S. F. Cook.*

WATER RELATIONS

6616. BODE, HANS ROBERT. *Beiträge zur Dynamik der Wasserbewegung in den Gefäßpflanzen.* [Contribution to the dynamics of the movement of water in the vascular plants.] *Jahrb. Wiss. Bot.* 62: 92-127. 1923.—The author made a large number of observations and experiments, using several methods of technique, on the following plants: *Impatiens Sultani*, *Tradescantia zebrina*, *Elatostemma sessile*, *Cucurbita Pepo*, *Syringa vulgaris*, *Lycium halimifolium*, *Taxus baccata*, *Ginkgo biloba*, *Phaseolus*, *Sambucus*, and *Helianthus annuus*. Direct microscopic examination of the vessels of wilted plants, under the most unfavorable conditions of water conduction, showed that the continuity of the water columns in the vessels was unbroken. The presence of a cohesion tension is shown by wounding the vessels under mercury, which is taken into the vessel in direct contact with the water, and it is made clear that it is impossible for the gas, dissolved in the water, to separate as bubbles. Such bubbles, found by the older workers, were due to faulty technique. The diameter of the vessels of herbaceous plants was observed to shrink, under unfavorable conditions, this being due to the cohesion tension of the water columns. In both the stem and root the filtration resistance shows a complete proportionality with the difference in pressure.—*S. F. Cook.*

MINERAL NUTRIENTS AND SALT RELATIONS

6617. HOFFER, G. N., and R. H. CARR. *Accumulation of aluminum and iron compounds in corn plants in its probable relation to rootrots.* *Jour. Agric. Res.* 23: 801-823. *Pl. I (col.)*-21. 1923.—A disintegration of tissue in the nodal plate of maize occurs in the absence of specific organisms. These regions show an excessive amount of iron or aluminum compounds or both. Brown, yellowish brown, and brownish purple lesions similar to those in diseased plants have been produced by injecting solutions of certain salts of aluminum and iron into the plants. A definite cumulative toxicity of aluminum salts was established by the injection experiments and the same phenomenon is believed to occur naturally in the field. The most severe cases of rootrot are found in soils deficient in lime and available phosphates but with variable quantities of salts of aluminum and iron available for absorption. Such organisms as *Fusarium moniliforme*, *Gibberella Saubinetii*, etc., are thought to be ubiquitous and under favorable conditions attack plants which are already weakened by the accumulation of toxic salts. Those plants which show the largest accumulation of iron and aluminum are the ones which develop the most severe cases of rootrot.—“The application of lime and phosphates to soils in which rootrots have developed in destructive proportions has been decidedly beneficial in controlling them. The use of limestone alone in some instances proved harmful, but in all cases studied the application of available phosphates produced plants which were better and more resistant to the rootrots.”—*D. Reddick.*

6618. TOTTINGHAM, W. E., and E. J. RANKIN. *The availability of iron in nutrient solutions for wheat.* *Amer. Jour. Bot.* 10: 203-210. 4 fig. 1923.—The solubility of ferric citrate, phosphate, and sulphate, and of ferrous sulphate, were determined at pH 4.2 and pH 6.0 of the Livingston-Tottingham nutrient solution. Ferric phosphate is relatively insoluble, and ferric and ferrous sulphate are so in solutions which approach neutrality. Ferric citrate is not very soluble but its solubility is maintained over a considerable range of pH values. The H-ion concentration is increased by ferric sulphate, decreased by ferric citrate, and affected little by the others. Young wheat plants showed much better growth in ferric citrate than in any other form of iron, the unfavorable effect of the others being presumably due to low solubility or to modification of the H-ion concentration.—*E. W. Sinnott.*

PHOTOSYNTHESIS, CHLOROPHYLL

6619. WLODEK, JEAN. *Recherches sur l'influence des engrais chimiques sur le coefficient chlorophyllien.* [The influence of chemical fertilizers on the chlorophyll coefficient.] *Bull. Acad. Polonaise Sci. et Lettres Classe Sci. Math. et Nat., Ser. B.* 1920: 19-52. 1922.—Determinations were made of the chlorophyll coefficient, neochlorophyll (A): allochlorophyll

(*B*) (Willstaetter's Chlorophyll *a* and *b*) by comparing the limits of the absorption bands by means of a Wagner spectrometer (Zeitschr. Instrumentenk. 1913, p. 149). The living leaves of potato and sugar-beet were studied, grown in soils to which various fertilizers were added: (1) without fertilizer; (2) P, K, and N; (3) P and N, but no K; (4) P, N, Mg, no K; (5) K, N, no P; (6) P, K, no N. It is concluded that after a certain period of development of the plants the relation of the chlorophyll pigments varies during the course of 24 hours; *B* increases during the day and *A* during the night. The lack of K results in an absolute and relative diminution of *B* and an increase in *A*, as well as a reduction of the daily variation of the 2 components. Lack of P also reduces the daily variation of the chlorophyll components and narrows the absorption bands; N tends to reduce *A* and augment *B*. The action of Ca and Mg is not definitely established.—*H. A. Spoehr*.

6620. WLODEK, JEAN. *Recherches sur l'influence de la lumière et des engrais chimiques sur le coefficient chlorophyllien.* [The influence of light and of chemical fertilizers on the chlorophyll coefficient.] Bull. Acad. Polonaise Sci. et Lettres Classe Sci. Math. et Nat., Ser. B. 1921: 143-190. 1922.—I. Using the same methods as in the foregoing paper [see preceding entry] Wlodek has studied the variations of the chlorophyll coefficient in *Iris germanica* under the influence of light, with attached and excised leaves. During illumination the absorption bands shift toward the more refrangible portion of the spectrum and in the opposite direction in the dark. In illuminated leaves the absorption band of allochlorophyll becomes wider, that of neochlorophyll narrower, while the reverse happens in the dark. This change does not take place instantaneously, requiring $\frac{1}{2}$ -2 hours. The shifting of the absorption band is noticeable after 15 minutes. Leaves which have died through wilting show an increased chlorophyll coefficient and a shifting of the absorption band towards the violet. Ether diminishes the variations in the chlorophyll coefficient.—II. In endeavoring to relate the chlorophyll coefficient to mineral nutrients of oats, barley, and beans, it was found that with a lack of K the coefficient diminishes at a certain phase of development of the plants. This is due to an increase of the absorption band of neochlorophyll and a decrease in that of allochlorophyll, as compared with plants grown under normal conditions. A lack of N in the soil increases the chlorophyll coefficient. A relation seems to exist between the width of the first absorption band and the nitrogen content in fresh bean leaves, in the straw and harvest of oats and barley. The nitrogen content increases with the width of the band. With a lack of K the chlorophyll coefficient does not change under the influence of light and darkness. In leaves which show an abnormal chlorophyll coefficient the production of vegetative material is less.—*H. A. Spoehr*.

METABOLISM (GENERAL)

6621. BERGMANN, MAX. The structure of sucrose. Jour. Chem. Soc. [London] 123: 1277-1279. 1923.

6622. BROWN, ELMER B., AND TREAT B. JOHNSON. The sugar found in tuberculinic acid, the nucleic acid of the tubercle bacillus. Jour. Amer. Chem. Soc. 45: 1823-1827. 1923.—In a former paper the authors found that this nucleic acid contained the pyrimidines, thymine and cytosine, but no uracil. In this paper they report the observation that the sugar making up the carbohydrate of this nucleic acid is a hexose rather than a pentose. From their findings it seems that the nucleic acid of the bacillus of tuberculosis resembles the nucleic acid of the animal rather than that of the plant. A complete description of the chemical methods used in this work is given.—*J. M. Brannon*.

6623. BRUNSWIK, HERMANN. Über Hesperidinsphärite im lebenden Hautgewebe von *Anthurium Binotii* Linden. [Hesperidin sphaerocrystals in living cells of *Anthurium Binotis*.] Ber. Deutsch. Bot. Ges. 39: 209-213. 1921.—Hesperidin, a rhamnoside glucoside, has been found in a monocotyledon, *Anthurium Binoti* Linden, and in crystalline form. Both are rare occurrences, since it had previously been reported in 24 dicotyledonous families, but in only 2 monocotyledonous families and always in solution in the cell sap.—The chemical reactions

and solubilities of the crystals are described. They are the usual tests for hesperidin.—Twelve other species of *Anthurium* were examined for hesperidin but none was found.—*S. H. Eckerson.*

6624. DOBBIN, LEONARD. On the presence of formic acid in the stinging hairs of the nettle. *Proc. Roy. Soc. Edinburgh* 39:137-142. 1919.—The experimental evidence upon which the textbook statements regarding the presence of formic acid in the stinging hairs of the common nettles, *Urtica dioica* or *U. urens*, are based is regarded as inadequate in the light of present-day knowledge. The author collected the exudate from the hairs by applying to the leaves strips of the very best filter paper impregnated with barium carbonate. This fixed the free acid of hairs without contamination from the protoplasmic contents of the cells. The paper was then tested for the presence of barium formate. This was done by extraction with cold water, filtering, mixing with phosphoric acid, and distilling. The distillate was mixed with lead or barium hydroxides, filtered, saturated with carbon dioxide, and evaporated to dryness on a steam bath. The residue was extracted with hot water and filtered. The filtrate was placed in small drops on glass slides and evaporated over sulphuric acid. These were examined with the polarizing microscope and found to show (a) "stellate groupings of strongly bi-refracting needles and (b) single crystals with well developed faces and sharp edges," both of which behave optically as lead formate. Slides from solutions in which barium hydroxide replaced the lead were confirmatory. They showed extremely bi-sphenoid crystals. The conclusion is thus reached that free formic acid is present in the stinging hairs of the common nettle. [See also *Bot. Absts.* 8, Entry 1461.].—*Ray C. Friesner.*

6625. FARNELL, R. G. Preliminary investigations on the pectic substances of plants. *Internat. Sugar Jour.* 25: 248-251. 1923.—The extraction and properties of plant tissue pectinogen (that is, pectin producing) are described. The yield of dry pectinogen from turnip, onion, and pods of peas was 20, 16, and 8 per cent; the galactan found was 40.9, 34.9 and 17.9 per cent; pentose 37.6, 17.6 and 30.7 per cent; and methoxyl 10.2, 3.2 and 1.9 per cent.—*C. Rumbold.*

6626. HOOKER, H. D., JR. Seasonal changes in the chemical composition of apple spurs. *Missouri Agric. Exp. Sta. Res. Bull.* 40. 51 p., 28 fig. 1920.—Samples of apple spurs with leaves, flowers, or fruit removed were collected 6 times during the year. Three types were investigated: spurs that blossomed and bore fruit; spurs that did not blossom, but which developed fruit-buds; and barren spurs that neither blossomed nor developed fruit-buds. The 1st type was represented by Wealthy, Ben Davis, and Jonathan; the 2nd by Jonathan and Ben Davis,—the Jonathan being the same one from which samples of the 1st type were taken; the 3rd by Ben Davis and Nixonite. Determinations were made of the dry weight, ash, titratable acidity, potassium, phosphorus, total nitrogen, reducing and non-reducing sugars, starch, total polysaccharids and H-ion concentration. In general, official analytical methods of the Association of Official Agricultural Chemists were used. The starch values were obtained by digestion, followed by hydrolysis of the digestion products. Some supplementary microchemical tests were made. The seasonal changes in most of the constituents examined were distinct and characteristic of the condition of the spur,—bearing, non-bearing, or barren. In general the bearing and barren spurs showed extreme values, while the non-bearing spurs assumed intermediate positions. The conditions characteristic of bearing and non-bearing spurs of the same tree (Jonathan) were practically identical with the conditions of spurs from different trees (Ben Davis) in the bearing and in the off-year respectively. Spurs from barren trees were characterized by a seasonal chemical picture distinctly different from the 2 types of spurs from productive trees. For most constituents, the spurs passed through 1 period of maximum content and 1 of minimum content during the course of the year. In the cases of starch and titratable acidity there were 2 maxima and 2 minima, the maxima of 1 coming at approximately the same time as the minima of the other. Carbohydrate consumption and titratable acidity are thought to be correlated. Conditions leading to high starch content at the time of fruit-bud differentiation is considered to be essential for fruitfulness.

Barren spurs and fruit-bearing spurs that developed leaf buds had a low starch content in June. During the late summer and fall there was a steady increase in the phosphorus and nitrogen content of spurs with fruit buds. The absence of this feature in barren spurs suggested that phosphorus and nitrogen storage was connected with the marked increase in these elements that was peculiar to bearing spurs in the spring.—*H. D. Hooker, Jr.*

6627. IRVINE, JAMES COLQUHOUN. Some constitutional problems of carbohydrate chemistry. Jour. Chem. Soc. [London] 123: 898-921. 1923.—This is a discussion of present knowledge regarding the molecular structure of glucose, maltose, cellobiose, lactose, sucrose, cellulose, starch, glycogen, inulin, certain glucosides (salicin, helicin, and populin), and the λ -sugars (forms in which the oxygen ring is displaced from the normal stable position). Numerous diagrams are given showing the arrangement and attachment of atoms and groups of atoms.—*F. E. Denny.*

6628. MURSCHHAUSER, HANS. Das optische Drehungsvermögen der Dextrose unter dem Einfluss von Salzsäure. II. Änderung des Drehungs- und Reduktionsvermögens von Dextroslösungen in Salzsäure bei 100°. [The influence of hydrochloric acid on the optical rotation of dextrose. II. Change in rotation and reducing power of dextrose solution by hydrochloric acid at 100°.] Biochem. Zeitschr. 116: 171-190. 1921.—In an earlier paper it was shown that at room temperature the addition of HCl to dextrose solution hastened the return to the constant rotation of $(L)_d 52.5^\circ$. The addition of HCl to a greater concentration than 2 per cent increased the constant rotation somewhat. This change was also dependent upon the dextrose concentration. In the present paper 20, 10, 5, and 2.25 per cent dextrose solutions were heated at 100°C. for varying lengths of time with 5.1, 8.1, and 10.2 per cent HCl. The 20 and 10 per cent dextrose solutions each exhibited an increase in dextro-rotation on treatment, this increase being greater with the 20 than with the 10 per cent sugar solution. The greater the concentration of HCl the sooner is the peak reached in the 20 per cent solution. In the 10 per cent solution all HCl concentrations are equally effective in increasing the rotation. The decrease in rotation on continued heating is greater the higher the HCl concentration is, but the total decrease is not as great in the 20 per cent as in the 10 per cent dextrose solution. From the beginning of the heating there is a decrease in the reducing power of the solutions. The decrease in reducing power increases with increase in acid content, but the decrease is slightly greater (concentration for concentration) in the 20 per cent than in the 10 per cent dextrose solution. At no time is there an increase in dextro-rotation with the 5 and 2.25 per cent dextrose solutions. The decrease in dextro-rotation is almost parallel with that in 10 per cent solution. The writer explains the increase in dextro-rotation as being due to the formation of isomaltose or some polysaccharid such as dextrin, which has a higher dextro-rotation than the dextrose. There is more of this substance formed in a high concentration of dextrose than in a low concentration. The loss in reducing power would be partly due to the formation of the polysaccharid and partly to a breaking down of the dextrose.—*F. G. Gustafson.*

6629. NAGAYAMA, T. Über die Zerlegung der Brenztraubensäure durch verschiedene Pilze. [The decomposition of pyroracemic acid by fungi.] Biochem. Zeitschr. 116: 303-306. 1921.—*Monilia candida*, *Oidium lactis*, *Aspergillus niger mutante*, *Mucor plumbeus*, *M. Rouxii*, and *M. racemosus* are able to decompose pyroracemic acid into acetaldehyde when present in the nutrient solution. The addition of sulphate increases the yield of acetaldehyde. Nutrient solutions without pyroracemic acid yield no acetaldehyde.—*F. G. Gustafson.*

6630. PATTERSON, JOCELYN. Investigation of the mannan present in vegetable ivory. Jour. Chem. Soc. [London] 123: 1139-1149. 1923.—The endosperm of the seed of the tagua palm was used as material for the investigation of the chemical constitution of the mannan.—*F. E. Denny.*

METABOLISM (NITROGEN RELATIONS)

6631. FRANZEN, HARTWIG, ADOLPH WAGNER, UND ARTUR SCHNEIDER. Über die chemischen Bestandteile grüner Pflanzen. XIII. Über die flüchtigen basischen Stoffe grüner Pflanzen. [Chemical constitutions of green plants. XIII. Volatile bases in green plants.] Biochem. Zeitschr. 116: 208-214. 1921.—It was found by titrating distillates obtained from 28 species with $\frac{N}{10}$ HCl, using methyl red as indicator, that there are volatile bases in green plants. *Rheum Rhaponticum*, required 146 cc. of $\frac{N}{10}$ HCl per kgm. of fresh plant to neutralize the base; *Vitis vinifera*, 88 cc. The other 26 species contained much less volatile base; *Quercus sessiliflora* and *Viburnum lantana* required only 5.5 cc. per kgm. of green material. In 13 of the 28 species examined ammonia was the chief volatile base. Other bases were present in much smaller quantities. The conclusion is drawn that ammonia or substances easily breaking down to ammonia are widely distributed in green plants.—F. G. Gustafson.

METABOLISM (ENZYMES, FERMENTATION)

6632. KOPELOFF, NICHOLAS, C. J. WELCOME, AND LILLIAN KOPELOFF. Prevention of sugar deterioration. Sugar 24: 388-389, 442-443. 1922.—A method of using superheated steam in the centrifugals to prevent sugar deterioration by fungi and bacteria is described.—C. W. Edgerton.

6633. OWEN, WM. LUDWELL. Mold fungi in sugar inversion. Facts about sugar 16: 519-521, 546-548. 1923.—Molds, as well as their extracts, have the power to invert sucrose and consequently cause a deterioration of sugar. Seventeen molds were tested and it was found that these differed widely in their inverting ability. Extracts were also made both from the mycelium and from the spores. An active invertase was obtained from the mycelium but not from the spores. More active extracts were obtained from young cultures than from old ones. In some instances, the fungus extracts were able to invert the sucrose at densities at which the fungus was inactive.—C. W. Edgerton.

6634. OWEN, WM. LUDWELL. Protective inoculation of raw sugar. Sugar 25: 65-68, 117-119, 177-179. 1923.—The inoculation of sugars with suitable types of filamentous yeasts (*Torulae*) prevents the development of fungi and consequently reduces the deterioration of the sugars. The *Torulae* ferment the invert sugar and give off CO₂, which prevents the development of the fungi.—C. W. Edgerton.

6635. WEIMER, J. L., AND L. L. HARTER. Influence of temperature on the pectinase production of different species of *Rhizopus*. Amer. Jour. Bot. 10: 127-132. 1923.—*Rhizopus nigricans*, *R. reflexus*, *R. Tritici*, *R. Artocarpi*, *R. Delemar*, *R. Maydis*, *R. nodosus*, *R. Oryzae*, *R. arrhizus*, *R. microsporus*, and *R. chinensis* were studied. All but the last 2 are parasitic on the sweet potato, producing a pectinase which dissolves the middle lamella, thus macerating the potato. The fungi were grown at 9, 20, 30, and 40°C., and the rate at which the enzyme which was exuded into the solution, as well as that which was retained in the mycelium, would macerate a disc of potato, was determined. The enzyme seems to be produced at any temperature at which the fungus grows. The amount produced was in all cases least at the highest temperature. That in the mycelium increased progressively as the temperature was lowered, and that exuded into the solution showed the same result except that the quantity was slightly reduced as the temperature fell from 20 to 9°C. The nonparasitic species produced a considerable quantity of enzyme, whereas *R. nigricans*, 1 of the parasitic ones, produced a very small amount. In general, the middle lamellae of old potatoes were dissolved in about $\frac{1}{2}$ the time required to macerate the tissue of new ones.—E. W. Sinnott.

6636. WEIMER, J. L., AND L. L. HARTER. Pectinase in the spores of *Rhizopus*. Amer. Jour. Bot. 10: 167-169. 1923.—The spores of 2 species, *Rhizopus nigricans* and *R. Tritici*,

were isolated and their macerating action on raw sweet potato discs tested. Spores of both species were found to contain pectinase capable of dissolving the middle lamella of the sweet potato. The rate of maceration produced by spores of the former species is much slower than that produced by the latter, when the concentration of the spores by weight is the same.—*E. W. Sinnott.*

ORGANISM AS A WHOLE

6637. ADAMS, J. The effect on certain plants of altering the daily period of light. *Ann. Botany* 37: 75-94. 1923.—Plants belonging to 11 common species were darkened in different cases for periods of 1, 2, $3\frac{1}{2}$, and 5 hours daily during June and July in latitude $45\frac{1}{2}^{\circ}$, and compared with undarkened plants. In almost all cases those exposed longest to light showed greatest average height, greatest average weight, and earliest flowering period.—*W. P. Thompson.*

6638. JOHNSTON, EARL S., WILLIAM E. BARRON, AND G. A. LOVELAND. Agricultural meteorology. *Bull. Amer. Meteorol. Soc.* 1: 76-77. 1920.—Methods for determining relations between plant growth and climatic conditions are noted.—*Earl S. Johnston.*

6639. ROSA, J. T., JR. Note on an indirect effect of spraying potatoes with Bordeaux mixture. *Amer. Jour. Bot.* 10: 113-116. 2 fig. 1923.—Potato plants sprayed with Bordeaux remained green about 3 weeks longer, and yielded over $\frac{1}{2}$ more, than unsprayed control plants, presumably because of the reduced injury through tip-burn and hopper-burn. The tubers from the sprayed plots, however, consisted to a large extent of knobby 2nd growths, so that the actual quantity of marketable potatoes was really much less than from the control plots where the tubers were mostly normal. The variety studied was Early Ohio. The author suggests that alternating wet and dry periods, with the resulting intermittent growth, may have been the cause of the 2nd growths, which would thus be more marked in the sprayed plants since their growing season was longer. If 2nd-growth tubers are due to this cause, they should not necessarily be discriminated against for seed purposes.—*E. W. Sinnott.*

MOVEMENTS OF GROWTH AND TURGOR CHANGES

6640. SNOW, R. The conduction of geotropic excitation in roots. *Ann. Botany* 37: 43-54. 4 fig. 1923.—When roots of *Vicia faba* are decapitated and placed horizontally they rarely curve down in response to gravity. But when the tips of the decapitated roots are stuck on again with gelatin, the roots in most cases respond in the ordinary way. Therefore, the excitation set up in the tip must be conducted back through the gelatin. When a cut is made half way through a root 2 mm. from the tip and a slip of mica is inserted the root responds strongly whether the cut be on the upper or lower side; the response is doubtful when the cut is lateral. If 2 slips are inserted from any 2 opposite sides no response takes place. Therefore the excitation cannot be conducted back by a sinuous path.—*W. P. Thompson.*

6641. WRIGHT, F. M. O. On the presentation time and latent time for reaction to gravity in fronds of *Asplenium bulbiferum*. *Ann. Botany* 37: 55-62. 1923.—The leaves are negatively geotropic. Their irritability shows a well marked grand period as measured by the presentation time (the shortest period of stimulation required to cause any response on a clinostat). At a very early stage in development, when the apical coil is just above the soil, the presentation time is about 8 hours (at 20°C. and 85 per cent moisture). It decreases to a minimum of $\frac{1}{2}$ hour when the leaf has 5-7 pairs of leaflets unfolded, and then rises to about 6 hours just before the leaf is mature, when irritability is lost. The latent time (period between the beginning of stimulation and the 1st indication of response) has a range of 16-5 hours and its curve is in general similar to that for presentation time, though not affected to so great an extent by the stage of development. Maximum geotropic irritability as judged by minimum presentation time is associated with maximum rate of growth.—*W. P. Thompson.*

TOXIC AGENTS

6642. STOVALL, W. D., AND M. STARR NICHOLS. Chlorination of swimming pool water. *Amer. Jour. Public Health* 13: 478-480. 1923.—“It seems that to maintain a pool in a potentially germicidal condition requires a chlorine residuum of either free or organic chlorine and that the amount will vary enormously with the water used and it seems that there will be found waters in which it will be found impossible to maintain a sufficient residuum owing to the irritating effect of the chlorine on the eyes.” For the present chlorination is to be considered a valuable adjunct to other methods of disinfection and sanitation.—*C. A. Ludwig.*

GENERAL

6646. ANONYMOUS. The botanical survey of British Malaya. [Rev. of: RIDLEY, H. N. *The flora of the Malay Peninsula*. Vol. 1. Polypetalae. xxx + 918 p. L. Reeve & Co.: London, 1922 (see *Bot. Absts.* 12, Entry 6124).] *Nature* 111: 6-7. 1923.—This review is mainly a brief summary of botanical surveys and publications dealing with the region.—*O. A. Stevens.*

6647. ALMQUIST, E. Linné und das natürliche Pflanzensystem. [Linnaeus and the natural plant system.] *Bot. Jahrb. Beiblatt* 128: 1-16. 1922.—The author attempts to present a clearer view than is ordinarily held of Linnaeus' conception of a natural system of classification. In so doing he correlates Linnaeus' views with those of Goethe, with the selection theory, and with Mendelism. Linnaeus held that there was an orderly relation of organisms from the simplest to the highest, but he did not conceive of actual descent except in limited groups. Species of a genus he thought may have come from a single original species; genera of a family from a single original genus. The multiplicity of species he believed due to hybridization. Linnaeus founded his species on characters which were not variable. Cultural variation of an ecological nature he omitted in his floras as well as monstrosities and pathological forms. Mendelism is in line with Linnaeus' idea of the origin of species by crossing, and tends to substantiate his hypothesis. The species concept in bacteria is discussed, also Linnaeus' "collective species," in which he employs trinomial instead of binomial nomenclature.—*K. M. Wiegand.*

6648. ASCHERSON, PAUL, UND PAUL GRAEBNER. *Synopsis der mitteleuropäischen Flora.* [Synopsis of the flora of central Europe.] Lieferung 92. Vol. VII. P. 401-480. Wilhelm Engelmann: Leipzig, Feb. 27, 1917.—This part continues the treatment of the Euphorbiaceae and includes the indigenous genera *Chrozophora*, *Mercurialis*, and *Euphorbia* in part. Four exotic genera are represented in the flora of central Europe through the following plants which have become there established: *Mallotus japonicus* Muell. Arg., *Acalypha virginica* L., *A. mexicana* Muell. Arg., *Ricinus communis* L., and *Homalanthus populifolius* Graham.—*J. M. Greenman.*

6649. BURNHAM, STEWART H., AND ROY A. LATHAM. *Flora of the Town of Southold, Long Island* (third supplementary list, part 2). *Torreyia* 23: 25-31. 1923.—This final installment includes 10 species of Polyporaceae, 4 of Agaricaceae, 3 of Gasteromycetes, 2 of Hepaticae, 12 of Musci, 1 of Pteridophyta and 67 of Spermatophyta. The total number of species reported in all the lists is 2,461, of which 1,130 are flowering plants.—*J. C. Nelson.*

6650. FYSON, P. F. [Rev. of: RANGACHARIAR, K., AND C. TADULINGAM. *A handbook of South Indian grasses.* Government Press: Madras, 1921.] *Jour. Indian Bot.* 3: 124-125. 1922.

6651. GARDNER, G. A. *Nouvelles observations. Réponse au Rév. Père Fontanel, S. J.* [New observations. A reply to Rev. Father Fontanel, S. J.] *Nat. Canadien* 48: 267-270. 1922.—The habitat, color, size and general appearance of plants are the characters which permit the determination of a species, and the author maintains that the number of species of violets, for instance, are not exaggerated. Perfume may also be a determining character. Further illustrations are taken from the various forms of *Hepatica*.—*A. H. MacKay.*

6652. JONES, CHAPIN. *Common forest trees of Virginia. A pocket manual describing their most important characteristics.* Virginia Geol. Commission Bull. 26. 2nd. ed., 64 p. 1923.—The author describes in non-technical terms 62 of the common trees of Virginia. The text is supplemented by figures showing the distinctive characters of each species.—*J. M. Greenman.*

6653. MACWATT, JOHN. *The primulas of Europe.* 8 vo, 208 p., 49 illus. (8 col.) Published at the offices of "Country Life," and by George Newnes: London; also Charles Scribner's Sons: New York, 1922.—The author of this volume has devoted years of study to the primroses and has embodied in this book some of the results obtained from a long experience in cultivating this selective group of plants. The systematic treatment is adapted largely from the work of Pax to whom due acknowledgement is made. A rather extended bibliography, readable descriptions, and excellent illustrations from photographs, some of which are colored, are outstanding features of the work.—*J. M. Greenman.*

6654. NELSON, JAMES C. [Rev. of: CHASE, AGNES. *A first book of grasses.* 121 p., 94 fig. The Macmillan Co.: New York, 1922.] *Torreyia* 23: 33-34. 1923.—The spikelet is taken as the basis of classification, and its modifications are studied in the order of their increasing complexity, beginning with the Festuceae. The book is sound in its pedagogy, and strictly scientific in method.—*J. C. Nelson.*

6655. RIDLEY, HENRY N. *The flora of the Malay Peninsula.* Vol. II. *Gamopetalae.* 8 vo, 672 p., 76-131 fig. L. Reeve & Co.: London, 1923.—This volume follows closely the plan of the previous one [see Bot. Absts. 12, Entry 6124] and includes the families Caprifoliaceae to Labiatae, likewise arranged essentially in the sequence of Bentham and Hooker's *Genera Plantarum*. The following new species, varieties, and combinations are included: *Argostemma involucratum* Hemsl. var. *glabrum* and var. *hirsutum* (*A. hirtum* Ridl.), *Ophiorrhiza major* (*O. erubescens* King, not Wall.), *O. rosacea* (*O. rosea* Ridl., not Hook. f.), *O. pallidula*, *O. scabrella*, *O. fruticosa* (*O. fruticulosa* Ridl., not Nadeaud.), *Hedyotis globiceps*, *Mussaenda*

spectabilis, *M. malaccensis*, *M. angustisepala* (*M. Teysmanniana* King, not Miq.), *M. cordifolia* Wall. var. *pubescens*, *Mycetia Scortechinii* (*Adenosacme Scortechinii* King & Gamble), *M. lanceolata* (*A. lanceolata* Ridl.), *M. flava* (*A. flava* Ridl.), *Urophyllum glabrum* Wall. var. *Blumeianum*, *U. sessiliflorum*, *Randia stenopetala* (*Gardenia stenopetala* King), *Petunga floribunda* (*P. Roxburghii* var. *floribunda* King), *Isora humilis* King & Gamble var. *Scortechinii* (*I. Scortechinii* King & Gamble), *Pavetta pauciflora*, *P. naucleiflora* Wall. var. *longifolia*, *Tarenna Napieri* (*Webera Napieri* Ridl.), *T. papillosa* (*Stylocoryna adpressa* var. *papillosa* King), *T. Evansii*, *T. rudis*, *T. salicina* (*Webera salicina* Ridl.), *T. pulchra* (*W. pulchra* Ridl.), *T. longifolia* (*W. longifolia* Hook. f.), *T. grandifolia* (*W. grandifolia* Hook. f.), *T. odorata* (*W. odorata* Roxb.), *T. Yappii* (*W. Yappii* King), *T. Wrayi* (*W. Wrayi* King), *T. Wallichii* (*W. Wallichii* Hook. f.), *T. Ridleyi* Pearson (*W. Ridleyi* Pearson), *T. stellulata* (*W. stellulata* Hook. f.), *T. Curtisii* (*W. Curtisii* King), *T. adangensis* (*W. adangensis* Ridl.), *T. calcarea*, *Timonius peduncularis* (*Guettarda peduncularis* Wall.), *Prismatomeris malayana* (*P. albiflora* King, not Thw.), *Morinda Scortechinii* (*M. umbellata* var. *Scortechinii* King & Gamble), *M. Ridleyi* (*M. umbellata* var. *Ridleyi* King & Gamble), *Psychotria pachyphylla* (*P. sarmentosa* var. *pachyphylla* King & Gamble), *P. sarmentosa* Bl. var. *montana*, *P. lanceolaria*, *P. Griffithii* Hook. f. var. *angustifolia*, *P. atroviridis*, *Cephaelis melanocarpa*, *Streblosa microcarpa* (*Psychotria microcarpa* Wall.), *Lasianthus stipularis* Bl. var. *hirtus*, *L. pilosus* Wight var. *setosus* (*L. setosus* Wight), *L. Maingayi* Hook. f. vars. *hirta* and *subglabra*, *L. Harveyanus* King & Gamble var. *longifolia*, *Borreria laevicaulis* (*Bigelovia laevicaulis* Miq.), *B. pilulifera*, *B. parviceps*, *B. setidens* (*Bigelovia setidens* Miq.), *Vernonia javanica* DC. var. *mollissima*, *Gynura malasica* (*G. zeylanica* var. *malasica* Ridl.), *Agapetes perakensis* (*A. Griffithii* King, not Clarke), *A. Wrayi*, *Rhododendron orion* Ridl. var. *aurantiacum*, *Pernettyopsis breviflora* (*Diplycosia breviflora* Ridl.), *Maesa lancifolia*, *M. oocarpa* (*M. ovocarpa* Ridl.), *Embelia rugosa* (*E. ribes* var. *rugosa* King & Gamble), *E. subcordata*, *Labisia pothoina* Lindl. vars. *alata* and *lanceolata*, *Ardisia andamanica* Kurz var. *latifolia*, *A. Vaughani*, *Siderozylon littorale*, *Bassia hirtiflora*, *B. caudata*, *B. Watsoni*, *B. laurifolia* King & Gamble vars. *typica*, *obtusata* and *parvifolia*, *B. Motleyana* Clarke var. *Scortechinii*, *Maba buxifolia* Pers. var. *rhomboidea*, *Diospyros tubicalyx*, *D. pubicarpa*, *D. cymosa*, *D. latiseppala* (*D. paniculata* King, not Dalziel), *Symplocos adenophylla* Wall. var. *montana*, *Cordyloblaste confusa* (*Symplocos confusa* Brand), *C. pulcherrima* (*S. pulcherrima* Ridl.), *C. obovata* (*S. obovata* Ridl.), *C. crenulata* (*S. crenulata* Ridl.), *C. Maingayi* (*S. Maingayi* Clarke), *C. Scortechinii* (*S. Scortechinii* King & Gamble), *Linociera caudifolia* (*L. caudata* King & Gamble, not Bedd.), *Olea penangiana* (*O. dentata* King, not Wall.), *Willughbeia flavesces* Dyer var. *rufescens* (*W. rufescens* Dyer), *Kopsia singapurensis* (*K. fruticosa* var. *albiflora* King & Gamble), *Ervatamia pauciflora* and var. *minor*, *Alstonia latifolia* (*A. angustifolia* var. *latifolia* King & Gamble), *Dregea stellaris* (*Marsdenia stellaris* Ridl.), *Hoya rufo-lanata*, *Phytosotelma Wrayi* (*Hoya Wrayi* King & Gamble), *Norrisia malaccensis* Gardn. var. *major* (*N. major* Solereder), *Fagraea pauciflora* (*F. racemosa* var. *pauciflora* King & Gamble), *Cryptophyllum giganteum* (*Fagraea gigantea* Ridl.), *Gaertnera acuminata* Benth. vars. *oxyphylla* (*G. oxyphylla* Benth.) and *montana*, *Datura fastuosa* L. vars. *typica* and *alba*, *Utricularia vitellina* (*U. aurea* Ridl., not Lour.), *U. albina* (*U. albiflora* Griff., not Br.), *Aeschynanthus breviflora* (*A. parviflora* Ridl., not Spreng.), *Didissandra petiolata*, *Didymocarpus sulphurea* Ridl. vars. *breviflora* and *grandiflora*, *D. urticaefolia*, *D. hispida* Ridl. var. *selangorensis*, *D. malayana* Hook. f. var. *fasciata*, *D. reptans* Jack var. *modesta* (*D. modesta* Ridl.), *D. Curtisii* (*D. crinita* var. *Curtisii* Ridl.), *Chirita parvula*, *C. sericea* Ridl. var. *Scortechinii*, *Paraboea cordata* Ridl. var. *ophirensis*, *P. tiumanica* Burkill, *P. salicina* (*Didymocarpus salicina* Ridl.), *P. grandifolia* (*D. grandifolia* Ridl.), *P. capitata* Ridl. var. *oblongifolia*, *Codonoboea leucocodon* (*Paraboea leucocodon* Ridl.), *C. ericaeflora* (*Didymocarpus ericaeflora* Ridl.), *C. lilacina* (*D. lilacina* Ridl.), *Boea lancifolia*, *B. minutiflora*, *Cyrtandra cupulata* Ridl. var. *minor*, *Pandorea Curtisii* (*Tecoma Curtisii* Ridl.), *Staurogyne longifolia* Kuntze var. *condensata*, *Hygrophila phlomoidea* Nees var. *angusta*, *Nomaphila stricta* Nees var. *minor* (*N. minor* Clarke) and var. *corymbosa* (*N. corymbosa* Bl.), *Srobilanthes phoeniceus* (*S. violacea* Ridl., not Bedd.), *Lepidagathis Yappii*, *Pseuderanthemum hirtipistillum* (*Eranthemum hirtipistillum* Clarke), *P. breviflos* (*E. breviflos* Clarke), *P. candidum* (*E. candidum* Ridl.), *P. caudifolium* (*E. caudifolium* Clarke), *P. selangorense* (*E. selangorense* Clarke), *P. sylvestre*, *P. Kingii* (*E. Kingii*

Clarke), *P. graciliflorum* (*E. graciliflorum* Nees), *P. Teysmanni* (*E. Teijsmanni* Clarke), *Calophanoides quadrifaria* (*Justicia quadrifaria* Wall.), *Justicia vegeta* Ridl. var. *terminalis*, *J. Clarkeana* (*Rungia laxiflora* Clarke), *J. ovalis*, *Ptyssiglottis parviflora* (*Pseuderanthemum parviflorum* Ridl.), *P. densiflora* (*Leda densiflora* Clarke), *P. flava* (*L. flava* Ridl.), *P. chrysea*, *P. rubro-lutea*, *Polytrema aequale* and var. *minor*, *Peristrophe acuminata* Nees var. *salicifolia* (*P. salicifolia* Miq.), *Callicarpa furfuracea*, *Premna rubens* (*P. flavescens* var. *rubens* Clarke), *P. integrifolia* L. var. *minor*, *P. angustior* (*P. integrifolia* var. *angustior* Clarke), *Clerodendron deflexum* Wall. var. *bracteatum*, *Vitex trifolia* L. var. *repens*, *Avicennia lanata*, and *A. sphaerocarpa* Stapf.—*J. M. Greenman.*

6656. SABNIS, T. S. The flora of Sind. Jour. Indian Bot. 3: 151-153, 178-180. 1923. (To be continued.)—The author is extending his investigations on the physiological anatomy of the plants of the Indian Desert. Part I will include a list of plants with their localities and distribution, and Part II will deal with the physiological anatomy and ecology of the flora. The plant list so far, based on Bentham and Hooker's system, includes 10 families, 21 genera, and 32 species. *Cleome brachycarpa* Vahl var. *longepetiolata* is described as a new variety. [See also Bot. Absts. 5, Entry 1904; 6, Entry 771; 11, Entry 4222.]—*Winfield Dudgeon.*

6657. SARASIN, FRITZ, UND JEAN ROUX. Nova Caledonia. Forschungen in Neu-Caledonien und auf den Loyalty-Iseln. Botanik. [New Caledonia. Researches in New Caledonia and on the Loyalty Islands. Botany.] 4 to. Vol. I-L. ii. P. 89-176, pl. 5-6. C. W. Kreidel's Verlag: Berlin and Wiesbaden, 1920.—The present part [see also Bot. Absts. 12, Entry 896] of this extensive work was edited by HANS SCHINZ and A. GUILLAUMIN. The groups of plants included and some of the specialists who have cooperated are: Fungi of New Caledonia and the Loyalty Islands by E. M. WAKEFIELD; Lichenes (Supplement) by A. D. COTTON; Hepaticae (Supplement) by FRANZ STEPHANI; Algae by R. MIRANDE; Lycopodiales (Supplement) by HANS SCHINZ; Siphonogamæ (Coniferae to Elaeocarpaceae) by HANS SCHINZ and A. GUILLAUMIN. The following new species and new variety of fungi are described: *Amanita pumila* Mass., *Marasmius sulcatus* Mass., *Favolus Sarasini* Wakefield, *Stereum umbro-alutaceum* Wakefield, *Clavaria Sarasini* Cotton, *Lachnocladium neglectum* Mass., *Dacryomitra tenuis* Wakefield, *Le Ratia coccinea* Mass. & Wakefield, *Xylaria hirtella* Wakefield, *Nectria nigro-ostiolata* Wakefield, and *Sarcoscypha coccinea* Jacq. var. *minor* Wakefield. New species and combinations among the flowering plants are: *Mariscus pennatus* Schinz & Guillaumin (*Cyperus pennatus* Lam.), *M. Deplanchei* Schinz & Guillaumin (*Baumea Deplanchei* Boeckl.), *Basselinia eriostachys* Beccari (*Cyphokentia eriostachys* Brongn.), *Campecarpus fulcita* Beccari (*Kentia fulcita* Brongn.), *Piper austro-caledonicum* C. DC. var. *crassispicum* C. DC., *P. staminodiferum* C. DC., *Peperomia kanalensis* C. DC., *P. lifuana* C. DC., *P. Sarasinii* C. DC., *Pachygone loyaltiensis* Diels, *Nasturtium sarmentosum* Schinz & Guillaumin (*Cardamine sarmentosa* Forster), *Acacia simplicifolia* Schinz & Guillaumin (*Mimosa simplicifolia* L. f.), *Arthroclanthus ischnopodus* Guillaumin, *Cajanus pseudocajan* Schinz & Guillaumin (*Cytisus pseudo-cajan* Jacq.), *Zanthoxylum Sarasinii* Guillaumin, *Geijera Balansae* Schinz & Guillaumin, (*Zanthoxylum Balansae* Baill.), *Erodia ignambiensis* Guillaumin, and *Cleidion Vieillardii* Baill. var. *mareense* Guillaumin.—*J. M. Greenman.*

6658. SARGENT, CHARLES SPRAGUE. Manual of the trees of North America (exclusive of Mexico). 2nd ed., 8 vo, xxvi + 910 p., 783 fig., 1 map. Houghton Mifflin Company: Boston & New York, 1922 (Price \$12.50).—The 1st edition of this manual was published in 1905. Since that time knowledge of the trees of North America has been greatly advanced, largely through the activities of the author of this work; and the present edition embodies much of the additional information acquired. Eighty-nine species, many varieties, and 141 illustrations have been added in the new edition. Comparatively few of the species recognized in the former edition have been reduced to the rank of varieties or to synonymy. It is noteworthy that in this work there have been relatively few changes in plant names. The more important generic names which have been changed are the following: *Tumion* Raf. gives way to *Torreya* Arn.; *Serenoa* Hook. f. to *Acoelorrhaphe* H. Wendl.; *Hicoria* Raf. to *Carya* Nutt.; *Pasania* Oerst.

to *Lithocarpus* Bl.; *Toxylon* Raf. to *Maclura* Nutt.; *Pisonia* L. to *Torrubia* Vell.; *Zygia* P. Br. to *Pithecolobium* Mart.; *Fagara* L. to *Xanthoxylum* L.; *Fremontodendron* Cov. to *Fremonia* Torr.; *Chytraculia* P. Br. to *Calyptanthus* Sw.; *Xolisma* Raf. to *Lyonia* Nutt.; *Icacorea* Aubl. to *Ardisia* Sw.; *Crescentia* L. to *Enallagma* Bail. While these alterations have necessarily required a change in the binomial they have not resulted in new combinations. Some of the species recognized in the former edition, which fall to synonymy are: *Yucca arborescens* Trel. = *Y. brevifolia* Engelm.; *Yucca radiosa* Trel. = *Y. elata* Engelm.; *Salix Nuttallii* Sarg. = *S. Scouleri*-ana Barr.; *Quercus californica* Coop. = *Q. Kelloggii* Newb.; *Quercus nana* Sarg. = *Q. ilicifolia* Wang.; *Persea pubescens* Sarg. = *P. palustris* Sarg.; *Sassafras* *Sassafras* Karst. = *S. officinale* Nees & Ebermaier; *Cercis texensis* Sarg. = *C. reniformis* Engelm.; *Metopium* *Metopium* Small = *M. toxiferum* Kr. & Urb.; *Rhus hirta* Sudw. = *R. typhina* L.; *Gyminda Grisebachii* Sarg. = *G. latifolia* Urb.; *Tilia americana* L. = *T. glabra* Vent. The groups having the largest number of additional species are the hawthorns and lindens. The present edition recognizes 153 species of *Crataegus* instead of 132; and *Tilia* now includes 15 instead of 6 species.—*J. M. Greenman.*

PTERIDOPHYTES

6659. D'ALMEIDA, J. D. The Indian Ophioglossums. Jour. Indian Bot. 3: 58-65. 1 pl. 13 fig. 1922.—Six species are recognized. *O. vulgatum* L. var. *Aitchisoni* C. B. Clarke is given specific rank, as *O. Aitchisoni*.—*Winfield Dudgeon.*

6660. FORBES, CHARLES N. Notes on *Marsilea villosa* Kaulf. Occasional Papers Bernice P. Bishop Mus. 7: 47-49. Pl. 13-14. 1920.—Comments are made on former collections of this plant and on the occurrence of a station for it in Palolo Valley, Honolulu. It is concluded "that *M. villosa* Kaulf. and *M. vestita* Hook. & Grev. are the same species."—*H. F. Bergman.*

6661. F[YSON], P. F. [Rev. of: BLATTER, E., AND J. F. D'ALMEIDA. The ferns of Bombay. 22 p., 17 pl. (2 col.), 45 fig. D. B. Taraporevala Sons & Co.: Bombay, (1922) (see Bot. Absts. 12, Entry 4636).] Jour. Indian Bot. 3: 157-158. 1923. [See also Bot. Absts. 12, Entry 4637.]

6662. MAXON, WM. R. Ferns new to the Cuban flora. Jour. Washington [D. C.] Acad. Sci. 12: 437-443. 1922.—From material collected in the higher mountainous regions of Cuba, the writer has described 4 new species and cited 22 other species new to Cuba. A number of these have previously been known only from Jamaica. The new species are: *Cyathea producta* of the Cyatheaceae, *Dicranopteris Leonis* of the Gleicheniaceae; *Polypodium calvum* and *Psilogramme cubensis* of the Polypodiaceae.—*Helen M. Gilkey.*

6663. MAXON, WM. R. The genus *Microstaphyla*. Jour. Washington [D. C.] Acad. Sci. 13: 28-31. 1923.—The rank of this genus, founded by Presl but since much disputed, is discussed, and the writer accepts it as a valid genus. A new species, *M. columbiana*, is described, and the principal synonymy of the 2 previously known species, cited.—*Helen M. Gilkey.*

6664. MOUSLEY, HENRY. Further notes on the ferns of Hatley, Stanstead County, Quebec, 1921-22. Canadian Field Nat. 36: 149-152. 1922.—The addition of 6 ferns now brings the total number for this region to 47 species and varieties.—*W. H. Emig.*

6665. MOUSLEY, HENRY. The alpine maidenhair fern (*Adiantum pedatum* L. var. *aleuticum* Rupr.) at Hatley, Stanstead County, Quebec. Canadian Field Nat. 37: 84-85. 1923.—This fern is rare in the eastern part of Canada and the U. S. A.—*W. H. Emig.*

SPERMATOPHYTES

6666. BAILEY, L. H. The cultivated Brassicas. Gentes Herbarum 1: 53-108. Fig. 18-49. 1922.—After interesting introductory remarks discussing problems of the taxonomy of cultivated plants in general, principles of generic and specific segregation, and the history of the genus *Brassica* with which *Sinapis* is united, the author gives a key to the 19 species recognized,

followed by the enumeration of the species and varieties with citation of synonyms and with full descriptions and illustrated by 31 figures. The following new species and new varieties are proposed: *Brassica alboglabra*, *B. Napobrassica* Mill. var. *solidifolia*, *B. Rapa* L. var. *lorifolia*, *B. nipposinica* and var. *laciniifolia*, *B. juncea* Coss. var. *crispifolia*, var. *japonica* (Thunb.), var. *multisecta*, *B. narinosa*, *B. parachinensis*, *B. dubiosa*.—Alfred Rehder.

6667. BEAUVERD, G. A propos du *Primula farinosa* forma *flexicaulis*. [Remarks on *Primula farinosa* forma *flexicaulis*.] Bull. Soc. Bot. Genève 13: 16. 1921.

6668. BEAUVERD, G. Contributions à la flore de l'Amerique du Sud. [Contributions to the flora of South America.] Bull. Bot. Soc. Genève 13: 7-8, 267-270. 1921.—Two new species and several varieties of plants from Uruguay are described. These are: *Nothoscordion Felipponei* Beauverd, *Alternanthera Felipponei* Beauverd, *Mollugo verticillata* L. subsp. *subsessilis* Beauverd & Felippone, *Oxalis Sellowiana* Zucc. var. *caulescens* Beauverd & Felippone, *O. articulata* Savi var. *nodulosa* Beauverd & Felippone, *Polygala linoides* Poir. var. *ambigua* Felippone & Beauverd, *Echium plantagineum* L. var. *monodasystemon* Beauverd & Felippone, and *Richardsonia brasiliensis* Gomez var. *dubia* Beauverd & Felippone.—W. H. Emig.

6669. BEAUVERD, G. Nouvelles Mutisiées des Andes de Bolivie. [New Mutisieae (Compositae) from the Bolivian Andes.] Bull. Soc. Bot. Genève 13: 10-11. 1921.—Several new plants here named will be described in a later issue of the Bulletin.—W. H. Emig.

6670. BEAUVERD, G. Une race nouvelle du *Primula hirsuta* All. en Valais. [A new variety of *Primula hirsuta* All. in Valais.] Bull. Soc. Bot. Genève 13: 11. 1921.—The plant is characterized as *Primula hirsuta* All. var. *serrulata* Bvrd. n. var.—W. H. Emig.

6671. BLAKE, S. F. Two new species of letterwood (*Piratinera*). Jour. Washington [D.C.] Acad. Sci. 12: 391-399. Fig. 1. 1922.—The heartwood of several species of *Piratinera* belonging to the family Moraceae and native to the Guianas, has long formed a timber of commerce, used principally in the manufacture of walking sticks, umbrella handles, and violin bows. From new material received from British and Dutch Guiana, the author has described 2 new species, *Piratinera scabridula* and *P. velutina*, and has reduced *P. discolor* Pittier to *P. guianensis* Aubl. Full descriptions of the new species, citations of the 4 previously known, and a key to all the species of the genus, are included.—Helen M. Gilkey.

6672. BRITTON, NATHANIEL LORD. Studies of West Indian plants—XI. Bull. Torrey Bot. Club 50: 35-56. 1923.—From Cuba are described the following new species: *Juniperus saxicola* Britton & Wilson, *Myrica cacuminis* Britton & Wilson, *Pilea oralifolia* Britton & Wilson, *P. membranacea* Britton & Wilson, *P. micromeriaefolia* Britton & Wilson, *P. yarensis* Britton & Wilson, *P. ermitensis* Britton, *P. crenata* Britton & Wilson, *Coccolobis monticola* Britton, *C. saxicola* Britton, *Talauma* (?) *orbiculata* Britton & Wilson, *Persea anomala* Britton & Wilson, *P. similis* Britton & Wilson, *Nectandra reticularis* Britton & Wilson, *Rubus turquinensis* Rydberg, *Polygala scabridula* Blake, *P. rhynchosperma* Blake, *P. ambigens* Blake, *Maytenus saxicola* Britton & Wilson, *Rhamnidium bicolor* Britton & Wilson, *Ouratea xolismaefolia* Britton & Wilson, *Taonabo monticola* Britton & Wilson, *T. Leonis* Britton & Wilson, *Haemocharis angustifolia* Britton & Wilson, *Begonia lomensis* Britton & Wilson, *Ginoria montana* Britton & Wilson, *Psidium* (?) *cacuminis* Britton & Wilson, *Calyptranthes montana* Britton & Wilson, *Eugenia cati* Britton & Wilson, *E. ginoriaefolia* Britton & Wilson, *E. lomensis* Britton & Wilson, *E. brevipetiolata* Britton & Wilson, *E. rigidula* Britton & Wilson, *Ananomis reticulata* Britton & Wilson, *Graffenrieda rufescens* Britton & Wilson, *Miconia plumieriaefolia* Britton & Wilson, *Rapanea microphylla* Britton & Wilson, *Symplocos Leonis* Britton & Wilson, *Plumiera montana* Britton & Wilson, *Marsdenia bicolor* Britton & Wilson, *Sebasten Leonis* Britton & Wilson, *Varronia longipedunculata* Britton & Wilson, *Salvia scopulorum* Britton & Wilson, *Rondeletia naguensis* Britton & Wilson, *R. calophylla* Standley, *Guettarda cryptantha* Standley, *G. cobrensis* Standley, *Stenostomum apiculatum* Britton & Standley, *Psychotria*

Leonis Britton & Wilson, *Lobelia cacuminis* Britton & Wilson, *Senecio Leonis* Britton & Wilson, and *Chaptalia montana* Britton. From Trinidad are described: *Bactris savannarum* Britton, *Pilea aripoensis* Britton, *Inga ierensis* Britton, *Serjania ierensis* Britton, *Clusia intertexta* Britton, *C. aripoensis* Britton, *Stylogyne tenuifolia* Britton, *Prestonia Fendleri* N. E. Brown, *Cordia ierensis* Britton, *Aegiphila trinitensis* Britton, *Anguria elliptica* Britton; from Porto Rico: *Scleria doradoensis* Britton, *S. Stevensiana* Britton, *Lagenocarpus portoricensis* Britton, *Rynchospora Blauneri* Britton, and *R. luquillensis* Britton; and from Hayti, *Siphocampylus pinnatisectus* Gleason.—P. A. Munz.

6673. FARWELL, OLIVER A. Notes on the Michigan Flora III. Rept. Michigan Acad. Sci. 22: 177-185. 1920.—Reports on additions to the known vascular flora of Michigan are recorded. The following new forms or combinations are given: *Setaria italica* (L.) Beauv. f. *praecox* (Alef.) n. comb. (*Panicum italicum* var. *praecox* Alef., *S. italica* var. *germanica* Hitchc.), *Setaria italica* var. *germanica* f. *Metzgeri* (Korn.) n. comb. (*Panicum italicum* var. *Metzgeri* Korn.), *Setaria italica* f. *macrochaeta* (Korn.), n. comb. (*P. italicum* var. *macrochaetum* Korn.), *Sporobolus cryptandrus* (Torr.) Gray var. *involutus* n. var., *Panicularia nervata* (Willd.) Kuntze var. *viridis* n. var., *Carex cristata* Schwein. f. *ellipsoidalis* n. f., *C. sterilis* Willd. f. *flexibilis* n. f., *C. cephalophora* Muhl. var. *bracteosa* n. var., *C. Grayii* Carey var. *rariiflora* n. var., *Polygonatum canaliculatum* Pursh var. *oblongifolium* n. var., *Allionia aggregata* (Ortega) Spreng. var. *hirsuta* (Pursh) n. comb. (*Allionia hirsuta* Pursh.), *Lespedeza frutescens* (L.) Britton var. *acutifructa* n. var., *Viola sagittata* Ait. var. *subsagittata* (Greene) n. comb. (*Viola subsagittata* Greene), *Scrophularia marilandica* L. var. *viridis* n. var., *Plantago lanceolata* L. f. *composita* n. f., *Helianthus divaricatus* L. var. *ternatus* n. var., *Senecio obovatus* Muhl. var. *minor* n. var., *Artium minus* f. *pallidum* n. f. A remarkable addition to the flora of Michigan is the crucifer *Hymenophysa pubescens* C. A. Meyer, discovered well established at Ypsilanti by B. A. Walpole. This is native to the Altai region of central Asia.—Ernst A. Bessey.

6674. FARWELL, OLIVER ATKINS. Notes on the Michigan flora IV. Papers Michigan Acad. Sci. 1: 85-100. 1923.—Notes are given on species new to the known flora of Michigan, together with some new species, varieties, or combinations. These are as follows: *Panicum Bicknellii* Nash var. *Bushii* (Nash) n. comb. (*P. Bushii* Nash), *Echinochloa Crusgalli* (L.) Beauv. f. *sabulicola* (a correction for the typographical error f. *sabulonum* Farwell), *Chaetochloa verticillata* (L.) Scribn. var. *brevisetata* (Godr.) n. comb. (*P. verticillatum* var. *brevisetum* Godr.), *C. viridis* (L.) Scribn. var. *major* (Gaud.) n. comb. (*P. viride* var. *majus* Gaud.), *C. viridis* (L.) Scribn. var. *minor* (Koch.) n. comb. (*Setaria viridis* var. *minor* Koch), *C. viridis* (L.) Scribn. var. *brevisetata* (Doell) n. comb. (*P. viride* var. *brevisetum* Doell), *C. italica* (L.) Scribn. f. *praecox* (Alef.) n. comb. (*P. italicum* var. *praecox* Alef.), *C. italica* (L.) Scribn. var. *germanica* (Roth) n. comb. (*P. germanicum* Roth), *C. italica* var. *germanica* (Roth) Farwell f. *Metzgeri* (Koern.) n. comb. (*P. italicum* var. *Metzgeri* Koern.), *C. italica* var. *germanica* (Roth) Farwell f. *macrochaeta* (Koern.) n. comb. (*P. italicum* var. *macrochaetum* Koern.), *Agrostis perennans* var. *humilis* n. var., *Graphephorum Cooleyi* (A. Gr.) n. comb. (*Dupontia Cooleyi* A. Gr.), *Lepturus incurva* (L.) n. comb. (*Aegilops incurva* L., *Lepturus incurvatus* Trin.), *Carex cephalophora* Muhl. var. *anomala* n. var., *C. vulpinoidea* Mx. var. *annectens* (Bicknell) n. comb. (*C. annectens* Bicknell), *C. sparaganioides* Muhl. var. *lutea* n. var., *Juncus Torreyi* Coville f. *longipes* n. f., also f. *brevipes* n. f. and var. *paniculata* n. var., *Habenaria hyperborea* (L.) R. Br. var. *media* (Rydb.) n. comb. (*Limnorchis media* Rydb.), also var. *huronensis* (Nutt.) n. comb. (*Orchis huronensis* Nutt.), *Polygonum amphibium* var. *marginatum* Farwell f. *hirtuosum* n. f., *Amaranthus Torreyi* (Gray) Benth. f. *prostratus* n. f., *Anemone quinquefolia* L. var. *bifolia* n. var., *Bursa Bursa-pastoris* (L.) Britton var. *minor* (DC.) n. comb. (*Capsella Bursa-pastoris* var. *minor* DC.), *Meibomia nudiflora* (L.) O.K. f. *foliolata* n. f., *Rhus copallina* L. f. *crispa* n. f., *Oenothera muricata* L. var. *rubricaulis* n. var., *Uraspermum aristatum* (Thunb.) var. *villicaule* (Fernald) n. comb., *Gentiana Billing-tonii* n. sp., *Teucrium occidentale* A. Gr. var. *menthifolium* (Bickn.) n. comb. (*T. menthifolium* Bicknell), *T. canadense* var. *virginicum* (L.) n. comb. (*T. virginicum* L.), *Dracocephalum*

virginianum L. var. *speciosum* (Sweet) n. comb. (*Physostegia virginiana* var. *speciosa* A. Gr.), *D. denticulatum* Ait. var. *obovatum* (Ell.) n. comb., *Aureolaria heterophylla* (Nutt.) n. comb. (*Gerardia heterophylla* Nutt.), *A. Skinneriana* (Wood) Farwell var. *asperula* (A. Gr.) n. comb. (*Gerardia tenuifolia* var. *asperula* A. Gr.), *A. tenuifolia* (Vahl.) Farwell var. *Gattingeri* (Small) n. comb. (*Gerardia Gattingeri* Small), *A. Skinneriana* f. *pallida* n. f., *Plantago Rugelii* Dene. var. *asperula* n. var., *P. Rugelii* var. *alterniflora* n. var., *Solidago bicolor* var. *concolor* T. & G. f. *ramosior* n. f., *S. neglecta* T. & G. var. *simulata* n. var., *Sericocarpus asteroides* (L.) B.S.P. f. *albopapposus* n. f., *Aster dumosus* f. *monocephalus* n. f.—Ernst A. Bessey.

6675. FORBES, CHARLES N. **New Hawaiian plants. VII.** Occasional Papers Bernice P. Bishop Mus. 7: 33-39. Pl. 3-11. 1920.—*Hibiscadelphus bombycinus*, *Viola kauaiensis* Gray var. *vahiauensis*, *Cyrtandra olona*, *C. hii*, *C. propinqua*, *C. Munroi*, *C. Georgiana*, *Clermontia Samuelii*, *Argyroxiphium caligini*, and *A. caligini* var. *Kai* are described as new to science.—H. F. Bergman.

6676. FORBES, CHARLES N., and GEORGE C. MUNRO. **A new Cyanea from Lanai, Hawaii.** Occasional Papers Bernice P. Bishop Mus. 7: 43. Pl. 12. 1920.—*Cyanea Baldwinii* sp. nov. is described.—H. F. Bergman.

6677. HITCHCOCK, A. S. **The grasses of Hawaii.** Mem. Bernice P. Bishop Mus. 8: 101-230. Pl. 31-35, fig. 1-110. 1922.—An introduction containing an account of the material examined is followed by a general discussion of the grasses characteristic of various habitats and a list of introduced species. Keys are given to the tribes, genera and species. Each species is described with synonymy and citation of Hawaiian specimens; figures are also given for a large number of them. At the end is a catalogue of specimens cited and a list of new species and new names. The following are described as new species: *Cenchrus Hillebrandianus*, *Eragrostis deflexa*, *E. leptophylla*, *E. mauiensis*, *Festuca hawaiiensis*, *Panicum Fauriei*, *P. Forbesii*, *P. kaalaense*, *P. kauaiense*. The following new combinations and new names are also included: *Poa sandvicensis* (*Festuca sandvicensis* Reichart), *Aira nubigena* (*Deschampsia nubigena* Hillebr.), *Calamagrostis Hillebrandii* (*Deyeuxia Hillebrandii* Munro), *C. expansa* (*Deyeuxia expansa* Munro), *Syntherisma chinensis* (*Paspalum chinensis* Nees), *S. microbachne* (*Panicum microbachne* Presl), *Panicum xerophilum* (*P. nephelophilum* γ var. *xerophilum* Hillebr.), *P. lanaiense* (*P. affine* Hook. & Arn., not Poir.), *P. Hillebrandianum* (*P. monticola* Hillebr., not Hook. f.), *Sacciolepis contracta* (*Panicum contractum* Wight & Arn.), *Ischaemum byrone* (*Spodiopogon byronis* Trin.).—H. F. Bergman.

6678. LAUTERBACH, C. **Die Guttiferen Papuasien.** [The Guttiferae of Papuasiasia.] Bot. Jahrb. 58: 1-49. 10 fig. 1922.—Under the general heading "Beiträge zur Flora von Papuasiasia, series IX, no. 80" the author treats the Guttiferae of this region, enumerating 66 species in 9 genera and giving keys as well as extensive bibliographical and distributional notes. Of the 9 genera 4 are endemic and of the 66 species, 61 are endemic. The largest genus is *Garcinia* with 42 species, 40 of which are endemic. Notes on exceptional or interesting species and genera are given. The following new species, forms, combinations, and names are proposed: *Hypericum Hellwigii* (*H. japonicum* Warbg. *H. Macgregorii* Lautb.), *Ochrocarpus papuanus*, *Calophyllum papuanum*, *C. Peckelii*, *C. Versteegii* (*C. Burmanni* Lautb.), *C. trachycaule*, *C. sil.*, *C. euryphyllum*, *Garcinia Holtrungii*, *G. squamata*, *G. Edelfeldtii* (*G. novo-guineensis* Vesque), *G. Moszkowskii*, *G. enthaematocides*, *G. tauensis*, *G. umbonata*, *G. Versteegi* (*G. aff. picrorhiza* Miq.), *G. sumbawensis*, *G. erythrosperma*, *G. nubigena*, *G. Klinkii*, *G. ramulosa*, *G. pallida*, *G. pachypetala*, *G. torensis*, *G. fruticosa*, *G. hygrophila*, *G. Ledermannii*, *G. assugu*, *G. oreophila*, *G. pallide-sanguinea*, *G. sabangensis*, *G. rupestris*, *G. tuberculata*, *G. maluensis*, *G. fusco-petiolata*, *G. Gjellerupii*, *G. Jaweri*, *G. Hunsteinii*, *G. Pullei*, *G. Schraderi*, *G. Schlechteri*, *Tripetalum cymosum* K. Schum. f. *pendula*, *Pentaphalangium latissimum* (?*Garcinia latissima* Miq.), *Cyclandra Ledermannii*, *C. papuana*. The genus *Cyclandra* is proposed as new.—K. M. Wiegand.

6679. MERRILL, E. D. New or noteworthy Bornean plants; part III. Jour. Malayan Branch Roy. Asiatic Soc. 1: 22-45. 1923.—The following new species are described: *Vaccinium Moultonii*, *Ardisia sublepidota*, *A. diversilimba*, *Rapanea multibracteata*. *Diospyros Jupii*, *Epigynum borneense*, *Willughbeia* (*Urnlaria*) *borneensis*, *Petraevitex membranacea*, *Callicarpa involucrata*, *Didymocarpus multinervia*, *Cyrtandra didissandriformis*, *C. longicarpa*, *C. simplex*, *Neonauclea longipedunculata*, *Hedyotis fissistipula*, *H. platyphylla*, *Urophyllum borneense*, *U. suberosum*, *Psychotria Woodii*, *P. grandistipula*, *Xanthophyllum longipedunculatum*, *Melothria diversifolia* and *Momordica acuminata*. New combinations are: *Willughbeia ovatifolia* (*Urnlaria ovatifolia* Stapf), *Pseudernathemum album* (*Justicia alba* Roxb., *Eranthemum album* Nees). New name: *Willughbeia Stapfii* (*Urnlaria oblongifolia* Stapf, not *Willughbeia oblongifolia* O. Ktz.). Twelve other species are mentioned, with localities.—R. E. Holttum.

6680. PARKER, R. N. A new species of *Astragalus* from Kumaon. Indian Forest. 49: 78-79. Pl. 5. 1923.—A full description of a new species, *Astragalus aegacanthoides*, is given.—E. N. Munns.

6681. PARKER, R. N. A new species of *Leptodermis*. Indian Forest. 48: 576-577. 1922.—A description is given of the new species *L. kumaonensis*, which is similar to both *L. lanceolata* Wall. and *L. Parkeri* Dunn.—E. N. Munns.

6682. PETCH, T. A new *Bulbophyllum*. Jour. Indian Bot. 3: 148-150. 12 fig. 1923.—*B. tricarinatum* is described as new, from the Maturata district, Ceylon.—Winfield Dudgeon.

6683. RIDLEY, H. N. A botanical excursion to northern Sumatra. Jour. Malayan Branch Roy. Asiatic Soc. 1: 46-113. 1923.—The mountain flora of the neighborhood of Berastagi is described, with an enumeration of about 490 species of vascular plants, including descriptions of 92 new species. A number of palaeartic genera common to the mountains of northern India and Java are found at Berastagi; a few of these are to be found also at 1 point in the Malay Peninsula (Telom, on the borders of Perak and Pahang) and it is considered probable that these Peninsula plants were derived from Sumatra and indicate a former land-connection between Sumatra and the Peninsula, and a former wider extension of the open type of vegetation in which they occur. Only 1 species of *Didymocarpus* is found at Berastagi, and palms are remarkably few as compared with similar situations on the Malay Peninsula. New species are: *Clematis sumatrana*, *Melodorum breviflorum*, *Saurauja roseata*, *Sterculia sumatrensis*, *Glycosmis sumatrana*, *Celastrus axillaris*, *Rhamnus sumatrensis*, *Rubus battakensis*, *Eugenia sulphurata*, *Melastoma vulcanicum*, *Oxydendron racemosum*, *Medinilla vulcanica*, *M. micrantha*, *Pachycentria scandens*, *Begonia Beccariana*, *B. flexula*, *Aralia Beccarii*, *Lonicera pulcherrima*, *Ophiorrhiza deflexa*, *O. exserta*, *O. subcrenata*, *Carlemannia sumatrana*, *Argostemma stellatum*, *A. corymbosum*, *A. triflorum*, *Mussaenda hirsuta*, *Mycetia angustifolia*, *Urophyllum grandifolium*, *U. macranthum*, *Petunga hirta*, *Stylocoryne sylvicola*, *Psychotria penduliflora*, *P. multinervia*, *Chasalia propinqua*, *Cephaelis pauciflora*, *Lasianthus* (*Mephitidia*) *vulcanicus*, *Blumea scabrifolia*, *Gynura aspera*, *Clethra pulcherrima*, *Ardisia* (*Pinelandra*) *megalocarpa*, *Labisia ovalifolia*, *Paysonia vulcanica*, *Hoya rhodostele*, *Dischidia polyphylla*, *Aeschynanthus fruticosus*, *Didymocarpus vulcanica*, *Rhynchosyche angustifolium*, *Cyrtandra pauciflora*, *C. pandurata*, *Strobilanthes hirticalyx*, *S. multiflora*, *S. anceps*, *Justicia virescens*, *Eranthemum sumatrense*, *Hypoestes tenuifolia*, *Callicarpa eriophylla*, *Clerodendron microcalyx*, *Pogostemon battakianum*, *Gomphostemma sumatrense*, *Thottea hirsuta*, *Piper* (*Cubeba*) *philodendron*, *P.* (*Eupiper*) *melanocarpum*, *P.* (*Eupiper*) *salicicola*, *P. coactile*, *Beilschmiedia sumatrensis*, *Trema lancifolia*, *Ficus inaequilatera*, *Oberonia elongata*, *Microstylis sumatrensis*, *Liparis pratensis*, *Ceratostylis scariosa*, *Dendrochilum lepidum*, *D. brevibracte*, *Calanthe unifolia*, *Goodyera casta*, *Hetaera grandiflora*, *Globba candida*, *Hedychium cylindricum*, *Amomum sumatrense*, *Hornstedtia Beccarii*, *Phaeomeria caudiculata*, *Musa sumatrana*, *Forrestia sumatrensis*, *F. porrecta*, *Pinanga parvula*, *Calamus karuensis*, *Homalomena Burkilliana*, *H.* (*Chamaecladon*) *obovata*, *Pothos paucinervis*, *Pandanus Burkillianus*, *Capillipedium scabridum*, *Erianthus decuss-sylvae*, and *Cyclophorus grandis*.—R. E. Holttum.

6684. SCHLECHTER, R. *Neue Orchidaceen Papuasiens*. [New orchids of Papuasiasia.] Bot. Jahrb. 58: 50-96. 1922.—Under the general heading "Beiträge zur Flora von Papuasien, series IX, no. 81" the author describes many new orchids of this region. This supplements a previous paper on the orchids of German New Guinea by the same author in 1914. Over 2,650 species are now known in Papuasiasia, which, in proportion to its area, makes this region the richest in orchids of any in the world even including the Cordillera States of South America. The number of large genera is remarkable: *Dendrobium* and *Bulbophyllum* contain more than 500 species and *Phreatia* more than 115. Several other genera are nearing the 100 mark, while at least 13 contain more than 20 species. The following species and varieties are proposed as new: *Corysanthes Ledermannii*, *Cryptostylis lancilabris*, *C. philippinensis*, *Lecanorchis bicarinata*, *Erythroides sepikana*, *Zeuxine leucotaenia* and var. *floribunda*, *Z. curvata*, *Microstylis dolichostachys*, *M. fulva*, *M. Ledermannii*, *M. petiolaris*, *M. Stolleana*, *M. vinosa*, *Oberonia elegans*, *O. Ledermannii*, *Liparis anceps*, *L. scleriifolia*, *Mediocalcar ericiflorum*, *M. sepikanum*, *Epiblastus Schultzii*, *Ceratostylis Bulbophylli*, *C. sphaerocephala*, *C. gracilicaulis*, *C. pinguis*, *C. tetrarioides*, *C. brachyphylla*, *C. heleocharis*, *C. tenuis*, *C. juncoides*, *Agrostophyllum sepikanum*, *A. congestum*, *A. cycloglossum*, *Glomera asperata*, *G. graminifolia*, *G. macrophylla*, *G. patens*, *G. Schultzii*, *Glossorrhyncha Hunsteiniana*, *G. Ledermannii*, *G. pteropetala*, *G. Schultzii*, *Giulianettia verrucosissima*, *G. fusca*, *G. inflata*, *Aglossorrhyncha stenophylla*, *Podochilus anguinus*, *P. falcipetalus*, *P. lancilabris*, *Appendicula sepikana*, *Cadetia cuneilabia*, *C. lactiflora*, *C. latoureoides*, *C. platyloba*, *C. quadriquetra*, *C. sepikana*, *Dendrobium lonchigerum*.—K. M. Wiegand.

6685. STANDLEY, PAUL C. *Diospyros Conzattii*, a new species of persimmon from Mexico. Jour. Washington [D. C.] Acad. Sci. 12: 399-400. 1922.

6686. STERRETT, W. D. A new oak from the Gulf States. Jour. Elisha Mitchell Sci. Soc. 37: 178-179. 1922.—The species described as *Quercus Ashei* is near the post oak, from which it differs mainly in narrower crown, more slender twigs, and much smaller fruit. It occurs in willow oak flats from Wood County, Texas, to Winn Parish, Louisiana.—W. C. Coker.

REVISIONS AND MONOGRAPHS

6687. ANONYMOUS. [Rev. of: PFEIFFER, NORMA E. Monograph of the Isoetaceae. Ann. Missouri Bot. Gard. 9: 79-232. 19 pl. 1922.] Nature 111: 443. 1923.

6688. BECCARI, ODOARDO. Asiatic palms—Lepidocaryeae. Part III. The species of the genera: *Ceratolobus*, *Calospatha*, *Plectocomia*, *Plectocomiopsis*, *Myrialepis*, *Zalacca*, *Pigafetta*, *Korthalsia*, *Metroxylon*, *Eugeissona*. Ann. Roy. Bot. Gard. Calcutta 12: 1-231. Pl. 1-6. 1918. IBID. Pl. 1-118. 1921.—Descriptions and illustrations of the following new species and combinations are included: *Ceratolobus rostratus* (*Korthalsia rostrata* Bl.), *Plectocomia billitonensis*, *P. Elmerii*, *P. bractealis*, *P. Kerrana*, *Plectocomiopsis dubius*, *Zalacca sumatrana*, *Z. Scortechinii*, *Korthalsia furcata*, *K. paucijuga*, *K. Merrillii*, *K. celebica*, *K. Rogersii*, *K. Hallieriana*, *K. macrocarpa*, *Metroxylon squarrosus*, *M. Warburgii* (*Coelococcus Warburgii* Heim), *M. upoluense*, *M. amicarum* (*Sagus amicarum* Wendl.), and *Eugeissona ambigua* (*E. tristis* Becc., not Griff.). Several new varieties are characterized. This volume also contains a conspectus of the genera of *Lepidocaryeae* and keys to the extra-Asiatic species of *Raphia*, *Ancistrophyllum*, *Oncocalamus*, *Eremospatha*, *Lepidocaryum*, and *Mauritia*. *Mauritia peruviana* is described as a new species from Peru. [See also Bot. Absts. 12, Entry 6692.]—J. M. Greenman.

6689. BECCARI, ODOARDO, AND JOSEPH F. ROCK. A monographic study of the genus *Pritchardia*. Mem. Bernice P. Bishop Mus. 8: 1-77. Pl. 1-24, fig. 1. 1921.—The monograph is divided into 2 parts. Part I deals with the distribution and characteristics of the genus *Pritchardia*. According to the authors "74 per cent of all the genus are endemic in the Hawaiian group." The fertilization and structural peculiarities of *Pritchardia* are discussed. This is followed by a discussion of the distribution of species by islands in the Hawaiian

group and the uses which the Hawaiians make of these palms. Part II is a systematic treatment. A conspectus of the species is presented followed by a detailed description of the species, of which there are 33 with several varieties. The following new species and varieties are described: *Pritchardia affinis* Becc. with vars. *holaphila*, *rhopalocarpa*, and *gracilis* Becc., *P. lanaiensis* Becc. & Rock, *P. glabrata* Becc. & Rock, *P. kaalae* Rock, *P. Forbesiana* Rock, *P. Lowreyana* Rock, *P. Lowreyana* var. *turbinata* Rock, *P. brevicalyx* Becc. & Rock, *P. Beccariana* Rock var. *Giffardiana* Becc., *P. Hardyi* Rock, *P. Munroii* Rock, *P. montis-kea* Rock, *P. viscosa* Rock, *P. kahanae* Rock & Caum, and *P. martioides* Rock & Caum.—H. F. Bergman.

6690. BROWN, N. E. The Cactus family. [Rev. of: BRITTON, N. L., and J. N. ROSE. The Cactaceae: descriptions and illustrations of plants of the Cactus family. Vol. 3. Carnegie Inst. Washington Publ. 248. Vol. 3. i-vii, 1-255. 24 pl. 1922.] Nature 111: 426-427. 1923.—This volume probably will appeal to a larger number of Cactus fanciers than the preceding ones as it deals chiefly with the smaller kinds which are more generally cultivated. It is unfortunate that such a name as "*Echinofossulocactus*" should come into use; the formation of such names might well be prohibited.—O. A. Stevens.

6691. FYSON, P. F. The Indian species of *Eriocaulon* (continued). Jour. Indian Bot. 3: 12-18, 91-115. Pl. 42-51. 1922.—Section VII, *Connato-sepalae*, with 1 species, and Section VIII, *Leucantherae*, with 5 species (*E. horsley-kundae* new) are described. Fifty-one species in all are recognized. Appendix I gives a list of 12 species which the author has not seen and has been unable to identify, and a list of species reduced from, restored to, changed, and new to Hooker's Flora of British India and Ruhland's Monograph. Appendix II gives a list of all the sheets of Indian species of *Eriocaulon* in the principal herbaria of India, and an index to the Indian species. [See also Bot. Absts. 11, Entry 4823.]—Winfield Dudgeon.

6692. [H., A. W.] Climbing palms and the sago palms. [Rev. of: BECCARI, ODOARDO. Asiatic palms—Lepidocarpaceae. Part III. The species of the genera: *Ceratolobus*, *Calospatha*, *Plectocomia*, *Plectocomiopsis*, *Myrialepis*, *Zalacca*, *Pigafetta*, *Korthalsia*, *Metroxylon*, *Euglossona*. Ann. Roy. Bot. Gard. Calcutta 12: 1-231. Pl. 1-6, 1918. Ibid. Pl. 1-118, 1921 (see Bot. Absts. 12, Entry 6688).] Nature 110: 372-373. 1922.

6693. MAIDEN, J. H. A critical revision of the genus *Eucalyptus*. Vol. VI. Part 8. P. 419-494, pl. 236-239. John Spence: Sydney, February, 1923.—The present part contains descriptions and illustrations of 4 previously published species and 6 species and 1 variety new to science, as follows: *Eucalyptus collina* Fitzgerald n. sp., *E. Flocktoniae* Maiden, *E. Shirleyi*, *E. Rummeryi*, *E. Herbertiana*, *E. comitae-vallis*, *E. longifolia* Link & Otto var. *multiflora*, *E. citriodora* Hooker, *E. hemiphloia* F.v.M., *E. microcarpa*, and *E. albens* Miquel. A chapter is included on the inflorescence.—J. M. Greenman.

6694. TUBEUF, KARL, VON. Monographie der Mistel. Roy. 8 vo, xii + 832 p., 35 pl., 179 fig., 6 maps. R. Oldenbourg: Munich and Berlin, 1923.—The author presents an exhaustive monograph of the true mistletoe, *Viscum album* L. The work is divided in 3 parts. The 1st part deals with the prehistoric occurrence of the mistletoe in Europe; the role of the mistletoe in the life of the people; the German, botanical, and common names of the mistletoe; the present geographical distribution. The 2nd part treats the morphology, anatomy, physiology, biology, and pathology of the mistletoe. The 3rd part takes up the role of the mistletoe in park, fruit, and forest trees. Of particular interest to the taxonomist is that portion of the work which concerns the detailed treatment of the geographical distribution.—J. M. Greenman.

6695. WATSON, E. E. The genus *Heliocarpus*. Bull. Torrey Bot. Club 50: 109-128. 1923.—A treatment is given of the genus *Heliocarpus* in which 22 species, and a possible 23rd, are recognized and for which diagnoses and distribution are given. *H. viridis*, *H. australis*, and *H. rudis* are described as new species.—P. A. Munz.

6696. YUNCKER, T. G. Revision of the South American species of *Cuscuta*. II. Amer. Jour. Bot. 10: 1-17. Pl. 1-5. 1923.—Of 14 species belonging to the subsection *Platycarpae* of the section *Clistogrammica*, *C. pentagona* var. *subulata* and *C. insquamata* are described as new.—E. W. Sinnott.

FLORISTICS AND PLANT DISTRIBUTION

6697. ANONYMOUS. Flore du Labrador. [Flora of Labrador.] Nat. Canadien 49: 183-186. 1923.—A list is given of over 130 species of Labrador plants, collected or observed in 1895 by Abbé P. Lemay.—A. H. MacKay.

6698. ASHE, W. W. Azalea in North Carolina. Jour. Elisha Mitchell Sci. Soc. 38: 90-91. 1922.—A key is given to the 13 species recognized from the eastern U. S. A., 8 of them occurring in North Carolina; in addition, 10 varieties are noted. There is appended a note on the distribution of *Rhododendron* in which the variety *Margarettae* of *R. carolinianum* is raised to specific rank.—W. C. Coker.

6699. ASHE, W. W. The eastern shrubby species of *Robinia*. Jour. Elisha Mitchell Sci. Soc. 37: 175-177. 1922.—A key is given of the 9 eastern shrubby species of the genus, including *R. margaretta* and *R. grandiflora*, which are described as new. *Robinia Hardwegii* Koeh. is reduced to a variety of *R. viscosa*.—W. C. Coker.

6700. BEAUVERD, G. Nouvelles acquisitions pour la florule phanérogamique Genevoise. [New acquisitions to the phanerogamic flora of Geneva.] Bull. Soc. Bot. Genève 13: 38-39. 1921.—The author describes *Stachys annua* L. var. *glareosa* as a new variety, and also characterizes 3 new subvarieties of *Prenanthes purpurea* L. var. *genuina* Bvrd.—J. M. Greenman.

6701. BEAUVERD, G. Résumé des herborisations aux marais de Sionnet-Rouelbeau (Genève), la plage des "Crenees" et les bois de Tanney-Mies (Vaud). [Résumé of a collection of plants from the swamps of Sionnet-Rouelbeau (Geneva) in the vicinity of "Crenees" and the forests of Tanney-Mies (Vaud).] Bull. Soc. Bot. Genève 12: 131-136. 1920.—The author lists noteworthy plants collected in certain bogs and forests of Switzerland.—W. H. Emig.

6702. BEAUVERD, G. Sur la flore vasculaire des environs de Modane, de Bardonnèche et de Suze (Massif du Cenis). [The vascular flora in the vicinity of Modana, Bardonnecchia, and Susa (Mont Cenis).] Bull. Soc. Bot. Genève 13: 115-184. 1921.—This article consists of a summary of a number of field trips including descriptions of the following new varieties and subspecies: *Pulsatilla alpina* Schrank var. *Cottianaea* Bvrd., *Ranunculus geraniifolius* Pourret subsp. *Cottianaeus* Bvrd., *Capsella Bursa-pastoris* (L.) Medic. var. *pulchella* Bvrd. & Guyot, *Linum alpinum* L. var. *praecox* Bvrd., and *Viola silvestris* Lam. var. *Cottianaea* Bvrd. The mountain and alpine plants make up 38.5 per cent of the total number of species found, xerophytic plants, 35 per cent, mesophytic plants, 14.5 per cent, and hygrophytic species, 12 per cent.—W. H. Emig.

6703. BERTSCH, K. Neue Gefässpflanzen unserer Flora. [New vascular plants of our flora.] Jahresh. Ver. Vaterländ. Naturk. Württemberg 76: 62-75. 3 fig. 1920.—As a result of recent explorations the author records the following species and hybrids as additions to the flora of Württemberg: *Equisetum trachyodon* A. Br., *Typha minima* Fek., *Potamogeton filiformis* Pers., *P. panormitanus* Bivona, *Calamagrostis arundinacea* × *epigeios*, *Festuca capillata* Lam., *Carex polygama* Schkuhr, *C. Hornschuchiana* × *lepidocarpa*, *C. Hornschuchiana* × *Oederi*, *Hemerocallis flava* L., *Gladiolus communis* L., *Thalictrum exaltatum* Gaud., *Aconitum Stoerkianum* Reichenb., *Corydalis ochroleuca* Koch., and *Aster lanceolatus* Willd. Each is accompanied by descriptive notes and by data on distribution. The figures represent the floral parts of the hybrid *Calamagrostis* and of the 2 parental species.—A. W. Evans.

6704. BESSEY, E. A. *Nymphaea microphylla* in Michigan. Papers Michigan Acad. Sci. 1: 59-60. 1923.—*Nymphaea microphylla* Pers. was found in 1920 in Gogebic County, the westernmost county of the Upper Peninsula of Michigan. This may throw light on the possible hybrid nature of *N. rubrodisca*, which is now shown to coincide in its range with *N. microphylla*.—Ernst A. Bessey.

6705. CHODAT, R. La végétation du Paraguay. XI. Borraginacées. [The vegetation of Paraguay. XI. Borraginaceae.] Bull. Soc. Bot. Genève 12: 157-171. Fig. 304-312. 1920.—The family Borraginaceae is represented by many species of *Heliotropium*, and *Tournefortia*. *H. curassavicum* L. occurs in waste places of coarse sand, and *H. inundatum* Sw. is found on the banks of lagoons. Ruderal species include *H. europaeum* and *H. indicum* L.; and in the woods and underbrush many forms of *H. monostachyum* DC. and *H. monostachyum* var. *tiaridioides* Cham. are represented. *Tournefortia laevigata* Lam. is common in similar situations. The genus *Cordia* is represented by a large number of trees. The structure of the flowers and leaves of certain species of *Cordia* is illustrated. [See also Bot. Absts. 11, Entry 3212.]-W. H. Emig.

6706. DANZIG, E. Beiträge zur Kenntnis der Phanerogamenflora des sächsischen Vogtlandes. [Contributions to the knowledge of the phanerogamic flora of the Saxon Vogtland.] Sitzungsber. u. Abhandl. Naturw. Ges. "Isis" 1920-21: 1-10. 1922.—The author records the more important results of his explorations during 1919-21 in the Vogtland, a district in the southern part of Saxony. He enumerates 96 species and hybrids of greater or less rarity, designating 24 as new to the region and 1, the hybrid *Anthemis arvensis* × *tinctoria*, as new to Saxony. Each species is accompanied by data regarding stations, and many descriptive or critical notes are included.—A. W. Evans.

6707. DARLINGTON, H. T. Contributions to the flora of Gogebic County, Michigan. Part I. Rept. Michigan Acad. Sci. 22: 147-176. 1921.—Gogebic County is the westernmost county of the Upper Peninsula of Michigan. Part is hilly and well drained, part is low and swampy; lakes are very abundant. Much of the area is covered with virgin hardwood timber. The plants collected in August, 1919, number 38 ferns and fern allies, 10 conifers, 143 monocotyledons, including 52 grasses and 35 sedges, and 316 dicotyledons, including 58 composites (in the wider sense of the term). Of the 316 dicotyledons, 65 were woody in whole or at least in part.—Ernst A. Bessey.

6708. DARLINGTON, H. T. Contributions to the flora of Gogebic County, Michigan. Part II. Papers Michigan Acad. Sci. 1: 74-82. 1923.—Collections made in the early part of the summer of 1920 added the following to the vascular flora of this county: 2 ferns (total 40); 43 monocotyledons (total 186) including 9 grasses (total 61) and 21 sedges (total 56); and 59 dicotyledons (total 375) including 5 composites (total 63). The 9 additional woody plants bring the total of woody plants up to 74 out of the total of 601 vascular plants.—Ernst A. Bessey.

6709. DIELS, L. Eine *Scaevola* von Mikronesien. [A *Scaevola* from Micronesia.] Bot. Jahrb. 56: 561. 1921.—This is no. 20 of the series: Beiträge zur Flora von Mikronesien und Polynesien II, edited by L. Diels. *Scaevola frutescens* (Mill.) Krause is reported from the Caroline and Marshall Islands.—K. M. Wiegand.

6710. GUYOT, HENRY. L'ancienne extension des forêts dans la région du Grand St-Bernard (Valais). [The ancient extension of the forests in the region of Grand St. Bernard (Valais).] Bull. Soc. Bot. Genève 12: 152-153. 1920.—*Pinus Cembra* L. occurred in the region of St. Bernard previous to the 17th century.—W. H. Emig.

6711. LENDNER, A., ET G. BEAUVERD. L'*Erica vagans* L. du territoire Genevois. [*Erica vagans* L. of the Geneva region.] Bull. Soc. Bot. Genève 13: 30. 1921.

6712. McATEE, W. L. Notes on interesting plants in Michigan. Papers Michigan Acad. Sci. 1: 155-166. 1923.—Here are published notes on various plants representing forms little known or that are additions to the known flora of Michigan, based on an annotated copy of Beal and Wheeler's Michigan Flora which was the property of the late Professor C. F. Wheeler, and upon letters and specimens enclosed in that copy.—*Ernst A. Bessey.*

6713. PRAEGER, R. LLOYD. Notes on Antrim plants. Irish Nat. 29: 95-105. 1920.—These notes concern chiefly the local distribution of plants in County Antrim, Ireland.—*W. E. Praeger.*

6714. PRAEGER, R. LLOYD. Notes on Down and Dublin plants. Irish Nat. 30: 101-103. 1921.—Sundry observations on habits and distribution are recorded.—*W. E. Praeger.*

6715. REBHOLZ, E. Beiträge zur Wildrosenflora des oberen Donautales und seiner Umgebung I. [Contributions to the wild rose flora of the upper valley of the Danube and vicinity. I.] Jahresh. Ver. Vaterländ. Naturk. Württemberg 78: 20-34. 1922.—The district studied is in the southern part of Württemberg and includes Tuttlingen and the surrounding country. The author describes the general appearance of the rose flora among the other elements of the vegetation and discusses in detail the local distribution of the individual species. In this, the 1st part of his work, he takes up the sections *Synstylae*, *Gallicae*, and *Caninae*. The 1st is represented by 1 species, *Rosa arvensis* Huds. (with 4 varieties); the 2nd, also by 1 species, *R. gallica* L.; while the 3rd is represented by 12 species (distributed among 5 subsections as follows: *R. Jundzillii* Besser (with 2 subspecies), *R. rubrifolia* Villars (with 3 varieties, the var. *Rebholzii* R. Keller being described as new), *R. pomifera* Herrmann (with 1 variety), *R. tomentosa* Sm. (with 4 varieties), *R. rubiginosa* L. (with 3 varieties), *R. micrantha* (with 1 variety), *R. agrestis* Savi (with 1 variety), *R. tomentella* Leman, *R. canina* L. (with 5 varieties) *R. dumetorum* Thuiller (with 4 varieties), *R. glauca* Villars (with 6 varieties), and *R. coriifolia* Fr. (with 4 varieties, the var. *atra* R. Keller & E. Rebholz being described as new). Critical and descriptive remarks are given in connection with many of the species and varieties.—*A. W. Evans.*

6716. ROMIEUX, HENRI. Remarques sur deux plantes du Maroc. [Remarks on two Moroccan plants.] Bull. Soc. Bot. Genève 13: 30. 1921.—At an elevation of 1400 m., near Geneva, were found 2 plants of special interest: *Asphodelus acaulis* Desf., and *Boucerosia* sp.—*W. H. Emig.*

6717. SCHLENKER, K. Über 2 Adventivpflanzen in der württ. Flora. [On 2 adventive plants in the flora of Württemberg.] Jahresh. Ver. Vaterländ. Naturk. Württemberg 78: xxvii-xxix. 1922.—A report of a meeting is given in which the discovery of *Senecio vernalis* and *Bidens radiatus* in Württemberg was announced. The 1st is a native of Central Asia and Russia, the 2nd of southeastern Siberia. Both species are widely introduced into other parts of western Europe.—*A. W. Evans.*

6718. SMITH, E. PHILLIP, AND JOHN B. SIMPSON. *Spiranthes autumnalis*. Nature 111: 291. 1923.—Two separate notes are recorded on the occurrence of this orchid at Carrbridge and on the Island of Coll, Argyllshire.—*O. A. Stevens.*

6719. SOTH, BLANCHE H. Flora of Pocatello, Idaho. Amer. Bot. 29: 48-53. 1923.—The seasonal aspect of the flora of this region is discussed.—*S. P. Nichols.*

6720. STELFOX, A. W. Note on *Carex muricata* L. and its segregates *C. contigua* Hoppe and *C. Pairaei* Schultz. Irish Nat. 30: 31-32. 1921.

6721. THOMPSON, BERTHA E. Distribution of the Violaceae of Michigan. Papers Michigan Acad. Sci. 1: 167-184. Pl. 35-36. 1923.—A list, based on specimens examined, is

given of the Violaceae occurring in Michigan, together with a key for their determination. One species of *Cubelium* and 34 of *Viola* are recognized in the state.—*Ernst A. Bessey*.

6722. TOTTEN, H. R. Wild ferns and flowers of Chapel Hill. Jour. Elisha Mitchell Sci. Soc. 38: 12. 1922.—*Tradescantia virginiana* L. and *Silene alba* Muhl. are added to the list of Chapel Hill (North Carolina) species.—*W. C. Coker*.

6723. TURRILL, W. B. *Convolvulus nitidus* Boiss., from the Balkan Peninsula. New Phytol. 22: 95-96. 1923.—The species named, known hitherto only from the mountains of southern Spain, is here reported from a similar locality (Mt. Ali-Botusch) in the Balkans.—*I. F. Lewis*.

6724. VOIGT, ALBAN. Beiträge zur Floristik des Tessins. II. [Contributions to the flora of Tessin. II.] Sitzungsber. u. Abhandl. Naturw. Ges. "Isis" 1920-21: 11-19. 1922.—The author reports the results of his 1921 explorations in the southern part of the canton of Tessin, Switzerland. He describes the physiographic and geological features of the district and comments on the large number of adventive plants in the flora, many of these having been introduced with Italian hay in 1919. The rare and otherwise interesting vascular plants collected are enumerated and number 91 species, varieties, and forms, 46 of which are new to the canton. Each species is accompanied by data regarding localities, and a few descriptive or distributional notes are given. A new variety, *Stachys Ocymastrum* var. *purpureiflorus* Thell., and a new form, *Sisymbrium Loeselii* f. *pallidiflorum* Voigt, are described. *A. W. Evans*.

6725. WINSTEDT, K. Farve-Vaid (*Isatis tinctoria* L.) vildtvoksende i Danmark. [*Isatis tinctoria* naturally growing in Denmark.] Nat. Verden 6: 33-36. 1922.—*Isatis tinctoria* L. var. *maritima* Rupr. was found in 1919 and 1920 on the island of Bornholm in the Baltic, where it was discovered in 1861, although absent in the meantime. It appears to have come from the Swedish coast where it grows spontaneously. The seed float on salt water 4-6 days. The plant was never much cultivated in Denmark, the localities are very few, and the occurrence may always be connected with import of foreign grass seed.—*Ernst Gram*.

6726. YUNCKER, T. G. The genus *Cuscuta* in Michigan. Papers Michigan Acad. Sci. 1: 185-189. 1923.—A list is given with key of the 8 species of *Cuscuta* occurring in Michigan, based upon specimens examined by the author.—*Ernst A. Bessey*.

MISCELLANEOUS, UNCLASSIFIED PUBLICATIONS

B. E. LIVINGSTON, *Editor*

S. F. TRELEASE, *Assistant Editor*

6727. AMANN, J. L'étude der mousses au microscope polarisant. [The study of mosses by means of a polarizing microscope.] Rev. Bryologique 50: 6-9. 1923.—The author presents some of the results obtained by the use of a polarizing microscope in the study of the leaves, peristomes, and other parts of mosses. He distinguishes between positive and negative effects, and brings out the fact that the optical properties of the cell-membranes depend upon chemical composition.—*A. W. Evans*.

6728. BADE, E. Between two worlds. Sci. Amer. 128: 34. 4 fig. 1923.—This article points out the various difficulties encountered in attempting to differentiate lower plants and lower animals, when employing the criteria of function and behavior.—*Chas. H. Otis*.

6729. BAILEY, VERNON. Sources of water supply for desert animals. Sci. Monthly 17: 66-86. 1923.—Some rabbits eat the prickley pear, *Opuntia Engelmanni*, and parts of even more spiny cacti. *Talinum* is also used. Rats, gophers, ground squirrels, and grasshopper

mice may use very little or no water, except that obtained from plants. Even man may live with a small amount, if he knows the plants to use and becomes accustomed to the conditions.—*L. Pace.*

6730. EWART, ALFRED J. **Biology during the war and after.** Rept. Australasian Assoc. Adv. Sci. 15: 134-144. 1921.—This is the President's address before Section D of Australasian Association for the Advancement of Science. It contains a short address on the value of botany as a science, followed by reports of recent Australasian researches in botany and zoology and by a short review of the work done at the National Herbarium of Victoria during the past 15 years.—*Ray C. Friesner.*

6731. FERRIS, G. F. **The place of the systematist in modern biology.** Sci. Monthly 16: 514-520. 1923.—The work of the systematist is not only for his own field; all other biologists depend on it. It should have the best minds, and not be left for amateurs.—*L. Pace.*

6732. GREER, W. C. **Black gold of the Tropics.** Pharm. Era 56: 215-218. 2 fig. 1923.—A description is given of the processes through which rubber passes in the manufacture of various articles.—*C. M. Sterling.*

6733. KÖHLER, A. **Das Mikroskop und seine Anwendung.** [The microscope and its uses.] Abt. II. Physikalische Methoden. Heft 2. Lieferung 95 of the **Handbuch der biologischen Arbeitsmethoden.** [Vol. II. Physical methods. Heft 2. Part 95 of the **Handbook of biological laboratory methods.**] P. 171-352. Fig. 138-248. Urban and Schwarzenberg: Berlin and Vienna, 1923. Edited by EMIL ABDERHALDEN.—The subject is treated under the following heads: geometrical relation between object and image; application of the law of images to lenses of definite thickness, or to a system of such lenses; remarks on photometry; photometrical relation between object and image; loss of light in optical systems; remarks concerning seeing with the unaided eye. Pages 237-286 are devoted to the hand lens, with the following sections: the formation of a level field through the magnifier; the imaging of a body through the magnifier; the imaging of an illuminated transparent or reflecting preparation; image defects of the magnifier and their improvement; different forms of magnifiers. Pages 286-352 deal with the simple microscope, with sections as follows: the imaging of a plane object by the simple microscope; the imaging of illuminated transparent objects; image defects of simple microscopes and their improvement; a few forms of the simple microscope; mountings and stands of the simple microscope; testing the magnifier and the simple microscope and measuring the magnification.—*C. S. Gager.*

6734. MANGHAM, SIDNEY. **Laboratory Notes. A simple respiroscope. A cheap bench light.** New Phytol. 21: 230-231. 1922.

6735. MAWSON, DOUGLAS. **Australasian Antarctic expedition. Report on progress of publication of scientific results.** Rept. Australasian Assoc. Adv. Sci. 15: 286-291. 1921.

6736. NORMAN, J. R. **Methods and technique of reconstruction.** Jour. Roy. Microsc. Soc. London 1923: 37-56. 8 fig. 1923.—A method of reconstructing objects in wax from serial sections is described.—*R. E. Cleland.*

6737. SLOSSON, EDWIN E. **Current comment.** Sci. Monthly 16: 557. 1923.—Power in large quantities may be obtained from the fruit of prickly pears.—*L. Pace.*

BOTANICAL ABSTRACTS

PUBLISHED MONTHLY UNDER THE DIRECTION OF
THE BOARD OF CONTROL OF BOTANICAL ABSTRACTS, INC.

CUMULATED INDEX, VOLUMES 1 TO 10, READY IN DECEMBER

Cumulated subject and author indexes of Botanical Abstracts, volumes 1 to 10, are ready to print. The author index contains about 26,000 citations while the subject index has 60,000 entries with perhaps 3 or 4 times as many citations. All topics mentioned in the abstracts are suitably indexed. For a sample page, see cover page 4 of this issue. The completed work will comprise a volume of about 500 pages.

The indexes will be offered for subscription within a few days. Subscribers will receive notice and an order blank in ample time to take advantage of a special reduced subscription price. Non-subscribers who desire a copy of the notice are requested to communicate at once with the Business Manager.

Subscribers are reminded that the early volumes were sold on the basis of a book of 300-325 pages. It was planned, at the outset, to publish annual subject indexes; but when a variety of circumstances made this impossible the volumes were filled up with abstracts and author indexes. Upon examination it will be found that the first 10 volumes average 311.4 pages each.

Price. It is estimated that the subscription price for the indexes will be \$10. If a great many non-subscribers desire a copy it may be possible to reduce the price somewhat. The post-publication price will be much higher than the subscription price.

Index for volume eleven. Subscribers to Botanical Abstracts are reminded that the index for volume 11 is in preparation and that its cost is included in the subscription price for that volume.

Address. All orders and other business communications should be addressed as follows: Botanical Abstracts, Ithaca, New York, U. S. A.

BOTANICAL ABSTRACTS

PUBLISHED MONTHLY UNDER THE DIRECTION OF
THE BOARD OF CONTROL OF BOTANICAL ABSTRACTS, INC.

IMPORTANT NOTICE

INDEX TO VOLUME 12

The December (concluding) number of Volume 12 will be devoted to the author and subject indexes for the volume. This volume, therefore, should not be bound until the number, which will be considerably delayed, is received. Meanwhile publication of Volume 13 (1924) will proceed. The cost of the index number of Volume 12 is included in the subscription price for that volume.

[INDEX TO VOLUME 11

This index (concluding number of Volume 11, 1922) is in preparation and will be distributed at the earliest possible time. Its cost is included in the subscription price for the volume.

CUMULATED INDEX TO VOLUMES 1 TO 10

Cumulated subject and author indexes of Botanical Abstracts, volumes 1 to 10, are ready to print. The author index contains about 26,000 citations while the subject index has 60,000 entries with perhaps 3 or 4 times as many citations. All topics mentioned in the abstracts are suitably indexed. For a sample page, see cover page 4 of this issue. The completed work will comprise a volume of about 500 pages.

Subscribers are reminded that the early volumes were sold on the basis of a book of 300-325 pages. It was planned, at the outset, to publish annual subject indexes; but when a variety of circumstances made this impossible the volumes were filled up with abstracts and author indexes. Upon examination it will be found that the first 10 volumes average 311.4 pages each.

Subscribers have already received notices regarding subscriptions to the index; attention is again called to the fact that in order to secure the special pre-publication price of \$10.00 (cloth-bound copies, if available, \$11.00) orders must be in the hands of the Business Manager on or before December 15. The post-publication price will be \$12.00 for paper-bound copies (cloth-bound copies, if available, \$13.00). Non-subscribers who desire a copy of the notice are requested to communicate at once with the Business Manager.

Address. All orders and other business communications should be addressed as follows: Botanical Abstracts, Ithaca, New York, U. S. A.
